- 2A. Plant green throughout; stems and often the axis of inflorescence glandular-puberulent, and loosely long spreading pubescent; leaves ovate-cordate, puberulent; fruit globose, sulcate; pedicels shorter to as long as the fruit. 1. *C. cordata*
- 2B. Stems and inflorescence often reddish, glabrous or puberulent; leaves ovate to ovate-oblong, cuneate to rounded at base; fruit obovoid; pedicels as long as to longer than the fruit.
- 3A. Axis of inflorescence rather thick, usually short-pubescent, rarely glabrous; fruit broadly obovoid, sulcate; pedicels as long as to 1.5 times as long as the fruit; leaves mostly cuneate, rarely rounded at base; petals deeply bifid.
- 4A. Stems recurved-puberulent; leaves slightly puberulent; axis of inflorescence glabrous or loosely puberulent. 2. *C. mollis*
- 4B. Stems glabrous or slightly puberulent; leaves nearly glabrous except the puberulent margins; axis of inflorescence rather densely short glandular-puberulent. 3. *C. quadrisulcata*
- 3B. Axis of inflorescence slender, glabrous; fruit narrowly obovoid or obovoid-clavate, not sulcate; pedicels 3 to 5 times as long as the fruit; leaves rounded at base; petals emarginate. 4. *C. erubescens*
- 1B. Fruit 1-locular, not sulcate, 1-seeded, clavate; petals nearly as long as the calyx-lobes; plant 5–10 cm. high, rarely 20 cm. high, glabrous, reddish; leaves deltoid-ovate, 1–3 cm. long, cordate. 5. *C. alpina* var. *caulescens*

1. *Circaea cordata* Royle. *C. cardiophylla* Makino—USHITAKI-SÔ. Green perennial 40–60 cm. high, with creeping rhizomes; stems branched, glandular-puberulent and loosely long spreading-pubescent; leaves ovate-cordate to broadly ovate, 7–12 cm. long, 5–8 cm. wide, abruptly acuminate, shallowly cordate to rounded at base, subentire or indistinctly mucronate-toothed, puberulent, the petioles 3–10 cm. long, with spreading short and long hairs; inflorescence 7–15 cm. long, rather densely spreading glandular-puberulent, the axis rather thick; petals with 2 deep narrow lobes, about 1/3–1/2 as long as the calyx-lobes; fruit nearly globose, about 3 mm. across, sulcate, densely yellow-brown uncinately-hairy and loosely puberulent, the pedicels shorter than to as long as the fruit.—Moist woods; Hokkaido, Honshu, Shikoku.—Korea, Manchuria, Ussuri, China, Formosa, and N. India.

2. *Circaea mollis* Sieb. & Zucc. *C. quadrisulcata* Fr. & Sav., excl. syn.; *C. coreana* Lévl.; *C. lutetiana* var. *taquetii* Lévl.—MIZU-TAMA-SÔ. Rhizomatous and stoloniferous; stems 20–50 cm. long, recurved-puberulent; leaves narrowly ovate to narrowly ovate-oblong, 5–10 cm. long, 2–3 cm. wide, ascending-puberulent, gradually acuminate, cuneate to acute, rarely rounded at base, loosely mucronate-toothed, the petioles 1–4 cm. long, puberulous; inflorescence elongate after anthesis, to 15 cm. long, the axis rather thick, glabrous or loosely puberulent; calyx-lobes broadly ovate-elliptic; petals obovate, moderately or deeply bifid, 1/2–2/3 as long as the calyx-lobes; fruit broadly obovoid, 3–4 mm. across, sulcate, uncinately-pilose, the pedicels 1–1.5 times as long as the fruit.—Aug.–Sept. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, China, and Indochina.

Var. *ovata* (Honda) Hara. *C. quadrisulcata* var. *ovata* Honda—HIRO-HA-MIZU-TAMA-SÔ. Leaves ovate, rounded to slightly cordate at base, long-petioled.—Honshu (Shimotsuke and Iwaki Prov.); rare.

3. *Circaea quadrisulcata* (Maxim.) Fr. & Sav. *C. lutetiana* sensu auct. Japon., non L.; *C. lutetiana* forma *quadrifida* Maxim.; *C. mollis* var. *maximowiczii* Lévl.; *C. maximowiczii* (Lévl.) Hara—YAMA-TANI-TADE. Stems 30–40 cm. long, glabrous or slightly puberulent; leaves narrowly ovate to narrowly ovate-oblong, 4–14 cm. long, 2–5 cm. wide, acumi-

nate, rounded to shallowly cordate to cuneate at base, obscurely mucronate-toothed, glabrous except the puberulent margins, the petioles shorter than the leaves; inflorescence elongate after anthesis, the axis rather densely short-glandular-puberulent; petals about 2/3 as long as the calyx-lobes, bifid to the middle; fruit broadly obovoid, about 3 mm. across, sulcate, uncinately-pilose, the pedicels as long as to 1.5 times as long as the fruit.—Moist grassy places; Hokkaido, Honshu (centr. distr.).—Sakhalin, Korea, Manchuria, n. China, e. Siberia, and Altai.

4. *Circaea erubescens* Fr. & Sav. *C. lutetiana* var. *intermedia* Lévl.; *C. lutetiana* subsp. *erubescens* (Fr. & Sav.) Lévl.; *C. kawakamii* Hayata—TANI-TADE. Slenderly stoloniferous, nearly glabrous rubescent herb, thinly puberulent while very young; stems 20–50 cm. long; leaves ovate or narrowly so, 3–7 cm. long, 1.5–3.5 cm. wide, acuminate, rounded at base, sparsely short-toothed, the petioles 2–5 cm. long, reddish; inflorescence glabrous, the axis slender, 6–10 cm. long; calyx usually reddish; petals obovate, emarginate, about 1/2 as long as the calyx-lobes; fruit narrowly ovoid to obovoid-clavate, 2–2.5 mm. across, not sulcate, short, uncinately-pilose, the pedicels slender, 3–5 times as long as the fruit.—July–Sept. Moist woods; Hokkaido, Honshu, Shikoku, Kyushu.—Formosa and China.

5. *Circaea alpina* L. var. *caulescens* Komar. *C. caulescens* (Komar.) Nakai—MIYAMA-TANI-TADE. Delicate, reddish, glabrous, stoloniferous herb, 5–10 cm. high, rarely 20 cm. high; stems glabrous or loosely puberulent; leaves deltoid-ovate to ovate, 1–3 cm. long, 7–20 mm. wide, acute, open-cordate to rounded-truncate at base, thinly puberulent on upper surface or only toward margin, with few acute teeth, the petioles 1–2 cm. long, reddish; inflorescence glabrous, 3–5 cm. long; calyx-lobes reddish; petals nearly as long as the calyx-lobes; fruit clavate, about 1.5 mm. across, not sulcate, 1-locular, 1-seeded, loosely soft uncinately-pilose, the pedicels slender, 1.5–2.5 times as long as the fruit.—July–Aug. Moist woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Widely distributed in the temperate and northern parts of the N. Hemisphere.

3. *EPILOBIUM* L. AKABANA ZOKU

Herbs or half-shrubs; leaves opposite or some of them alternate, entire or toothed; flowers solitary in axils or in terminal racemes or spikes, white, rose, or red-purple; calyx-tube adnate to ovary, linear, 4-angled or terete, the limb 4-lobed, deciduous; petals 4, obovate or obcordate; stamens 8; ovary 4-locular; styles prominent, the stigmas clavate or 4-lobed; ovules many, ascending, in 2 series on inner angle of the locule; capsules elongate, linear, 4-angled, loculicidally dehiscent, 4-valved, the axis persistent; seeds many, ascending, comose.—About 160 species, especially in the temperate and northern parts of the N. Hemisphere, abundant also in New Zealand.

(Treatment chiefly that of Dr. Hiroshi Hara.)

- 1A. Petals large, about 1.5 cm. long, entire, rose-purple; stamens and styles declined, the stigma deeply 4-lobed; plant 1–1.5 m. high, robust, with alternate leaves and a terminal racemose inflorescence. 1. *E. angustifolium*
- 1B. Petals smaller, 3–12 mm. long, emarginate, white to pale rose; stamens and styles erect; plants smaller and more slender, with more or less opposite leaves and axillary flowers, the inflorescence seldom racemose.
- 2A. Stigma 4-lobed; petals 7–12 mm. long.
 - 3A. Plant large, about 1 m. high; stems long spreading-pilose; pedicels, ovary, and calyx densely short-glandular and long-pubescent; flowers 12–15 mm. long. 2. *E. hirsutum* var. *villosum*
 - 3B. Plant smaller, 15–60 cm. high; stems and flowers with curved puberulence; flowers 7–11 mm. long. 3. *E. montanum*
- 2B. Stigma simple, capitate to clavate; petals mostly shorter.
 - 4A. Leaves nearly entire or obscurely serrulate; ovary densely white appressed-puberulent.
 - 5A. Seeds oblanceolate, 1.5–2.7 mm. long; flowers 5–9 mm. long; calyx 4–5 mm. long; leaves linear to ovate-lanceolate, obtuse to subacute; plant with stolons. 4. *E. palustre* var. *lavandulaefolium*
 - 5B. Seeds narrowly oblong, 1–1.5 mm. long, obtuse at both ends; flowers 3.5–4.5 mm. long; calyx 2.5–3.5 mm. long; leaves narrowly oblong or oblong-lanceolate, short-acute to obtuse; plant without stolons. 5. *E. fastigiatum* var. *mosaicum*
 - 4B. Leaves distinctly serrulate; ovary short-hairy.
 - 6A. Median leaves linear or narrowly lanceolate, 1–5 mm. wide.
 - 7A. Rhizomes with a terminal scaly subterranean winter bud; leaves with 1–2(–4) small teeth on each side; calyx-lobes minutely mucronate; pedicels 1–3.5 cm. long; stems slender. 6. *E. jauriei*
 - 7B. Rhizomes with subsessile innovation-shoots on the neck; leaves finely toothed; calyx-lobes prominently mucronate; pedicels 5–12 mm. long; stems usually stouter. 7. *E. formosanum*
 - 6B. Median leaves broader, oblong-lanceolate to broadly ovate, (3–)5–35 mm. wide.
 - 8A. Stigma capitate.
 - 9A. Stems densely long curved-puberulent along the ridges; leaves puberulent on nerves and on margin; ovary sparsely glandular-puberulent or the hairs not glandular. 8. *E. amurense*
 - 9B. Stems curved-puberulent or glabrous; ovary appressed curved-pubescent or glabrous. 9. *E. cephalostigma*
 - 8B. Stigma clavate.
 - 10A. Plants stout, (15–)35–90 cm. high; leaves usually rounded at base, prominently toothed; ovary densely glandular- or curved-puberulent.
 - 11A. Plant stoloniferous; stems without ridges; leaves 2–10 cm. long, 0.5–3 cm. wide; ovary usually prominently glandular-puberulent; seeds 1.5–1.8 mm. long, the coma often red-brown. 10. *E. pyrricholophum*
 - 11B. Plant with subsessile innovation shoots at base; stems ridged; leaves 4–9 cm. long, 1.5–2.5 cm. wide; ovary densely curved-puberulent and sparingly glandular-puberulent; seeds 0.8–1.4 mm. long, the coma whitish. 11. *E. glandulosum* var. *asiaticum*
 - 10B. Plants usually smaller, 5–30 cm. high; leaves narrowed at base, often obsolete toothed; ovary glabrous or with glandular or curved puberulence.
 - 12A. Seeds without papillae; flowers 3.5–4.5 mm. long; pedicels thinly glandular-puberulent. 12. *E. shiromense*
 - 12B. Seeds minutely papillose; flowers 4–6 mm. long.
 - 13A. Pedicels thinly glandular-puberulent, 3–20 mm. long in fruit. 13. *E. foucaudianum*
 - 13B. Pedicels thinly curved-puberulent, 22–35 mm. long in fruit. 14. *E. dielsii*

1. *Epilobium angustifolium* L. *Chamaenerion angustifolium* (L.) Scop.; *E. spicatum* Lam.—YANAGI-RAN. Rhizomatous perennial, 1–1.5 m. high; stems stout, erect, usually simple, terete, glabrous or sparsely curved-puberulent; leaves numerous, alternate, lanceolate, 8–15 cm. long, 1–3 cm. wide, acuminate, narrowed toward the subsessile base, subterete, puberulent on the midrib and glaucous beneath; racemes terminal, elongate, many-flowered, the bracts linear, the pedicels 8–30 mm. long; flowers 2–3 cm. across; ovary densely curved-puberulent; calyx deeply 4-cleft to just above the ovary, the lobes oblanceolate, about 1.5 cm. long; petals rose-purple, obovate-orbicular, about 1.5 cm. long, entire, short-clawed at base; stamens and styles declined, the stigmas deeply 4-lobed; capsules 8–10 cm. long.—July–Aug. Gregarious in grassy places; Hokkaido, Honshu (centr. distr. and northw.); rather

common.—Widely distributed in the temperate and northern parts of the N. Hemisphere.

2. *Epilobium hirsutum* L. var. *villosum* Hausskn. *Ö. AKABANA*. With creeping rhizomes and stout stolons; stems about 1 m. long, erect, rather stout, much branched, terete, densely long spreading-pilose and short glandular-puberulent; leaves linear-oblong to linear-lanceolate, 3–10 cm. long, 5–18 mm. wide, acute, slightly narrowed at base, sessile, clasping, acutely toothed, long-pubescent on both sides; flowers rose, 12–15 mm. long, mucronate in bud, the pedicels short, densely short-glandular and long spreading-pubescent; calyx 9–11 mm. long, the lobes 7–9 mm. long; petals broadly obovate, bifid, 10–12 mm. long; stigmas 4-fid; capsules 5–8 cm. long, the pedicels 4–12 mm. long; seeds oblong-obovate, 1–1.2 mm. long, rounded at apex, very densely papillose.—July–Aug. Hon-

shu (Sado and Iwashiro Prov.); rare.—The species is widely distributed in Eurasia and N. Africa.

3. *Epilobium montanum* L. *E. parviflorum* var. *menziesoides* sensu auct. Japon., non Hausskn.—EZO-AKABANA. Rhizomes short, with sessile innovation shoots on the neck; stems 15–60 cm. long, terete, without ridges, densely curved-puberulent, especially on upper portion; leaves ovate or oblong-ovate, the lower ones obtuse, the upper ones acute, rounded to subcordate, very short-petioled, irregularly serrulate, thinly puberulous; median leaves 2–5 cm. long, 10–23 mm. wide; flowers 7–11 mm. long, pale rose, subobtusate at apex in bud, the pedicels densely appressed white-puberulent and short glandular-pilose; calyx 5–7.5 mm. long; stigma 4-fid; capsules to 7 cm. long, curved-puberulent, the pedicels 8–15 mm. long; seeds oblong, 1–1.3 mm. long, rounded at apex, obtuse at base, densely papillose, the coma whitish.—July–Aug. Wet places in mountains; Hokkaido, Honshu (centr. distr. and northw.).—Siberia, Himalayas, Caucasus, Asia Minor, and Europe.

4. *Epilobium palustre* L. var. *lavandulaefolium* Lecoq & Lamotte. *E. dahuricum* sensu auct. Japon., non Fisch.; *E. lineare* sensu auct. Japon., non Muhl.—HOSOKA-AKABANA, YANAGI-AKABANA. Plant with elongate rhizomes and stolons; stolons with minute opposite scalelike leaves and a small ellipsoidal winter-bud at the tip; stems erect, 10–40 (–60) cm. long, usually without ridges, with minute curved-puberulence on upper portion; leaves linear to ovate-lanceolate, 2–6 cm. long, 2–15 mm. wide, obtuse to subacute, narrowly cuneate or obtuse at base, obscurely toothed, minutely curved-puberulent on upper side and curved-puberulent on nerves beneath and on margin, sessile or nearly so; flowers rose to white, 5–9 mm. long, the pedicels short, densely curved-puberulent; ovary densely white appressed-puberulent and with a few glandular hairs; calyx 4–5 mm. long; petals 5–8 mm. long; stigmas clavate, much shorter than the style; capsules 5.5–8 cm. long, with curved puberulence especially on the angles, the pedicels 1–2.5 cm. long; seeds oblanceolate, 1.5–2.7 mm. long, obtuse, narrowly cuneate at base, with small papillae on the surface, the coma nearly white.—July–Aug. Wet places in lowlands; Hokkaido, Honshu (centr. distr. and northw.).—The species is widely distributed in Europe, Asia, and N. America.

5. *Epilobium fastigiatum* Nakai. *E. palustre* var. *mandjuricum* Hausskn.—EDA-UCHI-AKABANA. Sometimes with elongate rhizomes and with stolons; stems much branched or simple, 20–40 cm. long, without ridges, densely leafy, with curved puberulence in upper portion; leaves narrowly oblong to oblong-lanceolate, 1.5–4.5 cm. long, 3–10 mm. wide, short-acute to obtuse, cuneate to subrounded at base, broadest about the middle, subentire, sparsely puberulent on upper side and on nerves beneath, the petioles less than 1 mm. long; flowers 3.5–4.5 mm. long, the buds minutely mucronate; ovary densely white-puberulent and with few glandular hairs; calyx 2.5–3.5 mm. long; stigmas clavate, shorter than the style; capsules 3–6 cm. long, the pedicels 5–15 mm. long; seeds narrowly oblong, 1–1.5 mm. long, obtuse at both ends, densely papillose.—Hokkaido; rare.—Korea, Manchuria, China, Ussuri, Amur, and Dahuria.

6. *Epilobium fauriei* Lév. *E. kitadakeense* Koidz.—HIME-AKABANA. Often gregarious; rhizomes slender, usually long-ascending, the terminal, ovoid, sessile, winter-bud with fleshy scalelike leaves; stems nearly erect, slender, densely leafy, 3–20 (–40) cm. long, without ridges, sometimes with 2

series of minute hairs, curved white-puberulent especially on upper portion; leaves linear, 1–2.5 (–3) cm. long, 1–3 (–5) mm. wide, subobtusate, cuneately narrowed to the very short petiole, 1- or 2 (–4)-toothed on each side, often with axillary bulbils resembling winter-buds in late autumn; flowers white to rose, 4–6 (–8) mm. long, the pedicels and ovary white-appressed curved-puberulent; calyx 3–4 (–5) mm. long, the lobes minutely mucronate; stigmas clavate, much shorter than the styles; capsules 2–3.5 (–4.5) cm. long, the pedicels 1–3.5 cm. long; seeds oblanceolate-oblong, 0.8–1.3 mm. long, abruptly narrowed at the tip, cuneate with a mucro at base, densely papillose, the coma whitish.—July–Sept. Wet gravelly places in mountains; Hokkaido, Honshu (centr. distr. and northw.), and Mount Daisen in Hōki Prov.).—Kuriles.

7. *Epilobium formosanum* Masam. *E. cephalostigma* var. *linearifolium* Hisauchi; *E. sohayakense* Koidz.—TODAI-AKABANA, SAIYŌ-AKABANA. Often gregarious, bearing innovation-shoots on the neck of the rhizomes; stems 20–35 cm. long, rather stout, without ridges, densely leafy, with curved puberulence; leaves linear to lanceolate, 1–3 (–4) cm. long, 1.5–5 mm. wide, subacute, cuneately narrowed at base, minutely toothed, the petioles 1–3 (–4) mm. long; flowers 3.5–5 mm. long, rose to white, distinctly mucronate at apex in bud, the pedicels and ovary rather densely puberulent; calyx 3–4 mm. long, the lobes distinctly mucronate; stigmas thick-clavate, much shorter than the styles; capsules 3–4 cm. long, the pedicels 5–12 (–18) mm. long; seeds oblong, 0.8 mm. long, rounded at apex, obtuse at base, densely papillose, the coma white.—High mountains; Honshu (s. Shinano and westw.), Shikoku.—Formosa.

8. *Epilobium amurense* Hausskn. *E. origanifolium* var. *pubescens* Maxim.; *E. gansuense* Lév.; *E. montanum* sensu auct. Japon., non L.; *E. miyabei* Lév.; *E. shikotanense* Takeda; *E. ovale* Takeda.—KEON-AKABANA. Rhizomes with innovation-shoots on the neck, the short stolons with small scalelike leaves and an innovation-shoot at the tip; stems 6–40 (–70) cm. long, densely rather long curved-puberulent along the 2 ridges, otherwise glabrous; leaves lanceolate-oblong to ovate, 1.5–6.7 cm. long, 6–30 mm. wide in the median ones, acute, narrowed to the very short petiole, irregularly incurved-toothed, puberulent on nerves and on margin; flowers usually rose, distinctly mucronate at apex in bud, glandular-puberulent or curved-puberulent; calyx 3.5–6 mm. long; petals 4–7 (–8) mm. long; stigmas capitate; capsules 2.5–5 (–6.5) cm. long, glabrous or sparingly puberulent, the pedicels 4–10 (–22) mm. long; seeds linear-oblong, 0.8–1.2 mm. long, rounded at apex, slightly narrowed toward the obtuse base, densely and minutely papillose, the coma whitish.—July–Aug. Streams in mountains; Hokkaido, Honshu, Shikoku.—Sakhalin, Kuriles, Manchuria, Amur, and Formosa.

9. *Epilobium cephalostigma* Hausskn. *E. affine* sensu auct. Japon., non Bong.; *E. calycinum* Hausskn.; *E. consimile* sensu auct. Japon., non Hausskn.; *E. coreanum* Lév.; *E. consimile* var. *japonicum* Nakai; *E. sugaharae* Koidz.—IWA-AKABANA. Rhizomes short, with subsessile innovation-shoots on the neck; stems 15–60 cm. long, minutely puberulent on upper part and on branches, only on ridges in lower portion; leaves lanceolate or oblong-lanceolate, sometimes ovate-lanceolate, 1.5–9 cm. long, 5–33 mm. wide in the median ones, acute, cuneately narrowed to the very short petiole, irregularly serrate, the upper leaves much smaller; flowers 4.5–8 mm. long, rose to white, distinctly mucronate at apex in bud, the pedicels

short, curved-puberulent; ovary puberulent; calyx 4-6(-7) mm. long; stigmas capitate, the styles slender, much longer than the stigmas; capsules 3.5-8 cm. long, the pedicels 4-15 mm. long; seeds lanceolate-oblong, 0.8-1.2 mm. long, rounded at apex, slightly narrowed toward the obtuse base, minutely papillose, the coma white.—July-Aug. Moist woods in mountains; Hokkaido, Honshu, Kyushu.—Sakhalin, s. Kuriles, Manchuria, and China.

Var. *nudicarpum* (Komar.) Hara. *E. nudicarpum* Komar.—KE-NASHI-IWA-AKABANA. Glabrous except margins of leaves.—Mountains; Hokkaido, Honshu (centr. distr.).—Korea and Manchuria.

10. *Epilobium pyrricholophum* Fr. & Sav. var. *pyrricholophum*. *E. tetragonum* var. *japonica* Miq.; *E. japonicum* Hausskn.; *E. oligodontum* Hausskn.; *E. pyrricholophum* var. *japonicum* (Miq.) Hara; *E. quadrangulum* Lév.; *E. chrysocoma* Lév.; *E. arcuatum* Lév.; *E. nakaiianum* Lév.; *E. axillare* Franch.—AKABANA. Stolons slender, loosely leafy; stems terete, 15-90 cm. long, more or less curved-puberulent, densely glandular-puberulent on upper part; leaves ovate to ovate-lanceolate, 2-10 cm. long, 0.5-3 cm. wide in the median ones, acute with an obtuse tip, rounded to subcordate at base, somewhat irregularly toothed; flowers 5-10 mm. long, rose; ovary densely glandular-puberulent, sometimes also sparingly curved-puberulent; calyx 4-6.5 mm. long; stigmas clavate, slightly shorter than the styles; capsules 3-8 cm. long, glandular-puberulent, the pedicels 7-15 mm. long; seeds lanceolate-oblong, 1.5-1.8 mm. long, rounded at apex, narrowed to the obtuse base, densely papillose, the coma usually red-brown.—July-Sept. Wet places in mountains and lowlands; Hokkaido (Oshima Prov.), Honshu, Shikoku, Kyushu; common.—Korea and China.

Var. *curvatopilosum* Hara. *E. rouyanum* Lév.; *E. hakodense* Lév.; *E. makinoense* Lév.; *E. prostratum* Lév.; *E. kiusianum* Nakai; *E. myokoense* Koidz.—MUTSU-AKABANA. Stems puberulent and with glandular hairs on the uppermost part; leaves mostly curved-puberulent; pedicels and ovary curved- and glandular-puberulent.—Hokkaido, Honshu, Kyushu.—s. Kuriles.

11. *Epilobium glandulosum* Lehm. var. *asiaticum* Hara. *E. maximowiczii* Hausskn.; *E. glandulosum* forma *brevifolia* Hausskn.; *E. glandulosum* sensu auct. Japon., non Lehm.; *E. punctatum* Lév.; *E. minutiflorum* sensu auct. Japon., non Hausskn.—KARAFUTO-AKABANA, AZUMA-AKABANA. Rhizomes short, with subsessile innovation-shoots on the neck; stems erect, 35-80 cm. long, usually branched, with slender longitudinal ridges, glabrous or curved-puberulent on the ridges at base, curved- and glandular-puberulent on upper part; median leaves oblong-lanceolate, 4-9 cm. long, 1.5-2.5 cm. wide, acute, rounded or subcordate at base, irregularly toothed, glabrescent, sessile or very short-petioled; flowers small, usually 3.5-5 mm. long, rarely to 7 mm. long, minutely mucronate at apex in bud, the pedicels very short, curved- and glandular-puberulent; ovary densely curved- and sparingly glandular-

puberulent; calyx 3-4 mm. long; stigmas clavate; capsules 4-6.5 cm. long, the pedicels 3-6 mm. long; seeds ovate-oblong, 0.8-1.4 mm. long, subrounded at apex, subacute at base, densely papillose, the coma whitish.—Wet places; Hokkaido, Honshu (centr. distr. and northw.).—Sakhalin and s. Kuriles.—The species occurs in Korea, Ussuri, Kamchatka, Alaska, and N. America.

12. *Epilobium shiromiense* Matsum. & Nakai. SHIRO-UMA-AKABANA. With rhizomes and small-leaved stolons; stems often gregarious, 5-30 cm. long, usually simple, curved-puberulent on the obscure ridges, glandular-puberulent on upper part; leaves oblong or ovate-lanceolate, 12-30 mm. long, 3-11 mm. wide, subobtuse in the lower ones, subacute in the upper ones, cuneate and obtuse at base, minutely and obsoletely toothed, nearly glabrous, the petioles 1-4 mm. long; flowers small, rose; calyx 3-3.5 mm. long, minutely mucronate; stigmas clavate, about $\frac{1}{2}$ as long as the styles; capsules 2-5 cm. long, glabrescent, the pedicels 15-30 mm. long, glandular-puberulent; seeds oblong-oblancheolate, 1.2-1.4 mm. long, narrowed at both ends, obtuse, acute at base, without papillae, the coma white.—July-Aug. Wet places in mountains; Hokkaido, Honshu (centr. distr.).

13. *Epilobium foucaudianum* Lév. *E. sertulatum* sensu auct. Japon., non Hausskn.; *E. lucens* Lév.; *E. hornemannii* sensu auct. Japon., non Reichenb.; *E. hornemannii* var. *foucaudianum* (Lév.) Hara.—MIYAMA-AKABANA. Plants with short rhizomes and small-leaved stolons; stems often gregarious, 5-22 cm. long, usually simple, curved-puberulent on the obscure ridges, glandular-puberulent on upper part; median leaves thin, oblong-lanceolate to oblong-ovate or ovate, 10-40 mm. long, 3-15 mm. wide, obtuse or rounded at apex, narrowed at base, often with obsolete short teeth, glandular-puberulent, the petioles 1-5 mm. long; upper leaves acute, rather prominently toothed; flowers 4-6 mm. long, rose, the pedicels glandular; calyx 3-4.5(-5) mm. long; stigmas clavate, $\frac{1}{2}$ as long or slightly shorter than the style; capsules 2-6 cm. long, the pedicels 3-20(-25) mm. long; seeds oblanceolate, 1.1-1.3 mm. long, slightly narrowed at apex, subacute at base, minutely papillose.—July-Aug. High mountains; Hokkaido, Honshu (centr. distr. and northw.).—Sakhalin.

14. *Epilobium dielsii* Lév. *E. nakaharanum* Nakai.—ASHIBOSO-AKABANA. With short rhizomes and small-leaved stolons; stems often gregarious, 3-10(-15) cm. long, curved-puberulent on the ridges; median leaves lanceolate to ovate-lanceolate, or oblong, 10-22 mm. long, 3.5-7 mm. wide, sub-obtuse, obscurely serrulate, glabrous except the puberulent midrib, the petioles 1-4 mm. long; upper leaves subobtuse; flowers few, 4-5 mm. long, rose, the pedicels puberulent; ovary glabrate or sometimes sparingly puberulent and glandular; calyx 3-4 mm. long; stigmas clavate, shorter than the styles; capsules 2.5-5 cm. long, the pedicels 22-35 mm. long, sparsely curved-puberulent; seeds oblanceolate, 1-1.2 mm. long, minutely papillose.—July-Aug. High mountains; Hokkaido, Honshu (centr. distr. and northw.).—s. Kuriles.

4. LUDWIGIA L. MIZU-YUKI-NO-SHITA ZOKU

Herbs or subshrubs, often aquatic; leaves usually membranous, alternate, rarely opposite, entire, rarely toothed; flowers solitary, usually axillary, sessile or pedicelled, 2-bracteolate on pedicels or on the lower part of ovary; calyx-tube cylindrical or obconical, scarcely extended beyond the ovary, the lobes 3-6, persistent or nearly so; petals 3-6 or absent; stamens usually twice as many as the calyx-lobes; ovary 4- or 5-locular; styles simple, the stigmas 3- to 6-grooved or lobed; ovules many, in many series on the inner angle of the placentae; capsules linear to obovoid, terete, angled, or winged, at the apex with a disc and

persistent calyx-lobes, dehiscent through a rupture of the pericarp; seeds many, small.—About 40 species, in tropical and warm-temperate regions of the world, especially abundant in America.

- 1A. Pedicels longer than the fruit; bracteoles on the lower half of ovary, deciduous; petioles with 2 stipulelike glands at base; flowers large, 2–2.5 cm. across, bright yellow; capsules cylindric-clavate. 1. *L. stipulacea*
 1B. Pedicels absent or very short; bracteoles very small at the base of flower; petioles without stipulelike glands at base; flowers smaller.
 2A. Leaves 3–8 cm. long; flowers with petals; capsules cylindrical, 1.5–5 cm. long.
 3A. Stamens 8; calyx-lobes 6–8 mm. long; petals 6–10 mm. long; capsules narrowly cylindric, about 4 mm. across.
 2. *L. octovalvis* var. *sessiliflora*
 3B. Stamens 4; calyx-lobes 2–4 mm. long; petals minute; capsules linear-cylindric, 1.5–2 mm. across.
 4A. Seeds in one longitudinal series in each locule; petals minute. 3. *L. epilobioides*
 4B. Seeds in 2 series in each locule; petals about 4 mm. long. 4. *L. greatrexi*
 2B. Leaves 1–2.5 cm. long; flowers apetalous; capsules ellipsoidal to nearly globose, 4–5 mm. long. 5. *L. ovalis*

1. *Ludwigia stipulacea* (Ohwi) Ohwi. *Jussiaea stipulacea* Ohwi; *J. repens* sensu auct. Japon., non *L.*; *Ludwigia adscendens* var. *stipulacea* (Ohwi) Hara—MIZU-KIMBAI. Nearly glabrous rhizomatous perennial somewhat viscid in upper part in life; stems terete, ascending or creeping at base, erect above, 25–30 cm. long; leaves alternate, oblanceolate, oblong-lanceolate to narrowly oblong, 4–7 cm. long, 1.3–2.5 cm. wide, obtuse to subacute or sometimes rounded at apex, gradually narrowed at base, entire, the petioles 1–1.5 cm. long, with 2 stipulelike glands at base, the lateral nerves rather many, parallel, ascending; flowers axillary, solitary, 2–2.5 cm. across, bright yellow, the bracteoles on lower part of ovary, broadly ovate, about 2 mm. long; calyx-lobes 4, sometimes 5, lanceolate, 8–10 mm. long, acuminate; petals broadly ovate, about 13 mm. long, emarginate; stamens twice as many as the calyx-lobes, in 2 series, the disc densely white-villous; capsules cylindric-clavate, 2–2.5 cm. long, narrowed to the base, the pedicels 3–4 cm. long; seeds obliquely 4-angled, about 2 mm. across.—July–Sept. Ponds and ditches in lowlands; Hokkaido, Honshu, Shikoku, Kyushu.

2. *Ludwigia octovalvis* (Jacq.) Raven var. *sessiliflora* (Micheli) Raven. *Jussiaea octonervia* var. *sessiliflora* Micheli; *J. suffruticosa* L.; *J. villosa* Lam.; *L. pubescens* var. *villosa* (Lam.) Hara—KIDACHI-KIMBAI. Coarsely hirsute, suffrutescent herb; stems erect, branched, 40–100 cm. long; leaves lanceolate, 4–8 cm. long, 5–12 mm. wide, subobtusely, short-petiole; flowers solitary in axils, pale yellow, subsessile, the bracteoles minute or absent; ovary and calyx more or less hirsute while young; calyx-lobes ovate, 6–8 mm. long; petals nearly orbicular, 6–10 mm. long, the disc with 4 tufts of hairs; capsules narrowly cylindric, 3–5 cm. long, about 4 mm. wide, terminated by the persistent calyx-lobes, narrowed to the base; seeds many, rounded, emarginate.—Aug.–Oct. Wet places; Kyushu (Yakushima).—Widely distributed in the Tropics.

3. *Ludwigia epilobioides* Maxim. *Nematopyxis japonica* Miq.; *Jussiaea fauriei* Lév.; *J. japonica* Lév.; *J. philippiana* Lév.; *J. prostrata* sensu auct. Japon., non Lév.; *L. prostrata* sensu auct. Japon., non Roxb.—CHÔJI-TADE. Annual, scattered-puberulent while young; stems erect or ascending,

branched, slightly ridged, reddish, 30–60 cm. long; leaves alternate, lanceolate or oblong-lanceolate, 3–12 cm. long, 1–3 cm. wide, gradually acute, acuminate at base, entire, with 7–15 pairs of lateral nerves, the petioles 5–15 mm. long; flowers sessile; ovary minutely appressed-pilose; calyx-lobes ovate, 2–4 mm. long, acute; petals minute; stamens 4; capsules linear-cylindric, somewhat obtusely angled, 1.5–3 cm. long, 1.5–2 mm. wide; seeds fusiform, about 1 mm. long, in one longitudinal series in each locule, enveloped in a spongy pericarp, with brown longitudinal striations.—Aug.–Oct. Wet places in lowlands especially in paddy fields; Honshu, Shikoku, Kyushu; common.—Widely distributed throughout the Tropics.

4. *Ludwigia greatrexi* Hara. *Jussiaea greatrexi* (Hara) Hara—USUGE-CHÔJI-TADE. Much resembling the preceding, but with somewhat larger flowers, white-villous on the disc, and smaller seeds arranged in 2 longitudinal series in each locule, and the young shoots more pubescent; stems short-pubescent while young; leaves puberulent on both sides especially while young, 7–8 cm. long, 1–2 cm. wide; flowers subsessile, densely appressed-puberulent, the bracteoles minute or absent; calyx-lobes usually 5, 3–4 mm. long; petals obovate, 4 mm. long; stamens usually 5, the disc white-villous; capsules usually 5-locular, the endocarp rather thick, not corky, not closely adherent to the seeds; seeds oblong, slightly curved, 0.8 mm. long, with an obscure ridge.—Honshu (Kadzusa, and Suruga Prov.), Kyushu; rare.

5. *Ludwigia ovalis* Miq. MIZU-YUKI-NO-SHITA. Glabrous perennial; stems long-creeping at base, 20–40 cm. long, terete; leaves alternate, broadly ovate, ovate-orbicular to elliptic-orbicular, 1–2.5 cm. long, 1–2 cm. wide, rounded to very obtuse, abruptly narrowed at base, entire, the lateral nerves of 4–6 pairs, the petiole to 7 mm. long; flowers solitary, sessile, apetalous, pale green-yellow, the bracteoles small, at base of the ovary; calyx-lobes 4, deltoid, about 2 mm. long, acute; stamens 4; capsules ellipsoidal or nearly globose, 4–5 mm. long; seeds ovoid, about 0.8 mm. long, red-brown, lustrous, with an appendage on one side.—July–Oct. Wet places; Honshu, Shikoku, Kyushu.—Formosa.

Fam. 150. HALORAGACEAE ARI-NO-TÔ-GUSA KA Water-milfoil Family

Herbs or shrubs, sometimes aquatic; leaves alternate, opposite, or verticillate, the immersed ones often finely dissected, stipules absent; flowers bisexual or unisexual, solitary, in corymbs or panicles, often very small; calyx-tube adnate to the ovary, the lobes obscure or 2–4, slightly imbricate or valvate; stamens 2–8, the anthers basifixed, longitudinally split; ovary inferior, 1- to 4-locular; styles 2–4; ovules pendulous, as many as the styles; fruit a small nut or drupe, often winged, indehiscent; seeds with endosperm.—About 7 genera, with about 100 species, in the Tropics and temperate regions.

- 1A. Terrestrial herbs or rarely subshrubs ligneous at base; leaves opposite; flowers solitary or more often racemose; petals 4; stamens usually 8. 1. *Haloragis*
 1B. Aquatic herbs; leaves verticillate (in ours); flowers axillary or in a terminal spike; petals 2–4 or absent; stamens 2–8. 2. *Myriophyllum*

1. HALORAGIS Forst. ARI-NO-TÔ-GUSA ZOKU

Glabrous or strigose perennials or subshrubs; leaves small, usually coriaceous, entire or serrate, sometimes pinnately lobed, often with cartilaginous margins, the lower ones often opposite, the upper alternate; bracteoles 2 or absent; flowers small, short-pedicelled, axillary or in racemes, usually deflexed or nodding, unisexual or bisexual; calyx-tube with 4 or 8 ribs, the lobes usually 4, short, sometimes petalate; petals usually 4, membranous to coriaceous, valvate; stamens usually 8, with short filaments; ovary 2- to 4-locular or 1-locular; styles 2-4 or absent, the stigmas usually pinnate; ovules solitary in each locule; fruit an indehiscent small drupe, striate, winged, or spined.—About 60 species, chiefly in Australia, few in N. America, e. and s. Asia, and the Pacific Islands.

- 1A. Leaves broadly linear, 1-1.5 mm. wide, often with a broadly linear to linear-lanceolate lobe or tooth on each side above the middle; inflorescence simple. 1. *H. walkeri*
 1B. Leaves ovate to broadly so, 5-10 mm. wide, few-toothed; inflorescence branched. 2. *H. micrantha*

1. *Haloragis walkeri* Ohwi. HOSÔBA-ARI-NO-TÔ-GUSA.

Rather firm glabrous perennial herb, much branched from a somewhat ligneous scarcely thickened ascending base; stems slender, weakly 4-striate, simple or rarely sparsely branched, erect, leafy; leaves rather firm, cauline, opposite, sometimes alternate in upper ones, broadly linear, 1-2 cm. long, 1-1.5 mm. wide, gradually narrowed at base, sessile, scabrid on margin, simple and entire or more often 3-parted above the middle, the segments linear-lanceolate to broadly linear, acuminate with an obtuse tip; median leaves larger, 5-7 mm. long, the lateral ones obliquely spreading to ascending, 2-5 mm. long or sometimes reduced to an obtuse tooth, the midrib slightly raised beneath; spikes terminal, bracteate, erect, loosely flowered; flowers solitary or in pairs, the short pedicels minutely bibracteolate; calyx-teeth minute, ovate-deltoid, papillose-scabrid; petals 4, navicular, 1.5 mm. long, obtuse and subcucullate at apex, pilose on back; stamens 8.—July. Wet places; Kyushu (Mageshima near Tanegashima).

2. *Haloragis micrantha* (Thunb.) R. Br. *Gonocarpus micranthus* Thunb.—ARI-NO-TÔ-GUSA. Glabrous perennial; stems erect from a creeping much-branched base, 10-30 cm. long, slender, 4-angled; leaves usually opposite, the upper ones alternate, ovate to broadly so, 7-15 mm. long, 5-10 mm. wide, acute or subacute, rounded at base, somewhat cartilaginous and translucent on margin, few-toothed, the petioles 0.5-1 mm. long; racemes 3-10 cm. long, loosely many-flowered, usually paniculately compound, the bracts minute, the pedicels slender, 0.3-0.5 mm. long, curved downward; flowers small, deflexed, brownish yellow; calyx-tube broadly obovoid, about 1 mm. long in fruit, with 8 raised ribs, the lobes 4, ovate, about $\frac{1}{2}$ as long as the calyx-tube, erect, subacute, slightly cordate at base; petals oblong, inflexed and mitrate at apex, 2-2.5 times as long as the calyx-lobes, deciduous.—July-Sept. Grassy places in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, Malaysia, and Australia.

2. MYRIOPHYLLUM L. FUSA-MO ZOKU

Soft, glabrous, often aquatic herbs; leaves opposite, alternate, or verticillate, linear to ovate, entire or toothed, sometimes pinnately lobed, the immersed ones often pinnately dissected into filiform segments; flowers unisexual, small, solitary in axils or in a terminal spike, sessile, the staminate uppermost, the pistillate below; calyx-tube of staminate flowers very short, the lobes 4 or rarely 2; petals 2-4; stamens 2-8, filiform; calyx-tube of pistillate flowers 4-grooved, the lobes obscure or 4, linear, minute; petals minute or absent; ovary 4- or rarely 2-locular; styles 4, short, pinnate, usually reflexed; ovules solitary in each locule; drupe 4-grooved or separating into 4 nutlike fruits, the pericarp coriaceous or slightly fleshy, sometimes tuberculate on back.—About 40 species, in wet places or aquatic.

- 1A. Flowers axillary. 1. *M. verticillatum*
 1B. Flowers in spikes.
 2A. Aerial leaves pinnately lobed; plants monoecious.
 3A. Aerial leaves green; petals and calyx-tube smooth. 2. *M. spicatum*
 3B. Aerial leaves whitish on upper side; petals of staminate flowers and calyx-tube of pistillate flowers minutely papillose. 3. *M. oguraense*
 2B. Aerial leaves usually linear; plants dioecious. 4. *M. ussuriense*

1. *Myriophyllum verticillatum* L. FUSA-MO. Aquatic perennial herb; stems often much elongate, sparsely branched, with cylindric winter buds in axils; leaves verticillate in 4's, sessile, the immersed ones 3-4 cm. long, pinnately dissected into capillary segments, but the aerial ones linear-oblong, 1-1.5 cm. long, 3-5 mm. wide, pinnately cleft into narrowly linear ascending lobes; flowers solitary in axils of aerial leaves, the staminate terminal; petals 4, narrowly oblong, about 3 mm. long, obtuse; stamens 8, the anthers 1.5-2 mm. long; pistillate flowers below the staminate; calyx-tube urceolate, with 4 obtuse angles; fruit ovoid-globose, about 2.5 mm. long, 4-grooved, crowned by the persistent calyx-lobes and remnant of the styles.—May-July. Ponds and ditches in lowlands; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common.

—Widely distributed in temperate regions of the world.

2. *Myriophyllum spicatum* L. HOZAKI-NO-FUSA-MO. Aquatic monoecious perennial herb; stems elongate, often 1.5 m. long, sparsely branched; leaves verticillate in 4's, sessile, 2-3.5 cm. long, pinnately cleft or dissected, the segments filiform, entire, the aerial leaves green; inflorescence aerial, spicate, 3-8 cm. long, with 4 flowers at each node, the bracts narrowly oblong, spreading, 1-1.5 mm. long, entire, obtuse; staminate flowers on upper part of the spike, the petals 4, about 2.5 mm. long, obtuse, deciduous at anthesis; stamens 8, the anthers 1.5 mm. long; calyx-tube in the pistillate flowers nearly campanulate, 4-grooved, about 1 mm. long, the lobes minute; fruit globose-ovoid, about 2.5 mm. long, separating into 4 nutlike fruits, smooth on back.—May-Oct. Ponds and

ditches; Hokkaido, Honshu, Shikoku, Kyushu; common.—Widely distributed in warmer and temperate regions of the world.

Var. *muricatum* Maxim. TOGE-HOZAKI-NO-FUSA-MO. Margins of fruitlets on back with callose tubercles.

3. *Myriophyllum oguraense* Miki. OGURA-NO-FUSA-MO. Resembles the preceding species; winter-buds elongate, 6–8 cm. long, about 3 mm. across; leaves pinnately cleft, verticillate in 4's, the immersed ones 5 cm. long, the segments about 2.5 cm. long, the aerial ones about 1 cm. long, the lobes ascending, linear, whitish on upper side in life; pistillate flowers in lower leaf axils, the calyx-tube minutely papillose; staminate flowers in upper leaf axils, the petals 4, minutely papillose; stamens 8.—Nov. Ponds and ditches; Honshu (Kinki Distr.), Shikoku.

4. *Myriophyllum ussuriense* (Regel) Maxim. *M. verticillatum* var. *ussuriense* Regel—TACHI-MO. Winter-buds 6–8 mm. long, to 3 mm. wide; stems 5–20 cm. long, much elongate in the immersed ones; leaves verticillate in 3's or 4's, pinnately parted, broadly lanceolate, 5–10 mm. long, the segments linear, short, entire, the upper leaves linear, entire; flowers unisexual (plants dioecious); petals of the staminate flowers 4, obovate-oblong, about 2 mm. long, obtuse; stamens 8, the anthers about 1 mm. long; calyx-tube of pistillate flowers globose-urceolate, with short tubercles.—June–Sept. Wet places and ponds; Hokkaido, Honshu, Shikoku, Kyushu.—Ussuri, Amur, Manchuria, Korea, and Formosa.

Fam. 151. HIPPURIDACEAE

SUGINA-MO KA

Marestail Family

Aquatic or marsh herbs; stems erect; leaves simple, verticillate, entire; flowers small, solitary in axils, sessile, bisexual or unisexual; calyx-tube subglobose, terete, entire; petals absent; stamens solitary, superior, the filaments rather short, the anthers basifixed, longitudinally split on inner side; ovary 1-locular; style solitary, papillose the full length; ovules solitary, pendulous from the top of the locule; drupe coriaceous, the stone crustaceous, 1-seeded; seeds short-cylindric, the testa membranous, endosperm scanty, embryo cylindric.—A single genus, with about 3 species, in cooler regions of the N. Hemisphere and S. America.

1. HIPPURIS L.

SUGINA-MO ZOKU

Characters of the family.

1. *Hippuris vulgaris* L. SUGINA-MO. Mostly glabrous aquatic herb with long-creeping rhizomes; stems erect, simple, 20–50 cm. long; leaves verticillate in 6's to 12's, entire, the aerial ones broadly linear to narrowly oblong, 1–1.5 cm. long, about 2 mm. wide, obtuse, spreading, the immersed ones 2–6 cm. long, 2–3 mm. wide, 1-nerved; flowers axillary in the upper aerial leaves, solitary, sessile; calyx about 1 mm. long,

the limb entire; anthers broadly ovate, embracing the style on inside at first; style linear, slender; fruit narrowly oblong, about 2 mm. long, smooth.—July–Aug. Wet places and shallow ponds; Hokkaido, Honshu (Osenuma in Kotsuke and northw.).—Widely distributed in cooler parts of the N. Hemisphere.

Fam. 152. THELIGONACEAE

YAMATOGUSA KA

Theligonum Family

Herbs; leaves somewhat fleshy, ovate, the lower opposite, the upper alternate, entire; stipules membranous; flowers unisexual (plants monoecious), axillary, nearly sessile; perianth of staminate flowers with 2–5 sepals; stamens 10–30, the anthers linear, on long capillary filaments; perianth of the pistillate flowers small, connate, 3- or 4-toothed; ovary inferior; carpels 1; ovules with single integument; stigma 1, lateral; fruit a small achene.—One genus, with about four species, in the Mediterranean region and e. Asia.

1. THELIGONUM L.

YAMATOGUSA ZOKU

Characters of the family.

1. *Theligonum japonicum* Okubo & Makino. *Cynocrambe japonica* (Okubo & Makino) Makino—YAMATOGUSA. Perennial; stems loosely branched and creeping at base, terete, 15–30 cm. long, with a longitudinal line of recurved short hairs; leaves ovate or narrowly so, 1–3 cm. long, 8–20 mm. wide, short-acuminate to obtuse, entire, loosely short-pubescent, the petioles 5–10 mm. long; stipules slightly connate at base, membranous, 2–3 mm. long; staminate flowers 1 or 2 on each node, subsessile, 8–10 mm. long just before anthesis, the perianth-segments 3, membranous, valvate, narrowly oblong,

obtuse, strongly circinnate at anthesis, about 10-nervulose; stamens 20–25, free, the anthers pendulous on capillary filaments, 4–5 mm. long, linear; pistillate flowers small, axillary, sessile, with a bracteole at base, the calyx obovoid, coarsely pilose; stigma from the small bilobed body attached laterally to the calyx, minutely papillose; achenes narrowly obovate or obovate-elliptic, 3–3.5 mm. long, flat, coarsely pilose on both sides.—Apr.–June. Woods in mountains; Honshu (Kantô and Kinki Distr.), Shikoku, Kyushu.

Fam. 153. ARALIACEAE

UKOGI KA

Ginseng Family

Evergreen or deciduous trees, shrubs, or herbs, rarely scandent; stems often spiny or prickly; leaves alternate, rarely opposite or falsely verticillate, simple, or palmately to pinnately compound; stipules absent or at base of petioles; inflorescence in umbels

or heads; flowers bisexual or polygamous (plants sometimes dioecious), actinomorphic, small; calyx superior, small, entire or dentate; petals 3 or more, usually 5, valvate or slightly imbricate in bud, usually free; stamens free, usually as many as the petals and alternate with them, the disc superior to the ovary, often inserted at the base of the style; ovary 1- to many-locular; styles free or connate; ovules solitary and pendulous from the top of the locule, anatropous; fruit a berry or drupe; seeds with copious endosperm and a small embryo.—About 60 genera, with about 900 species, chiefly in the Tropics.

- 1A. Leaves pinnately compound. 1. *Aralia*
 1B. Leaves simple or palmately compound.
 2A. Herbs; leaves palmately compound, falsely verticillate on top of a naked simple stem; petals more or less imbricate in bud. 2. *Panax*
 2B. Woody plants; petals valvate in bud.
 3A. Evergreen woody vine, climbing or scrambling, with adventitious roots on the stems; leaves simple, entire or 2- or 3-lobed. 3. *Hedera*
 3B. Trees or shrubs, not vines.
 4A. Leaves evergreen.
 5A. Leaves palmately compound. 4. *Schefflera*
 5B. Leaves simple, palmately lobed or partly undivided.
 6A. Shrubs; leaves 7- to 9-lobed; inflorescence a large terminal panicle. 5. *Fatsia*
 6B. Trees; leaves entire and undivided, or 3-lobed in young individuals; inflorescence simple or slightly branched. 6. *Dendropanax*
 4B. Leaves deciduous.
 7A. Leaves palmately compound into leaflets.
 8A. Stones of the fruit laterally flattened; leaves (in ours) 5-foliolate. 7. *Acanthopanax*
 8B. Stones of the fruit dorsally flattened; leaves 3-foliolate. 8. *Evodiopanax*
 7B. Leaves simple, or often palmately lobed.
 9A. Shrub, densely aculeolate-prickly on stems and leaves; styles free; leaves with spines; calyx-teeth obscure. 9. *Olopanax*
 9B. Tree, with large flattened prickles on stems and branches; styles mostly connate; leaves unarmed; calyx-teeth minute. 10. *Kalopanax*

I. ARALIA L. TARA-NO-KI ZOKU

Shrubs or herbs, sometimes prickly; leaves pinnately compound or ternate-pinnate, toothed; stipules adnate to base of the petioles; umbels usually compound, the bracts small; flowers usually polygamous; calyx-limb distinct, truncate or minutely 5-toothed; petals 5, ovate, slightly imbricate in bud; stamens 5; ovary usually 5-locular; styles as many as the locules of ovary, free or connate toward the base; fruit a berrylike drupe, the stones 2-5, ovate or oblong, flat, rounded.—About 30 species, in e. and s. Asia, Malaysia, Australia, and N. America.

- 1A. Deciduous shrub, often densely prickly on stems and leaves; inflorescence a compound raceme, the main axis not elongated. 1. *A. elata*
 1B. Herbs, without prickles; inflorescence simple or sparsely branched, the umbels terminal, the axis simple or elongated.
 2A. Plant green, loosely pilose throughout, except the flowers; flowers pale green. 2. *A. cordata*
 2B. Plant purplish, mostly glabrous throughout, except for scattered appressed hairs on leaves; flowers purplish. 3. *A. glabra*

1. *Aralia elata* (Miq.) Seem. *Dimorphanthus elatus* Miq.; *A. canescens* Sieb. & Zucc.; *D. mandshuricus* Rupr. & Maxim.; *A. mandshuricus* (Rupr. & Maxim.) Maxim.; *A. spinosa* var. *canescens* (Sieb. & Zucc.) Fr. & Sav. and var. *glabrescens* Fr. & Sav.—TARA-NO-KI. Deciduous erect large shrub with simple or sparsely branched thick prickly stems; leaves alternate, very large, terminal and densely resolute on the branches, deltoid in outline, 50-100 cm. long, twice pinnate, prickly, the leaflets 5-9 on each pinna, subsessile, ovate, elliptic, or narrowly ovate, 5-12 cm. long, 2-7 cm. wide, acuminate, irregularly toothed, loosely pubescent on both sides, densely so on nerves and whitish beneath; inflorescence a terminal compound raceme, very large, 30-50 cm. long, densely brownish curved-pubescent, the main axis very short or obsolete; flowers white, about 3 mm. across; fruit globose, black, about 3 mm. across, the stones with obscure granular striations; styles 5, free, filiform, slightly recurved, about 1.5 mm. long.—Aug. Thickets and thin woods in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Sakhalin, Amur, Ussuri, Manchuria, and s. Kuriles.

Var. *subinermis* Ohwi. *A. spinosa* var. *canescens* Fr. & Sav.; *A. elata* var. *canescens* (Fr. & Sav.) Nakai.—MEDARA. Plant less prickly, densely brownish or yellowish pubescent.—Occurs with the typical phase.

2. *Aralia cordata* Thunb. *A. edulis* Sieb. & Zucc.; *A. nutans* Fr. & Sav.; *Dimorphanthus edulis* (Sieb. & Zucc.) Miq.—UDO. Large stout perennial herb 1-1.5 m. high, loosely short-pilose throughout except the flowers; leaves alternate, few, large, deltoid in outline, 50-100 cm. long, twice pinnate, the petioles long, with a small stipule on each side at base, the leaflets 5-7 on each pinna, ovate to oblong, or ovate-elliptic, 5-30 cm. long, 3-20 cm. wide, acuminate, toothed, sessile or short-petioluled; inflorescence a loosely branched terminal raceme, axillary on upper part of stem; flowers pale green, about 3 mm. across; fruit ovoid-globose, about 2 mm. long, glabrous, purple-black, the stones smooth; styles about 1 mm. long, spreading, slightly recurved, connate toward base to form a column.—Aug. Thickets and thin woods especially along streams and ravines; Hokkaido, Honshu, Shikoku, Kyushu; frequently cultivated and the shoots eaten as a vegetable.—Sakhalin, Manchuria, Korea, and China.

Var. *sachalinensis* (Regel) Nakai. *A. racemosa* var. *sachalinensis* Regel.—KARAFUTO-UDO. Calyx-tube pubescent.—Hokkaido and Honshu.

3. *Aralia glabra* Matsum. MIYAMA-UDO. Nearly glabrous purplish herb 80-100 cm. high, with thick rhizomes; stems rather stout, few-leaved; leaves petioled, twice ternate-pinnate, the leaflets membranous, usually petioluled, ovate-cor-

date to ovate or ovate-elliptic, 3-10 cm. long, 3-6 cm. wide, acuminate-caudate, toothed, with appressed callose hairs on upper side, nerves beneath often short-pilose; inflorescence racemose-umbellate, branched, terminal and from upper axils, peduncled, glabrous or nearly so, often purplish, umbels with very short bracts, the pedicels very slender, 1-2 cm. long;

flowers about 3 mm. across; petals purplish green, minutely papillose on upper margin, subglobose, about 3 mm. long, purple-black, glabrous; styles about 1 mm. long, connate toward base, free and subcurved at tip.—June-Aug. Dense woods in mountains; Honshu (Kantō and centr. distr.); rather rare.

2. PANAX L. NINJIN ZOKU

Perennial polygamodioecious herbs with thick rhizomes or roots; stems simple, with few membranous scales at base; leaves 3-5, falsely verticillate and terminal on the naked stems, petioled, palmately compound, the leaflets petioluled; inflorescence umbellate, the umbels solitary or few, terminal, on long peduncles, the pedicels jointed below the fertile flowers, not jointed in the staminate flowers; calyx-teeth 5; petals 5, slightly imbricate in bud; stamens 5, the disc flat; ovary 3- or 4-locular; styles 3 or 4, free in fertile flowers, connate in the staminate; fruit with a rather fleshy pericarp, stones 2-4.—Few species, in c. Asia, India, and N. America.

1. *Panax japonicus* C. A. Mey. *P. schinseng* var. *japonica* Nees; *P. quinquefolium* var. *subsessilis* Miq.; *P. repens* Maxim.; *Aralia repens* (Maxim.) Makino; *A. quinquefolia* var. *repens* (Maxim.) Burkill; *P. ginseng* var. *japonicum* Makino.—TOCHIBA-NINJIN. Perennial 50-80 cm. high with rather thick, nodose, creeping rhizomes; stems erect, simple, glabrous; leaves 3-5 in terminal false-verticils, palmately 3- to 7-, usually 5-foliolate, the petioles 5-10 cm. long, the leaflets membranous, green, irregularly toothed, the lateral ones gradually smaller, the median oblanceolate to obovate or obovate-oblong, 10-30 cm. long inclusive of the petiolule, 2-7 cm. wide, long-acuminate to caudate; umbels solitary or sometimes 2-4, many-

flowered, the bracts minute, smooth, the pedicels 1-2 cm. long, slender, slightly scarious; flowers yellowish green, about 3 mm. across; fruit globose, 4-5 mm. long, red, sometimes black above; styles 2(-4), free, recurved, about 1.5 mm. long.—June-Aug. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather rare.

Panax schinseng Nees. NINJIN, OTANE-NINJIN. Closely resembles the preceding species, but differs chiefly in the very short indistinct rhizomes and stout, fusiform, rarely forked main roots. Often cultivated in our area as a Chinese drug plant.—Korea and Manchuria.

3. HEDERA L. KIZUTA ZOKU

Evergreen woody climbers or scramblers with adventitious hold-fast roots on the stems; leaves simple or lobed, often with stellate hairs or scales; stipules absent; umbels forming a panicle-like inflorescence, the bracts minute or absent; flowers bisexual; calyx-limb obsolete and entire or 5-toothed; petals 5; stamens 5; ovary 5- or 4-locular, subinferior; styles 5, connate the whole length, the stigmas obsoletely 5-lobed; fruit a berry-like subglobose drupe, with 4 or 5 stones; seeds solitary in each stone, the embryo ruminate.—Few species, in Europe, N. Africa, and Asia.

1. *Hedera rhombea* (Miq.) Bean. *H. helix* Thunb., non L.; *H. helix* forma *rhombea* Miq.; *H. japonica* W. Paul, non Jungh.; *H. japonica* Tobler; *H. toberi* Nakai.—KIZUTA, FUYUZUTA. Branches gray-brown, the scales stellately 15- to 20-lobed, yellowish; leaves on flowering branches coriaceous, broadly lanceolate to ovate-orbicular, usually rhombic-ovate, 3-6 cm. long, 2-4 cm. wide, subobovate, acute to rounded at base, deep green and lustrous on upper side, paler beneath, simple, entire or 2- or 3-lobed, the petioles 2-5 cm. long; juvenile leaves

on nonflowering vegetative shoots subdeltoid, palmately 3(-5)-lobed, truncate to cordate at base; flowers green-yellow, 4-5 mm. across, the pedicels 1-1.5 cm. long; fruit black, globose, 6-7 mm. across, with an orbicular terminal disc about 4 mm. across and short persistent style.—Oct.-Nov. Thickets and woods especially near the sea; Honshu, Shikoku, Kyushu; common.—Forma *pedunculata* (Nakai) Hatusima. *H. pedunculata* Nakai.—NAGABO-KIZUTA. Peduncles and pedicels longer, the latter 2-4 cm. long.—Kyushu.—Ryukyus.

4. SCHEFFLERA Forst. FUKA-NO-KI ZOKU

Evergreen shrubs or trees, sometimes epiphytic, without prickles or spines; leaves mostly palmately compound, petioled, the leaflets coriaceous, entire or with irregular incisions; stipules prominent, usually adnate to base of petioles; inflorescence racemose or panicle-like, the umbels rarely subcapitate, the bracts woolly, the pedicels not jointed beneath the flower; calyx-limb entire or toothed; petals 5-8, sometimes more, valvate; stamens as many as the petals; styles connate to form a column, or very short; fruit subglobose; seeds flattened.—Many species in the Old World Tropics.

1. *Schefflera octophylla* (Lour.) Harms. *Aralia octophylla* Lour.; *Agalma octophyllum* (Lour.) Seem.; *Heptapleurum octophyllum* (Lour.) Hance; *A. lutchuense* Nakai.—FUKA-NO-KI. Evergreen tree; branchlets thick, spreading, with large V-shaped leaf-scars, densely brownish stellate-puberulent while young; leaves 7- to 10-foliolate, the petioles

15-30 cm. long, the leaflets narrowly oblong or narrowly obovate-oblong, unequal, 7-20 cm. long, 3-7 cm. wide, entire or in young plants often irregularly pinnately incised, abruptly acute, acute to obtuse at base, the petiolules 2-5 cm. long; stipules semirounded, adnate on back to base of petioles; inflorescence terminal, rather much branched, about 20 cm. long,

the bracts persistent; flowers greenish, 4-5 mm. across, the pedicels 4-6 mm. long; calyx-teeth short; fruit subglobose, about 5 mm. across, glabrous, the disc less than 1.5 mm. across; column of styles about 1 mm. long, the stigmas disclike, with

a slightly depressed center; seeds 4-6.—Nov.-Jan. Woods and thickets; Kyushu (s. distr. incl. Yakushima and Tanegashima).—Ryukyus, Formosa, China, and Indochina.

5. *FATSIA* Decne. & Planch. YATSUDE ZOKU

Evergreen shrubs without spines or prickles; leaves large, palmately 7- to 9-lobed, the petioles dilated at base; stipules absent; inflorescence in large terminal panicles, the lateral umbels staminate, the terminal ones bisexual, the bracts caducous, the bracteoles membranous, caducous, narrow; flowers polygamous; petals 4-6, valvate in bud; stamens as many as the petals; ovary 2- to 6-locular; styles of the bisexual flowers free, with a capitate stigma, of the staminate short, connate; fruit globose, fleshy, the stones sulcate or rugose on back, seeds flattened.—Few species, in e. Asia.

1. *Fatsia japonica* (Thunb.) Decne. & Planch. *Aralia japonica* Thunb.; *A. sieboldii* K. Koch.—YATSUDE. Shrub, unbranched or sparsely branched, with stout branches about 1.5 cm. thick, and large lunate leaf-scars; stems rusty-brown woolly while young; leaves thick-coriaceous and lustrous above, soon glabrate, nearly orbicular, 20-40 cm. across, cordate to cordate-truncate at base, long-petioled, palmately 7- to 9-lobed, the lobes narrowly ovate-elliptic, acuminate, toothed; panicles terminal, 20-40 cm. long, broadly pyramidal, with caducous

white bracts in bud; umbels many-flowered, the bracteoles caducous, scarious, brown; flowers white, about 5 mm. across, 5-merous, the disc convex, about 3 mm. across in fruit; calyx-teeth indistinct; fruit subglobose, black, about 5 mm. across; styles 5, slender, about 1.5 mm. long.—Oct.-Nov. Woods near the sea; Honshu (Pacific side from Iwaki Prov. through Tōkaidō to Kii Prov.), Shikoku, Kyushu; rather common and frequently cultivated, with several cultivars grown in gardens.—Ryukyus and s. Korea.

6. *DENDROPANAX* Decne. & Planch. KAKURE-MINO ZOKU

Evergreen glabrous trees or shrubs; leaves simple, entire or 3- to 5-lobed; stipules small, intrapetiolar, adnate to the base of petioles on back, sometimes absent; umbels simple or branched, the bracts small or absent, the pedicels not jointed; flowers bisexual or rarely polygamous; calyx-limb distinct, entire or 5-toothed; petals rather thick, valvate in bud; stamens 5; ovary 5- to 8-locular; styles connate at least to middle or nearly the whole length, fruit globose or nearly so, sulcate when dried, the pericarp fleshy or juicy, the stones flat or subtriangular.—About 30 species, in e. Asia, the Malay Peninsula, Centr. and S. America.

1. *Dendropanax trifidum* (Thunb.) Makino. *Acer trifidum* Thunb.; *Hedera japonica* Jungh.; *Fatsia ? mitsde* (Sieb.) de Vriese; *Aralia mitsde* Sieb.; *Textoria japonica* Miq.; *D. japonicus* (Jungh.) Seem.; *Gilbertia japonica* (Jungh.) Harms; *G. trifida* (Thunb.) Makino; *T. trifida* (Thunb.) Nakai.—KAKURE-MINO. Small glabrous evergreen tree with gray-brown branches and rather thick green branchlets; leaves of inflorescence broadly rhombic-ovate to ovate, 7-12 cm. long, 3-8(-12) cm. wide, broadly cuneate at base, with 3 nerves rising from the base, entire or sometimes partly 2- or 3-lobed, often deeply 3- to 5-cleft and broadly truncate at base in young

plants, with a small obsolete gland beneath among the reticulate veinlets, the petioles 2-10 cm. long; stipules adnate to the swollen base of petioles; umbels usually solitary and terminal, subglobose, with a flat disc 3-4 mm. across at apex of peduncle, the pedicels 6-15 mm. long; flowers yellowish green, 4-5 mm. across; calyx-teeth undulate; fruit black, broadly ellipsoidal, about 8 mm. long, with a terminal disc about 2 mm. across; styles 5, connate and forming a short column; seeds with 3 obtuse ridges on back.—Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

7. *ACANTHOPANAX* Miq. UKOGI ZOKU

Deciduous shrubs or trees, glabrous or with crisped pubescence, the branches often prickly; leaves palmately compound, the leaflets toothed; stipules often long-ciliate; umbels simple or paniculately compound; flowers polygamous or bisexual; calyx-teeth minute or obsolete; petals usually 5, valvate in bud; stamens as many as the petals; ovary 2- to 5-locular; styles free or connate to the top; fruit globose or slightly flattened, the pericarp juicy, the stones 2-5; seeds flattened laterally.—About 30 species, in e. and s. Asia.

1A. Styles 2, free or connate in lower half.

2A. Umbels from the short spurs, with the leaves rosulate at base.

3A. Leaves glabrous beneath.

4A. Leaflets herbaceous, 2-4 cm. long, rounded at apex, long-cuneate at base, the lateral nerves and veinlets prominent and slightly raised beneath. 1. *A. japonicus*

4B. Leaflets membranous, 2-7 cm. long, acute to obtuse, acute to acuminate at base, the nerves not raised. 2. *A. spinosus*

3B. Leaves short-pubescent beneath, the nerves not raised. 3. *A. nikiaianus*

2B. Umbels terminal, on elongate loosely leaved shoots; branches with slender prickles. 4. *A. trichodon*

1B. Styles 2-7, connate nearly the full length, the free portion very short.

5A. Styles 5-7.

6A. Leaflets sessile, 3-7 cm. long; umbels solitary and terminal, on short spurs with rosulate leaves at base of peduncle; prickles thick; styles 5- to 7-lobed at apex; flowering May and June. 5. *A. sieboldianus*

- 6B. Leaflets petioluled, 5–15 cm. long; umbels 1–3, terminal, on long loosely leaved shoots; prickles slender; styles minutely 5-lobed at apex; flowering August and September. 7. *A. hypoleucus*
- 7A. Inflorescence usually with 3 umbels; plant nearly glabrous throughout. 8. *A. senticosus*
- 7B. Inflorescence usually with a solitary umbel; petioles and nerves of leaflets pubescent beneath. 9. *A. sciadophylloides*
- 5B. Styles 2.
- 8A. Shrub; styles 2–2.5 mm. long; inflorescence densely gray-brown crisped-pubescent, the axis with several to 10 or more umbels on long, loosely leaved shoots; branches with thickened prickles; leaflets 5–12 cm. long. 6. *A. divaricatus*
- 8B. Tree; styles 0.3–0.5 mm. long; inflorescence glabrous, with abbreviated axis, with few lateral branches and numerous umbels; branches unarmed; terminal leaflets 10–15 cm. long. 9. *A. sciadophylloides*

1. *Acanthopanax japonicus* Fr. & Sav. *A. nipponicus*

Makino, saltem pro parte; *A. commixta* Nakai, pro parte—OKA-UKOGI. Shrub with gray-brown, glabrous, prickly branches; leaves glabrous, the petioles 2–8 cm. long, the leaflets 5, herbaceous, nearly equal in size, obovate to broadly cuneate-oblongate, 2–4 cm. long, 1–2.5 cm. wide, rounded, long-cuneate at base, sessile, margins toward tip with mucronulate, incurved, obtusely acute teeth or sometimes rather irregularly incised, with a thin membrane and tuft of hairs in axil of nerves beneath; umbels many-flowered, glabrous, the peduncles glabrous, 4–6 cm. long, the pedicels 4–6 mm. long; fruit black, slightly flattened, globose, 5–6 mm. across; styles 2.5 mm. long, free or connate on lower half.—May. Honshu, Kyushu.

2. *Acanthopanax spinosus* (L. f.) Miq. *Panax spinosum*

L. f.; *Aralia pentaphylla* Thunb.—YAMA-UKOGI, ONI-UKOGI. Shrub usually with prickly branches; petioles 3–7 cm. long, glabrous, with a tuft of crisped hairs at apex; leaflets 5, membranous, slightly unequal in length, narrowly obovate to obovate-cuneate, 2–7 cm. long, 1–3.5 cm. wide, acute to obtuse, acute to acuminate toward the petiolelike base, glabrous, with obscure incurved teeth, a thin membrane, and a tuft of hairs in the axil of nerves beneath; umbels many-flowered, the peduncles 2–5 cm. long, the pedicels 8–12 mm. long; fruit black, rather flattened, globose, 5–6 mm. across; styles slender, 2–2.5 mm. long, free or connate only at base.—May. Honshu; common.

3. *Acanthopanax nikaianus* Koidz. ex Nakai. *A. nipponicus* Nakai—URAGE-UKOGI.

Shrub usually with prickly branches; leaves 5-foliolate, the petioles 3–7 (–10) cm. long, the leaflets membranous, rhombic- or broadly obovate, 1.5–5 cm. long, 1–2.5 cm. wide, acute, acuminate to cuneate at base, doubly serrate to somewhat incised, sparsely strigose on upper side, callose-pilose beneath; umbels glabrous, rather many-flowered, the peduncles 2–3 (–4) cm. long, the pedicels 5–8 mm. long; fruit globose, about 5 mm. long; styles slender, about 2 mm. long, nearly free.—May. Honshu (Kinki Distr. and westw.), Kyushu.

4. *Acanthopanax trichodon* Fr. & Sav. MIYAMA-UKOGI.

Prickly shrub with grayish white branches; petioles 2–5 cm. long, purplish red; leaflets thin, rhombic- or cuneate-obovate, 2–6 cm. long, 1–2 cm. wide, acuminate with an acute tip, somewhat cuneate at base, loosely spinulose on margin and nerves on upper side; umbels terminal on new shoots, purplish red, glabrous, the peduncles 2–4 cm. long, slender; flowers many, the pedicels 1–2 cm. long, slender; fruit slightly flattened, globose, about 6 mm. across, purple-black; styles about 1 mm. long, free, somewhat appressed to the fruit.—May–June. Mountains; Honshu (Kantō, Tōkaidō, and Kinki Distr.); rare.

5. *Acanthopanax sieboldianum* Makino. *Aralia pentaphylla* Sieb. & Zucc., non Thunb.—UKOGI, HIME-UKOGI.

Shrub with prickly, grayish, glabrous branches; petioles 3–10 cm. long; leaflets (3–)5, rather unequal, the terminal ones

rather thick, deep green, oblanceolate to obovate-oblong, 3–7 cm. long, 1–2.5 cm. wide, acuminate at base, short-toothed, glabrous; umbels terminal, solitary, on short spurs, glabrous, the peduncles 5–10 cm. long, rather thick, the pedicels 1–2 cm. long; fruit globose, 6–7 mm. across, not flattened, black, with 5–7 stones; styles 5–7, about 1.2 mm. long, connate on lower half, the upper free portion recurved.—May–June. Cultivated in our area for medicinal and culinary uses.—China.

6. *Acanthopanax divaricatus* (Sieb. & Zucc.) Seem.

Panax divaricatus Sieb. & Zucc.; *Kalopanax divaricatus* (Sieb. & Zucc.) Miq.; *A. asperatus* Fr. & Sav.—KE-YAMA-UKOGI, ONI-UKOGI. Shrub; branches with broadened prickles, densely gray-brown crisped-pubescent when young; leaves 5-foliolate, the petioles 3–8 cm. long, shorter than to as long as the leaflets, densely crisped-pubescent, often short-prickly, the leaflets ovate or obovate-oblong, 5–12 cm. long, 2–6 cm. wide, acuminate to acute, acuminate at base, doubly toothed, puberulent on nerves on upper side, paler green and densely gray-brown crisped-pubescent beneath especially on nerves, the lateral nerves pinnate, the petiolules 0.8 mm. long; inflorescence paniculately racemose, terminal, with several to 10 or more umbels, on long loosely leaved new shoots, densely gray-brown crisped-pubescent; flowers in the terminal umbels bisexual, the others staminate, the pedicels 3–10 mm. long; fruit globose, about 6 mm. across, black, pubescent near the persistent calyx-teeth; styles connate the full length, slightly bifid at apex, slender, 2–2.5 mm. long.—Aug.–Sept. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather rare.—China.

7. *Acanthopanax hypoleucus* Makino. *A. javrii*

Harms; *A. higoensis* Hatus.—URAJIRO-UKOGI. Shrub; branches rusty-brown, with needlelike prickles or unarmed, glabrous; petioles 3–12 cm. long, purplish; leaflets thinly chartaceous, obovate-oblong, 7–15 cm. long, 2.5–5 cm. wide, acuminate, acute to acuminate at base, toothed, green on upper side, glaucous beneath, glabrous, the petiolules 5–10 mm. long; inflorescence on new shoots, glabrous, sparsely branched; umbels 2 or 3, rather long-peduncled, the pedicels many, rather slender, 1–2 cm. long; fruit globose, 6–8 mm. across, purple-black; style wholly connate, 1–1.2 mm. long, obsolete 5-lobed; stones 5.—Aug. Mountains; Honshu (Shinano, Kai, Musashi Prov.); rare.

8. *Acanthopanax senticosus* (Rupr. & Maxim.) Harms.

Hedera senticosa Rupr. & Maxim.; *Eleutherococcus senticosus* (Rupr. & Maxim.) Maxim.; *A. eleutherococcus* (Maxim.) Makino.—EZO-UKOGI. Shrub, branches gray-brown, with acicular prickles especially around the base of petioles; petioles 3–8 cm. long, loosely crisped-pilose or glabrous; leaflets membranous, obovate-oblong or narrowly obovate, 6–10 cm. long, 2–4 cm. wide, abruptly acuminate, acute at base, acutely double-toothed, loosely brownish crisped-pilose beneath especially on the nerves, the petiolules rather densely pilose, 3–10 mm. long; inflorescence glabrous, terminal on the new shoots, with a single umbel, the peduncles 2.5–4 cm. long, the pedicels 1–1.8 cm.

long; fruit ellipsoidal, glabrous, about 6 mm. long, with persistent calyx-limb and styles on top; styles short, wholly connate, 1-1.8 mm. long, the stigmas small, peltate, obscurely 5-lobed; stones 5.—Aug. Hokkaido.—Sakhalin, Korea, Manchuria, Amur, and N. China.

9. *Acanthopanax sciadophylloides* Fr. & Sav. *Kalopanax sciadophylloides* (Fr. & Sav.) Harms.—KOSHI-ABURA. Unarmed mostly glabrous tree with light brown crisped hairs on young growth; branchlets gray-brown, the lenticles elliptic; petioles 7-30 cm. long, with a slightly adnate stipule at base; leaves 5-foliolate, the leaflets unequal, the lateral ones smaller, the terminal ones obovate-oblong to obovate or elliptic, 10-15 cm. long, 4-7 cm. wide, acuminate, cuneate or acuminate at

base, aristate-toothed, paler to slightly glaucous with persistent axillary tufts of crisped hairs beneath, the petioles 1-2 cm. long; inflorescence terminal on the new shoots, glabrous, with an abbreviated main axis, the branches slender, 7-12 cm. long, spreading, sparsely branched, with 1-5 umbels on the upper half, the bracts small, deltoid, the pedicels 4-7 mm. long; flowers yellow-green, small; calyx-teeth depressed-deltoid; petals recurved, 1.5 mm. long, about half as long as the stamens; fruit globose, slightly flattened, 4-5 mm. across, black-purple; styles 0.3-0.5 mm. long, connate and slightly bifid at apex; stones flat, with 2 shallow grooves on each side.—Aug. Hills; Hokkaido, Honshu, Shikoku, Kyushu; common.

8. EVODIOPANAX Nakai TAKA-NO-TSUME ZOKU

Deciduous trees, unarmed, glabrous; leaves petiolate, alternate, exstipulate; leaflets 3, serrulate, the petioles swollen at base; inflorescence a corymbose-panic, on short spurs, glabrous; umbels several; flowers small, the bracts and bracteoles minute or absent; calyx-limb absent; petals 5, valvate in bud; stamens 5; styles 2, connate toward base; ovary 2-locular; fruit a berrylike drupe, black; stones 2, rather flattened dorsi-ventrally, flat on innerside, convex on back.—Two species, in Japan and China.

1. *Evodiopanax innovans* (Sieb. & Zucc.) Nakai. *Panax innovans* Sieb. & Zucc.; *Acanthopanax innovans* (Sieb. & Zucc.) Fr. & Sav.—TAKA-NO-TSUME, IMO-NO-KI. Small tree with gray-brown branches; leaflets thinly membranous, 3, sometimes 1 or 2, the lateral ones slightly oblique at base, the terminal elliptic or ovate-elliptic, 5-15 cm. long, 2.5-6 cm. wide, acuminate at both ends, sessile, with minute teeth ending in a short awn, glabrous, except a tuft of hairs in axil of nerves be-

neath, the petioles rather slender, 5-12 cm. long; inflorescence terminal on short spurs, with several pedunculate umbels on upper part, usually with a single branch at base, 7-12 cm. long, the pedicels many, 5-12 mm. long; flowers yellow-green; fruit globose, 5-6 mm. across, black; styles rather slender, about 1 mm. long, arcuate toward tip.—May. Hills; Hokkaido, Honshu, Shikoku, Kyushu; common.

9. OPLOPANAX Miq. HARIYUKI ZOKU

Deciduous shrubs unbranched or sparsely branched, densely armed with slender spreading prickles; leaves long-petiolate, often peltate, palmately lobed, toothed, densely prickly, exstipulate; inflorescence a terminal panicle or racemelike panicle with an elongated main axis, rather much branched; flowers bisexual and staminate, greenish; calyx-teeth indistinct; petals 5, valvate in bud; stamens 5; styles 2, free or connate toward base; ovary 2-locular; drupe berrylike, red, slightly flattened; stones 2, laterally flattened.—Three species, in E. Asia, and N. America.

1. *Oplopanax japonicus* (Nakai) Nakai. *O. horridus* var. *japonicus* (Nakai) Hara and var. *brevipes* Hara; *Echinopanax japonicus* Nakai.—HARIYUKI. Shrub about 1 m. tall; stems nearly simple, stout, about 1-1.5 cm. thick throughout, yellowish brown, the prickles 5-10 mm. long; petioles armed, with firm crisped hairs; leaves membranous, orbicular to orbicular-cordate, 20-40 cm. long and nearly as wide, palmately 7- to 9-lobed, loosely armed on nerves on both sides, with long firm crisped hairs especially on nerves beneath, the lobes

3-parted, long-acuminate, irregularly toothed, setulose on margin; inflorescence solitary, terminal, racemelike, or with short branches at base; umbels many, 10-20 cm. long, 3-5 cm. across, densely crisped-pilose and with prickles, the bracts membranous, lanceolate, caducous, the pedicels 3-10 mm. long; fruit globose-obovoid, 6-7 mm. long, red at maturity; styles slender, 1.5-2 mm. long.—June-July. Coniferous woods; Hokkaido, Honshu (n. and centr. distr. including Mount Omine in Yamato), Shikoku.

10. KALOPANAX Miq. HARIYUKI ZOKU

Deciduous tree with thick grayish terete branches and thick prickles, mostly on the young growth; leaves alternate, often densely aggregated near top of branches, palmately 5- to 9-lobed, the petioles 10-25 cm. long, the lobes 10-30 cm. long and as wide, acuminate, truncate to cordate at base, minutely toothed, usually brownish crisped-pubescent beneath, especially on nerves, and with axillary tufts of hairs beneath, soon becoming glabrous; stipules adnate on innerside to swollen base of petioles; inflorescence terminal on the new shoots, with an abbreviated main axis, composed of several umbellate-pedunculate racemes, the branches 8-15 cm. long, spreading, the bracts 1-2 cm. long, caducous; flowers small, yellow-green, bisexual, the pedicels 7-10 mm. long; calyx-limb 5-toothed; petals 5, valvate in bud, the disc convex; stamens 5; styles 2, 1.5-2 mm. long, connate almost to the top, with 2 short stigma-lobes on innerside; fruit a drupe, globose, 4-5 mm. across, blue-black, with a juicy pericarp; stones 2, rarely 3, prominently ribbed on back, laterally 2-grooved, flat inside.—A single species, in E. Asia.

1. *Kalopanax septemlobus* (Thunb.) Koidz. *Acer pictum* Thunb.; *A. septemlobum* Thunb.; *Panax ricinifolium* Sieb. & Zucc.; *K. ricinifolius* (Sieb. & Zucc.) Miq.; *Acantho-*

panax ricinifolius (Sieb. & Zucc.) Seem.; *K. pictus* (Thunb.) Koidz. ex Rehd.—HARIYUKI, SEN-NO-KI. Tree, branches thick, grayish, armed with broad-based erect or slightly re-

curved prickles; leaves 10-30 cm. long and as wide, 5- to 9-lobed, the lobes acuminate, minutely toothed, soon glabrous on upper side, usually pale-brown curled-pubescent, especially on nerves beneath and with tufts of axillary hairs on the nerves on lower side, truncate to cordate at base, the petioles 10-25 cm. long; inflorescence terminal on the current year's shoots, glabrous or nearly so, the main axis very short and obsolete, the branches few to more than 10, 8-15 cm. long, spreading, with few umbels at the apex, the bracts 1-2 cm. long, caducous, the pedicels 7-10 mm. long; fruit globose, 4-5

mm. across; styles connate, 1.5-2 mm. long, rather slender, bifid at apex.—July-Aug. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—s. Kuriles, Sakhalin, Korea, Manchuria, China, and Ussuri.

Var. *lutchuensis* (Nakai) Ohwi. *K. autumnalis* Koidz.; *K. ricinifolium* var. *lutchuense* Nakai; *K. sakaguchiana* Koidz.; *K. pictus* var. *lutchuensis* (Nakai) Nemoto—MIYAKO-DARA, RYUKYU-HARIGIRI. Southern glabrous phase.—Kyushu.—Ryukyus.

Fam. 154. UMBELLIFERAE SERI KA (SANKEI KA) Carrot Family

Herbs, rarely more or less woody; stems usually fistulose, rarely solid; leaves alternate, usually prominently divided and compound, the upper petioles frequently embracing the young inflorescence with a dilated sheathlike base; flowers bisexual or polygamous, in simple or compound umbels, sometimes capitate; calyx adnate to the ovary, usually 5-toothed; petals 5, valvate or slightly imbricate in bud, free, deciduous, often incurved at apex; stamens 5, alternate with the petals, the filaments incurved in bud; ovary inferior, bilocular; styles 2, often slightly accrescent, usually with a swollen base (stylopodium); ovules solitary in each locule, pendulous; fruit dry, bilocular, separating into the 2 carpels, these usually suspended from the top of a slender prolongation of the fruit axis called a carpophore, with 5 primary ribs and sometimes 4 intermediate or secondary ones, vittae (oil-tubes) often present; seeds with abundant endosperm and a small embryo.—About 200 genera, with about 3,000 species, cosmopolitan.

1A. Umbels simple or irregularly compound.

2A. Leaves simple, orbicular-cordate, usually palmately lobed or incised; carpels compressed laterally, without vittae.

3A. Carpels 5-ribbed, without transverse veinlets; leaves with a pair of free stipules at base of petiole; involucre bracts small, or wanting. 1. *Hydrocotyle*

3B. Carpels 7- to 9-ribbed, with transverse veinlets forming areoles; leaves without stipules; involucre conspicuous. 2. *Centella*

2B. Leaves 3- to 5-parted or -divided, the segments or leaflets lobed; carpels essentially terete in cross section, with vittae.

4A. Carpels densely prickly or tuberculate; ovulate flowers sessile with prominent calyx-teeth. 4. *Sanicula*

4B. Carpels smooth; flowers more or less pedicellate, without evident calyx teeth. 8. *Cryptotaenia*

1B. Umbels regularly compound.

5A. Fruit more or less compressed; carpels essentially terete in cross section.

6A. Fruit densely prickly. 7. *Torilis*

6B. Fruit smooth, rarely loosely setose or tuberculate.

7A. Carpels setose, caudate at base and decurrent on the pedicel. 6. *Osmorhiza*

7B. Carpels not caudate or decurrent on the pedicel.

8A. Flowers yellow; leaves simple, entire. 3. *Bupleurum*

8B. Flowers white or purplish; leaves lobed or dentate, usually compound.

9A. Carpels 5-8 mm. long, with indistinct ribs. 5. *Anthriscus*

9B. Carpels 2-5 mm. long, with distinct ribs.

10A. Umbels small, 1- to 3-flowered, with very short, unequal pedicels; umbels regularly compound. 9. *Pternopetalum*

10B. Umbels many-flowered (at least more than 10-flowered).

11A. Stylopodium prominent, conical to nearly subglobose, as long or longer than wide.

12A. Calyx-teeth prominent, deltoid, acute.

13A. Carpels with slender, filiform ribs and numerous vittae; woodland plants. 10. *Spuriopimpinella*

13B. Carpels with thick, acute ribs and a solitary vitta at each interval; plants of wet, grassy places.

12B. Calyx-teeth obscure or obsolete. 23. *Pterygopleurum*

14A. Carpels subterete in cross section, with thick ribs. 11. *Oenanthe*

14B. Carpels 5-angled, scarcely compressed, with very slender ribs.

15A. Vittae numerous; styles short. 12. *Pimpinella*

15B. Vittae lacking; styles elongate. 13. *Aegopodium*

11B. Stylopodium depressed, wider than long.

16A. Carpels with slender, filiform ribs much narrower than the intervals; woodland plants. 16. *Chamaele*

16B. Carpels with thick, more or less corky ribs often broader than the intervals; plants of wet places.

17A. Styles very short, from a slender minute stylopodium; carpels with vittae solitary in the intervals; leaves simply pinnate. 20. *Apodocarpum*

17B. Styles rather short, from a broad, prominent but short stylopodium.

18A. Leaves 2-4 times ternately pinnate; vittae solitary at the intervals. 18. *Cicuta*

18B. Leaves simply pinnate; vittae numerous. 19. *Sium*

5B. Fruit terete or compressed dorsally in cross section; carpels semiorbicular to strongly flattened dorsally, sometimes with winged lateral ribs.

19A. Carpels semiorbicular or lunate in cross section, the lateral ribs unwinged or all ribs with equal narrow wings.

20A. Stylopodium conical, as long or longer than wide; carpels with thickened ribs.

21A. Small herbs, 10-30 cm. high (in ours); pericarp layers persistently adnate; carpel ribs obtuse. 14. *Cnidium*

21B. Rather stout herbs, 60-100 cm. high; pericarp layers separating; carpel ribs acute, almost winged. 15. *Pleurospermum*

- 20B. Stylopodium depressed.
 22A. Carpels pubescent.
 23A. Carpels puberulent, with filiform ribs. 17. *Seseli*
 23B. Carpels pubescent, with prominent acute ribs much wider than the intervals. 21. *Glehnia*
 22B. Carpels glabrous, with slender, acute, noncorky ribs. 22. *Tilingia*
 19B. Carpels strongly flattened dorsally, the lateral ribs often more prominently winged than the dorsal ribs.
 24A. Lateral ribs on carpels equaling or only very slightly broader than the dorsal ribs.
 25A. Ribs solid and subequal; calyx teeth minute or obsolete; petals at tip incurved, retuse, or bifid. 24. *Ligusticum*
 25B. Ribs hollow, the lateral ones membranous, winged; calyx teeth obsolete; petals only slightly inflexed and entire at apex. 25. *Coclopleurum*
 24B. Lateral ribs on carpels much broader than the dorsal ribs.
 26A. Vittae extending the full length of the carpel; petals all equal.
 27A. Dorsal ribs on fruit winged.
 28A. Fruit-wings thick; calyx-teeth evident. 26. *Dystaenia*
 28B. Fruit-wings thin; calyx-teeth obsolete. 27. *Conioselinum*
 27B. Dorsal ribs on fruit scarcely winged.
 29A. Pericarp single-layered; wings on fruit thinly membranous; calyx-teeth usually evident. 29. *Ostericum*
 29B. Pericarp multilayered; wings thicker; calyx-teeth usually minute, indistinct.
 30A. Lateral wings on fruit membranous, those of the 2 carpels not closely appressed. 28. *Angelica*
 30B. Lateral wings thick, those of the 2 carpels closely appressed. 30. *Peucedanum*
 26B. Vittae clavate, not reaching the base of the mericarp; petals unequal, the marginal ones much larger. 31. *Heracleum*

1. HYDROCOTYLE L. CHIDOMEGUSA ZOKU

Annual or perennial herbs with creeping or shortly erect stems usually rooting from the nodes; leaves petiolate, with membranous stipules, herbaceous, usually simple, palmately lobed or incised, sometimes peltate; umbels capitate, small, opposite the leaves or axillary, solitary or in terminal spikes, the involucre usually of small deciduous bracts, or wanting; flowers bisexual, white to pale green; calyx-teeth obsolete; petals entire, acute, usually valvate in bud; disc flat; styles filiform; fruit compressed laterally, the commissure narrow, the carpels compressed laterally, the ribs slender, the vittae obsolete or nearly so.—About 100 species, in the Tropics and warm-temperate regions.

- 1A. Leaves usually 3–6 cm. in diameter; umbels solitary to several in fascicles, sessile to long-pedunculate; fruits 15–40, 1–1.2 mm. long. 1. *H. javanica*
 1B. Leaves 0.7–2.5 cm. in diameter; umbels solitary, pedunculate; fruits 2–10, rarely as many as 15.
 2A. Umbels cauline; stems or branches ascending to erect; leaves 2–2.5(–3.5) cm. in diameter; stipules prominent, brown, scarious; pedicels short but evident; fruits about 1.5 mm. long.
 3A. Leaves cordate, with margins often overlapping at base; lobes much-depressed, rounded; upper leaves often smaller and much shorter than the inflorescence. 2. *H. ramiflora*
 3B. Leaves cordate with an open sinus; lobes depressed-deltoid, obtuse; upper leaves usually longer or only slightly shorter than the inflorescence. 3. *H. maritima*
 2B. Umbels radical; stems creeping; leaves 5–20 mm. in diameter; stipules small and very thin; pedicels nearly lacking.
 4A. Petioles glabrous or with a few long hairs at apex.
 5A. Leaves 0.8–1.5 cm. in diameter, often evergreen, lobed on upper $\frac{3}{4}$ – $\frac{1}{4}$, the basal margins approximate; fruits few to more than 10, about 1 mm. long. 4. *H. sibthorpioides*
 5B. Leaves 0.5–2 cm. in diameter, deciduous in winter, lobed on upper half, the basal margins not approximate; fruits few, about 1.3 mm. long. 5. *H. yabei*
 4B. Petioles thinly pubescent with crisped, white, recurved, short hairs; fruits about 0.6 mm. long. 6. *H. dichondroides*

1. *Hydrocotyle javanica* Thunb. *H. nepalensis* Hook.; *H. polycephala* Wight & Arn.; *H. javanica* var. *polycephala* (Wight & Arn.) Masam. and var. *laxa* Masam. —**ŌNA-CHIDOME.** Perennial; stems long-creeping, with few-leaved ascending branches 5–25 cm. long, crisped-puberulent, sparingly branched in upper part; leaf-blades reniform-orbicular, 3–6 cm. in diameter, obtuse, deeply cordate, with callose hairs on upper side, shallowly 5- to 9-lobed, the lobes depressed-deltoid, obtusely double-dentate, the petioles of the radical leaves 7–15 cm. long, of the cauline 5–10 mm. long, the stipules membranous, rounded, about 3 mm. wide; umbels rather many-flowered, usually borne only on the branches; fruit short-pedicellate, the styles short.—July–Oct. Woods in low mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Tropics of Asia.

2. *Hydrocotyle ramiflora* Maxim. *H. wilfordii* Maxim. —**Ō-CHIDOME.** Perennial, glabrous except pubescent on the upper side of leaves and petioles; stems long-creeping, slender, with erect or ascending branches 10–15 cm. long, few-

leaved; leaf-blades depressed-orbicular with overlapping margins, about 2–2.5(–3.5) cm. in diameter, the lobes much depressed-orbicular with overlapping basal margins, rounded at apex, shallowly toothed, the petioles 4–8 cm. long, the upper ones very short, the stipules membranous, 2–2.5 mm. wide, often brownish with darker spots, toothed; peduncles 2–5 cm. long, much longer than the leaves, the pedicels short; fruits more than 10, the styles slender.—June–Sept. Lawns and sunny places in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

3. *Hydrocotyle maritima* Honda. *H. wilfordii* sensu auct. Japon., non Maxim.; *H. ramiflora* var. *maritima* (Honda) Hiroe.—**NO-CHIDOME.** Resembles the preceding; branches 7–15 cm. long; leaf-blades orbicular-cordate, 2–3(–3.5) cm. in diameter, somewhat 5-angled, with an open sinus at base, palmately 5-lobed on the upper 1/2–2/3, glabrous or loosely long-pilose on upper side, usually long-pilose beneath, the lobes broadly obovate-cuneate, incised and few-toothed; peduncles cauline, shorter (or the upper slightly longer) than the leaves,

1-3 cm. long, the pedicels short; fruits more than 10, the styles rather long and slender.—June-Sept. Lawns and roadsides in lowlands and hills; Honshu, Shikoku, Kyushu; common.—Korea, China, and Bonins.

4. *Hydrocotyle sibthorpioides* Lam. *H. rotundifolia* Roxb.—CHIDOME. Glabrous evergreen perennial; stems slender, creeping, subterranean; leaves all radical, the blades orbicular-reniform, with overlapping basal margins, 1-1.5 cm. in diameter, the lobes shallow and very obtuse, 3- to 5-toothed, the petioles 1-3 cm. long, the stipules thin, membranous, soon withering, about 1.5 mm. wide; peduncles radical, shorter or slightly longer than the leaves, 5-12 mm. long; fruits few to 10, rarely more, the styles short, slender.—June-Oct. Shaded places in the lowlands; Honshu, Shikoku, Kyushu; common.—Widely distributed in tropical and warm-temperate Asia.

5. *Hydrocotyle yabei* Makino. *H. japonica* Makino; *H. yabei* var. *japonica* (Makino) Hiroe—HIME-CHIDOME. Perennial, in autumn producing short-cylindrical winter-buds at the end of slender, elongate, creeping stems, glabrous or with a few long hairs at the summit of the petiole; stems filiform, long-creeping, loosely leafy; leaves radical, deciduous in autumn, the blades reniform-orbicular, with closed to open basal

margins, 5(-7)-lobed, 5-20 mm. in diameter, the lobes broadly cuneate, with 3-5 obtuse marginal teeth, the petioles 7-20 mm. long, the stipules thin, membranous, about 1.2 mm. wide; peduncles radical, shorter or slightly longer than the leaves, filiform, the pedicels obsolete or nearly so; fruits 2-4(-10), the styles slender.—June-Oct. Woods in hills and mountains; Honshu, Shikoku, Kyushu.

6. *Hydrocotyle dichondroides* Makino. *H. delicata* auct. Japon., non Elmer; *H. sibthorpioides* var. *dichondroides* (Makino) Hiroe—KE-CHIDOME. Delicate evergreen herb with very slender, filiform, creeping stems often thinly white, recurved-puberulent; leaf-blades thin, membranous, reniform-orbicular, with an open sinus at base, 3-10 mm. in diameter, glabrous or short-puberulent on the nerves above, shallowly (on upper 1/5-1/3) 5- to 7-lobed, the lobes truncate-rounded at apex, with 3-5 obscure teeth, the petioles 5-15 mm. long, sparsely white-puberulent, the stipules about 1 mm. wide; peduncles 5-20 mm. long, very slender, the pedicels obsolete or very short; fruit very small, about 0.8 mm. long, usually pale green, the styles short, slender.—July-Sept. Kyushu (s. distr.).—Ryukyus, Formosa.

2. CENTELLA L. Tsubo-Kusa Zoku

Perennial herbs, rarely suffrutescent, usually with long-creeping stems rooting at the nodes; stipules absent; leaves long-petiolate, the blades usually reniform-cordate, dentate, palmately veined; umbels solitary or in fascicles, axillary, rather few-flowered, rarely 1-flowered, the involucre bracts few, usually thinly membranous; calyx-teeth obsolete; disc flat or slightly convex; petals flat, obtuse, slightly imbricate in bud; fruit flattened laterally, the carpels rather firm, with 7-9 nerves connected by transverse veinlets, the vittae absent, the styles filiform.—About 20 species, especially abundant in S. Africa.

1. *Centella asiatica* (L.) Urban. *Hydrocotyle asiatica* L.; *H. repanda* Pers.—Tsubo-Kusa. Perennial herb, usually woolly-pubescent in young parts; stems long-creeping, rooting at nodes, the scalelike leaves in false pairs; ordinary leaves long-petiolate, fasciated in the axils of scale-leaves, the blades reniform-rounded, 2.5-5 cm. wide, deeply cordate with an open sinus at base, with depressed teeth, the petioles 4-10 (-20) cm. long; umbels axillary, on peduncles 2-8 mm. long, 2- to 5-flowered, the pedicels very short or obsolete; involucre

bracts 2, ovate, membranous, persistent; fruit about 3 mm. long, somewhat flattened, depressed ovate-globose, the carpels with raised reticulations, loosely pubescent when young, soon glabrate.—May-Aug. Old stone walls and rocky, sunny places in lowlands and hills especially near seashores; Honshu (s. Kantō Distr., Echigo Prov. and westw.), Shikoku, Kyushu; common.—s. Korea, Ryukyus, Formosa, China, and the warmer regions of the Old World.

3. BUPLEURUM L. Mishima-Saiko Zoku

Usually perennial, sometimes annual herbs or (rarely) shrubs, glabrous and often glaucous throughout; leaves entire, narrow, sometimes ensiform, often clasping at base; umbels usually compound, subdivided into umbellets, the involucre and involucl usually of leaflike bracts and bractlets, these sometimes small, or lacking; flowers usually pedicellate; calyx-teeth obsolete; petals yellow, incurved at apex; styles short; stylopodium flat; fruit compressed laterally, sulcate on the commissure, the carpels 5-angled in cross section, the ribs thick or slender, the vittae solitary at the intervals or sometimes nearly obsolete, or dispersed as oil glands, the carpophore bifid; seeds terete or angled in cross section, the face concave.—About 90 species, widely distributed in warm-temperate regions of the Old World.

- 1A. Leaves laterally flattened, rather firm, green, with prominent parallel nerves, narrowed at base, broadly linear to narrowly lanceolate, not clasping; involucl of small bractlets; stems 40-70 cm. long. 1. *B. falcatum*
- 1B. Leaves flattened dorsiventrally, thin, glaucous at least beneath, broadly lanceolate to oblanceolate, the upper ones rounded or auriculate at base, clasping.
- 2A. Stems 5-10 (-15) cm. long; umbellets 3-5, the rays shorter or slightly longer than the involucre, the involucl longer than the fruit, with broadly elliptic or ovate, abruptly aristate-mucronate bractlets. 2. *B. triradiatum*
- 2B. Stems 20-100 cm. long; umbellets numerous, the rays much longer than the involucre, the involucl longer or sometimes slightly shorter than the fruit, the bractlets acuminate.
- 3A. Rhizomes thick and short; stolons absent; stems 20-100 cm. long, branched; bractlets of involucl usually lanceolate to narrowly oblong, rarely elliptic. 3. *B. longiradiatum*
- 3B. Rhizomes slender; stolons filiform; stems 20-40 cm. long, usually simple; bractlets of involucl ovate to obovate-elliptic, or obovate-oblong, usually longer than the pedicels. 4. *B. nipponicum*

1. *Bupleurum falcatum* L. *B. scorzoneraefolium* Willd.; *B. falcatum* var. *scorzoneraefolium* (Willd.) Ledeb.; *B. chinense* DC.; *B. falcatum* var. *komarowii* Koso-Pol.; *B. stenophyllum* (Nakai) Kitag.; *B. scorzoneraefolium* var. *stenophyllum* Nakai—MISHIMA-SAIKO. Rhizomes short, thick, with thickened roots; stems erect, 40–70 cm. long, branched above; radical leaves 10–30 cm. long, including the narrow petiolelike base, the cauline leaves rather thick and firm, broadly linear to narrowly lanceolate, 4–10 cm. long, 5–15 mm. wide, acuminate and with a short awn at tip, with several prominent parallel nerves, green on both sides, gradually narrowed to a sessile base; umbels numerous, with 2–7 rays, the involucre 0–15 mm. long, with linear-lanceolate bracts much shorter than the rays; umbellets 5- to 10-flowered, the involucre of broadly linear to oblong bractlets 2.5–4 mm. long, shorter than the fruiting pedicels; fruit ellipsoidal, 2.5–3.5 mm. long.—Aug.–Oct. Grassy slopes in hills; Honshu, Shikoku, Kyushu; common.—Siberia, Mongolia, China, Korea, Manchuria, the Caucasus, and Europe.

2. *Bupleurum triradiatum* Adams. *B. triradiatum* var. *alpinum* Rupr.; *B. ranunculoides* var. *triradiatum* forma *alpinum* Rupr. ex Wolff—REBUN-SAIKO. Rhizomes short, thick, branched; stems tufted, 5–10(–15) cm. long, few-leaved; radical leaves oblanceolate to broadly so, 5–10 cm. long, acute, gradually narrowed to the base, glaucous, the cauline leaves broadly oblanceolate to narrowly oblong or narrowly ovate, 1–3 cm. long, 5–10 mm. wide, rounded and clasping at base; umbels usually solitary, sometimes 2, the involucre with 3(–5) broadly elliptic or suborbicular bracts 1–2 cm. long, the rays 3(–5), 1–1.5 cm. long; umbellets 3–5, rather many-flowered, the involucre with 5(–6) broadly elliptic to broadly ovate bractlets, abruptly aristate-mucronate, longer than the fruit, the pedicels short; fruit oblong.—July–Aug. High mountains; Hokkaido; rare.—Sakhalin, Kamchatka, and e. Siberia.

3. *Bupleurum longiradiatum* Turcz. var. *breviradiatum* F. Schmidt. *B. sachalinense* F. Schmidt; *B. longiradiatum* var. *sachalinense* (F. Schmidt) H. Boiss.—HOTARU-SAIKO. Rhizomes short, with thick roots; stolons absent; stems 20–100 cm. long, branched with many umbels on upper part; radical leaves long-petiolate, broadly lanceolate to narrowly oblong, usually membranous, glaucous beneath, the

lower cauline similar but subsessile, the upper ones 5–15 cm. long, 2–3.5 cm. wide, acute to acuminate with a minute awn at apex, sessile and clasping at the rounded-auriculate base; umbels rather numerous, 10- to 15-flowered, the involucre bracts 2 or 3, small, the involucre with 3–5 lanceolate to narrowly oblong bractlets 2–3 mm. long, the pedicels 4–5 mm. long, longer than the involucre; carpels with prominent ribs.—Aug.–Oct. Mountains; Hokkaido, Honshu, Shikoku, and Kyushu.—s. Kuriles and Sakhalin.

Var. *longiradiatum*. *B. longiradiatum* var. *genuinum* Wolff; *B. yokoyamae* Miyabe & Tatew.—ÔHOTARU-SAIKO. Stems taller; pedicels more slender, 6–7(–15) mm. long, 5–7 times as long as the flowers and 2–3 times as long as the fruit.—Hokkaido, Honshu, and Kyushu; rare.—China, Manchuria, Korea, and Amur.

Var. *shikotanense* (Hiroe) Ohwi. *B. shikotanense* Hiroe; *B. aureum* sensu auct. Japon., non Fisch.—KOGANE-SAIKO. Stems 20–30 cm. long; leaves rather thick; umbels few, the pedicels 2–3 mm. long, shorter than to as long as the fruit; bractlets of the involucre often slightly longer than the fruit, 4–5 mm. long, oblong.—Hokkaido (Kitami and Nemuro Prov.).—s. Kuriles.

4. *Bupleurum nipponicum* Koso-Pol. *B. multinerve* forma *minus* auct. Japon., non DC.—HAKUSAN-SAIKO. Rhizomes slender; stems erect, 20–40(–50) cm. long, simple, slender, few-leaved, sparingly branched; lower cauline leaves oblanceolate or narrowly so, narrowed and clasping at base, the median and upper ones lanceolate to broadly so, 3–10(–12) cm. long, 1–2 cm. wide, subacuminate, clasping at the rounded-auriculate base, the uppermost leaves deltoid-ovate, short; umbels terminal, 1–5, the rays 5–8, the involucre bracts 1(–3), broadly ovate, the involucre bractlets 5 or 6, ovate, obovate-elliptic or obovate-oblong, abruptly acuminate, 6–8 mm. long, the pedicels 2–3.5 mm. long in fruit, slender; fruit 3–3.5 mm. long, oblong, the carpels with slender and prominent ribs.—July–Aug. High mountains; Honshu (centr. distr. and northw.).

Var. *yesoense* (Nakai) Hara. *B. yesoense* Nakai—HOSONA-KOGANE-SAIKO. Leaves acuminate; bractlets narrowly ovate, acuminate.—Hokkaido (Mountains of Hidaka Prov.).

4. SANICULA L. UMA-NO-MITSUBA ZOKU

Glabrous, perennial or rarely annual herbs; leaves ternately compound, palmately or rarely pinnately lobed; umbels simple or irregularly compound, the bracts prominent or small; flowers unisexual or polygamous, the fertile ones in the central part of the umbel 1 to many, sessile, the staminate pedicellate, usually marginal; calyx-lobes prominent, free in the fertile flowers, often connate in the staminate; petals imbricate in bud, emarginate and incurved at tip; disc flat, the styles usually filiform; fruit globose or ellipsoidal, the carpels orbicular in cross section, aculeolate, uncinatate, or tuberculate, without a carpophore, the vittae 5 or numerous, often obscure; seeds plane or concave on the face.—About 40 species, widely dispersed over the world, except in Australia and the Arctic.

1A. Fruit densely uncinatate-prickly; radical leaves 6–20 cm. wide; plants stout.

2A. Stems much-branched, with few petiolate, alternate leaves, and with many umbels in upper part. 1. *S. chinensis*
2B. Stems with a single pair or rarely 2 pairs of sessile leaves on upper part, naked or with a single petiolate leaf near base; umbels solitary or few.

3A. Involucral bracts small, 1–2 mm. long, much shorter than the staminate flowers and fruits; petiolate cauline leaves sometimes present; umbels with 1–5 rays, the peduncles 5–30 cm. long; flowers white or purplish. 2. *S. kaensis*

3B. Involucral bracts foliaceous, 10–20 mm. long, much longer than the flowers and fruits; petiolate cauline leaves absent; umbels 1–5, the peduncles 3–6 cm. long; flowers dark purple. 3. *S. rubriflora*

1B. Fruit densely armed with straight prickles or tuberculate; radical leaves 3–5 (–7) cm. wide; plants rather slender or delicate.
4A. Umbels 1–3, on peduncles 1–3 cm. long, many-flowered; involucral bracts 4–10 mm. long, spreading; fertile flowers 1–4; fruit densely tuberculate, the upper tubercles rather fleshy-spinous. 4. *S. tuberculata*

4B. Umbels 3–5, on peduncles 4–7 mm. long, few-flowered; involucral bracts minute, 2–3 mm. long, aristate-acicular; fertile flowers solitary; fruit densely prickly with small callose spines. 5. *S. lamelligera*

1. *Sanicula chinensis* Bunge. *S. europaea* sensu auct. Japon., non L.; *S. europaea* var. *elata* Makino, excl. syn.; *S. elata* var. *japonica* Koidz.; *S. elata* var. *chinensis* (Bunge) Makino—UMA-NO-MITSUBA. Rhizomes short and thick; stems 30–60 cm. long, much branched above; radical leaves with petioles 10–20 cm. long, the blades 5-angled, reniform-cordate, 5–10 cm. wide, glabrous, trisect, the lateral segments 2-parted, the lobes and segments rhombic-obovate or rhombic, acute, sometimes shallowly 2- or 3-lobed and incised, dentate with awn tipped teeth, the cauline leaves few, shorter petiolate, the upper sessile and smaller with the lateral lobes often undivided; leaves of the inflorescence 3-parted, often bracteate, small; peduncles 3–20 mm. long, few-flowered; staminate flowers very short-pedicellate, the involucre bracts 2–3 mm. long, longer than the staminate flowers; fruits 2–4, usually 3, globose-ovoid, sessile, 5–6 mm. long, including the persistent acicular calyx-teeth 1.5–2 mm. long, the uncinates prickles firm, spreading, about 1.5 mm. long.—July–Sept. Woods in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—S. Kuriles, S. Sakhalin, Korea, Manchuria, and China.

2. *Sanicula kaensis* Makino & Hisauchi. YAMANASHI-UMA-NO-MITSUBA. Rhizomes short and thick; stems elongate after anthesis, 15–60 cm. long, simple, with a pair of sessile terminal leaves, sometimes with a petiolate leaf at the middle bearing an axillary branch; radical leaves with petioles 10–30 cm. long, the blades rather thin, reniform-cordate, 4–10 cm. wide, glabrous, trisect, the lateral segments 2-parted, the segments and lobes cuneate-obovate, shallowly 3-fid, incised and acutely dentate, acute, the median cauline leaves similar to the radical, with shorter petioles, the terminal leaves sessile or nearly so, with the lateral segments sometimes undivided, and the segments narrower, cuneate-oblong; umbels 1–5, unequal, from the axils of the upper leaves, 5- to 10-flowered, the peduncles 1–5, unequal, ascending, 5–30 cm. long, the involucre bracts lanceolate, spreading, usually 2–3 mm. long, the pedicels of the staminate flowers 2–3 mm. long; fruit ovoid-ellipsoidal, about 4 mm. long including the persistent calyx-lobes, the uncinates prickles rather slender, 3 mm. long, tuberculate at base, often very short in the lower ones.—May–June, fruiting July–Sept. Mountains; Honshu (Kai and Shinano Prov.); very rare.

3. *Sanicula rubriflora* F. Schmidt. KUROBANA-UMA-NO-MITSUBA. Rhizomes short and thick; stems with a pair of terminal leaves, elongate after anthesis, naked, 20–50 cm. long; radical leaves with petioles 20–40 cm. long, the blades thin, smooth, reniform-orbicular, 6–20 cm. wide, trisect, the lateral segments 2-parted, all segments and lobes obovate-cuneate, obtuse, shallowly and acutely 3- to 5-fid or incised, acutely den-

tate; cauline leaves a single pair at summit of stem, sessile, trisect, the segments slightly narrower, the lateral segments undivided; umbels 1–5, axillary in the paired leaves, densely many-flowered, the peduncles 3–6 cm. long, the involucre bracts foliaceous, linear-oblanccolate, spreading, green, 10–20 mm. long; staminate flowers dark purple, the pedicels 1–2 mm. long, 1–2 times as long as the calyx-lobes; fruits sessile, 1–3 in each umbel, about 4 mm. long including the calyx lobes, the uncinates prickles firm, ascending, about 2 mm. long.—May–June, fruiting June–July. Honshu (Mount Himegamayama in Rikuchu, Azusayama in Shinano, and elsewhere); rare.—Amur, Manchuria, and Korea.

4. *Sanicula tuberculata* Maxim. FUKIYA-MITSUBA. Rhizomes short and thick; stems 8–20 cm. long, slender, usually with 2 pairs of terminal leaves; radical leaves with petioles 5–15 cm. long, the blades 5-angled, reniform-orbicular, glabrous, 3–5(–7) cm. wide, trisect, the lateral segments 2-parted, the segments and lobes cuneate-obovate, shallowly 2- or 3-fid, acute, mucronate-dentate, paler beneath; cauline leaves subsessile, slightly smaller than the radical, with the lateral segments usually undivided; umbels 1–3, in the axils of the terminal cauline leaves, the peduncles 1–3 cm. long; involucre bracts linear-lanceolate, 4–10 mm. long, spreading; staminate flowers about 10, the pedicels 2–3 mm. long, 2 or 3 times as long as the lanceolate calyx-lobes; fruits 1–4 in each umbel, about 3.5 mm. long including the calyx-lobes, depressed-globose, densely tuberculate, the spines or prickles short and thick, erect, the upper tubercles 0.5–0.7 mm. long, rather fleshy-spiny.—May, fruiting in June. Honshu (w. Tōkaidō Distr. and westw.), Shikoku, Kyushu; rare.—Korea.

5. *Sanicula lamelligera* Hance. *S. satsumana* Maxim.; *S. wakayamensis* Masam.; *S. lamelligera* var. *wakayamensis* (Masam.) Murata—HIME-UMA-NO-MITSUBA. Rhizomes short and thick; stems erect, 6–15 cm. long, slender, subscape; radical leaves with petioles 5–10 cm. long, the blades 5-angled, cordate-orbicular, 2–3.5 cm. wide, trisect, deep green on upper side, paler beneath, the segments rhombic, 2- or 3-lobed, sub-acute, with awn-tipped incurved teeth, glabrous, often narrowed to a short petiolelike base; cauline leaves 1 or 2, small, bracteate, often 3-lobed; umbels 3–5, few-flowered, the peduncles 1–3 cm. long, the involucre bracts aristate-acicular, 2–3 mm. long; pedicels of the staminate flowers 2–2.5 mm. long, 3–4 times as long as the acicular calyx-lobes; fruit ovoid, 2–2.5 mm. long including the calyx-lobes, the prickles or spines callose, ascending, slender, firm, straight, about 0.5 mm. long.—May. Honshu (Kii Prov.), Kyushu (s. distr.); rare.—Ryukyus, Formosa, and China.

5. ANTHRISCUS Hoffm. SHAKU ZOKU

Annuals or perennials, usually pubescent on the leaves and upper part of the stems; leaves pinnately or ternately compound, the segments pinnately divided, lobed and toothed; umbels numerous, the involucre bracts 1 or 2 or none, the bractlets of the involucre entire, numerous; flowers white, often polygamous; calyx-teeth minute or obsolete; petals often unequal, with an incurved tip; stylopodium usually conical, entire; fruit slightly compressed laterally, with a sulcate commissure, lanceolate or oblong, the carpels terete or subterete with the ribs distinct only in the upper part, glabrous or minutely spiny, the vittae very slender, solitary in the intervals or obscure, the carpophore sometimes bifid; seeds subterete or dorsally compressed, grooved on the face.—About 13 species in Eurasia.

1. *Anthriscus sylvestris* (L.) Hoffm. *A. nemorosa* (Bieb.) Spreng.; *Chaerophyllum nemorosum* Bieb.; *A. sylvestris* var. *acumula* Woron.; *A. sylvestris* subsp. *nemorosa* (Bieb.) Koso-Pol.—SHAKU, KOJAKU. Perennial; taproot thick-

ened; stems hollow, simple, 80–140 cm. long, erect, branched above, glabrous or with reflexed white hairs at base; radical leaves long-petiolate, the blades green, herbaceous, 20–50 cm. long, deltoid, 2–3 times ternate and pinnately parted, the ultri-

mate lobes acute or acuminate, toothed, with spreading, white, setulose hairs at least on the nerves beneath, the cauline leaves similar and gradually reduced upward, the upper petioles reduced to a white-pilose sheath; umbels numerous, glabrous, the involucre absent, the umbellets 5-12, glabrous, on rays 3-4 cm. long, rather many-flowered, the bractlets of the involucre 4-8, recurved, pale green, membranous, oblong to lanceolate, abruptly caudately acuminate, 3-8 mm. long, ciliate; pedicels smooth, short-setulose near the apex; fruit lanceolate, dark gray

and slightly lustrous at maturity, 5-8 mm. long, glabrous or with short, ascending, callose tubercles, as long as to half as long as the pedicels.—May-June, fruiting June-July. Hokkaido, Honshu, Shikoku, Kyushu; common in mountains.—e. Europe, Caucasus, Siberia, Kamchatka, Kuriles, Sakhalin, Korea, Manchuria, and China.

Var. *hirtifolius* (Ohwi) Hara. *A. nemorosa* var. *hirtifolius* Ohwi—KEJAKU. Rather densely pilose, the fruit yellowish setulose.—Occurs with the typical phase.

6. OSMORHIZA Raf. YABU-NINJIN ZOKU

More or less pilose perennials; leaves triternate, the lobes or segments pinnately lobed or toothed; umbels few to rather numerous, the involucre and involucre minute or absent; flowers white; calyx-teeth obsolete; petals obovate or oblong, retuse, incurved at apex; stylopodium conical, entire; fruit narrowly oblanceolate or broadly linear, gradually narrowed at base, decurrent on the pedicels, the carpels 5-angled, nearly terete in cross section, the ribs evident, setose, the vittae numerous, weak or obscure, the carpophore slender, bifid, the seeds flattened dorsally, grooved on the face.—Few species in India, e. Asia, N. and S. America.

1. *Osmorhiza aristata* (Thunb.) Makino & Yabe. *Chaerophyllum aristatum* Thunb.; *O. japonica* Sieb. & Zucc.—YABU-NINJIN. White-pilose perennial with thick ascending rhizomes; stems erect, sparingly branched above, 40-60 cm. long, solid, few-leaved; radical leaves long-petiolate, the blades deltoid, 2 or 3 times ternately pinnate, 10-20 cm. long, the primary pinnae deltoid-ovate, acute, the ultimate segments thin, ovate or oblong, toothed, green, the cauline leaves sessile, shortly sheathing at base; umbels 2 or 3 on long peduncles, the involucre of lanceolate, acuminate, recurved, deciduous bracts, the rays 3-6, 5-10 cm. long, smooth, spreading-ascending, the umbellets 5- to 10-flowered, the involucre bractlets 5 or 6, lanceolate, recurved, acuminate, membranous, 5-8 mm. long; fruit linear-oblanceolate, 18-20 mm. long, about 1.5 mm. wide,

appressed-setose, narrowed gradually toward base, the pedicels about as long as the fruit, loosely setose on upper part, the styles slender, 2.5-3 mm. long, including the conical stylopodium.—Apr.-May. Woods in hills and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Korea, China, and Formosa to India.

Var. *montana* Makino. *O. amurensis* F. Schmidt; *O. montana* (Makino) Makino—MIYAMA-YABU-NINJIN, ONAGA-YABU-NINJIN. Less pubescent, the primary leaf segments acuminate, the ultimate segments or lobes smaller, narrower.—May-June, fruiting June-Aug. Woods in mountains; Hokkaido, Honshu (centr. distr. and northw.).—e. Siberia, Korea, Sakhalin, and s. Kuriles.

7. TORILIS Spreng. YABUJIRAMI ZOKU

Coarsely hirsute annuals or perennials; leaves 2 or 3 times ternately pinnate, with small ultimate segments; umbels numerous, usually opposite the leaves, the bracts and bractlets few, linear; flowers white; calyx-teeth deltoid-lanceolate, firm, persistent, acute; petals obovate, emarginate at the incurved or slightly bifid apex; stylopodium conical, the styles short; fruit ovoid, with a groove on the commissure, the carpels densely prickly with scabrous prickles, the vittae solitary in the intervals, 2 on the commissure; seeds deeply grooved on the face.—About 20 species, chiefly in the Mediterranean region, a few in S. Africa and e. Asia.

- 1A. Fruits 4-10, ovoid, 2.5-3 mm. long, in a dense umbellet; fruit-prickles short, gradually upward-curved. 1. *T. japonica*
 1B. Fruits 3-6, oblong, 4.5-6 mm. long, in a loose umbellet; fruit-prickles rather long, spreading. 2. *T. scabra*

1. *Torilis japonica* (Houtt.) DC. *Caucalis japonica* Houtt.; *T. anthriscus* Gmel., non Gaertn.; *T. anthriscus* var. *japonica* (DC.) H. Boiss.—YABUJIRAMI. Biennial with short, appressed, setose hairs throughout; stems erect, 30-70 cm. long, retrorsely hirsute; lower cauline leaves petiolate, green, ovate-deltoid, 5-10 cm. long, acute, twice ternately pinnate, appressed-hirsute, the ultimate segments narrowly ovate, pinnatifid, the upper cauline leaves rather small, sessile, acuminate; umbels few, pedunculate, the involucre bracts 4-8, linear, about half as long as the rays, suberect, the involucre bractlets linear, appressed to the pedicels, rather unequal, as long as to shorter than the fruit, the pedicels 2-4 mm. long, ascending; fruits 4-10, crowded, ovoid, 2.5-3-(3.5) mm. long, densely covered with short, scabrous, slightly uncinat prickles.—May-July. Grassy places and thickets in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—

Europe and Caucasus, Africa, n. and e. Asia, naturalized in s. Asia.

2. *Torilis scabra* (Thunb.) DC. *Chaerophyllum scabrum* Thunb.; *Caucalis scabra* (Thunb.) Makino—O-YABUJIRAMI. Resembling the preceding species; stems 30-70 cm. long, branched above; lower cauline leaves 5-10 cm. long, the ultimate segments pinnatifid; umbels pedunculate, the rays 2-3, rarely 4, 2-3 cm. long, the bracts of the involucre 1 or none, short, filiform, the involucre bractlets linear, ascending, as long as the fruiting pedicel; fruits 3-6, oblong, 4.5-6 mm. long, about as long as the pedicels, appressed-pilose between the spreading, scabrous, slightly uncinat prickles.—May-July. Grassy places and thickets in lowlands and hills; Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, China, and s. Korea.

8. CRYPTOTAENIA DC. MITSUBA ZOKU

Glabrous perennials; leaves radical and cauline, trisect, the leaflets broad, incised-dentate; umbels irregularly compound, the peduncles, rays, and pedicels very unequal, the bracts and bractlets small or none; calyx-teeth obsolete; petals small, incurved at apex; stylopodium conical, entire; fruit oblong, compressed, laterally grooved on the commissure, the carpels teretely 5-angled in cross section, the commissure plane or nearly so, the ribs subequal and evident, the vittae beneath and between the ribs, the carpophore bifid.—Few species in e. Asia, Africa, and N. America.

1. *Cryptotaenia japonica* Hassk. *C. canadensis* sensu auct. Japon., non DC.; *C. canadensis* var. *japonica* (Hassk.) Makino.—MITSUBA. Glabrous perennial with short rhizomes and rather thick roots; stems erect, slightly branched above, 30–60 cm. long; radical and lower cauline leaves long-petiolate, the blades cordate-deltoid, 5–15 cm. wide, 3-foliolate, the leaflets sessile, the terminal one broadly rhomboid-ovate to broadly ovate, 3–8 cm. long, 2–6 cm. wide, acuminate, abruptly narrowed to the acuminate base, incised- or irregularly dentate, rarely deeply lobed, the lateral leaflets at base with a slightly dilated outer margin, the leaves of the inflorescence very short, often undivided, linear to lanceolate; umbellets 1- to 4-flow-

ered, erect, narrow, the pedicels very unequal, 3–15 mm. long, erect, the involucre bractlets linear, short, the flowers white; fruit 3–4 mm. long, glabrous, the carpels oblong-cylindric, narrowed at apex, the styles erect, the stylopodium elongate-conical.—June–July, fruiting in Aug. Woods in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and frequently cultivated as a vegetable.—Korea, China, Ryukyus, and s. Kuriles.—Forma *atropurpurea* (Makino) Ohwi. *C. japonica* var. *atropurpurea* Makino.—MURASAKI-MITSUBA. Dark purple throughout. Rarely cultivated as an ornamental.

9. PTERNOPETALUM Franch. IWA-SENTÔ-SÔ ZOKU

Small or slender, glabrous to pilose perennials; stems erect or ascending, simple or sparingly branched above; leaves ternately decomposed, the upper with often narrow, elongate segments; umbels compound, numerous, on the long rays, the pedicels 2 or 3, very unequal, short, erect, the involucre small, the flowers white, bisexual; calyx-teeth sometimes obsolete, often acute; petals emarginate, incurved at apex; stylopodium conical, the styles erect, slender; fruit oblong or ovoid, compressed laterally, usually with a groove on each side, glabrous, the carpels 5-angled, subterete in cross section, the ribs usually slender, the vittae 1–3 in the intervals; seeds flat on the face, the carpophore bifid.—About 10 species, in India, China, and Japan.

1. *Pternopetalum tanakae* (Fr. & Sav.) Hand.-Mazz. *Carum tanakae* Fr. & Sav.; *Cryptotaeniopsis tanakae* (Fr. & Sav.) H. Boiss.—IWA-SENTÔ-SÔ. Glabrous, delicate or slender perennial; rhizomes creeping and short stolons also developed; stems 10–25 cm. long, erect, simple, 1- or 2-leaved; radical leaves petiolate, ovate-deltoid in outline, 3–4 cm. wide, 2 or 3 times ternately pinnate, the ultimate segments short-petiolulate, usually ovate, 4–6 mm. long, deeply 3-parted, usually few-lobed, minutely scabrous on the margin, the upper

cauline petiolate, 1 or 2 times divided, the ultimate segments linear, 1–3 cm. long, about 2 mm. wide, acute; umbels 1 or sometimes 2, glabrous, the involucre lacking, the rays 10–20, slender, 2.5–3 cm. long, the umbellets 2- or sometimes 3-flowered, the involucre of small linear bractlets, the pedicels unequal, to 2 mm. long, erect; fruit glabrous, 2–2.5 mm. long, the styles short, the calyx-teeth very small.—May–June. Damp mountain woods; Honshu (Kantô Distr. and westw.), Shikoku, Kyushu.—s. Korea.

10. SPURIOIMPINELLA Kitag. KA-NO-TSUME-SÔ ZOKU

Rather slender perennials; stems erect, hollow, loosely few-leaved; leaves radical and cauline, petiolate, usually ternately decomposed, membranous, the segments pinnately lobed and dentate; umbels few or solitary, the involucre bracts few or none, the rays slender, the umbellets with many bractlets; flowers bisexual; calyx-teeth prominent; petals white, equal, incurved at apex; stylopodium conical, the styles filiform; fruit glabrous, compressed laterally, ovoid or ellipsoidal, the carpels nearly orbicular in cross section, the ribs equal, filiform, the vittae many and slender, the seeds adnate to the pericarp.—About 10 species, in e. Asia and e. Siberia.

1A. Fruit longer than wide; leaves with short, ascending, setose hairs on nerves on both surfaces and on margin; upper leaves usually once ternate, with narrowly ovate to broadly lanceolate leaflets; petiolules and upper part of petioles with callose hairs.

1B. Fruit as wide as long; leaves membranous, coarsely pilose on both surfaces and on the margin; upper leaves usually twice ternate, with ovate leaflets; petiolules and petioles subglabrous or pilose. 1. *S. calycina*
..... 2. *S. nikkoensis*

1. *Spuriopimpinella calycina* (Maxim.) Kitag. *Pimpinella calycina* Maxim.—KA-NO-TSUME-SÔ. Stems 50–80 cm. long, branched above, glabrous; radical and lower cauline leaves petiolate, twice ternate, often simply ternate in the upper ones, the leaflets sessile or nearly so, membranous, broadly ovate or obovate, 3–8 cm. long, 2–4 cm. wide, acute to abruptly acuminate, dentate, with short, ascending, setose hairs on nerves on both surfaces and on the margin, the leaf-

lets of the upper leaves narrowly ovate to broadly lanceolate, 8–12 cm. long, 2–4 cm. wide, long-acuminate; umbels solitary or few, the rays 2–4 cm. long, slender, the involucre bracts few, linear, 2–8 mm. long, the umbellets few- to more than 10-flowered, the involucre bractlets few, linear, 2–3 mm. long, the pedicels slender, minutely tuberculate on the inner side, 6–10 mm. long; fruit ovoid to narrowly so, 4–5 mm. long, the ribs slender, the calyx-teeth deltoid, erect, the styles slender

and recurved, scarcely 2 mm. long.—Aug., fruiting Sept.–Oct. Damp mountain woods; Hokkaido, Honshu, Shikoku, Kyushu.

2. *Spuriopimpinella nikoensis* (Yabe ex Hisauchi) Kitag. *Pimpinella nikoensis* Yabe ex Hisauchi; *P. koreana* (Yabe) Nakai—HIKAGE-MITSUBA. Perennial; rhizomes short; stems 50–80 cm. long, slightly branched above; radical leaves long-petiolate, the cauline petiolate or sessile, 10–15 cm. long and wide, biternately compound, the leaflets usually sessile, thinly membranous, green, ovate to obovate, 1.5–4 cm. long, 1–3 cm. wide, usually abruptly caudately acuminate, dentate, sparsely pilose on both surfaces, short-ciliate; umbels

few, the involucre bracts lacking, or 1–3, linear, 5–20 mm. long, the rays about 10, 15–35 mm. long, minutely tuberculate on the inner side, the umbellets more than 10-flowered, the bracts of the involucre 2–5 mm. long, linear, the pedicels slender, 8–12 mm. long, minutely tuberculate on the inner side; calyx-teeth elongate-deltoid, erect; fruit ovoid-globose, 3–4 mm. long, only a single carpel often maturing, the styles about 1 mm. long, recurved.—Aug., fruiting Sept.–Oct. Mountain woods; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—*Forma dissecta* (Nakai) Ohwi. *Pimpinella nikoensis* var. *dissecta* Nakai—HAGOROMO-HIKAGE-MITSUBA. Leaves finely dissected.

11. OENANTHE L. SERI ZOKU

Glabrous perennials growing in wet places; leaves pinnate or rarely bladeless; umbels compound, the bracts and bractlets numerous, rarely absent; flowers white; calyx-teeth acute; petals emarginate, incurved at apex; stylopodium conical, narrow; fruit ovoid or oblong, terete, with a broad, flat commissure, the carpels semi-orbicular in cross section, the ribs corky, rather thick, the lateral ones broader than the subequal dorsal ribs, the vittae solitary in the intervals, the carpophore absent; seeds dorsally compressed, with a flat face.—About 30 species, in the N. Hemisphere, S. Africa, and Australia.

1. *Oenanthe javanica* (Bl.) DC. *Stum javanicum* Bl.; *Falcaria javanica* (Bl.) DC.; *O. stolonifera* DC.; *O. linearis* DC.; *O. benghalensis* DC.; *S. laciniatum* Bl.; *O. lacinata* (Bl.) Zoll.; *Dasyloma subbipinnatum* Miq.; *D. japonicum* Miq.; *O. stoloniferum* var. *japonica* (Miq.) Maxim.—SERI. Glabrous perennial with slender roots; stems erect, 20–40 cm. long, angled, striate, from a long-creeping, branched base; leaves petiolate, 7–15 cm. long, deltoid or deltoid-ovate, once or twice pinnately compound, the ultimate segments ovate or narrowly so, 1–3 cm. long, 7–15 mm. wide, acute or subacuminate, irregularly dentate, sometimes deeply lobed; umbels

pedunculate, opposite the leaves, the rays 5–15, usually minutely tuberculate on the angles, 1–2.5 cm. long, the umbellets 10- to 25-flowered, the involucre bractlets few, linear, shorter than the fruit, the pedicels 2–5 mm. long; flowers white; fruit ellipsoidal, about 2.5 mm. long, the carpels with corky ribs, the calyx-teeth persistent, the styles slender, suberect, about 1.5 mm. long.—July–Aug. Ditches, ponds, paddy fields, and wet places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, China, Malaysia, India, and Queensland (Australia).

12. PIMPINELLA L. MITSUBAGUSA ZOKU

Perennials or rarely annuals; leaves pinnately or sometimes ternately compound, rarely simple, dentate; umbels compound, the bracts and bractlets few or lacking; calyx-teeth obsolete; petals usually white, with an entire or emarginate incurved apex; stylopodium conical, depressed or cushionlike, entire; fruit ovoid or ellipsoidal, compressed laterally, with a concave commissure, the carpels 5-angled, subterete in cross section, the ribs equal, slender, filiform, the vittae numerous, the carpophore bifid; seeds compressed dorsally, with a nearly plane face.—About 100 species in the N. Hemisphere and S. Africa.

- 1A. Fruit broadly ovoid, 1.5 mm. long, short-pubescent; cauline leaves usually 3-foliolate or simple, the leaflets irregularly acute-dentate or incised. 1. *P. diversifolia*
 1B. Fruit narrowly ovoid, 2.5–3 mm. long, glabrous; cauline leaves 5–9 foliolate; the leaflets often ternately cleft to divided, coarsely and acute-dentate. 2. *P. thellungiana* var. *gustavohegiana*

1. *Pimpinella diversifolia* DC. *P. sinica* Hance; *Platyraphe japonica* Miq.—MITSUBAGUSA. Stems erect, 80–100 cm. long, terete, branched, with short whitish hairs; lower cauline leaves simple or 3-foliolate, petiolate, sparsely short-pubescent, the leaflets herbaceous, orbicular-cordate, obtuse or rounded, 4–7 cm. long and as wide, cordate to truncate at base, irregularly acute-dentate or incised, the upper leaves sessile, the leaflets ovate or broadly so, acute, deeply lobed, the terminal one slightly larger than the others, 3–7 cm. long, 2–4 cm. wide, the lateral leaflets sessile; umbels rather numerous, short-pubescent, the involucre bracts solitary or none, the rays about 10, 1.5–2 cm. long, the umbellets about 10-flowered, the involucre of few, linear, small bractlets, the pedicels about 5 mm. long; flowers white; fruit broadly ovoid, short-pubescent, 1.5 mm. long, the styles short, about 0.5 mm. long.—Aug., fruiting Sept. Kyushu.—China and N. India.

2. *Pimpinella thellungiana* H. Wolff var. *gustavo-*

hegiana (Koidz.) Kitam. *P. magna* sensu auct. Japon., non L.; *P. gustavohegiana* Koidz.; *P. thellungiana* sensu auct. Japon., non H. Wolff—TSUKUSHI-BÖFŪ. Stems terete, erect, branching, 30–80 cm. long, densely white-puberulent; radical and lower cauline leaves petiolate, 8–20 cm. long, oblong-ovate, the leaflets 5–9, sessile, broadly ovate, obtuse to rounded, 2–3.5 cm. long, 1.5–3 cm. wide, often ternately cleft or divided, coarsely acute-dentate, loosely puberulent on upper side, densely so beneath, the upper leaflets 3 or 5, sessile; umbels few, glabrous, pedunculate, the rays 10–15, 2.5–3 cm. long, nearly smooth, the involucre and involucre lacking; flowers crowded, rather numerous, the pedicels 5–8 mm. long, suberect, somewhat flattened; fruit narrowly ovoid, 2.5–3 mm. long, glabrous, the styles spreading obliquely, slender, about 1.2 mm. long.—Aug. Mountains; Kyushu (Bungo).—The typical phase occurs from Dahuria to China and Formosa.

13. AEGOPODIUM L. EZO-BÖFŪ ZOKU

Perennials with rhizomes; leaves once or twice ternately compound, the ultimate segments broad, dentate; umbels 1 to many, the involucre bracts and bractlets few or lacking; flowers white; calyx-teeth obscure; petals emarginate, incurved at apex; stylopodium thick, nearly conical, entire; fruit ovoid or ovoid-ellipsoidal, glabrous, slightly compressed laterally, the carpels 5-angled in cross section, very slightly flattened dorsally, the ribs slender, filiform, equal, the vittae absent, the carpophore bifid; seeds flat on the face.—Few species in Eurasia.

1. *Aegopodium alpestre* Ledeb. Ezo-bōfū. Glabrous perennial except the leaf-margins and inner side of the rays; rhizomes short and slender; creeping stolons with thickened nodes; stems rather slender, erect, 30–50 cm. long, sparsely branched above, terete, hollow, few-leaved; radical and lower cauline leaves long-petiolate, deltoid, 2–3 times ternately compound, the ultimate segments thinly membranous, ovate to narrowly so, 1–2.5 cm. long, 8–20 mm. wide, acuminate to acute, irregularly dentate, often 3-lobed, the upper leaves ses-

sile, small; umbels 1–3, on long peduncles, the involucre and involucre lacking, the rays 8–12, 2–3 cm. long, the umbellets more than 10-flowered, the pedicels 5–8 mm. long; fruit ovoid-oblong, 3–3.5 mm. long, the stylopodium subglobose, the styles slender, about 1 mm. long.—June–July, fruiting Aug.–Sept. Damp mountain woods; Hokkaido, Honshu (Kantō Distr. and northw.).—S. Kuriles, Sakhalin, n. Korea, China, Manchuria, e. Siberia, and Altai.

14. CNIDIUM Cuss. HAMAZERI ZOKU

Perennials or biennials; leaves petiolate, long-sheathed at base, 1–3 times pinnately compound; umbels rather large, with many rays, without an involucre, the involucre present; flowers white; calyx-teeth obsolete; petals obovate with an incurved apex; stylopodium elongate-conical with the styles spreading at apex; fruit ovoid-globose, very slightly compressed laterally, the carpels subterete in cross section, the ribs thick, obtuse and unwinged, usually corky, the vittae solitary in the intervals, 2 or 3 on the commissure; seeds 5-angled in cross section with a nearly flat face.—More than 10 species, in Eurasia.

1. *Cnidium japonicum* Miq. HAMAZERI. Glabrous biennial with simple, thickened roots; stems few, erect or decumbent at base, 10–30 cm. long, striate, branched above; radical and cauline leaves petiolate, ovate-oblong, 3–6 cm. long, pinnately compound, the leaflets 5–7, sessile or the lowest rarely short-petiolulate, ovate-deltoid, 7–12 mm. long, deeply pinnately lobed, lustrous, smooth on the margin; umbels pedunculate, glabrous, the rays few, stout, 5–10 mm. long,

the bracts and bractlets few, linear, 2–5 mm. long, the pedicels 2–4 mm. long, the umbellets about 10; flowers white, crowded; fruit ovoid, about 3 mm. long, the carpels with equal, thick, corky, rather acute ribs, the calyx-teeth obsolete, the stylopodium conical, the styles 0.3–0.5 mm. long.—Aug.–Oct. Sandy places near seashores; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, China, Ryukyus, and Bonins.

15. PLEUROSPERMUM Hoffm. Ō-KASA-MOCHI ZOKU

Perennials or biennials; stems often stout; leaves ternately pinnate, the ultimate segments incised or dentate, sometimes pinnately lobed; umbels compound, large, the rays numerous, the bracts and bractlets numerous, membranous or foliaceous, sometimes pinnately lobed; flowers white, rather large; calyx-teeth minute; petals obovate or cuneate with an incurved apex; stylopodium flat or convex, entire; fruit ovoid or globose, nearly orbicular in cross section, with a broad commissure, the carpels convex and with subequal, acute, narrowly winged ribs, the vittae usually solitary (rarely 2) in the intervals, the outer pericarp loosely connected with the inner, the carpophore bifid; seeds compressed dorsally, with a deep groove on the commissural side.—About 15 species in Eurasia, especially the Himalayas.

1. *Pleurospermum camtschaticum* Hoffm. *P. uraleense* Hoffm.; *P. austriacum* sensu auct. Japon., non Hoffm.; *P. austriacum* subsp. *uraleense* (Hoffm.) Somm.—Ō-KASA-MOCHI. Stout, glabrescent perennial; stems stout, erect, hollow, usually simple, short-branched above, leafy; rhizomes simple, short and thick; radical and lower cauline leaves petiolate, broadly ovate-deltoid, twice ternately pinnate, 20–40 cm. long, the ultimate segments narrowly ovate, acuminate, sessile, membranous, glabrous except for the papillose nerves and margins, pinnatifid, acutely incised-dentate, 4–15 cm. long; umbels few,

the terminal one largest, semiglobose, with numerous, densely papillose-puberulent rays 7–15 cm. long, the bracts of involucre and bractlets of involucre numerous, foliaceous, green, scarious-margined, the pedicels 1.5–3 cm. long; flowers rather large; fruit ovoid, 6–7 mm. long, the styles about 2 mm. long, the stylopodium conical, the ribs scabrous.—July–Aug., fruiting Sept.–Oct. Mountains; Hokkaido, Honshu (centr. and n. distr.).—Kuriles, Sakhalin, Korea, Manchuria, Kamchatka, and Siberia.

16. CHAMAELE Miq. SENTŌ-SŌ ZOKU

Small perennials; stems scapellike, leafless; radical leaves 2 or 3 times ternately pinnate, the leaflets small, incised to lobed; umbels with few rays, the involucre and involucre lacking, the umbellets few-flowered, the central one often sessile; flowers small, white; calyx-teeth obscure; petals shortly incurved at apex; styles short, sometimes recurved; stylopodium flat, entire; fruit oblong or ovoid-oblong, compressed laterally, glabrous, grooved on the commissure, the carpels nearly 5-angled in cross section, with slender, filiform, equal ribs, the vittae absent; seeds nearly orbicular in cross section, the carpophore bifid.—A single species, in Japan.

1. *Chamaele decumbens* (Thunb.) Makino. *Sium decumbens* Thunb.; *C. tenera* Miq.; *Aegopodium tenerum* (Miq.) Yabe—SENTÔ-SÔ. Delicate, glabrous perennial with rather thick, short rhizomes; leaves radical and petiolate, the petioles dilated and stipulelike in those at base, the blade ovate-deltoid, 3–6 cm. long, 2 or 3 times ternately pinnate, the ultimate segments membranous, ovate or deltoid, rather acute, 5–10 mm. long, deeply lobed; peduncles 10–25 cm. long, the involucre and involucre lacking, the rays 3–5, 3–5 cm. long, the central one often very short, the umbels 7- to 10-flowered, the pedicels unequal, 1–5 mm. long, papillose on the inner

side; flowers white, small; fruit 2.5–3.5 mm. long, the styles spreading-recurved, 0.5–1 mm. long.—Apr.–May. Woods; Hokkaido, Honshu, Shikoku, Kyushu; rather common and variable in shape of the leaflets.—Forma *japonica* (Yabe) Ohwi. *C. japonica* Makino ex Yabe in syn.; *C. decumbens* var. *japonica* Makino; *Aegopodium tenerum* var. *japonicum* Yabe—MIYAMA-SENTÔ-SÔ. Ultimate segments slender, linear.—Forma *dilatata* Satake & Okuyama. *IBUKI-SENTÔ-SÔ*. Leaves once or sometimes twice compound, larger, the ultimate segments broader.

17. SESELI L. IBUKI-BÔFŪ ZOKU

Usually pilose perennials; stems often angled; leaves ternately pinnate or pinnately compound, the ultimate segments usually narrow; umbels compound, the involucre bracts many or absent, the bractlets of the involucre numerous; flowers white; calyx-teeth evident; petals rather broad, emarginate at the incurved apex; styles usually slender; stylopodium flat or convex, with undulate teeth on the margin; fruit ovoid or oblong, short-pubescent, nearly orbicular in cross section, the carpels compressed dorsally, the ribs equal or nearly so, rather prominent, obtuse, the vittae usually solitary in the intervals and rarely also under the ribs, the carpophore bifid; seeds semi-orbicular in cross section, with a nearly flat face.—About 10 species, in Eurasia.

1. *Seseli libanotis* (L.) K. Koch var. *japonica* H. Boiss. *S. libanotis* sensu auct. Japon., non K. Koch; *S. libanotis* subsp. *japonica* (H. Boiss.) Hara; *S. ugoensis* Koidz.; *Libanotis ugoensis* (Koidz.) Kitag.; *S. libanotis* subsp. *japonica* forma *ugoensis* (Koidz.) Hara—IBUKI-BÔFŪ. Pubescent perennial, the thick rhizome at the apex sparsely fibrous; stems 40–80 cm. long, branched; radical and lower cauline leaves petiolate, 2 or 3 times pinnately compound, ovate, the ultimate segments ovate, deeply cleft, 2–3 cm. long, the lobes lanceo-

late, finely ciliate, the upper leaves smaller, sessile, less divided; umbels pedunculate, papillose-pilose on the peduncles at tip, the rays more than 10, 2–3 cm. long, papillose-puberulent; involucre absent, the involucre bractlets short, few, appressed to the short pedicels; fruit ovoid, about 2 mm. long, papillose-puberulent, the calyx-teeth elongate-deltoid, the styles about 1 mm. long, the stylopodium convex.—Aug.–Sept. Hokkaido, Honshu (Yamato Prov. and northw.).—s. Kuriles. The typical phase occurs in Europe and w. Asia.

18. CICTA L. DOKUZERI ZOKU

Tall, glabrous perennials usually of wet places; leaves pinnate; umbels compound, many-rayed; bracts of the involucre few or absent; involucre bractlets few, small; flowers white; calyx-teeth small, acute; petals rather broad, incurved and emarginate at apex; stylopodium rather thick, flat, entire; fruit ovoid to depressed ovoid-globose, slightly compressed laterally, slightly grooved on the commissure, the carpels slightly flattened dorsally, suborbicular in cross section, the ribs thick, obtuse, broad, rather corky, the pericarp membranous, the vittae solitary in the intervals, the carpophore bifid; seeds suborbicular or flattened dorsally in cross section, convex on the face.—Few species in wet places in the N. Hemisphere.

1. *Cicta virosa* L. *C. nipponica* Fr. & Sav.; *C. virosa* var. *nipponica* (Fr. & Sav.) Makino; *C. virosa* var. *tenuifolia* Koch; *C. virosa* var. *latisepta* Koso-Pol.—DOKUZERI. Large, glabrous perennial with thick, green, jointed rhizomes; stems much branched, 60–100 cm. long; radical and lower cauline leaves long-petiolate, deltoid-ovate in outline, 30–50 cm. long, twice pinnately compound, the ultimate segments linear-lanceolate to broadly lanceolate, 3–8 cm. long, 7–20 mm. wide, acute, acutely dentate, the upper leaves subsessile, smaller and

less divided; umbels glabrous, rather numerous, the involucre bracts absent, the rays about 20, 3–7 cm. long, spreading, the umbellets more than 10-flowered, the bractlets of the involucre few, linear-filiform, 3–7 mm. long; pedicels slender, 8–10 mm. long; fruit ovoid-globose, about 2.5 mm. long, green, with thick yellow ribs, the calyx-teeth deltoid, minute, the styles slender, about 1 mm. long.—June–Aug. Wet places; Hokkaido, Honshu, Shikoku, Kyushu.—Europe, Siberia, China, Manchuria, Korea, and perhaps Alaska.

19. SIUM L. MUKAGO-NINJIN ZOKU

Glabrous herbs of wet places, with thickened spongy roots; stems elongate, leafy; leaves usually simply pinnate, the leaflets dentate; umbels compound, the bracts and bractlets numerous, usually prominent, green; calyx-teeth acute; petals emarginate and incurved at apex, white; stylopodium thickened, depressed-conical, entire; fruit ovoid or oblong, flattened or laterally grooved on each side on the commissure, the carpels nearly 5-angled in cross section, the ribs thick, obtuse, equal, often corky, the vittae numerous, the carpophore obscure, or undivided; seeds nearly orbicular in cross section, the seed-face plane.—About 10 species, in the N. Hemisphere and Africa.

- 1A. Rays 5–10, rather stout; involucre bracts few, often deflexed; pedicels 10–15, rather stout, 3–6 mm. long; fruit ovoid-globose or ob-ovoid.
- 2A. Leaflets 7–11 (very rarely 5), the terminal distinctly petiolulate; axillary bulbils none; fruit obovoid. 1. *S. suave*
- 2B. Leaflets 3–5, the terminal sessile or short-petiolulate; axillary bulbils present; fruit ovoid-globose. 2. *S. sisarum*
- 1B. Rays 2–5, very slender; involucre bracts 1 or none; pedicels 2–7 (–10), very slender, 7–10 mm. long; leaflets 3–5, the terminal sessile or nearly so; fruit ovoid. 3. *S. serra*

1. *Sium suave* Walt. var. *nipponicum* (Maxim.) Hara. *S. nipponicum* Maxim.—SAWAZERI, NUMAZERI. Rhizomes short-creeping, with thick spongy white roots; stems 60–100 cm. long, branched above, glabrous; radical and lower cauline leaves long-petiolate, 20–40 cm. long, simply pinnate, the leaflets 7–9 (rarely 11), sessile except the terminal one, narrowly ovate, sometimes broadly lanceolate, 3–10 cm. long, 1–3 cm. wide, acuminate, rarely obtuse, acutely dentate, the upper cauline leaves with fewer and smaller, narrower, lanceolate leaflets; umbels glabrous, the rays 7–12, the bracts and bractlets broadly linear, deflexed, 2–6 mm. long, the pedicels 10–20, 3–7 mm. long; fruit obovoid, 2.5–3 mm. long, the calyx-teeth deltoid, minute, the styles short, slender.—July–Sept. Hokkaido, Honshu, Shikoku, Kyushu.

Var. *ovatum* (Yatabe) Hara. *S. ovatum* Yatabe—HIROHA-NUMAZERI. Leaflets ovate.

Var. *suave* *S. cicutae-folium* Schrank; *S. lineare* Michx.; *Apium cicutae-folium* (Schrank) Benth. & Hook. f. ex Forbes & Hemsl.—TŌNUMAZERI, HOSOGA-NUMAZERI. Leaflets 7–17, narrow, 5–15 cm. long, linear to lanceolate; calyx-teeth obsolete.—Hokkaido, Honshu.—Korea, China, Siberia to e. Europe and N. America.

2. *Sium sisarum* L. *S. ninsi* L.—MUKAGO-NINJIN. Rhizomes short, with thickened, whitish, spongy roots; stems 30–80 cm. long, flexuous and branched above; lower cauline leaves petiolate, 5- or sometimes 3-foliolate, the leaflets sessile

or nearly so, lanceolate to linear, rarely narrowly oblong, 2–5 cm. long, 5–10 mm. wide, obtuse to acute, with short-awned, acute teeth, scabrous on the margin, the upper leaves smaller and usually 3-foliolate, with small purplish bulbils in the axils; bracts and bractlets lanceolate, scarious-margined, 2–4 mm. long, the rays about 10, about 2 cm. long, the pedicels 10–20, 3–5 mm. long; fruit ovoid-globose, about 2 mm. long, the calyx-teeth minute, the stylopodium thick, the styles about 0.5 mm. long, nearly appressed to the fruit.—Aug.–Sept., fruiting Oct. Hokkaido, Honshu, Shikoku, Kyushu.—Korea and China.

3. *Sium serra* (Fr. & Sav.) Kitag. *Pimpinella serra* Fr. & Sav.—TANI-MITSUBA. Glabrous perennial with thickened, spongy, white, fusiform roots; stems erect, branched above, 60–80 cm. long; cauline leaves petiolate, ternately 3-foliolate or pinnately 5-foliolate, the leaflets sessile, subequal, ovate to broadly lanceolate, thinly membranous, long-acuminate, minutely serrulate, the upper leaves small, short-petiolate; umbels few, delicate, the involucre-bracts solitary, filiform or none, the rays 2–5, very slender, 1–2 cm. long, the involucre bractlets few, filiform, 1–2 mm. long, the pedicels 2–7 (rarely 10), 7–10 mm. long, very slender; fruit ovoid, about 2 mm. long, glabrous, the calyx-teeth minute, the styles about 0.5 mm. long, slender and spreading.—Aug. Hokkaido, Honshu (centr. and n. distr.).

20. APODICARPUM Makino EKISAIZERI ZOKU

Small, glabrous perennial, of wet places; leaves simply pinnate; umbels compound, the bracts and bractlets few, small; calyx-teeth lacking; petals white, ovate-orbicular, acute, slightly incurved at apex; styles very short; stylopodium small, flat; fruit ellipsoidal, compressed laterally, with a groove on each side of the commissure, the carpels connate, suborbicular in cross section, the ribs rather thick, obtuse, equal, the vittae solitary in the intervals, 2 in the commissure, the carpophore lacking; seeds 5-angled, suborbicular in cross section, slightly inflated on the ventral side.—A single species, in Japan.

1. *Apodicarpum ikenoi* Makino. *Apium ikenoi* (Makino) Drude—EKISAIZERI. Perennial, with short rhizomes; stems erect, sparsely branched, 5–20 cm. long; radical and lower cauline leaves petiolate, simply pinnate, ovate-oblong in outline, 4–7 cm. long, the leaflets sessile except the terminal one, equal, 7–9, narrowly to broadly ovate, 1–2 cm. long, 7–15 mm. wide, acute to subobtusely, irregularly dentate, the upper leaves 3- to 5-foliolate, smaller, sessile; umbels few, long-pedunculate, the lower ones opposite the leaves, the in-

volucre bracts few, linear-lanceolate, 3–8 mm. long, rather unequal, the involucre bractlets few, linear, 2–4 mm. long, spreading, the rays 3–5, unequal, glabrous, about 3 cm. long, the pedicels rather stout, unequal, 2–5 mm. long; fruit ellipsoidal or obovoid-ellipsoidal, 2.5–3 mm. long, the styles very slender, nearly erect.—May, fruiting through June. Wet muddy places along rivers in the lowlands; Honshu (Musashi and Owari Prov.); rare.

21. GLEHNIA F. Schmidt HAMA-BŌFŪ ZOKU

Pubescent perennials with thick, elongate rhizomes; leaves twice ternately pinnate with elliptic, dentate, often 3-lobed leaflets; umbels few, terminal and from the upper axils, densely pubescent, without an involucre, the bracts of the involucre few, linear; calyx-teeth evident, linear-deltoid, acute, 1-nerved; petals white, obovate, emarginate, with an incurved tip; styles elongate; stylopodium disc-shaped, prominent, convex; fruit ellipsoidal, densely pubescent, nearly orbicular in cross section, the carpels with thick, rather winglike prominent ribs, the lateral ribs slightly broader than the dorsal, the vittae numerous, the carpophore bifid, the pericarp corky; seeds semi-orbicular in cross section, with a plane face.—One species, in e. Asia and w. N. America.

1. *Glehnia littoralis* F. Schmidt. *Phellopterus littoralis* Benth. & Hook. f.—HAMA-BŌFŪ. Plant densely long white-pubescent; rhizomes often elongate, rather thick; stems short, usually simple, 5–30 cm. long, few-leaved; radical and lower cauline leaves long-petiolate, spreading, usually deltoid or ovate deltoid, 10–20 cm. long, once or twice pinnately ternate, the leaflets often 3-lobed, rather thick, elliptic, obovate-elliptic or ovate-orbicular, 2–5 cm. long, 1–3 cm. wide, obtuse to rounded at apex, often partly suffused with red, often glabrous except on the nerves, irregularly denticulate, often cal-

lose on the margin; umbels 1, sometimes to 3, densely long white-villous, the rays more than 10, 4–6 cm. long, spreading, crowded, the umbels densely 20- to 40-flowered, the bracts of the involucre linear, not exceeding the flowers; calyx-teeth 0.5–1 mm. long; styles 1.5–2 mm. long; fruit about 4 mm. long, villous.—June–July. Sandy beaches along the sea; Hokkaido, Honshu, Shikoku, Kyushu; common.—s. Kuriles, Sakhalin, Ussuri, Ochotsk Sea region, Manchuria, China, Korea, Ryukyus, Formosa, and the Pacific Coast of N. America.

22. *TILINGIA* Regel SHIRANE-NINJIN ZOKU

Glabrous perennials with thick rhizomes; stems rather slender, few-leaved, often scapose; leaves twice to several times ternately compound, toothed or dissected into linear segments; umbels simple or compound, the involucre bracts 1 to few, the bractlets of the involucre few small and linear; calyx-teeth deltoid, acute, small but evident; petals white, emarginate and incurved at apex; styles rather short, the stylopodium conical, entire; fruit oblong or ovoid-oblong, slightly compressed laterally, the carpels 5-angled, suborbicular in cross section, with slender filiform ribs, the vittae solitary in the intervals, 2-4 on the commissure; seeds compressed, with the flat side on the commissure.—Few species in e. Siberia, Manchuria, Korea, and Japan.

- 1A. Stems 50–80 cm. long, leafy; leaves twice or once ternate, the leaflets broadly ovate to broadly lanceolate, thin, 2–8 cm. long, acuminate; umbels nearly glabrous, few. 1. *T. holopetalata*
 1B. Stems 7–20 cm. long, few-leaved; leaves finely ternately dissected, the ultimate segments linear to broadly ovate, rather thick, 5–20 mm. long; rays minutely puberulent on the inner side. 2. *T. ajanensis*
 2A. Ultimate leaf-segments broadly ovate to narrowly oblong, few-toothed to -cleft; styles nearly as long as or slightly longer than the stylopodium. 3. *T. tachiroei*
 2B. Ultimate leaf-segments linear-filiform, entire; styles 2.5–3.5 times as long as the stylopodium. 3. *T. tachiroei*

1. *Tilingia holopetalata* (Maxim.) Kitag. *Carum holopetalum* Maxim.; *Ligusticum holopetalum* (Maxim.) Hiroe & Constance.—IBUKIZERI. Rhizomes ligneous, shortly branched; stems 50–80 cm. long, leafy, branched; radical and lower cauline leaves long-petiolate, 1- or 2-ternate, the leaflets thin, broadly ovate to broadly lanceolate, irregularly dentate and usually pinnately incised or lobed, 2–8 cm. long, acuminate, membranous, with microscopically raised marginal cells, the upper leaves smaller, sessile, ultimately reduced to bracts; umbels few, pedunculate, nearly glabrous, the involucre bracts 1 or 2, linear, the rays 8–10, 3–4 cm. long, the peduncle and rays at apex with winglike ridges, the pedicels 8–12 mm. long, the involucre bractlets few, linear, 4–8 mm. long; calyx-teeth evident; styles short, about as long as the stylopodium; fruit ovoid-oblong, 3.5–4 mm. long.—Aug., fruiting Sept.–Oct. Grassy places in mountains; Hokkaido, Honshu (centr. and n. distr.).

2. *Tilingia ajanensis* Regel. *Conioselinum kamtschaticum* var. *alpinum* Rupr.; *Selinum tilingia* (Regel) Maxim.; *Cnidium ajanense* (Regel) Drude; *Cnidium tilingia* (Regel) Takeda; *Ligusticum ajanense* (Regel) Koso-Pol.—SHIRANE-NINJIN. Small perennial, glabrous except for papillae on the umbels beneath and on the inner side of the rays; rhizomes short, rather thick; stems 7–20 cm. long, rarely to 35 cm. long, leafless, or 1- to 3-leaved; radical and lower cauline leaves petiolate, 2–4 times ternately compound, the ultimate segments broadly ovate to narrowly oblong, thick-membranous or herbaceous, usually with finely dissected linear to narrowly

oblong lobes, 5–20 mm. long, lustrous and deep green on upper side, glabrous, the upper leaves very small, often reduced to sheaths; umbels 1–3, the rays 5–10, 1.5–2.5 cm. long, the involucre bracts 1, 2 or few, the umbellets 20 to 30-flowered, the bractlets of the involucre few, linear, the pedicels 3–6 mm. long, nearly as long as the involucre; flowers white, sometimes purplish; calyx-teeth minute; styles nearly as long as or slightly longer than the stylopodium; fruit ovoid, 2.5–3 mm. long; vittae 4 on the commissure.—July–Aug., fruiting Sept.–Oct. Alpine slopes; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin, Kuriles, Kamchatka, Ochotsk, and e. Siberia.

3. *Tilingia tachiroei* (Fr. & Sav.) Kitag. *Seseli tachiroei* Fr. & Sav.; *Cnidium tachiroei* (Fr. & Sav.) Makino; *Ligusticum tachiroei* (Fr. & Sav.) Hiroe & Constance.—MIYAMAIKYO. Resembles No. 2; glabrous except for papillae on the umbels below and on the inner side of rays; rhizomes short, thick; stems 10–20 (–35) cm. long, 1- to 4-leaved; radical and lower cauline leaves 3–10 cm. long, long-petiolate, deltoid-ovate, several times finely dissected into linear-filiform entire segments, these 5–15 mm. long, 0.5–0.75 mm. wide, acute, entire, smooth, the upper leaves with fewer segments or reduced to sheaths; umbels 1–4; fruit ovoid-oblong, about 3 mm. long; styles slender, about 1.2 mm. long, 2.5–3.5 times as long as the stylopodium, the calyx-teeth evident; vittae 2 on the commissure.—Aug., fruiting Sept.–Oct. High mountains; Hokkaido, Honshu (centr. and n. distr.), Shikoku (Mount Tsurugi).—Korea.

23. *PTERYGOPLEURUM* Kitag. SHIMURA-NINJIN ZOKU

Glabrous perennial with short rhizomes and fleshy white roots; stems erect, fistulose, branched above, angular; leaves once or twice ternately compound, the ultimate segments linear, entire, with thickened margins; umbels compound, the bracts and bractlets few, entire, narrow; flowers white; calyx-teeth deltoid, acute; petals equal, with an incurved and shallowly bifid apex; styles short, becoming recurved, the stylopodium depressed-conical with undulate margin; fruit glabrous, slightly compressed laterally, oblong, the carpels semi-orbicular in cross section, with thick, acute ribs, the vittae solitary in the intervals, 2 on the commissure, the carophore bifid; seeds compressed and angular, with a flat face.—One species, in Japan.

1. *Pterygopleurum neurophyllum* (Maxim.) Kitag. *Edosmia neurophyllum* Maxim.; *Carum neurophyllum* (Maxim.) Fr. & Sav.; *Sium neurophyllum* (Maxim.) Hara.—SHIMURA-NINJIN. Stems angled, erect, loosely branched above, 80–120 cm. long; leaves rather firm, 2 or 3 times ternately compound, 10–20 cm. long, deltoid-orbicular in outline, the ultimate segments linear, 4–10 cm. long, 3–5 mm. wide, entire, acuminate, narrowed at base, scabrous on the margins, the upper leaves smaller and simpler, ternate, sessile, directly attached by a narrow sheath; umbels compound, the

peduncles and rays with winglike ridges at the apex, the rays 8–10, rather firm, smooth, 2.5–4 cm. long, the involucre bracts 7–12 mm. long, appressed to the outer rays, bracts of the involucre appressed to the pedicels, 2–5 mm. long, the pedicels 6–10 mm. long; fruit 3.5–4 mm. long, the styles about 0.5 mm. long, appressed to and nearly as long as the stylopodium.—Aug.–Sept. Wet places along rivers in lowlands and plateaus; Honshu (Musashi Prov.), Kyushu (Tano in Bungo); rare.—Korea.

24. *LIGUSTICUM* L. MARUBA-TÖKI ZOKU

Glabrous perennials; leaves ternately or pinnately compound; umbels compound, involucre bracts numerous, few, or absent, bractlets of the involucre numerous, usually entire; flowers white; calyx-teeth small or obsolete; petals with an incurved emarginate or bifid apex; stylopodium thick, sometimes conical, often undulate on the margin; fruit ovoid or oblong, nearly terete to dorsally compressed in cross section, the commissure broad, the carpels compressed dorsally with a flat commissural side, the ribs prominent, acute or winglike, the lateral ribs often broader than the dorsal, the vittae numerous, slender, sometimes obsolete, the carpophore bifid; seeds compressed dorsally, the seed-face flat or concave, free from the pericarp when mature. —About 50 species, in the N. Hemisphere.

- 1A. Leaves twice ternate; rays 15–20, 2–3.5 cm. long; fruit narrowly oblong, 8–11 mm. long. 1. *L. hultenii*
 1B. Leaves simply ternate; rays 5–8, 1–2 cm. long; fruit broadly ovate, about 2 mm. long. 2. *L. tsusimense*

1. *Ligusticum hultenii* Fern. *Angelica hultenii* (Fern.)

Hiroe; *L. scoticum* sensu auct. Japon., non L.—MARUBA-TÖKI.

Rhizomes thick; stems glabrous, erect, sparsely branched above, terete, striate; leaves twice ternate, broadly deltoid-orbicular in outline, 10–25 cm. long and as wide, the ultimate segments broadly rhombic-ovate, often 3-lobed, acute to obtuse, 3–5 cm. long and as wide, dentate, glabrous, the upper leaves small, sessile, the uppermost reduced to short sheaths; umbels few, glabrous, the peduncles with winged ridges minutely serrulate in the upper portion, the rays 15–20, 2–3.5 cm. long, the involucre bracts few, membranous, linear, 8–10 mm. long, the involucre bractlets few, linear, shorter than the pedicels, the pedicels 5–8 mm. long; fruit narrowly oblong, 8–11 mm. long, the carpels flat, semi-orbicular in cross section, the ribs subequal, prominent; calyx-teeth minute; styles short, ascending, about 0.5 mm. long, the stylopodium globose-conical.—July–Aug., fruiting Sept.–Oct. Near the seashore; Hokkaido, Honshu (n. distr.)—Korea, Ussuri, Sakhalin, Kuriles, Ochotsk, Kamchatka, and Alaska.

2. *Ligusticum tsusimense* Yabe. *Ostericum tsusimense*

(Yabe) Kitag.; *Pimpinella tsusimensis* (Yabe) Hiroe & Constance—TSUSHIMA-NODAKE, TSUSHIMA-TÖKI.

Rhizomes short, few; roots rather thick; stems erect, branched above, slender, faintly striate, 25–40 cm. long; radical and lower cauline leaves long-petiolate, deltoid or 5-angled, ternate; leaflets thickish, sometimes 2- or 3-lobed, whitish beneath, coarsely toothed, rhombic-ovate or the lateral obliquely ovate, 3–5 cm. long, 15–25 mm. wide, acute, cuneate at base, sometimes pilose above, scabrous on the margins, the veinlets slender to obsolete, the upper leaves reduced to oblanceolate sheaths; umbels long-pedunculate, few, the rays 5–8, 1–2 cm. long, subequal, minutely papillose on the inner side, the bractlets of the involucre few, linear-filiform, nearly as long as the pedicels, often incurved, the pedicels about 10, 2–5 mm. long; fruit broadly ovoid, about 2 mm. long, nearly round in cross section, the carpels with distinct, filiform, slender ribs.—Aug., fruiting in Oct.; Kyushu (Tsushima).

25. *COELOPLEURUM* Ledeb. EZO-NO-SHISHI-UDO ZOKU

Tall, stout perennials; leaves large, ternately compound, the leaflets dentate; umbels compound; flowers white; calyx-teeth obsolete; petals oblong, entire, incurved at apex; stylopodium flat, often undulate on the margin; fruit ovoid or ovoid-oblong, slightly compressed dorsally, with a broad commissure, the carpels flat, often becoming corky on back, the dorsal ribs thick, keel-like, the lateral winged, the vittae numerous, the carpophore bifid; seeds flattened dorsally, nearly plane on face.—Few species, in Siberia and W. N. America.

- 1A. Stems often more than 1 m. long; rays numerous, densely pubescent; pedicels 4–7 mm. long; fruit often pubescent while young. 1. *C. lucidum*
 1B. Stems usually 40–70 cm. long; rays 20–30, densely puberulent; pedicels 1–1.5 cm. long, slender, smooth; fruit glabrous. 2. *C. multisectum*

1. *Coelepleurum lucidum* (L.) Fern. var. *gmelinii*

(DC.) Hara. *Archangelica gmelinii* DC.; *Angelica gmelinii* (DC.) Wormsk. ex DC. in syn.; *C. gmelinii* (DC.) Ledeb.—

EZO-NO-SHISHI-UDO. Stout, 1–1.5 m. high, glabrous except short-pubescent on the upper part; leaves twice ternate, the ultimate segments ovate to rhombic-ovate, usually cuneate at base, often 3-lobed, mostly regularly dentate, pilose on the nerves, the upper leaves reduced to inflated sheaths; involucre bract solitary or absent, densely short yellowish brown pubescent on upper part, the rays numerous, densely pubescent, unequal, the involucre bractlets many, broadly linear, nearly as long as the pedicels, the pedicels 4–7 mm. long; calyx-teeth absent; fruit oblong, 6–8 mm. long, about as long as or longer than the pedicels, often pubescent when young, with nearly equal, thick, corky ribs, the lateral ribs slightly broader than the dorsal, the vittae solitary in the intervals, the ribs 2 on the commissure; seed drupe-like, with a slightly convex face.—Hokkaido.—Kuriles, Sakhalin, Ochotsk, and Kamchatka.

Var. *trichocarpum* (Hara) Hara. *Angelica trichocarpa* Hara; *C. trichocarpum* (Hara) Kitag.—EZO-YAMA-ZENKO.

Involucre of several bracts; leaflets smaller, 1.5–3.5 cm. long, irregularly acutely dentate.—Aug. Mountains; Hokkaido.

2. *Coelepleurum multisectum* (Maxim.) Kitag. *Angelica multisecta* Maxim.—MIYAMA-ZENKO.

Roots thick; stems erect, 40–70 cm. long, sparsely branched, stout, striate, glabrous, except pubescent below the umbels; leaves 3 to 5 times ternate, deltoid in outline, 10–15 cm. long, glabrous, the leaflets rather thin, oblong, ovate or rhombic-ovate, 1–3 cm. long, 7–20 mm. wide, acuminate, irregularly dentate, the upper leaves small, reduced to inflated sheaths; umbels few, long-pedunculate, the rays 20–30, spreading, densely puberulent, 4–6 cm. long, bractlets of the involucre as long as to shorter than the pedicels, the pedicels 20–40, smooth, slender, 1–1.5 cm. long; fruit oblong, glabrous, somewhat compressed dorsally, 4.5–5 mm. long, the ribs prominent, rather corky, thickened, the lateral ones slightly broader than the dorsal, the vittae solitary in the intervals, 2–4 on the commissure, the styles slender, about 1.5 mm. long, the stylopodium conical, the calyx-teeth obsolete, the carpophore bifid.—July–Aug., fruiting in Sept.—Alpine; Honshu (centr. distr.).

26. *DYSTAENIA* Kitag. SERI-MODOKI ZOKU

Stems rather stout; radical and cauline leaves petiolate, 2 or 3 times ternately pinnate, the ultimate segments toothed and incised, often 3-lobed; umbels compound, the involucre bracts lacking, the involucre of many, narrow bractlets; flowers white; calyx-teeth evident, acute; petals equal, deeply emarginate at the incurved apex; stylopodium depressed-conical, undulate on the margin, the styles slender; fruit broadly ellipsoidal, compressed dorsally, with a broad commissure, the dorsal ribs thin, winged, the lateral more broadly winged, the vittae irregular, weak, numerous between and beneath the ribs, seeds semi-orbicular, with a flat face, the carpophore bipartite.—Two species, in Japan and Korea.

1. *Dystaenia ibukiensis* (Yabe) Kitag. *Ligusticum ibukiense* Yabe; *Angelica ibukiensis* Makino ex Yabe.—SERI-MODOKI, TANI-SERI-MODOKI. Perennial herb, white-papillose beneath the stem-nodes and in the inflorescence; stems 30–70 cm. long, striate, branched above; leaves twice ternately pinnate, deltoid in outline, 10–25 cm. long, the ultimate segments narrowly rhombic-ovate to deltoid-ovate or orbicular, 2–4 cm.

long, 1–2 cm. wide, pinnately lobed or incised and dentate, acuminate, scabrous on the nerves and margins, the veinlets prominent; umbels few, the rays 10–20, 2–4 cm. long, the involucre of filiform-linear, scabrous bractlets slightly longer than the pedicels, the pedicels 5–10 mm. long; fruit 5–6 mm. long, the styles reflexed, 1.5–2 mm. long.—July–Aug., fruiting Sept.–Oct.; Honshu (centr. and n. distr.).

27. *CONIOSELINUM* Fisch. MIYAMA-SENKYŪ ZOKU

Perennials with fistulose stems; leaves twice ternately pinnate, the ultimate segments pinnatifid; umbels compound, the rays numerous, the involucre bracts few or absent, the bractlets of the involucre narrow; flowers white; calyx-teeth usually obsolete; petals obovate with an incurved and emarginate apex; stylopodium conical; fruit oblong, compressed dorsally, the carpels flat, the ribs membranous, winglike, the lateral much broader than the dorsal, the vittae 1 to few in the intervals, 4–8 on the commissure, the carpophore bifid; seed with a plane face.—Species few, in the N. Hemisphere.

- 1A. Primary leaflets acute to short-acuminate, firmly membranous; fruit oblong, the dorsal wings broad. 1. *C. kamtschaticum*
 1B. Primary leaflets long-acuminate, thinly membranous; fruit ellipsoidal with narrowly winged dorsal ribs. 2. *C. filicinum*

1. *Conioselinum kamtschaticum* Rupr. *C. gmelinii* sensu Hult., non Coult. & Rose.—KARAFUTO-NINJIN. Perennial, glabrous except the inflorescence; stems striate, simple or sparingly branched above; rhizomes short, thick, with thickened roots; radical and lower cauline leaves long-petiolate, triternate, deltoid in outline, 10–20 cm. long, the primary leaflets acute to short-acuminate, the ultimate segments narrowly to broadly ovate, pinnatifid, acute, incised-dentate, 15–35 mm. long, 1–2 cm. wide, scabrous on the margins, the veinlets distinct, the upper leaves small, reduced to basal sheaths; umbels few, the involucre bracts few, linear, spreading, shorter than the rays or lacking, the rays 10–20, 2–3 cm. long, papillose on the inner side and on the upper part of the peduncle, the involucre of a few, linear bractlets as long as or slightly shorter than the flowers, the pedicels 20–30, 6–8 mm. long; fruit oblong, about 4 mm. long, the dorsal wings broad, the styles slender, appressed to the stylopodium, about 1 mm. long; vittae 2 or 3 in the intervals, 6 on the commissure.—Aug., fruiting in Oct. Grassy places near the sea; Hokkaido.—Sakhalin, Kuriles, Kamchatka and e. Siberia to Alaska.

2. *Conioselinum filicinum* (H. Wolff) Hara. *C. univittatum* sensu auct. Japon., non Turcz.; *C. nipponicum* Hara; *Pucedanum filicinum* H. Wolff.—MIYAMA-SENKYŪ. Rhizomes stout; stems striate, glabrous except the inflorescence, sparsely branched above, 40–80 cm. long; radical and lower cauline leaves thinly membranous, long-petiolate, ternately tri-pinnate, deltoid in outline, 15–25 cm. long, the primary leaflets long-acuminate, the ultimate segments narrowly ovate or oblong, acute to acuminate, pinnatifid, 2–5 cm. long, 1–3 cm. wide, incised-dentate, scabrous on the margins, the veinlets slender; umbels few, the rays 15–25, 4–6 cm. long, papillose-puberulent on the inner side and on the upper part of the peduncle, the involucre bracts 2 or 3, linear, 1–2 cm. long or lacking, the bractlets of the involucre few, filiform-linear, as long as to slightly longer than the flowers, the pedicels 7–10 mm. long, the styles about 1 mm. long, slender, recurved; fruit elliptic, 4–5 mm. long, the dorsal wings narrow; vittae solitary in the intervals, 2 on the commissure.—Aug., fruiting in Oct. Alpine regions; Hokkaido, Honshu (centr. and n. distr.).—s. Kuriles.

28. *ANGELICA* L. SHISHI-UDO ZOKU

Usually stout perennial herbs with robust, leafy, fistulose or rarely solid stems; leaves ternately or pinnate-ternate compound, the ultimate segments often large, dentate; umbels compound, few to numerous, with numerous rays, the bracts and bractlets small or lacking; flowers white to dark purple; calyx-teeth minute or obsolete; petals obovate to oblanceolate, narrowed at base, usually with an incurved and emarginate apex; stylopodium flat, entire; fruit ovate, dorsally much compressed, with a broad commissure, the carpels lunate or planoconvex in cross section, the lateral ribs membranous, winged, the dorsal usually prominent but unwinged, the vittae 1–3 in the intervals, 2 to several on the commissure, the carpophore bifid; seeds compressed with a flat or slightly concave face.—More than 50 species, in temperate regions of the N. Hemisphere.

- 1A. Leaves simply pinnate; leaflets lanceolate with regular minute teeth, the lower often 2- or 3-lobed; sheaths of upper leaves somewhat inflated; carpels semiorbicular in cross section, with very narrowly winged lateral ribs. 1. *A. cartilaginomarginata*
 1B. Leaves usually ternately or pinnate-ternate compound; carpels strongly compressed dorsally, planoconvex in cross section, with prominently winged lateral ribs.
 2A. Small or medium-sized herbs; leaf-segments 0.5–7 cm., rarely to 10 cm. long.
 3A. Leaflets thick or thickish, not herbaceous.
 4A. Ultimate leaf-segments dissected into linear to lanceolate lobes 2–5 mm. wide; upper leaves reduced to much-inflated sheaths.

- 5A. Rays 10–15; ultimate leaf-segments 5–10 mm. long, ovate to rhombic-ovate, dissected into lanceolate lobes. . . . 2. *A. longeradiata*
 5B. Rays 20–40; ultimate leaf-segments 2–6 cm. long, dissected into linear to lanceolate, acuminate lobes. . . . 3. *A. ubatakensis*
 4B. Ultimate leaf-segments ovate or broadly so, dentate, rarely incised or lobed, if the ultimate lobes linear-lanceolate, then the sheaths of the upper leaves not or scarcely inflated.
 6A. Leaves smooth, the ultimate segments gradually narrowed toward apex; rays 20–40, rarely fewer.
 7A. Vittae numerous; involucre of few bractlets. . . . 4. *A. acutiloba*
 7B. Vittae solitary in the intervals, 2 on the commissure; involucre of 1 or 2 bractlets or lacking. . . . 5. *A. shikokiana*
 6B. Leaf margins smooth or microscopically roughened, the leaflets or ultimate leaf-segments abruptly acuminate, acute or obtuse; rays 5–30.
 8A. Rays 20–30; leaflets deeply 3-cleft and incised, the teeth coarse and few; stems puberulent. . . . 6. *A. saxicola*
 8B. Rays 10–20, rarely to 25; leaflets sometimes deeply cleft, the teeth numerous.
 9A. Leaflets and their lobes acute; terminal leaflets sessile, winged and decurrent at base; petals incurved but not emarginate.
 7. *A. decursiva*
 9B. Leaflets and their lobes abruptly acuminate; terminal leaflets usually petiolulate.
 10A. Flowers dark purple, rather large; stems and petioles glabrous. . . . 8. *A. gigas*
 10B. Flowers white, small; stems and petioles sparsely pubescent. . . . 9. *A. hakonensis*
 3B. Leaflets thin and herbaceous.
 11A. Sheaths of upper leaves not inflated; rays 10–15, very unequal; styles very short. . . . 10. *A. inaequalis*
 11B. Sheaths of upper leaves inflated; rays 20–60.
 12A. Ovary glabrous; leaflets ovate to narrowly so; rays 20–40; vittae 2 on the commissure. . . . 11. *A. polymorpha*
 12B. Ovary puberulent; leaflets broadly lanceolate to narrowly ovate; rays 40–60; vittae 4 on the commissure. . . . 12. *A. genuflexa*
 2B. Large, stout herbs with thick, erect stems; leaf-segments 5–15 cm. long, sometimes longer, often with a decurrent, winged base; upper leaves reduced to inflated sheaths.
 13A. Involucre of few linear to lanceolate bractlets.
 14A. Seashore plants with milky juice; leaflets thick, dark green and lustrous on upper surface.
 15A. Leaflets short-pubescent on nerves above, equally and minutely toothed; fruit elliptic; juice pale milky-white. . . . 14. *A. japonica*
 15B. Leaflets glabrous above, acutely and slightly irregularly toothed; fruit oblong; juice distinctly yellow. . . . 15. *A. reiskiei*
 14B. Inland plants with colorless juice; leaflets relatively thin and nearly dull above.
 16A. Ultimate segments of the leaves lanceolate to narrowly ovate-oblong, acuminate, narrowed at base, prominently confluent and decurrent; bractlets lanceolate, several-nerved; fruit elliptic. . . . 13. *A. dahurica*
 16B. Ultimate segments of the leaves ovate, elliptic or broadly rhombic-ovate, acute, usually rounded and not decurrent at base; bractlets linear; fruit oblong. . . . 16. *A. edulis*
 13B. Involucre lacking or sometimes of 1 or 2 bractlets.
 17A. Leaflets usually glabrous, usually somewhat whitish beneath.
 18A. Rays of umbels up to 30 cm. long; ultimate segments of the leaves usually prominently decurrent and confluent. . . . 17. *A. ursina*
 18B. Rays of umbels up to 12 cm. long; ultimate segments of the leaves usually distinct or only the terminal confluent or decurrent. . . . 18. *A. anomala*
 17B. Leaflets pubescent, paler beneath; rays of umbels 3–16 cm. long. . . . 19. *A. pubescens*

1. *Angelica cartilaginomarginata* (Makino) Nakai. *Peucedanum cartilaginomarginatum* Makino ex Yabe; *P. makinoi* Nakai; *A. cartilaginomarginata* var. *matsumurae* (H. Boiss.) Kitag.; *Sium matsumurae* H. Boiss.; *A. confusa* Nakai; *A. crucifolia* Komar.—HIME-NODAKE. Rhizomes short, with a few thickened roots; stems erect, branched above, rather slender, glabrous, 50–80 cm. long; radical and lower cauline leaves petiolate, simply pinnate, 10–25 cm. long, the leaflets or segments 5–9, sometimes 3, lanceolate, the lower 2- or 3-lobed, sessile or short-petiolulate, often 3- to 5-fid near the base, the upper ones decurrent to the base, the terminal lobes often 3-fid, rather firm, 4–8 cm. long, 7–20 mm. wide, acute, with minute marginal teeth, often loosely papillate-pilose on the nerves on upper side, paler and prominently veined beneath, slightly cartilaginous on the margin, the upper leaves reduced to slender much-inflated sheaths; umbels few, on long slightly papillate peduncles, the rays 8–12, unequal, 2–5 cm. long, white-papillate on the inner side, the pedicels 3–7 mm. long; fruit broadly ovate-elliptic, suborbicular in cross section, glabrous, about 2 mm. long, with very narrowly winged lateral ribs, the calyx-teeth obsolete, the stylopodium short and small.—Aug.–Oct., fruiting Sept.–Oct.; Honshu (Chūgoku Distr.), Shikoku, Kyushu.—Korea and Manchuria.

2. *Angelica longeradiata* (Maxim.) Kitag. *Selinum longeradiatum* Maxim.; *Cnidium longeradiatum* (Maxim.) Yabe; *C. yakushimensis* Masam. & Ohwi; *A. longeradiata* var. *yakushimensis* (Masam. & Ohwi) Kitag.—TSUKUSHI-ZERI. Rhizomes thick; stems often scapiform or to 4-leaved, 5–25 cm.

long, slightly puberulent in upper part; radical and lower cauline leaves with petioles 2–8 cm. long, the blades ternately to pinnately decomposed, deltoid-ovate, obtuse, glabrous, the leaflets rhombic-ovate to ovate, 5–10 mm. long, 3–8 mm. wide, deeply 2- to 5-lobed or -parted, the ultimate segments lanceolate, acute, entire, often papillose on the nerves on upper side, the upper leaves reduced, their sheaths elliptic, inflated; umbels 1–5, long-pedunculate, the rays 10–15, rather unequal, 2–5 cm. long, papillate-puberulent on the inner side and on the upper part of the peduncle and the inner side of the pedicels, the umbels 20–30, the pedicels 2–5 mm. long, as long as or slightly shorter than the involucre, bractlets of the involucre few, linear; fruit compressed, elliptic, 2.5–3 mm. long, the dorsal ribs slender, short, rather prominent toward base, the lateral ribs rather thick, winged, the styles slender, nearly as long as the stylopodium.—Aug.–Sept., fruiting Oct.; Honshu (Mount Hiruzen in Mimasaka), Kyushu.

3. *Angelica ubatakensis* (Makino) Kitag. *Peucedanum ubatakense* Makino.—UBATAKE-NINJIN. Rhizomes thick, with thick elongate roots; stems to 40 cm. long, often scapiform or to 4-leaved, short-pubescent especially in upper part; radical and lower cauline leaves petiolate, deltoid-orbicular, 5–25 cm. long, ternately to pinnately decomposed, the leaflets and ultimate segments dissected into linear and lanceolate lobes, 2–6 cm. long, acuminate, scabrous on the nerves on upper side, the upper leaves reduced, their sheaths elliptic, inflated; umbels few, long-pedunculate, the rays rather unequal, 20–40, papillose-puberulent on the inner side, 3–6 cm. long,

the involucre bractlets few, longer or shorter than the pedicels, linear, the calyx-teeth minute; fruit glabrous, elliptic, about 3 mm. long, the lateral ribs winged, the vittae solitary in the intervals, 2 on the commissure.—Aug. Mountains; Shikoku, Kyushu; rare.

4. *Angelica acutiloba* (Sieb. & Zucc.) Kitag. *Ligusticum acutilobum* Sieb. & Zucc.; *Sium triternatum* Miq.; *A. ibukicola* Makino; *L. ibukicola* Makino—Tōki. Rhizomes short and thick, with few thick roots; stems glabrous, striate, 30–70 cm. long, solid; radical and lower cauline leaves long-petiolate, once or twice ternately pinnate, deltoid in outline, 10–25 cm. long, glabrous, the leaflets 5–10 cm. long, rather thin, 3-cleft, cuneate, truncate, or rounded at base, the ultimate segments lanceolate, often shallowly 3-lobed, 10–25 mm. wide, long-acuminate, doubly or simply and acutely dentate, the reticulate veinlets fine but prominent; umbels few, papillate, the rays 30–40, 3–8 cm. long, papillate, the involucre of a few, filiform-linear bractlets, the pedicels slender, 7–18 mm. long; fruit oblong, 4–5 mm. long, slightly compressed, narrowed toward base, the carpels with slender ribs, the lateral ribs slightly winged, the vittae 3 or 4 in the intervals, 4 on the commissure.—Aug., fruiting Sept.–Oct. Mountains; Honshu (Kantō distr.); cultivated for medical purposes.

Var. *iwatensis* (Kitag.) Hikino. *A. iwatensis* Kitag.; *Ligusticum japonicum* Maxim.—MIYAMA-TŌKI, NAMBU-TŌKI, IWATE-TŌKI. Ultimate segments of the leaves narrowly ovate, usually rounded to shallowly cordate, rarely broadly cuneate at base, 1–2.5 cm. wide; carpels 4–6 mm. long, 2–2.5 mm. wide, the vittae 3–6 in the intervals, 8–10 on the commissure.—Honshu; sometimes cultivated for medicinal purposes.

Var. *lanceolata* (Tatew.) Ohwi. *Ligusticum linearilobum* var. *lanceolatum* Tatew.; *A. acutiloba* var. *lineariloba* (Koidz.) Hikino; *L. linearilobum* Koidz.; *A. stenoloba* Kitag.—HOSOGAWA-TŌKI. Leaves more deeply cut, the leaflets broadly linear, 3–8 mm. wide.—High mountains; Hokkaido (Mount Yubari and Apoi); rare.

5. *Angelica shikokiana* Makino. INU-TŌKI. Rhizomes thick; stems 50–80 cm. long, glabrous, striate; radical and lower cauline leaves long-petiolate, once or twice ternately compound, deltoid or ovate-deltoid, 20–30 cm. long, glabrous, the terminal leaflets often deeply 3-cleft, the ultimate segments broadly lanceolate to narrowly ovate, long-acuminate, usually rounded at base, 4–8 cm. long, 1.5–3 cm. wide, usually shallowly dentate, rather thin, the reticulate veinlets prominent, the upper leaves reduced, and the sheaths rather prominently inflated, narrowly oblong to broadly oblanceolate; umbels few, minutely papillate-puberulent on the inner side of the rays and pedicels, the rays 15–30, 3–6 cm. long, the bractlets of the involucre 1 or 2 or lacking, the pedicels 5–10 mm. long; fruit narrowly oblong, about 5 mm. long, the carpels strongly compressed, emarginate at base, the lateral ribs broad, the dorsal ones slender, the styles short but slender; vittae solitary in the intervals, 2 on the commissures.—Aug. Mountains; Shikoku, Kyushu.

Var. *tenuisecta* Makino. *A. tenuisecta* (Makino) Makino—KAWAZENKO. Leaves finely dissected, the leaflets 3–5 cm. long, 8–15 mm. wide, paler beneath.—Mountains of Honshu (Kii Prov.).

6. *Angelica saxicola* Makino ex Yabe. *Peucedanum saxicola* Makino ex Makino & Nemoto—ISHIZUCHI-BŌFŪ. Rhizomes short, with thickened elongate roots; stems 20–80 cm. long, cylindrical, striate, puberulent; radical and lower cauline leaves long-petiolate, once or twice ternately com-

pound, 5–25 cm. long, the leaflets deltoid to deltoid-orbicular, 2–5 cm. long, 1–2 cm. wide, deeply 3-cleft and incised, rhombic-ovate to narrowly ovate, acuminate, with a few coarse acute teeth, scabrous only on the nerves on upper side, glaucous beneath, the upper leaves reduced, their sheaths obovately inflated; umbels few, densely short-pubescent, the rays 20–30, 3–6 cm. long, the umbellets 25- to 40-flowered, the involucre of a few, linear bractlets often longer than the flowers, the pedicels 5–10 mm. long; calyx-teeth minute but evident, deltoid; ovary glabrous, the styles slender, recurved, 2 or 3 times as long as the stylopodium; fruit oblong.—July–Aug. High mountains; Shikoku (Mount Ishizuchi in Iyo); rare.

7. *Angelica decursiva* (Miq.) Fr. & Sav. *Porphyrascia decursiva* Miq.; *Peucedanum porphyroscia* (Miq.) Makino; *Peucedanum decursivum* (Miq.) Maxim.; *Panax fallax* Miq.—NODAKE. Usually purplish and nearly glabrous perennial herb; rhizomes short, with thickened roots; stems 80–150 cm. long, cylindrical, prominently striate, with white pith; radical and lower cauline leaves large, long-petiolate, ternately pinnate, broadly deltoid-ovate, usually pubescent on the nodes and the upper part of the petioles, the leaflets 3(–5), usually deeply 3- to 5-cleft to -parted, the segments rather firm, usually decurrent on a winglike sessile base, narrowly ovate to oblong, 5–10 cm. long, 2–4 cm. wide, acute, cuneate to rounded at base, rather regularly and acutely serrate, sometimes pinnately incised, scabrous on the nerves on upper side and on the margin; upper leaves much reduced, with an obovate much-inflated sheath; umbels pedunculate, the peduncles and upper side of the rays papillate-puberulent, the rays 10–20, 3–6 cm. long, the umbellets 20- to 30-flowered, the involucre with few linear bractlets, the pedicels often nearly glabrous, 5–10 mm. long; flowers dark purplish; fruit broadly elliptic, about 5 mm. long, flat, glabrous, the carpels ribbed, the lateral ribs rather thick, winged, the vittae 1–4 in the intervals, 4–6 on the commissure.—Sept.–Oct., fruiting Oct.–Nov. Grassy places in woods in lowlands and hills; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common.—Korea to E Siberia and China.—Forma *angustiloba* (Makino) Ohwi. *Peucedanum decursivum* var. *angustilobum* Makino—HOSOGAWA-NODAKE. Leaflets narrow.—Forma *albiflora* (Maxim.) Nakai. *Peucedanum decursivum* var. *albiflorum* Maxim.—SHIROBANA-NODAKE. Flowers white.

8. *Angelica gigas* Nakai. ONI-NODAKE. Resembles the preceding species; rhizomes thickened; stems sometimes fistulose, 1–2 m. long, glabrous; radical and lower cauline leaves long-petiolate, once (sometimes twice) ternate, the leaflets 3-parted, sometimes again 2- or 3-cleft, the segments oblong or ovate, 6–12 cm. long, rounded to obtuse at base, abruptly acuminate, doubly and acutely serrate, the terminal segment rhombic-ovate, cuneate at base, the upper leaves modified to elliptic, much-inflated purplish sheaths; umbels papillate-pubescent with crowded purplish brown hairs, the involucral bract solitary or lacking, the rays 15–20, the umbellets rather densely 25- to 40-flowered, the involucre of few linear-lanceolate bractlets; flowers rather large, dark purple; ovary minutely punctate; fruit about 8 mm. long, 5 mm. wide, the vittae solitary in the intervals.—Aug. Mountains; Shikoku, Kyushu.—Korea and Manchuria.

9. *Angelica hakonenis* Maxim. IWA-NINJIN. Rhizomes short and thick, with thick elongate roots; stems 60–120 cm. long, rather stout, branched above, terete, sparsely whitish pubescent beneath the umbels; radical and lower cauline leaves petiolate, 15–30 cm. long, deltoid-ovate in out-

line, twice or thrice ternately pinnate, the leaflets narrowly ovate to broadly rhombic-ovate, acuminate, cuneately narrowed toward base, often 2- or 3-cleft, 3-6 cm. long, deeply and acutely serrate, scabrous on the nerves on both surfaces and on the margin, the upper leaves modified to elliptic inflated sheaths; umbels few, the rays 10-25, 3-5 cm. long, rather stout, with short, dense, sordid yellow hairs, the bractlets of the involucre few to several, linear, longer than the pedicels, the pedicels 20-30, rather stout, 2-8 mm. long, puberulent on the inner side; flowers small, white; fruit about 6 mm. long, elliptic, glabrous, the carpels prominently ribbed, the lateral ribs winged, the vittae solitary in the intervals, 4 on the commissure, the styles short, about as long as the stylopodium.—Aug.-Sept. Mountains; Honshu (Kantō Distr. and Suruga Prov.).

Var. *nikoensis* (Yabe) Hara. *A. nikoensis* Yabe—NoDAKE-MODOKI. Leaves once to twice compound, the leaflets larger, 5-10 cm. long, 3-4 cm. wide.—Honshu (Kantō Distr.).

10. *Angelica inaequalis* Maxim. HANABIZERI. Glabrous herb with short rhizomes and few, rather thick roots; stems fistulose, cylindric, stout or slender, sparsely branched above, 60-80 cm. long; radical and lower cauline leaves long-petiolate, twice or thrice ternately compound, herbaceous, the leaflets often again 2- or 3-cleft to -parted, the ultimate segments thin, narrowly ovate, rhombic-ovate or broadly ovate, 3-7 cm. long, 2-3.5 cm. wide, acuminate, cuneate to rounded at base, irregularly dentate, incised and often pinnately lobed, paler beneath, minutely papillate on the nerves on upper side and on margin; sheaths of the upper leaves narrow, green, with a much-reduced blade; umbels few, the long peduncles, inner side of the rays, and pedicels minutely papillate at apex, the rays 10-15, very unequal, 1-8 cm. long, the involucre with a few, linear-filiform bractlets as long as the pedicels, the pedicels 20-30, unequal, 3-12 mm. long; fruit oblong, glabrous, emarginate at base, the dorsal ribs filiform, the lateral ones broadly winged, the vittae 3 or 4 in the intervals, 6 on the commissure, the calyx-teeth lax, sometimes evident, the styles very short, shorter than the stylopodium.—Aug.-Sept., fruiting Oct. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

11. *Angelica polymorpha* Maxim. SHIRANE-SENKYŪ, SUZUKA-ZERI. Rhizomes short, with few, thickened roots; stems erect, glabrous, branched above, 80-150 cm. long; radical and lower cauline leaves long-petiolate, 3 or 4 times ternately pinnate, deltoid or deltoid-ovate in outline, 20-30 cm. long, herbaceous, glabrous or nearly so, the leaflets ovate to narrowly so, 3-6 cm. long, acuminate to acute, often again 3-cleft, pinnately incised or toothed, the sheaths of the much-reduced upper leaves oblong to broadly lanceolate; umbels few to rather numerous, papillate on the upper portion of the peduncles and the inner side of the rays and pedicels, the rays 20-40, rather unequal, 4-6 cm. long, the umbellets 20 to 40-flowered, the pedicels 5-12(-15) mm. long, the involucre with a few linear bractlets nearly as long as the pedicels; ovary glabrous; fruit elliptic, emarginate at both ends, flat, glabrous, 4-5 mm. long, the carpels ribbed, the lateral ribs rather broadly winged, the styles 1-1.5 mm. long, the vittae solitary in the intervals, 2 on the commissure.—Sept.-Oct., fruiting Oct.-Nov. Mountains; Honshu, Shikoku, Kyushu.—Korea and Manchuria.

12. *Angelica genuflexa* Nutt. *A. refracta* F. Schmidt; *A. yabeana* Makino; *A. refracta* var. *yabeana* (Makino) Koidz.;

A. caudata H. Boiss.—ŌBA-SENKYŪ, EZO-ŌBA-SENKYŪ. Rhizomes thick; stems fistulose, rather soft, glabrous, branched above, 80-150 cm. long; radical and lower cauline leaves petiolate, once or twice ternately pinnate, rather large, the petioles of the primary leaflets divaricate, often reflexed, the leaflets herbaceous, broadly lanceolate to narrowly ovate, 3-10 cm. long, 1-2.5(-3) cm. wide, long-acuminate, narrowed toward base, irregularly and acutely dentate, papillate on the nerves on both surfaces and on the margin; umbels rather numerous, the peduncles densely papillate-puberulent at summit and on the inner side of the rays and pedicels, the rays 40-60, the involucre with a few, linear-filiform bractlets shorter than to as long as the pedicels, the pedicels 30-50, slender, 10-18 mm. long, the ovary puberulent; fruit broadly lanceolate, emarginate at both ends, 4-5 mm. long, glabrous, the lateral ribs broadly winged, the vittae solitary in the intervals, 4 on the commissure, the styles slender, 1.5-2 mm. long.—July-Sept., fruiting Aug.-Oct. Along mountain streams and ravines; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin, Kuriles, Kamchatka, and w. N. America.

13. *Angelica dahurica* (Fisch.) Benth. & Hook. f. *Calisace dahurica* Fisch.—ŌSHISHI-UDO. Gigantic perennial herb; stems erect, branched above, 1-2 m. long, very stout, glabrous, puberulent on upper part; radical and lower cauline leaves petiolate, large, twice or thrice ternately pinnate, the terminal leaflets decurrent at base, deeply 3-cleft to -parted, the ultimate segments rather thick, narrowly lanceolate-oblong, 5-10 cm. long, 2-5 cm. wide, acuminate, coarsely serrate, deep green and often scabrous on margins and on the nerves on upper side, whitish and puberulent especially on the nerves beneath, sheaths of the much-reduced upper leaves ovate or oblong, inflated; umbels few, the peduncles, rays, and pedicels rather densely papillate-puberulent, the rays 20-40, 4-6 cm. long, the involucre bractlets few, broadly lanceolate, caudately acuminate, as long as the pedicels, the pedicels 4-10 mm. long; fruit elliptic, glabrous, flat, slightly emarginate at base, 8-9 mm. long, the dorsal ribs slender, filiform, the lateral ribs winged, the vittae 1(-2) in the intervals, 2-4 in the commissure.—July-Aug. Mountains; Honshu.—Korea, Manchuria, and e. Siberia.

14. *Angelica japonica* A. Gray. *A. kiusiana* Maxim.—HAMA-UDO, ONI-UDO. Gigantic perennial herb; stems stout, thick, 50-100 cm. long, often dark purplish, puberulent in upper part; radical and lower cauline leaves petiolate, large, broadly ovate-deltoid, once or twice (rarely thrice) ternately pinnate, glabrous, the ultimate leaflets rather thick, oblong to ovate-elliptic, 7-10 cm. long, 2-4 cm. wide, acute, smooth margined, obliquely rounded at base, lustrous, paler and with finely reticulate veinlets beneath, equally and finely toothed, the terminal leaflets often again 3-fid, decurrent toward base, sheaths of the much-reduced upper leaves elliptic, inflated; umbels rather numerous, puberulent, the rays 30-40, puberulent on the inner side, 4-7 cm. long; bractlets of the involucre several, broadly lanceolate, caudately acuminate, shorter to slightly longer than the pedicels, the pedicels 20-40, 5-12 mm. long; fruit elliptic, flat, glabrous, 6-7 mm. long, the dorsal ribs filiform, the lateral ones rather thick, winged, the vittae solitary in the intervals, 4 on the commissure.—Apr.-June. Near seashores; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyu.

15. *Angelica keiskei* (Miq.) Koidz. *Archangelica keiskei* Miq.; *Angelica utilis* Makino ex Yabe.—ASHITABA. Rhizomes thick and short, with few elongate roots; stems stout,

branched above, 80–120 cm. long, glabrous; radical and lower cauline leaves long-petiolate, usually evergreen, twice or thrice ternately pinnate, obtusely deltoid in outline, 20–60 cm. long, glabrous, the leaflets rather thick, usually deeply 2- or 3-cleft to -parted, usually rounded at base, deep green and lustrous, the segments usually ovate, 5–10 cm. long, 3–6 cm. wide, acute, toothed, with impressed veinlets on upper side, the sheaths on the upper part elliptic, inflated; umbels rather numerous, the peduncles in upper part, the inner side of the rays and pedicels puberulent, the rays 10–20, the pedicels 20–40; bractlets of the involucre several, linear or broadly so, slightly broadened at base, caudately elongate, slightly longer or shorter than the pedicels; fruit oblong, glabrous, 6–8 mm. long, flat, the dorsal ribs short and rather thick, the lateral ones winged, the vittae solitary in the intervals, 4 on the commissure, the styles short, as long as the stylopodium.—May–Oct. Near seashores; Honshu (Kantō Distr. and Izu Prov.).

16. *Angelica edulis* Miyabe ex Yabe. AMA-NYŪ, MARUBA-AMA-NYŪ. Gigantic perennial herb; stems 1–3 m. long, purplish, glabrous; leaves once or twice ternately compound, glabrous except on the nodes, the leaflets herbaceous, cordate at base, slightly lustrous, paler beneath, 10–20 cm. long and as wide, again 2- or 3-cleft, the segments ovate to broadly rhombic-ovate, 3–10 cm. wide, abruptly acuminate to acute, irregularly dentate, often again 2- or 3-lobed, the terminal leaflets broadly ovate to deltoid-orbicular, 3-lobed to -parted, abruptly acuminate, the sheaths of the upper much-reduced leaves narrowly obovate to oblong; umbels often rather numerous, the peduncles in upper part, the inner side of the rays, and pedicels papillate-puberulent, the rays 30–50, unequal, 3–12 cm. long, the involucre with linear bractlets shorter than the pedicels, the pedicels 30–60, slender, 5–15 mm. long, spreading; fruit oblong, emarginate at base, glabrous, the dorsal ribs filiform, the lateral ones winged, the vittae solitary in the intervals, 2 on the commissure, the styles slender, as long as the stylopodium.—Aug. Mountain woods; Hokkaido, Honshu (centr. and n. distr.).—? Sakhalin.

17. *Angelica ursina* (Rupr.) Maxim. *Angelophyllum ursinum* Rupr.; *Angelica japonica* A. Gray, pro parte—Ezo-NYŪ. Gigantic perennial herb; stems 1–3 m. long, very stout, glabrous, slightly pubescent beneath the umbels; leaves large, twice or thrice ternately pinnate, the leaflets large, again pinnatifid to pinnately parted, the ultimate segments narrowly ovate-oblong, acuminate, often decurrent at base, irregularly dentate, glabrous or sparsely pubescent on the nerves and paler beneath, the terminal leaflets obovate-rhombic, cleft, acuminate, the upper leaves much reduced, with an ovoid, much-inflated sheath; umbels rather numerous, large, the involucre bract solitary or lacking, the rays 60–100 or more, 3–30 cm. long, papillate-puberulent on the inner side as in the pedicels, the umbellets 30- to 40-flowered, the pedicels 1–3 cm. long, the involucre obsolete; fruit broadly elliptic, about 7 mm. long, the carpels with filiform dorsal ribs and winged lateral ribs, the

vittae 1(–2) in the intervals, 4 on the commissure.—Hokkaido, Honshu (n. distr.).—Sakhalin, Kuriles, and Kamchatka to e. Siberia.

18. *Angelica anomala* Lallemand. *Peucedanum angelicaefolium* Turcz.; *A. montana* var. *angustifolia* Ledeb.; *A. sachalinensis* Maxim.; *Angelophyllum dauricum* Rupr.; *Angelica refracta* var. *glaucaephylla* Koidz.; *A. pubescens* var. *glabra* Yabe; *A. glabra* (Yabe) Makino—Ezo-no-YOROIGUSA, Ezo-no-YOROIGUSA.

Gigantic perennial herb, glabrous except the inflorescence; stems 1–2 m. long, fistulose, often purplish, branched above; leaves twice or thrice ternately pinnate, large, deltoid in outline, the leaflets rather thick, often again 2- or 3-fid to -parted, whitish beneath, the ultimate segments narrowly oblong to narrowly ovate, acuminate, often decurrent toward base, deep green, scabrous on the nerves on upper side, glabrous or sparingly pubescent on the under side, acutely dentate, smooth and somewhat callose on the margin, the upper leaves much reduced, their sheaths obovate and inflated, often puberulent; umbels rather numerous, rather densely puberulent on the upper portion of the peduncles, rays, and pedicels, the rays 30–70, 3–12 cm. long, the involucre lacking, the pedicels 40–60, 5–15 mm. long, slender; fruit obovate-elliptic, 6–7 mm. long, emarginate at base, the carpels with low dorsal ribs and rather narrowly winged lateral ribs, the vittae solitary in the intervals, 4 on the commissure, the styles slender, about 1 mm. long.—Aug. Hokkaido, Honshu (centr. and n. distr.).—e. Siberia, Korea, Manchuria, n. China, and Sakhalin.

19. *Angelica pubescens* Maxim. *A. polyclada* Franch.; *A. myriostachys* Koidz.; *A. schischiuodo* Koidz.—SHISHI-UDO, UDO-TARASHI, TAKAO-KYŌKATSU. Stems stout, green, terete, 1–2 m. long, sparingly pubescent; leaves large, about thrice ternately pinnate, the leaflets ovate to elliptic, 5–10 cm. long, sometimes oblong, abruptly acuminate, often decurrent at base, acutely dentate, pale green beneath, the upper leaves much reduced, with obovate, inflated sheaths; umbels rather numerous, the bracts and bractlets lacking, the rays numerous, 3–16 cm. long, puberulent, the pedicels 25–40, slender; 1–1.5 cm. long, puberulent; fruit oblong, 7–8 mm. long, emarginate at both ends, the dorsal ribs slender and filiform, the lateral ones broadly winged, the vittae 1–3 in the intervals, 2–6 on the commissure, the styles short, shorter than the stylopodium.—Aug. Hills and low mountains; Honshu, Shikoku, Kyushu; rather variable.

Var. *matsumurae* (Yabe) Ohwi. *A. matsumurae* Yabe—MIYAMA-SHISHI-UDO. Larger, glabrescent mountain phase with the ultimate leaf-segments broadly lanceolate to ovate-oblong, acuminate to long-acuminate, rather regularly dentate.—Higher mountains of Honshu.—Forma *muratae* Ohwi. *A. pubescens* forma *glabra* (Koidz.) Murata, non Yabe; *A. matsumurae* var. *glabra* Koidz.—KENASHI-MIYAMA-SHISHI-UDO. Glabrous phase.

29. OSTERICUM Hoffm. YAMAZERI ZOKU

Perennials with glabrous, striate or sulcate stems; leaves ternately compound, the segments toothed; umbels compound, the involucre of few bracts, the involucre of several bractlets, the flowers white, the calyx-teeth 5, persistent, the petals obovate, incurved and emarginate at apex, the styles slender, the stylopodium depressed-conical; fruit elliptic, flattened dorsally, the carpels flat, the dorsal ribs filiform, the lateral ones extended into a thin broad wing, the pericarp thin, consisting of one layer of convex cells, free from the seed at least on the marginal side, the vittae 1–3 in the intervals, 2–8 on the commissure, the carpophore 2-fid, the seed often stonelike, flat.—About 10 species, e. Asia to e. Europe.

- 1A. Stems 50–80 cm. long, leafy, rather stout and branched above; leaves rather large, 10–30 cm. long; leaflets thin and herbaceous, ovate, coarsely dentate, 3–6 cm. long; rays 4–7. 1. *O. sieboldii*
 1B. Stems 15–30 cm. long, slender; leaves smaller; leaflets 1–3 cm. long, rather thick, dissected into broadly linear segments 2–3 mm. wide; rays 7–15. 2. *O. florentii*

1. **Ostericum sieboldii** (Miq.) Nakai. *Peucedanum sieboldii* Miq.; *Angelica miqelianiana* Maxim.; *O. miqelianum* (Maxim.) Kitag.—YAMAZERI. Glabrous perennial herb with short thick rhizomes and few thickened roots; stems erect, branched, rather stout, 50–80 cm. long, leafy; leaves long-petiolate, deltoid in outline, 10–30 (–40) cm. long, 2 or 3 times ternately pinnate, the leaflets thin, sessile or short-petiolulate, ovate to broadly so, 3–6 cm. long, glabrous or nearly so except on the margin, coarsely dentate, acute to acuminate, cuneate to rounded at base, rarely 2- or 3-fid, the upper leaves reduced, their sheaths broadly oblanceolate to narrowly oblong; umbels several, the peduncles beneath the umbels and on the inner side of the rays and pedicels very slightly papillate-puberulent, the rays 4–7, 1.5–3 cm. long, the involucre bracts few, lanceolate or lacking, the bractlets of the involucre several, narrowly lanceolate, thinly membranous on the margin, as long as the pedicels, the pedicels 15–20, slender, 5–10 (–12) mm. long; fruit elliptic, glabrous, emarginate at both ends, 3.5–4 mm. long, the dorsal ribs slender, the lateral ribs extended into a broad wing, the calyx-teeth small, erect, the stylopodium minute, as broad as the style.—July–Oct. Mountain woods; Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and n. China.

2. **Ostericum florentii** (Fr. & Sav.) Kitag. *Angelica florentii* Fr. & Sav.—MIYAMA-NINJIN. Glabrous perennial with short slightly thickened rhizomes and slender stalks; stems erect, 15–30 cm. long, slender, few-leaved; radical and lower cauline leaves petiolate, deltoid- to broadly ovate in outline, 2 or 3 times pinnate or ternately pinnate, the leaflets rather thick, ovate to broadly so, 1–3 cm. long, dissected into broadly linear segments, 2–3 mm. wide, entire or sometimes 3-fid, acute, scaberrulous on the margin, the upper leaves reduced, with an oblong or narrowly oblong inflated sheath; umbels, inner side of rays, and pedicels slightly papillate-puberulent, the rays 7–15, ascending, 1.5–3 cm. long, the involucre bracts 1–4, membranous, dilated at base, shorter than the rays, linear, the bractlets of the involucre about 10, linear-filiform, shorter to slightly longer than the flowers, the pedicels 20–30, 5–10 mm. long; fruit broadly ovate-elliptic, flat, glabrous, 5–6 mm. long, emarginate at base, the dorsal ribs slender and rather prominent, the lateral ones extended into a broad wing, the calyx-teeth minute, the styles slightly longer than the stylopodium.—Aug.–Sept. Mountains; Honshu (Kantō and centr. distr.).

30. PEUCEDANUM L. KAWARA-BŌFŪ ZOKU

Perennials, frequently pilose; leaves ternately or pinnately compound, the ultimate segments often dentate; umbels compound, the rays numerous, the involucre and involucre of few small bracts and bractlets or these lacking; flowers white, sometimes yellow; calyx-teeth minute or obsolete; petals obovate or cuneate, incurved and retuse at apex, the stylopodium usually small, undulate on margin; fruit elliptic, strongly compressed, the carpels slightly convex on the back, the dorsal ribs filiform to rather thick, the lateral ones rather thick and extended into a wing, the wings of the two carpels appressed, the vittae 1 (–3) in the intervals; seeds flattened, slightly convex on the back, the seed-face flat or slightly concave.—About 160 species, in temperate regions of the N. Hemisphere of the Old World, and Africa.

- 1A. Stout maritime plants, slightly glaucous, bluish green; leaves 20–60 cm. long, twice or thrice ternately pinnate, rather thick; leaflets obovate-cuneate, with coarse teeth on margin near tip; fruit puberulent. 1. *P. japonicum*
 1B. Plants of lowlands or mountains, often rather large, green; leaves 5–20 cm. long, once or twice ternate or ternately pinnate, rather thin; leaflets ovate, ovate-orbicular or rhombic-ovate, usually dentate at least on the upper half; fruit glabrous.
 2A. Cauline leaves several, ternately pinnate; leaflets broadly ovate to deltoid, pinnatifid and incised, the upper sheaths narrow, not inflated; umbels few to numerous, the involucre of 4–12 filiform-linear bractlets, shorter than to as long as the pedicels; fruit broadly ovate-elliptic, about 3.5 mm. long; styles about 0.5 mm. long. 2. *P. terebinthaceum*
 2B. Cauline leaves few, ternately compound; leaflet elliptic or obovate, incised or coarsely dentate, often 2- or 3-lobed, the upper sheaths inflated; umbels 1–3, the involucre absent; fruit oblong, 8–10 mm. long; styles about 2 mm. long. 3. *P. multivittatum*

1. **Peucedanum japonicum** Thunb. BOTAN-BŌFŪ. Stout bluish green, glaucous herb, glabrous in lower part, short-pubescent in the upper part, with thick roots and short rhizomes; stems branched, 60–100 cm. long, solid, fibrous at base; leaves rather thick, long-petiolate, 20–60 cm. long, twice or thrice ternately pinnate, the leaflets obovate-cuneate, 3–6 cm. long, obtuse with a minute mucro at apex, often 3-lobed, irregularly deeply dentate, with coarse teeth on upper margin, the veinlets reticulate with free veinlets in each net, the upper leaves reduced, with a membranous, uninflated sheath; umbels numerous, on rather short peduncles, the rays 10–20, somewhat flattened, ascending, 2–3.5 cm. long, densely puberulent especially on the inner side, the involucre absent, the involucre of few to about 10 lanceolate bractlets as long as to shorter than the pedicels, the pedicels 20–30, slightly longer than the

fruit; fruit elliptic, puberulent, 4–5 mm. long, the dorsal ribs slender and filiform, the lateral narrowly winged, the vittae 3–4 in the intervals, 8 on the commissure, the styles short and slender, as long as the stylopodium.—July–Sept. Sandy places near seashores; Honshu (Kantō Distr., Kaga Prov. and westw.), Shikoku, Kyushu; rather common.—China, Formosa, and Philippines.

2. **Peucedanum terebinthaceum** (Fisch.) Fisch. ex Turcz. *Selinum terebinthaceum* Fisch. ex Trevir.; *P. deltoideum* Makino; *P. terebinthaceum* var. *deltoidum* (Makino) Makino—KAWARA-BŌFŪ, YAMA-NINJIN. Rhizomes short, fibrous at the apex, with slightly branched, rather thick roots; stems erect, branched, leafy, glabrous, 30–80 cm. long; leaves petiolate, 5–10 cm. long, acute, broadly ovate in outline, ternately pinnate, glabrous, the leaflets broadly ovate to deltoid,

3-5 cm. long, acute with a mucro at apex, decurrent to a narrowly winged base, somewhat pinnately cleft and again incised, with a few acute teeth, the upper leaves reduced, their sheaths narrowly oblanceolate, not inflated; umbels few to numerous, the rays 10-15, 1-2.5 cm. long, slightly papillate-puberulent on the inner side and on the pedicels, the involucre bracts 1(-2) or lacking, the involucre of 4-12 filiform-linear bractlets, slightly shorter than to as long as the flowers, the pedicels 20-30, 5-10 mm. long; fruit broadly ovate-elliptic, 3-4 mm. long, glabrous, the dorsal ribs low and slender, filiform, the lateral ones narrowly winged, the styles very slender, about 0.5 mm. long, the vittae solitary in the intervals, 2 on the commissure.—Aug.-Sept. Hokkaido, Honshu, Shikoku, Kyushu.—c. Siberia, Manchuria, and Korea.

3. *Peucedanum multivittatum* Maxim. HAKUSAN-BÖFŪ. Glabrous perennial herb with thick, short nonfibrous rhizomes with thickened roots; stems erect, simple or sparingly branched, fistulose, few-leaved, often pilose on the nodes; radi-

cal and lower cauline leaves long-petiolate, deltoid to broadly ovate in outline, 5-8 cm. long, once to sometimes twice ternately compound, the leaflets narrowly ovate to obovate-orbicular, 3-5 cm. long, obtuse to acuminate, often 2- or 3-lobed, incised or coarsely dentate, glabrous, the upper leaves reduced, often with narrow leaflets, their sheaths obovate or elliptic and inflated; umbels 1-3, the peduncles, inner side of rays, and pedicels brownish short-pubescent, the rays 8-15, 3-5 cm. long, the involucre and involucre absent, the pedicels 10-20, 1-1.5 cm. long; fruit oblong, glabrous, 8-10 mm. long, the dorsal ribs low, filiform, the lateral ones narrowly winged, the vittae numerous, slender, the calyx-teeth broadly lanceolate to narrowly ovate, minute, the styles slender, 1.5-2 mm. long.—Aug., fruiting Oct. Alpine slopes; Hokkaido, Honshu (centr. distr. and northw.).—Forma *linearilobum* (Tatew.) Ohwi. *P. multivittatum* var. *linearilobum* Tatew.—EZO-NO-HAKUSAN-BÖFŪ. Leaflets dissected and cut into broadly linear lobes.

31. HERACLEUM L. HANA-UDO ZOKU

Pubescent perennials; leaves pinnately or ternately compound, the leaflets often large, dentate; umbels usually large, the involucre lacking or of few bracts, the involucre of numerous bractlets, the calyx-teeth usually inconspicuous, the petals cuneate or rhombic, white, rarely yellow, usually unequal, inflexed and bifid to emarginate at apex, the stylopodium conical or minute; fruit orbicular, obovate or elliptic, much flattened, glabrous or pubescent, the carpels flat with very slender dorsal ribs and broadly winged lateral ones, the vittae usually solitary in the intervals, clavate, shorter than the carpels, the carpophore 2-parted; seeds with a flat face.—About 60 species, in temperate, regions of the N. Hemisphere.

- 1A. Leaves 3-foliolate; stems 1-2 m. long; high mountains. 1. *H. dulce*
 1B. Leaves 3- to 5-foliolate; stems 70-100 cm. long; usually in low mountains and in lowlands. 2. *H. moellendorffii*

1. *Heracleum dulce* Fisch. *H. lanatum* sensu auct. Japon., non Michx.; *H. lanatum* subsp. *asiaticum* Hiroe; *H. lanatum* var. *asiaticum* (Hiroe) Hara—Ō-HANA-UDO. Stems stout, fistulose, 1-2 m. long, pubescent or nearly glabrous, branched above; radical and lower cauline leaves long-petiolate, large, pinnately 3-foliolate, the leaflets broadly ovate-cordate to broadly ovate, 20-40 cm. long, paler beneath, glabrous or usually pubescent, cordate to rounded at base, 2- or 3-cleft, the lobes acuminate and shallowly 2- or 3-lobed, incised, and acutely dentate, the upper leaves reduced, with inflated sheaths; umbels rather numerous, large, the rays 20-30, pubescent on the inner side, 8-12 cm. long, the involucre absent, the involucre of several narrowly lanceolate, filiform-attenuate bractlets shorter than the pedicels, the pedicels slender, unequal, 5-25 mm. long; flowers rather large, white, the petals unequal; fruit strongly flattened, broadly obovate, glabrescent, 7-8 mm. long, the dorsal ribs filiform, the lateral ones broadly winged, the vittae linear-oblongate, solitary in the intervals, 2 on the commissure, the styles 1.5-2.5 mm. long, the stylopodium conical.—June-Aug. Grassy high mountain slopes; Hokkaido, Honshu; rather common.—Alaska, Aleutians, Kamchatka, Kuriles, and Sakhalin.

2. *Heracleum moellendorffii* Hance. *H. lanatum* sensu auct. Japon., pro parte, non Michx.; *H. inperpastum* Koidz.; *H. nipponicum* Kitag.; *H. lanatum* subsp. *moellendorffii*

(Hance) Hara—HANA-UDO. Resembles the preceding, the stems shorter, 70-100 cm. long, usually loosely pubescent; radical and lower cauline leaves petiolate, large, pinnately 3- to 5-foliolate, short-pubescent on the under side and on the petioles, the terminal leaflets rounded-cordate, deeply 3-fid, the lateral ones broadly ovate or deltoid-ovate, 2- or 3-fid, both 7-20 cm. long, the ultimate segments or lobes abruptly acuminate, incised and acutely dentate; umbels large, the rays 20-30, 7-10 cm. long, pubescent on the inner side, the involucre lacking or of few bracts, the involucre of linear-filiform bractlets, lanceolate at base, shorter than the pedicels, the pedicels 25-30, unequal, to 2 cm. long; fruit strongly flattened, nearly glabrous, the carpels nearly the same as in the preceding species.—May-June. Hills, low mountains and lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *tsurugisanense* (Honda) Ohwi. *H. tsurugisanense* Honda; *H. barbatum* subsp. *moellendorffii* var. *tsurugisanense* (Honda) Hiroe—TSURUGI-HANA-UDO. A smaller mountain phase.

Var. *akasmontanum* (Koidz.) Ohwi. *H. lanatum* var. *akasmontanum* Hara; *H. akasmontanum* Koidz.—HOSOBANA-UDO. A mountain phase with much-dissected leaflets and broadly linear ultimate segments.—Honshu (Akaiishi Mts.).

Fam. 155. CORNACEAE Mizu-ki Ka Dogwood Family

Trees or shrubs, sometimes herbs; leaves opposite or alternate, simple; stipules absent or pinnatifid; flowers small, in panicles or racemes, often capitate, perfect (or unisexual and the plants dioecious), actinomorphic; calyx-tube adnate to the ovary, the limb 4- or 5-lobed or nearly entire; petals 4 or 5, rarely absent, imbricate or valvate in bud; stamens as many as the petals, alternate with them, the anthers short, 2-locular, longitudinally dehiscent; disc nearly flat; ovary inferior, 1- to 4-locular; styles simple or lobed; ovules pendulous, solitary in each locule, anatropous, with 1 integument; drupe 1- to 4-stoned, the endosperm copious.—About 15 genera, with more than 100 species, chiefly in the N. Hemisphere.

- 1A. Inflorescence or flowers borne on upper leaf surface; leaves alternate. 1. *Helwingia*
 1B. Inflorescence terminal or axillary, not borne on a leaf; leaves usually opposite.
 2A. Flowers in terminal panicles; plants dioecious; leaves evergreen; large shrub. 2. *Aucuba*
 2B. Flowers in corymbs or umbels; plants bisexual, leaves deciduous; rarely low evergreen herbs. 3. *Cornus*

1. HELWINGIA Willd. HANA-IKADA ZOKU

Glabrous deciduous dioecious shrubs; leaves simple, alternate, toothed, the stipules free, filiform; flowers few, small, fasciculate, borne on the midrib on the upper side of leaves, the pedicels short; calyx-lobes obsolete; petals 3-5, commonly 4, valvate in bud; stamens 3-5, the filaments rather thick; disc flat in the staminate, depressed-conical in the pistillate flowers; ovary 3- or 4-locular; styles connate, the stigmas 3-5; drupe berrylike, 1- to 4-stoned.—Three species, in e. Asia and the Himalayas.

1. *Helwingia japonica* (Thunb.) F. G. Dietr. *Osyris japonica* Thunb.; *H. rusciflora* Willd.—HANA-IKADA. Glabrous shrub about 2 m. high, with green branchlets; leaves ovate or elliptic, 3-10 cm. long, 2-6 cm. wide, acuminate, short awn-toothed, the petioles 2-4 cm. long; flowers pale green, 4-5 mm. wide, the staminate few, the pistillate 1-3, the

pedicels 3-4 mm. long; petals 4(3-5), ovate-deltoid; fruit black, globose, about 7 mm. across; stones 2-4, oblong, 6-7 mm. long, with raised reticulations on surface.—May. Woods and thickets in hills and low mountains; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common.—Ryukyus.

2. AUCUBA Thunb. AO-KI ZOKU

Evergreen dioecious shrubs with rather thick branchlets; leaves opposite, simple, petiolate, toothed; stipules absent; flowers small, in terminal panicles; staminate flowers small, the calyx 4-toothed, the petals 4, valvate, ovate or lanceolate, the stamens 4, with short filaments; disc fleshy; pistillate flowers; small, the calyx-tube ovoid, with 4 teeth on the limb, the petals 4, disc fleshy, the style thick, short, with an entire stigma, the ovary 1-locular, the ovules pendulous; drupe ellipsoidal, red, rarely white or yellow; stones oblong, the endosperm fleshy.—Few species, in e. Asia and the Himalayas.

1. *Aucuba japonica* Thunb. *Eubasis dichotoma* Salisb.—AO-KI. Nearly glabrous evergreen shrub to 3 m. high, with thick terete green dichotomously forked branchlets; leaves oblong to ovate-oblong, rarely broadly lanceolate or elliptic, 8-20 cm. long, 2-10 cm. wide, black when dried, acute to acuminate with an obtuse tip, subacute at base, obtusely toothed, lustrous and deep green on upper side, the petioles 2-3 cm. long; flowers about 7 mm. across, the petals short-acuminate, reflexed, brown to dark purple, rarely green inside, the staminate in panicles 7-10 cm. long, the pistillate in pani-

cles 1-2 cm. long; peduncles and pedicels short-pubescent; fruit ellipsoidal to ovoid-ellipsoidal, red, glabrous, lustrous, 15-20 mm. long.—Mar.-May. Woods in lowlands and mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common. Variable and with many cultivars grown in gardens.

Var. *borealis* Miyabe & Kudo. HIME-AO-KI. Plant smaller, usually minutely pubescent on petioles, under side of leaves, and on young branchlets.—Hokkaido and Japan Sea side of Honshu.

3. CORNUS L. MIZU-KI ZOKU

Deciduous, rarely evergreen, trees and shrubs or rarely evergreen herbs; leaves simple, petiolate, entire, alternate or opposite; inflorescence terminal in corymbs or umbels; involucre prominent or absent; flowers bisexual, small, usually white; calyx-tube urceolate or campanulate; petals 4, oblong, valvate in bud, deciduous; ovary 2-locular; styles columnar, simple, the stigma capitate, clavate, or truncate; ovules solitary in each locule; drupe globose or ellipsoidal, the stones solitary, 2-locular, 1-seeded in each locule, the testa membranous, the endosperm fleshy.—About 40 species, in temperate regions of the N. Hemisphere.

- 1A. Inflorescence bractless, cymose.
 2A. Leaves alternate; stones pitted at tip. 1. *C. controversa*
 2B. Leaves opposite; stones unpitted. 2. *C. brachypoda*
 1B. Inflorescence bracteate, umbellate, or capitate.
 3A. Trees.
 4A. Flowers yellow, before the leaves, the involucre bracts not exceeding the inflorescence in length, early deciduous. . . 3. *C. officinalis*
 4B. Flowers yellow-green, following the leaves, the involucre bracts longer than the inflorescence, persistent. 4. *C. kousa*
 3B. Herbs.
 5A. Flowering stems with 6 leaves crowded at the top; petals usually white; ovary densely appressed-hairy. 5. *C. canadensis*
 5B. Flowering stems with 4 or 5 distinct pairs of opposite leaves; petals usually purplish; ovary usually sparingly appressed-hairy. 6. *C. suecica*

1. *Cornus controversa* Hemsl. *C. macrophylla* sensu auct. Japon., non Wall.; *C. ignorata* sensu Fr. & Sav., non K. Koch.—MIZU-KI. Deciduous tree with grayish bark longitudinally fissured when old; branchlets glabrous, green, sometimes reddish; leaves alternate, broadly ovate to elliptic, 5-12 cm. long, 3-8 cm. wide, abruptly short acuminate, rounded to cuneate at base and slightly decurrent, green above, white be-

neath, short appressed-hairy on upper side when young, persistent beneath, the lateral nerves of 5-8 pairs, the petioles reddish, glabrescent, 1.5-6 cm. long; inflorescence many-flowered, cymose, minutely puberulent; flowers white; calyx-tube with appressed white hairs; petals narrowly oblong, 4-5 mm. long; filaments about 5 mm. long, the anthers versatile; styles about half as long as the filaments, the stigma capitate-trun-

cate; fruit globose, black, 6-7 mm. across, the stones pitted at tip.—May-June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea and China.

2. *Cornus brachypoda* C. A. Mey. *C. crispula* Hance; *C. macrophylla* sensu Rehd., pro parte, non Wall.—KUMANO-MIZUKI. Resembling the preceding; branches glabrous or nearly so, becoming brownish when dry; leaves opposite, ovate to narrowly so or ovate-oblong, acuminate, often abruptly so, rounded to obtuse at base, whitish beneath, the lateral nerves of 6-8 pairs, the petioles 1.5-3.5 cm. long; inflorescence cymose, pedunculate; petals 4-5 mm. long, as long as to slightly longer than the filaments, anthers about 1.5 mm. long; styles shorter than the filaments, the stigma subglobose, truncate; fruit black, globose, about 5 mm. across, the stones unspitted.—June-July. Mountains; Honshu, Shikoku, Kyushu.—China.

3. *Cornus officinalis* Sieb. & Zucc. *C. mascula* var. *japonica* Sieb. ex Miq.; *Macrocarpon officinale* (Sieb. & Zucc.) Nakai.—SANSUYU, HARU-KOGANEBAWA, AKI-SANGO. Deciduous tree; branches glabrous, terete, glaucous, with exfoliating bark; leaves ovate to narrowly so or narrowly elliptic, 4-10 cm. long, 2.5-5 (-6) cm. wide, entire, acuminate with an obtuse tip, rounded at base, loosely appressed-pilose above while young, the hairs persistent beneath, also with axillary tufts of yellow-brown hairs on under side, the lateral nerves of 6 or 7 pairs, the petioles 6-10 mm. long; inflorescence 20- to 30-flowered, very short-pedunculate; involucre bracts 4, yellow-green, early deciduous, 6-8 mm. long, elliptic, acute; flowers appearing before the leaves, yellow, 4-5 mm. across, the pedicels about 10 mm. long, loosely appressed-pilose; fruit oblong, about 15 mm. long, red; stone smooth.—Apr. Cultivated in our area.—Korea and China.

4. *Cornus kousa* Buerg. ex Hance. *Benthamia japonica* Sieb. & Zucc.; *C. japonica* sensu G. Don; *Benthamidia japonica* (Sieb. & Zucc.) Hara; *Benthamia viridis* Nakai; *Benthamia kousa* (Buerg. ex Hance) Nakai; *Cynoxylon japonica* (Sieb. & Zucc.) Nakai; *C. kousa* (Buerg. ex Hance) Nakai; *Dendrobenthamia japonica* (Sieb. & Zucc.) Hutchins.—YAMABOSHI. Deciduous tree with glabrescent rather slender branches; leaves elliptic to ovate-obicular, 6-12 cm. long, 3.5-7 cm. wide, abruptly acuminate, abruptly acute to rounded at base, loosely appressed-hairy, green on upper side, paler and with axillary tufts of brown hairs beneath, the lateral nerves of 4 or 5 pairs, the petioles 5-10 mm. long; inflorescence terminal, the peduncles 5-10 cm. long, erect, loosely appressed-pilose while young; involucre bracts 4, spreading, longer than the inflorescence, persistent, narrowly ovate, 3-6 cm. long, acuminate, usually

white, with few parallel nerves; flowers 20-30, in a dense globose head, yellow-green; fruit globose, red, fleshy, the syncarp 1-1.5 cm. across; stones ellipsoidal, smooth.—June-July. Mountains; Honshu, Shikoku, Kyushu; common.—Korea and China.

Cornus florida L. AMERIKA-YAMABOSHI, of e. United States, is sometimes planted in parks and gardens.

5. *Cornus canadensis* L. *Chamaepericlymenum canadense* (L.) Asch. & Graebn.—GOZEN-TACHIBANA. Small evergreen herb with slender, long-creeping rhizomes; stems erect, slender, 5-15 cm. long, 4-angled, glabrous to sparsely appressed-pilose, usually unbranched; flowering stems with a pair of terminal leaves and with few smaller axillary leaves, thus appearing 6-leaved at the top of stem; leaves subsessile, narrowly obovate to rhombic-elliptic, 3-6 cm. long, 1-2.5 cm. wide, acute at both ends or acuminate at the base, appressed-pilose on both sides or only on upper surface, sometimes nearly glabrous on both sides, the lateral nerves rising near the base, of 2 or 3 pairs; peduncles erect, 1.5-3 cm. long; involucre bracts 4, broadly ovate, 7-10 mm. long, acute, white, persistent, 5- to 7-nerved; flowers 10-25, short-pedicelled; petals reflexed, about 1.5 mm. long, lanceolate-deltoid; petals usually white; ovary densely appressed-hairy; fruit globose, red, 5-6 mm. across, appressed-pilose; stones oblong, shallowly grooved.—June-July. Coniferous woods; Hokkaido, Honshu (centr. distr. and northw.), Shikoku (alpine); common.—Amur, Sakhalin, Kuriles, Kamchatka, Korea, and N. America.

6. *Cornus suecica* L. *Chamaepericlymenum suecicum* (L.) Asch. & Graebn.—EZO-GOZEN-TACHIBANA. Resembling the preceding; stems erect, 5-20 cm. long, simple or sparingly branched, 4-angled, glabrous to loosely appressed-pilose, with 4 or 5 distinct pairs of opposite leaves; leaves sessile, ovate-elliptic to oblong or sometimes broadly ovate, 1.5-3 cm. long, 1-2 cm. wide, subrounded to subacute, rounded to subacute at base, sparingly appressed-pilose on upper side, the lateral nerves of 2(-3)-pairs, rising near the base; inflorescence terminal and solitary, 10- to 20-flowered, the peduncles 1-2 cm. long; involucre bracts 4, broadly elliptic to ovate-obicular, sometimes rhombic, 6-8 mm. long, subobtusely, white, 5- to 7-nerved; flowers short-pedicelled; petals purplish; ovary usually sparingly appressed-hairy; fruit globose, red, 5-6 mm. across, glabrous; stones slightly grooved.—July. Coniferous woods in lowlands; Hokkaido (e. distr.); rare.—Europe, Siberia, Korea, Manchuria, Sakhalin, Kuriles, Kamchatka, and N. America.

2. Metachlamydeae Gamopetalae

Fam. 156. DIAPENSIACEAE IWA-UME KA Diapensia Family

Small shrubs or herbs; leaves simple, small and densely arranged on branchlets or loosely arranged and rather small; flowers bisexual, actinomorphic, solitary or in racemes or sometimes headlike, white, rose, or purple; calyx 5-lobed, persistent, the lobes imbricate in bud; corolla 5-lobed, the lobes imbricate; stamens adnate to and as many as the corolla-lobes and alternate with them, the scalcelike or spatulate staminodia, when present, opposite the corolla-lobes; anthers 1- or 2-locular, usually longitudinally dehiscent, the disc absent; ovary superior, 3-locular, the ovules few to many, on axile placentae; style solitary, the stigma 3-lobed; capsule loculicidally dehiscent; seeds small, with fleshy endosperm; embryo cylindric.—About 6 genera, with 10 species, in Europe, Asia, N. America.

- 1A. Staminodia absent; densely matted subshrubs; leaves very small, 7-15 mm. long, entire, obovate-spathulate; flowers solitary and terminal. 1. *Diapensia*
- 1B. Staminodia alternate with the stamens, scalcelike or spatulate-linear; typically not densely matted; leaves flattish, rather large, 2-6 cm. long, long-petiolate, toothed, ovate to depressed-obicular; flowers in racemes, solitary or few. 2. *Shortia*

1. DIAPENSIA L. IWA-UME ZOKU

Glabrous evergreen densely matted subshrubs with densely leafy branchlets; leaves coriaceous, alternate, spatulate, obtuse, entire; flowers solitary, terminal, erect, pedunculate, white or pink, sometimes purplish; calyx 2- or 3-bracteate at the base, the segments broadly ovate, obtuse; corolla campanulate-infundibuliform, 5-lobed; stamens 5, inserted on the throat of the corolla-tube, the filaments short, the anther-locules divergent, vertically dehiscent; staminodes absent; style filiform, the stigma obtusely and shortly 3-lobed; ovules numerous; capsules subglobose, 3-valved, the seeds numerous, nearly tetrahedral, small.—Few species, in the Himalayas, China, and the cooler regions of the N. Hemisphere.

1. *Diapensia lapponica* L. var. *obovata* F. Schmidt. *D. obovata* (F. Schmidt) Nakai; *D. lapponica* subsp. *obovata* (F. Schmidt) Hult.; *D. lapponica* sensu auct. Japon., non L. —IWA-UME. Dwarf evergreen densely matted subshrub, 1–3 cm. high, glabrous; leaves thick, obovate-spatulate, 7–15 mm. long, 3–5 mm. wide, rounded to retuse, entire, long-decurrent and petiolelike at base, subclasping, lustrous above, yellow-green beneath, irregularly rugose on upper side, with 1 or 2 short impressed lateral nerves when dried, the midrib strongly impressed above; peduncles 1–2 cm. long, solitary, terminal on the branchlets, nearly naked; bracts 2 or 3, elliptic,

shorter than the calyx-segments, the lowermost bracts often near the center of the peduncle; calyx-segments oblong, obtuse to rounded, 5–6 mm. long, green, erect; corolla white, 1–1.2 cm. across, the tube broad, the lobes elliptic-orbicular, ascending, entire, rounded at apex; styles rather persistent, narrowly cylindric, about 5 mm. long, truncate; capsules globose, erect, about 3 mm. across, surrounded by the persistent calyx.—June–July. Dry slopes and rocky cliffs in alpine regions; Hokkaido, Honshu (centr. and n. distr.); common. —Sakhalin, Kuriles, Kamchatka, Alaska, and c. N. America.

2. SHORTIA Torr. & Gray IWA-UCHIWA ZOKU

Evergreen glabrous perennials with creeping branched stems; leaves radical, petiolate, ovate to depressed-orbicular, lustrous, undulately toothed; flowers in racemes, solitary or few, scape, one-sided, bracteate, rose-colored or white; calyx-segments 5, obtuse, nerved, persistent, imbricate in bud; corolla-lobes 5, campanulate to infundibuliform, obtusely toothed to laciniate; anthers dorsally attached, the staminodes linear to scalelike or clavate; style columnar, obsoletely 3-lobed; ovules many; capsules globose, erect, dehiscent, 3-valved, surrounded by the persistent calyx; seeds many, small.—Few species, in c. Asia and N. America.

- 1A. Flowers solitary on the scape; corolla broadly campanulate, glabrous inside, the lobes deeply toothed; staminodes papillose, scalelike; calyx-segments glabrous, slenderly many-nerved. 1. *S. uniflora*
 1B. Flowers few on the scape or peduncle; corolla narrowly infundibuliform, with white mammillate-hairs inside, the lobes laciniate; staminodes linear, inserted on the tube below the middle; calyx-segments ciliate while young, 4- to 7-nerved. 2. *S. soldanelloides*

1. *Shortia uniflora* (Maxim.) Maxim. *Schizocodon uniflorus* Maxim.—IWA-UCHIWA. Stems slender, creeping, rather firm, sparingly branched; leaves few, approximate near the top of the stems and branches, long-petiolate, firm, slightly lustrous, depressed-orbicular to cordate-orbicular, 2.5–7 cm. long and as wide, rounded to retuse, cordate to rounded at the base, undulately toothed, with slightly raised nerves; scapes erect, to 15 cm. long, with few bud-scales at base, the bracts about 3, acute or subacute, broadly lanceolate, usually closely contiguous or the lowest widely separated from the calyx, slightly shorter than the calyx-segments; calyx segments green, oblong, glabrous, slenderly many-nerved, 8–12 mm. long, thick-papery; corolla pale rose-colored, 2.5–3 cm. across, glabrous, the lobes deeply and obtusely toothed; capsules ovoid-globose, 4–5 mm. across, mucronate, the valves somewhat coriaceous; seeds dark brown, oblong, about 0.7 mm. long, finely veined.—Apr.–May. Woods in mountains; Honshu (Kinki Distr. and eastw.).

2. *Shortia soldanelloides* (Sieb. & Zucc.) Makino. *Schizocodon soldanelloides* Sieb. & Zucc.; *Schizocodon soldanelloides* var. *genuinus* Makino; *Shortia soldanelloides* var. *genuina* (Makino) Makino.—IWA-KAGAMI. Glabrous perennial with creeping, loosely branched, slender stems and branches; leaves few, coriaceous, disposed mostly at end of stem, long-petiolate, orbicular to ovate-cordate, 3–6 cm. long, 3–5 cm. wide, deep green and lustrous on upper side, short-toothed; scapes 10–30 cm. long, with few bud-scales at base; racemes one-sided, 3- to 10-flowered, the bracts lanceolate or broadly linear, shorter than the calyx, the pedicels shorter than the flowers, erect after anthesis; calyx segments narrowly oblong, 5–10 mm. long, loosely ciliate near tip when young, very ob-

tuse, 4- to 7-nerved, becoming coriaceous-chartaceous in fruit; corolla rose-colored, narrowly infundibuliform, 1–1.5 cm. across, white-hairy at base inside, the lobes ascending, laciniate; capsules globose, 3–4 mm. across, the style persistent, 7–10 mm. long.—Apr.–June. Woods and thickets in mountains and sunny places in alpine regions; Hokkaido (w. distr.), Honshu, Shikoku, Kyushu.—Forma *alpina* (Maxim.) Makino. *Schizocodon soldanelloides* forma *alpinus* Makino.—KO-IWA-KAGAMI. Dwarf alpine phase.

Var. *minima* (Makino) Masam. *Shortia soldanelloides* forma *minima* Makino; *S. yakusimensis* Masam.—HIME-KO-IWA-KAGAMI. Very dwarf phase with few-toothed or entire leaves. Flowers mostly solitary.—High mountains of Yakushima.

Var. *magna* Makino. *Schizocodon soldanelloides* var. *magnus* (Makino) Hara; *Shortia magna* (Makino) Makino; *Schizocodon magnus* (Makino) Honda.—Ō-IWA-KAGAMI. Larger montane phase with leaves 8–12 cm. long and as wide.—Rather abundant in the western region.

Var. *ilicifolia* (Maxim.) Makino. *Schizocodon soldanelloides* var. *ilicifolius* (Maxim.) Makino; *S. ilicifolius* Maxim.; *Shortia ilicifolia* (Maxim.) Takeda.—HIME-IWA-KAGAMI. Leaves smaller, ovate-orbicular, with few, coarse, deltoid teeth nearly confined to the upper half.—Woods in mountains; Honshu, Kyushu; rather rare.

Var. *intercedens* Ohwi. *Schizocodon ilicifolia* var. *intercedens* (Ohwi) Yamazaki.—YAMA-IWA-KAGAMI. Leaves broadly ovate, abruptly narrowed at tip, whitish beneath, with 5–15 coarse teeth on each side; flowers white.—Woods in mountains; Honshu (Tōkaidō); rare.

Fam. 157. **CLETHRACEAE** RYÖBU KA White Alder Family

Trees and shrubs with simple alternate exstipulate leaves; flowers bisexual, in terminal racemes or panicles; calyx 5-parted, the segments imbricate in bud, persistent; corolla lobes 5, free, imbricate in bud; stamens 10–12, free, the anthers reflexed in bud, sagittate, opening by pores; disc absent; ovary superior, 3-locular; style solitary, 3-lobed; ovules many, the placentae axile; capsules globose, loculicidally dehiscent, 3-valved, the axis persistent; seeds many, flat or 3-angled, sometimes winged; endosperm fleshy, the embryo cylindric.—Two genera, with about 30 species, in e. Asia, N. America, and Madeira.

1. **CLETHRA** L. RYÖBU ZOKU

Evergreen or deciduous trees or shrubs, usually stellate-pubescent; leaves short-petiolate, usually toothed; flowers white or pink.—About 30 species, in N. America, e. Asia, and Madeira.

1. *Clethra barbinervis* Sieb. & Zucc. *C. kawadana* Yanagita; *C. barbinervis* var. *kawadana* (Yanagita) Hara; *C. repens* Nakai.—RYÖBU. Deciduous tree with smooth, yellow-brown bark, the young branchlets glabrous or minutely stellate-pubescent; leaves herbaceous to chartaceous, alternate, often approximate toward the top of branchlets, broadly oblanceolate to narrowly cuneate-obovate, abruptly acuminate to acute, acutely toothed, green and glabrous or sparingly stellate-pubescent on upper side, paler beneath and with loosely appressed hairs, especially on the nerves, the axillary hairs

tufted, the lateral nerves 8 to 15 pairs; inflorescence 8–15 cm. long, more or less paniculate, many-flowered, densely stellate-pubescent; flowers white, pedicelled, 6–8 mm. across; calyx-segments ovate-elliptic, pilose; petals elliptic, rounded at apex, irregularly minutely toothed; fruit depressed, erect, exceeding the calyx, long-hairy, 4–5 mm. across; seeds elliptic, flat, about 1 mm. long, narrowly margined, with raised reticulations on the surface.—July–Sept. Hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and very variable.—Korea (Quelpaert Isl.).

Fam. 158. **PYROLACEAE** ICHI-YAKU-SŌ KA Shinleaf Family

Small shrubs or herbs sometimes saprophytic; leaves simple, alternate, rarely verticillate or opposite, sometimes scalelike and without chlorophyll, without stipules; flowers bisexual, actinomorphic, solitary or in terminal racemes or corymbs; calyx 5-parted, rarely absent; petals 5, sometimes 4; stamens 10, sometimes 8, the anthers opening by pores; ovary 5- or 4-locular; superior, many-ovuled; style and stigma simple; fruit a 5- or sometimes 4-valved capsule, rarely a berry; seeds minute, numerous, the testa transparent, the endosperm copious.—About 11 genera, with about 50 species, chiefly in the temperate regions of the N. Hemisphere.

- 1A. Plants green; anthers opening by pores, reflexed in bud.
 - 2A. Leaves radical, ovate, elliptic or depressed-orbicular, long-petiolate; capsules dehiscent from the base; herbs.
 - 3A. Flowers in racemes, not fully expanded; valves of capsules with webby pubescence on margin. 1. *Pyrola*
 - 3B. Flowers solitary, fully expanded; valves of capsules without webby pubescence on margin. 2. *Moneses*
 - 2B. Leaves cauline, lanceolate or narrowly oblong, short-petiolate; capsules dehiscent from the apex; flowers in corymbs or umbels, not fully expanded; subshrubs. 3. *Chimaphila*
- 1B. Plants saprophytic, without chlorophyll, with scalelike leaves; anthers vertically dehiscent, erect in bud.
 - 4A. Fruit a capsule; ovary 5-locular, with axile placentae. 4. *Monotropa*
 - 4B. Fruit a berry; ovary 1-locular, with parietal placentae. 5. *Monotropastrum*

1. **PYROLA** L. ICHI-YAKU-SŌ ZOKU

Glabrous evergreen perennial herbs, often stoloniferous; leaves usually radical, long-petiolate, entire or toothed; flowers in simple racemes on nearly naked scapes, bracteate, nodding, white, reddish or purplish, rarely yellowish; calyx persistent, deeply 5-parted; petals 5, not fully expanded, connivent at tip, deciduous; stamens 10, erect, the anthers reflexed in bud, 4-locular, opening by pores; ovary globose, 5-locular; style simple, erect or descending, the stigma depressed, obsolete 5-lobed; ovules numerous, on the spongy placentae of the persistent axis, disc absent, or 10-toothed; capsules depressed-globose, 5-locular, dehiscent; seeds many, small, the testa produced at both ends, the endosperm fleshy.—More than 20 species, in the temperate regions of the N. Hemisphere.

- 1A. Inflorescence glabrous; flowers in loose racemes, 1–1.5 cm. across; pores of anthers short-tubulose; disc absent; pollen in tetrads.
 - 2A. Style descending, 6–10 mm. long.
 - 3A. Leaves reniform-orbicular, with overlapping basal margins; scapes usually completely naked except at base; calyx-segments sub-orbicular, very obtuse, much shorter than wide. 1. *P. renifolia*
 - 3B. Leaves elliptic to depressed-orbicular, scarcely cordate; scapes usually with few scalelike leaves; calyx-segments deltoid to lanceolate, acuminate to acute, longer or as long as wide.
 - 4A. Calyx-segments deltoid or ovate-deltoid, as long as to only slightly longer than wide; slender plants with few-flowered scapes.
 - 5A. Leaves depressed-orbicular, slightly shorter than wide; bracts lanceolate, only slightly longer than to nearly as long as the pedicel. 2. *P. nephrophylla*
 - 5B. Leaves elliptic, slightly longer than wide; bracts broadly linear, slightly shorter to slightly longer than the pedicel. 3. *P. alpina*
 - 4B. Calyx-segments broadly lanceolate, $2\frac{1}{2}$ –4 times as long as wide; stouter plants sometimes with 10-flowered scapes.

- 6A. Flowers white, bracts deltoid-lanceolate, gradually narrowed at tip, very acute. 4. *P. japonica*
 6B. Flowers deep rose-colored; bracts oblong-lanceolate, abruptly acute. 5. *P. incarnata*
 2B. Style straight, not curved, 3-4 mm. long; calyx-segments elliptic, subacute; leaves elliptic; bracts broadly lanceolate, acute. 6. *P. fauriana*
 1B. Inflorescence minutely papillose; leaves ovate, subacute to obtuse, subverticillate on lower creeping part of stems; flowers in a one-sided rather dense raceme, about 5 mm. across, greenish; pores of anthers not tubulose; disc 10-lobed; pollen grains single. 7. *P. secunda*

1. *Pyrola renifolia* Maxim. *P. sodanellifolia* H. Andres. —JIN-YŌ-ICHI-YAKU-SŌ. Rhizomes very slender, long-creeping; leaves 1-3, approximate, dull, deep green but paler along the nerves above, pale green beneath, reniform-orbicular or subreniform, 1-3 cm. long, 1.5-4 cm. wide, obsoletely toothed, rounded at apex, the petioles 2-5 cm. long; scapes 10-20 cm. long, rarely with a minute scale; flowers 2-4, 1-1.2 cm. across, white to greenish, the bracts linear-lanceolate, 1-2 mm. long, much shorter than the pedicel; calyx-segments suborbicular or depressed-deltoid, obtuse to rounded at the tip; style exerted; capsules 5-6 mm. across.—Damp coniferous woods in mountains; Hokkaido, Honshu (centr. and n. distr.).—s. Kuriles, Sakhalin, Korea, Manchuria, and Amur.

2. *Pyrola nephrophylla* (H. Andres) H. Andres. *P. media* sensu auct. Japon., non Sw.; *P. rotundifolia* 3. *nephrophylla* H. Andres.—MARUBA-NO-ICHI-YAKU-SŌ. Rhizomes slender, long-creeping; leaves 2-5, approximate, depressed-orbicular, 1-2.5 cm. long, 1.5-3.5 cm. wide, rounded at apex, rounded-truncate or slightly cordate at base, obsoletely toothed, the petioles 2-5 cm. long; scapes 10-20 cm. long, 1- to 3-scaled, the scales broadly lanceolate, membranous, 7-12 mm. long, acuminate; flowers 4-7, rarely 10, white, 1-1.2 cm. across, the bracts lanceolate, membranous, acuminate, 4-7 mm. long, nearly as long as the pedicels; calyx-segments deltoid, acuminate or very acute; styles exerted; capsules 4-6 mm. across.—Damp woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—s. Kuriles.

3. *Pyrola alpina* H. Andres. *P. elliptica* var. *minor* Maxim.; *P. maximowicziana* Makino.—KŌBA-NO-ICHI-YAKU-SŌ. Rhizomes slender, long-creeping; leaves 4-8, approximate or nearly so, deep green, elliptic, obsoletely toothed, rounded to abruptly mucronate at apex, rounded to subtruncate, rarely somewhat acute at base, the petioles 1-3 cm. long; scapes 10-20 cm. long, erect, the scales linear-lanceolate, acuminate, 3-7 mm. long, sometimes absent; flowers 3-5, rarely 7, white, 12-15 mm. across, the bracts broadly linear, gradually acuminate, 3-5 mm. long; calyx-segments deltoid, acuminate; styles exerted; capsules 4-5 mm. across.—July-Aug. Woods in mountains; Hokkaido, Honshu.

4. *Pyrola japonica* Klenz ex Alef. *P. asarifolia* var. *japonica* Miq.; *P. rotundifolia* var. *albiflora* Maxim.; *P. elliptica* var. *intermedia* H. Boiss.; *P. denticulata* Koidz.; *P. incarnata* var. *japonica* (Klenze ex Alef.) Koidz.—ICHI-YAKU-SŌ. Rhizomes creeping; leaves 1-5, rarely to 8, approximate, elliptic, 4-7 cm. long, 2.5-4.5 cm. wide, rounded to obtuse at apex, rounded to subacute at base, deep green with paler nerves on upper side, rather loosely and obsoletely toothed, the petioles 3-8 cm. long; scapes 15-30 cm. long, angled, 5- to 12-flowered, often with 1 or sometimes 2 scales near the middle, the bracts linear-lanceolate, gradually narrowed from the base, long-acuminate, 5-8 mm. long, with a raised costa on the back, longer than to as long as the pedicels; flowers white, 12-15 mm. across; calyx-segments broadly lanceolate to narrowly ovate, 2.5-3 times as long as wide, acute; styles exerted; capsules 7-8 mm. across.—June-July. Woods in foothills; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria,

and Formosa.—Forma *subaphylla* (Maxim.) Ohwi. *P. subaphylla* Maxim.; *P. rotundifolia* var. *incarnata* forma *subaphylla* (Maxim.) Makino; *P. japonica* var. *subaphylla* (Maxim.) H. Andres.—HITOTSUBA-ICHI-YAKU-SŌ. Leaves mostly reduced to scales. Occurs rarely with the typical pure.

5. *Pyrola incarnata* Fisch. *P. rotundifolia* var. *purpurea* Bunge; *P. rotundifolia* var. *incarnata* DC.; *P. asarifolia* var. *incarnata* (Fisch.) Fern.; *P. tokugoensis* Nakai.—BENIBANA-ICHI-YAKU-SŌ. Rhizomes creeping, the plants forming an extensive loose mat; leaves 3-5, approximate, elliptic or ovate-elliptic, rounded to very obtuse, rounded or scarcely cordate, rarely subacute at base, lustrous above, deep green, obsoletely short-toothed, the petioles 3-5 cm. long; scapes 10-25 cm. long, angled, the scales 1-3, broadly lanceolate to narrowly oblong, 7-10 mm. long; flowers 7-15, deep rose-colored, 12-15 mm. across, the bracts broadly lanceolate, membranous, acuminate, 5-8 mm. long, longer than the pedicels; calyx-segments narrowly ovate to broadly lanceolate, acuminate, 3-4 times as long as wide; styles exerted; capsules 7-8 mm. across.—June-Aug. Thickets and shaded grassy places in mountains; Hokkaido, Honshu (centr. and n. distr.); locally abundant.—Kuriles, Kamchatka, e. Siberia, Korea, Manchuria, n. China, and N. America.

6. *Pyrola fauriana* H. Andres. *P. minor* sensu auct. Japon., non L.—KARAFUTO-ICHI-YAKU-SŌ. Rhizomes creeping, slender; leaves 3-7, approximate, ovate-elliptic, ovate-orbicular, or broadly elliptic, 2.5-3.5 cm. long, 2-3 cm. wide, rounded and mucronulate at apex, rounded or shallowly cordate at base and abruptly decurrent, obsoletely short-toothed, the petioles 2-4 cm. long; scapes 10-20 cm. long, angular, naked except for a few basal scales; racemes rather densely 7- to 17-flowered; flowers white, sometimes pinkish, about 6 mm. across, the bracts lanceolate, membranous, 4-6 mm. long; calyx-segments elliptic or broadly ovate, subacute, about 1.5 times as long as wide; styles thick, scarcely curved; anthers short.—July-Aug. Hokkaido, Honshu (mountains in n. distr.); rare.—s. Kuriles and Sakhalin.

7. *Pyrola secunda* L. *Orthilia parviflora* Raf.; *Ramischia secunda* (L.) Garcke; *O. secunda* (L.) House.—KŌ-ICHI-YAKU-SŌ. Rhizomes creeping, with few whorls of false leaf verticils in 3's or 4's; leaves thinly coriaceous to herbaceous, ovate to broadly so or sometimes elliptic, 1.5-3 cm. long, 1-2 (-2.5) cm. wide, acute to subobtusely rounded at base, the petioles 1-1.5 cm. long; scapes slender, 7-12 cm. long, loosely and minutely papillose, the scales 1-3, narrowly ovate or broadly lanceolate, 2-5 mm. long, rather densely 8- to 15-flowered; flowers greenish white, one-sided, about 5 mm. across, the bracts membranous, broadly oblanceolate or broadly lanceolate, 3-5 mm. long, abruptly acute, the margins somewhat hyaline, the pedicels slender, rather prominently papillose; calyx-segments depressed-orbicular, minutely toothed, about as long as wide; styles long-exserted; capsules about 4 mm. across.—July-Aug. Damp coniferous woods; Hokkaido, Honshu (centr. and n. distr.).—Widely distributed in boreal areas of the Northern Hemisphere.

2. *MONESSES* Salisb. ICHIGE-ICHI-YAKU-SÔ ZOKU

Small evergreen glabrous stoloniferous perennial; leaves radical, petiolate, somewhat coriaceous; flowers solitary, terminal on scapes, white or pink; calyx persistent; stamens 10 or 8, the filaments slender, glabrous, the anthers erect, reflexed in bud, 2-locular, with 2 short tubular pores at apex, disc 10- or 8-lobed; ovary 5-locular, superior, globose; style erect, columnar, slightly thickened at apex; ovules on thickened placenta on the inner angle of the locule; capsules subglobose, 5-ridged, 5-locular, 5-valved, the valves septate; seeds numerous, small, with a netlike loose testa at both ends.—One species of wide distribution in the N. Hemisphere.

1. *Moneses uniflora* (L.) A. Gray. *Pyrola uniflora* L.; *M. grandiflora* S. F. Gray.—ICHIGE-ICHI-YAKU-SÔ. Leaves 2-4 at the apex of the rhizomes, ovate-orbicular or nearly orbicular, 1-1.5 cm. long, rounded to very obtuse, subrounded to broadly cuneate at base, minutely toothed, shortly decurrent on the petioles, deep green and slightly lustrous, paler beneath, the petioles 6-8 mm. long; scapes 5-10 cm. long, loosely 1- to 2-scaled in upper part, the scales membranous,

oblong to obovate, 2-3 mm. long, obtuse, ciliate; flowers white, about 2 cm. across, nodding; petals 5 or 4, orbicular, sessile, spreading; calyx-segments 5 (sometimes 4), ovate-elliptic, about 2.5 mm. long, rounded at apex, ciliate; style 4-5 mm. long, the stigma 5-lobed; capsules erect, about as long as the style, depressed obovate-globose.—July. Woods; Hokkaido; very rare.—Sakhalin, Korea, China, Siberia to Europe, and N. America.

3. *CHIMAPHILA* Pursh UMEGASA-SÔ ZOKU

Herbs or subshrubs; leaves petiolate, evergreen, falsely verticillate, lanceolate to narrowly ovate, coriaceous, lustrous, toothed; flowers solitary or in terminal corymbs, white or purplish, bracteolate; calyx 5-lobed, persistent, the segments obtuse; petals 5, orbicular, concave, spreading to reflexed, sessile, deciduous; stamens 10, the filaments short, dilated and ciliate on the lower half, the anthers 2-locular, opening by the terminal pores; style short, obconical, the stigma rounded, entire or with 5 undulate teeth; ovules very many; capsules subglobose, 5-locular; seeds small, the testa loosely reticulate at both ends.—Few species, in Europe, N. America, and Asia.

- 1A. Leaves broadly lanceolate, broadest below the middle, toothed nearly to the base; flowers 1 or sometimes 2; bracts broadly lanceolate; calyx-segments narrowly ovate to broadly lanceolate, 2-4 times as long as wide, nearly as long as the corolla. 1. *C. japonica*
 1B. Leaves oblanceolate, broadest below the apex, long-cuneate below, toothed only on upper half; flowers 3-9; bracts broadly linear; calyx-segments ovate-orbicular, about as long as wide, $\frac{1}{4}$ as long as the corolla. 2. *C. umbellata*

1. *Chimaphila japonica* Miq. *C. astyla* Maxim.—UMEGASA-SÔ. Subshrub; stems simple or scarcely branched, erect, terete, 5-10 cm. long, slender, few-leaved, glabrous; leaves opposite or in 3's, alternating with the scalelike leaves, coriaceous, rather lustrous, broadly lanceolate, 2-3.5 cm. long, 6-10 mm. wide, acute or rarely obtuse, mucronate, rounded to subacute at base, deep green with paler midrib above, glabrous, few-toothed, the petioles 6-8 mm. long; peduncles erect, with 1 or 2 bracts on the upper portion, papillose; flowers 1 or sometimes 2, nodding, white, about 1 cm. across, not fully open; calyx-segments membranous, 6-7 mm. long, irregularly toothed; corolla-lobes obovate-orbicular, 7-8 mm. long; capsules depressed-globose, about 5 mm. across, the stigma sessile.—June-July. Dry woods in hills and low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin, s. Kuriles, Korea, Manchuria, and China.

2. *Chimaphila umbellata* (L.) Barton. *Pyrola umbellata* L.; *C. corymbosa* Pursh.—Ô-UMEGASA-SÔ. Low subshrub; stems 5-12 cm. long, rather slender, erect, simple or sparsely branched, glabrous; leaves verticillate, rather many, thick-coriaceous, cuneate-oblanceolate, 3-5 cm. long, 6-10 mm. wide, obtuse to subacute, lustrous, glabrous, few-toothed above the middle, the nerves impressed above, the petioles 3-6 mm. long; peduncles 5-10 cm. long, papillose, 3- to 9-flowered, the pedicels erect, 1.5-2.5 cm. long, the bracts broadly linear, 3-4 mm. long; flowers white, sometimes roseate, about 8 mm. across, not fully open; calyx-segments ovate-orbicular, about 2 mm. long, irregularly toothed; corolla-lobes suborbicular; capsules depressed-globose, about 6 mm. across; stigma nearly sessile.—July. Dry woods especially near the sea; Hokkaido, Honshu (Hitachi Prov. and northw.); rare.—Sakhalin to Europe, and N. America.

4. *MONOTROPA* L. SHAKUJÔ-SÔ ZOKU

Saprophytic, fleshy, usually white or reddish, black when dry; stems simple, terete, with alternate scalelike leaves; flowers solitary or in a terminal raceme, nodding; calyx-lobes 4 or 5, deciduous; petals 4 or 5, longer than the sepals, deciduous, oblong, often saccate at base; stamens 8-10, sometimes 12, erect, filiform-linear, the anthers short; disc adnate to the base of ovary, 8-10 or rarely 12-toothed; capsules 4- or 5-locular, erect, loculicidally dehiscent, the valves septate within, the placenta remaining on the persistent axis; style columnar, erect, the stigma infundibuliform; seeds small, very many.—Few species, in the temperate regions of the N. Hemisphere.

- 1A. Flowers terminal and solitary; style thick and short. 1. *M. uniflora*
 1B. Flowers in a terminal raceme; style longer than the ovary. 2. *M. hypopitys*

1. *Monotropa uniflora* L. *M. uniflora* var. *nipponica* Makino; *M. morisoniana* Michx.; *Hypopitys uniflora* (L.) Crantz.—GINRYÔ-SÔ-MODOKI, YÛREI-SÔ-MODOKI, AKI-NO-GINRYÔ-SÔ. White, fleshy, saprophytic herb, becoming black when

dry; stems erect, simple, terete, 10-30 cm. long, with leaflike scales; scales suberect, narrowly oblong or narrowly ovate-oblong, 1-2 cm. long, 5-8 mm. wide, obtuse to rounded, rather fleshy, glabrous or only slightly pubescent under the

flower; flowers terminal, solitary, tubular-campanulate, nodding, about 2 cm. long; sepals deciduous, scalelike; petals 5, fleshy, cuneate or obovate-oblong, erect, irregularly denticulate in upper part, usually long-pubescent inside, gibbous, deciduous; capsules ellipsoid-globose, about 12 mm. long, erect; style thick, 3-4 mm. long, the stigma glabrous.—Aug.-Oct. Damp woods in hills and mountains; Honshu, Shikoku, Kyushu.—N. America, c. Asia, and India.

2. *Monotropa hypopitys* L. *Hypopitys multiflora* Scop.; *H. monotropa* Crantz; *M. hypopitys* var. *japonica* Fr. & Sav. —SHAKUJŌ-sō. Pale yellow-brown, rather fleshy saprophytic herb becoming black when dry, usually pubescent on

stems and inflorescence; scales 20-30, suberect, ovate-oblong or broadly lanceolate, 1-1.5 cm. long, 5-7 mm. wide, usually acuminate, the upper ones often irregularly toothed, rather fleshy; flowers few, tubular-campanulate, 1-1.5 cm. long, in a nodding raceme; petals cuneate-oblong, deciduous after anthesis, rather fleshy, saccate at base, rounded to obtuse and irregularly toothed at apex; capsules ellipsoid-globose, 5-7 mm. long; style rather thick, 3-5 mm. long.—July. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Europe, Siberia, Sakhalin, s. Kuriles, China, Formosa, Korea, Manchuria, and N. America.

5. MONOTROPASTRUM H. Andres GINRYŌ-SŌ ZOKU

Usually white, saprophytic, fleshy herbs; stems simple, scaly; flowers tubular-campanulate, nodding, solitary; calyx of separate, scalelike lobes which simulate the upper scalelike leaves; petals 3-5, fleshy, erect, saccate at base, slightly longer than the sepals; stamens about 10, erect, the filaments linear, usually pubescent, the anther-locules horizontally divergent, transversely split; disc 10-lobed, adnate to the base of the ovary; ovary ovoid, 1-locular, with parietal placentation; style very short, thick, the stigma infundibuliform, indigo-blue on the margin, depressed in the center; berry nodding, ovoid-globose; seeds very many, small.—Few species, in e. Asia and India.

1. *Monotropastrum globosum* H. Andres. *Monotropa uniflora* sensu auct. Japon., pro parte; *Monotropa uniflora* var. *tripetal* Makino; *Monotropastrum globosum* var. *tripetalum* (Makino) Honda—GINRYŌ-SŌ, YŪREI-TAKE, MARUMI-NO-GINRYŌ-SŌ. Usually white, rarely somewhat roseate, fleshy herb becoming black when dry; stems erect, 10-20 cm. long, terete, often long-pubescent in upper part; scales 10-20, suberect, alternate, oblong, narrowly or broadly ovate, 7-20 mm. long, 5-10 mm. wide, rounded to obtuse, sometimes denticulate;

flowers terminal, 15-25 mm. long; sepals 1-3, oblong; petals 3-5, cuneate-oblong, 1.5-2 cm. long, 5-10 mm. wide, rounded, saccate at base, white pubescent inside; filaments white-pubescent, the anthers papillose; style short, the stigma dilated, 3-5 mm. across; berry erect, ovoid-globose, abruptly narrowed to the very short thick style; seeds ovoid, small.—Apr.-Aug. Damp woods in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin, s. Kuriles, Ryukyus, and Korea.

Fam. 159. ERICACEAE TSUTSUJI KA Heath Family

Shrubs or small trees with alternate, rarely opposite or verticillate, deciduous or evergreen, simple, entire or toothed exstipulate leaves; flowers bisexual, actinomorphic or slightly zygomorphic, solitary, in racemes or panicles, or sometimes umbellate; calyx persistent, usually 4- or 5-lobed; corolla usually gamopetalous, rarely of separate petals, infundibuliform, campanulate, or urceolate, the lobes 4 or 5 or rarely fewer or many, imbricate or contorted in bud; stamens as many or twice as many as the corolla-lobes, inserted at the base of disc; anthers 2-locular, often appendaged, opening by pores or very rarely longitudinally dehiscent; ovary superior, sometimes inferior, 2- to 5-locular, the ovules many; style and stigma single and solitary; fruit a capsule or berry; seeds small, numerous, with endosperm; embryo small, in the center of the seed.—About 70 genera, with more than 1,500 species, chiefly in the temperate and cooler regions of both hemispheres and in mountains of the Tropics.

1A. Ovary superior.

2A. Fruit a septicidal capsule; seed-coat loose, prominently striate, the seeds often winged; anthers without appendage.

3A. Petals free.

4A. Petals 3; stamens 6; ovary 3-locular; leaves deciduous, glandless; flowers in racemes or panicles. 1. *Tripetaleia*

4B. Petals 5; stamens 5-10; ovary 5-locular; leaves evergreen, with sessile discoid glands; flowers in umbellate corymbs. 2. *Ledum*

3B. Petals united.

5A. Leaves ovate to lanceolate, flat.

6A. Flowers tubular-campanulate or urceolate, 4-merous, nodding; stamens not exerted. 3. *Menziesia*

6B. Flowers infundibuliform, rotate or sometimes tubular-campanulate, mostly 5-merous; stamens usually exerted. 4. *Rhododendron*

5B. Leaves usually linear, with prominently recurved or revolute margins.

7A. Leaves alternate.

8A. Flowers solitary and terminal, the corolla rotate, deeply 4-parted; stamens 8; capsules 4-valved. 5. *Bryanthus*

8B. Flowers umbellate and terminal, the corolla urceolate or campanulate, shallowly 5-lobed; stamens 10; capsules with 5 bilobed valves. 6. *Phyllodoce*

7B. Leaves opposite; flowers subumbellate; corolla infundibuliform-campanulate; anthers longitudinally split. 7. *Loiseleuria*

2B. Fruit a loculicidal capsule or rarely berrylike.

9A. Fruit a capsule, rarely berrylike.

10A. Leaves opposite or terete.

11A. Leaves opposite, decussate, scalelike, closely appressed to the branches and branchlets; flowers axillary. 8. *Cassiope*

11B. Leaves ternate or partly opposite, small, flat, spreading, rather loosely arranged on the stems and branches; flowers in a terminal verticil of 3 or in short racemes. 9. *Arctica*

- 10B. Leaves alternate.
 12A. Leaves scalelike, very many and very densely arranged; flowers terminal and solitary; fruit a dry capsule. . . . 10. *Harrimanella*
 12B. Leaves well developed, not scalelike.
 13A. Leaves and young branches with many yellow-brown discoid sessile glands; calyx 5-sected, the segments imbricate in bud; fruit dry. 11. *Chamaedaphne*
 13B. Leaves and branches without sessile discoid glands.
 14A. Prostrate shrub; flowers reddish or pink; placentae thickened, becoming fleshy. 12. *Epigaea*
 14B. Erect shrubs; flowers white to pinkish; placentae not becoming fleshy.
 15A. Bracts and bracteoles persistent or nearly so; seeds small, many.
 16A. Inflorescence racemose or subcorymbose with a distinct axis.
 17A. Calyx-lobes imbricate in bud. 13. *Leucothoe*
 17B. Calyx-lobes valvate in bud.
 18A. Valves of capsules not thickened on margin; evergreen trees or shrubs. 14. *Pieris*
 18B. Valves of capsules thickened and hardened on margin; deciduous or half-evergreen trees or shrubs. 15. *Lyonia*
 16B. Inflorescence umbellate, without a distinct axis. 16. *Andromeda*
 15B. Bracts and bracteoles absent or very small, often caducous; inflorescence umbellate or racemose-corymbose; seeds few and relatively large. 17. *Enkianthus*
 9B. Fruit a berry or berrylike, enveloped by the thickened fleshy calyx-lobes.
 19A. Calyx becoming accrescent, fleshy and enveloping the capsule; evergreen shrubs. 18. *Gaultheria*
 19B. Calyx not accrescent, dry, not enveloping the capsule; deciduous shrubs. 19. *Arctostaphylos*
 18B. Ovary inferior or half-inferior; fruit a berry or berrylike drupe; calyx persistent.
 20A. Prostrate creeping shrub; ovary half-inferior; fruit white. 20. *Chiogenes*
 20B. Erect shrubs; ovary wholly inferior; fruit red or blue-black. 21. *Vaccinium*

1. TRIPETALEIA Sieb. & Zucc. HO-TSUTSUJI ZOKU

Deciduous shrubs with entire, short-petiolate, alternate leaves; flowers in terminal panicles or racemes, white, sometimes roseate, bracteate and bracteolate; calyx small and cuplike with the margin toothed or of free segments; petals 3, free, reflexed; stamens 6, the filaments often dilated, the anthers longitudinally split above, without an appendage; ovary 3-locular, the ovules many in each locule; style slender, more or less curved upward, the stigma obsoletely 3-lobed; capsules septicidally dehiscent, often short-stipitate; seeds ovoid or ellipsoidal.—Two species, in Japan.

- 1A. Sepals free, 4–5 mm. long; capsules nearly sessile, 4–5 mm. across; inflorescence a few-flowered raceme; branches nearly terete, obtusely striate; leaves rounded to obtuse; bracts foliaceous, 5–10 mm. long. 1. *T. bracteata*
 1B. Sepals united, the calyx cup-shaped, 1–2 mm. long and wide, with 5 undulate-dentate teeth; capsules distinctly stipitate, about 3 mm. across; inflorescence a rather many-flowered panicle; branches acutely angled; leaves usually acute, the tip obtuse; bracts 2–4 mm. long. 2. *T. paniculata*

1. *Tripetaleia bracteata* Maxim. *Elliottia bracteata* (Maxim.) Benth. & Hook. f.; *Botryostege bracteata* (Maxim.) Stapf.—MIYAMA-HO-TSUTSUJI, HAKO-TSUTSUJI. Much-branched shrub with red-brown, nearly terete, obtusely striate branchlets; leaves obovate, 2.5–6 cm. long, 12–20 mm. wide, rounded to very obtuse and mucronate, subcuneate at base, glabrous or slightly ciliate while young, the petioles 1–2 mm. long; racemes 3- to 8-flowered, 6–10 cm. long, inclusive of the peduncles, puberulous, the bracts elliptic or obovate, green and foliaceous, 5–10 mm. long, rounded to very obtuse; flowers greenish white; sepals acute or obtuse, slightly ciliate; petals oblong, recurved, 8–10 mm. long.—July–Aug. High mountains; Hokkaido, Honshu (centr. and n. distr.); common northw.

2. *Tripetaleia paniculata* Sieb. & Zucc. *T. paniculata*

var. *angustifolia* Maxim.; *Gautiera triquetra* Sieb. & Zucc. pro parte; *Elliottia paniculata* (Sieb. & Zucc.) Benth. & Hook. f.; *T. yakushimensis* Nakai; *T. paniculata* var. *yakushimensis* (Nakai) Kitam.; *T. paniculata* var. *latifolia* Maxim.—HO-TSUTSUJI. Erect branched shrub with red-brown, 3-angled, glabrous branchlets; leaves obovate, to narrowly ovate-elliptic, 3–8 cm. long, 1.5–3 cm. wide, acute to obtuse, acute at base, entire, spreading-puberulent beneath, the midrib puberulent on upper and lower side, the petioles 1–2 mm. long; panicles 7–15 cm. long inclusive of the peduncle, rather densely many-flowered, puberulent, the bracts subulate-linear, 2–4 mm. long; flowers small, white to roseate; calyx cup-shaped, about 2 mm. across; petals 6–8 mm. long; fruit about 3 mm. across, the style short, about 1 mm. long.—Aug.–Sept. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.

2. LEDUM L. ISO-TSUTSUJI ZOKU

Small decumbent or ascending glandular shrubs; leaves evergreen, alternate, short-petiolate, usually rusty-pubescent, rather coriaceous, linear to lanceolate, entire with recurved or revolute margins; flowers many, white, in terminal sessile corymbs, the pedicels bracteate; calyx small, 5-toothed; petals 5, imbricate in bud, free; stamens 5 to 10, exserted, the filaments filiform, the anthers small; disc small, annular, 8- to 10-lobed; ovary 5-locular, densely glandular-dotted; styles filiform, the stigma 5-lobed; capsules ellipsoidal; seeds many.—Few species, in the cooler parts of the N. Hemisphere.

1. *Ledum palustre* L. var. *diversipilosum* Nakai. *L. palustre* var. *dilatatum* sensu auct. Japon., non Wahlb.; *L. palustre* var. *nipponicum* Nakai, and var. *yessoense* Nakai;

L. palustre var. *groenlandicum* sensu Nakai, non Rosenvinge; *L. hypoleucum* Komar.—ISO-TSUTSUJI. Rusty-tomentose, erect, aromatic shrub, 30–50 cm. high; leaves coriaceous, lance-

olate, 3-5 cm. long, 5-12 mm. wide, obtuse to acute, sometimes mucronate, deep green, entire, with yellow sessile glands especially while young, usually glaucous and white-papillose beneath, recurved on margin, the petioles 1-5 mm. long; corymbs densely many-flowered, terminal and sessile, densely puberulent, often glandular-dotted, the pedicels 1-3 cm. long, the bracts ovate, acute, caducous; flowers white, 8-10 mm. across; petals elliptic, glabrous; capsules oblong, 5-valved, obtuse at both ends, 4-5 mm. long, glandular-dotted, nodding; styles nearly as long as to slightly shorter than the capsules. —June-July. Wet boggy slopes and high moors; Hokkaido,

Honshu (n. distr.); gregarious. —Sakhalin, s. Kuriles, Korea, and e. Siberia.

Var. *decumbens* Ait. *L. palustre* var. *angustifolium* Hook.; *L. decumbens* (Ait.) Lodd. ex Steud.; *L. palustre* subsp. *decumbens* (Ait.) Hult. —HIME-ISO-TSUTSUJI. Low decumbent shrub with broadly linear, obtuse, revolute leaves 1-2 cm. long, 2-3 mm. wide, the petioles 1-2 mm. long, the pedicels slightly shorter; flowers smaller. —July. High moors in alpine regions; Hokkaido (Mount Daisetsu). —Kuriles, Korea, Siberia, and N. America.

3. MENZIESIA J. E. Smith YORAKU-TSUTSUJI ZOKU

Glabrous or pilose deciduous shrubs; leaves alternate, petiolate, elliptic, entire, membranous; flowers rather small, in terminal umbels or abbreviated racemes, nodding, white, greenish, or rose-purple, the pedicels with a caducous bract at base; calyx 4- or 5-parted; corolla urceolate, campanulate, or tubular-globose, 4- to 5-lobed, the lobes imbricate in bud; stamens as many or twice as many as the corolla-lobes, not exerted, the anthers unappendaged, opening by pores; style slender; capsules oblong to globose, erect, septically dehiscent, 4- to 5-valved; seeds minute, slightly attenuate at both ends. —About 10 species, in N. America and Japan.

- 1A. Leaves pale green beneath; corolla obliquely urceolate, 5-7 mm. long; stamens 5, as many as the corolla-lobes. 1. *M. pensandra*
 1B. Leaves usually glaucous beneath; corolla tubular-campanulate, scarcely urceolate, 10-17 mm. long; stamens 8 or 10, twice as many as the corolla-lobes.
 2A. Ovary glabrous; leaves glabrous on margin; corolla 4-lobed, glandular-pilose outside. 2. *M. goyozanensis*
 2B. Ovary hairy; leaves ciliate at least while young; corolla 4- to 5-lobed, glabrous outside.
 3A. Ovary glandular-hairy; corolla-lobes 5, not ciliate. 3. *M. cilicalyx*
 3B. Ovary with eglandular hairs; corolla-lobes 4, glandular-ciliate. 4. *M. purpurea*

1. *Menziesia pensandra* Maxim. KO-YORAKU-TSUTSUJI. Much-branched pilose pubescent shrub; leaves flat, narrowly elliptic, 2.5-5 cm. long, 1-2.5 cm. wide, acute at both ends, membranous, coarsely pilose with ascending hairs on upper side and on midrib beneath, green above, paler beneath; flowers 3-6, umbellate, yellowish, 5-7 mm. long, the pedicels 1.5-3 cm. long, obliquely spreading, slightly nodding, becoming erect in fruit, puberulous and glandular-pilose; calyx 2-3 mm. across, 5-parted, glandular-ciliate; corolla obliquely urceolate, puberulent inside at tip and on lobes; stamens 5, glabrous, the anthers broadly lanceolate, about 1.5 mm. long; ovary puberulent and glandular-pilose; style about 4 mm. long; capsules ovoid-globose, 3-4 mm. in diameter, 5-valved. —May-June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu. —Sakhalin and s. Kuriles.

2. *Menziesia goyozanensis* M. Kikuchi. GYOZAN-YORAKU. Much-branched shrub with glabrous branchlets; leaves oblong, 2.5-4 cm. long, 1-2 cm. wide, glabrous on margin, long appressed-hairy toward the margin on upper side, glaucous and nearly glabrous beneath except for the appressed hairy costa; pedicels 3-6 together, about 1 cm. long, nodding, glandular-pilose; calyx small, 4-fid, lobes broadly ovate; corolla tubular, 13-15 mm. long, 2-3 mm. across, glandular-pilose outside, short-pubescent inside, pale yellow, rose-colored outside; stamens 8, filaments pilose on lower half; ovary glabrous. —June. Honshu (Mount Gōyōzan in Rikuchū Prov.).

3. *Menziesia cilicalyx* (Miq.) Maxim. (?) *Andromeda cilicalyx* Miq.; *M. cilicalyx* var. *tubiflora* Koidz. ex Nakai; *M. tubiflora* Koidz. —USUGI-YORAKU. Shrub to 1 m. high, erect, branched, the inner bud-scales glandular-ciliate, the young branchlets glabrous or sparsely puberulous; leaves membranous, ovate-oblong or obovate, sometimes oblong, 2.5-5 cm. long, 1.5-2.5 cm. wide, subacute to subobtusate, loosely pilose especially toward the margin, ciliate at first, the hairs later

falling and leaving minute obsolete teeth, glaucous and with appressed coarse hairs on the midrib beneath, the petioles 2-4 mm. long; flowers 3-8, umbellate, tubular-campanulate, slightly oblique, pale yellow or pale greenish yellow, 13-17 mm. long, nodding, the pedicels usually 2-3 cm. long, glandular-pilose; corolla white-pubescent inside; anthers slender, about 4 mm. long; ovary with few glandular hairs; capsules about 4 mm. long, 5-valved; style 10-14 mm. long. —May-June. Mountains and hills; Honshu (Totomi and Echizen Prov. and westw.); rather common.

Var. *lasiostipes* Ohwi. KENAGA-USUGI-YORAKU. Hairs of pedicels and of calyx margin longer, partly eglandular. —Mountains; Honshu (Mino, Mikawa, and s. Shinano).

Var. *multiflora* (Maxim.) Makino. *M. multiflora* Maxim. —URAJIRO-YORAKU. Differs from the typical phase in the elongate, linear-lanceolate to lanceolate, ciliate calyx-segments 4-6 mm. long; anthers 2-3 mm. long; styles 7-10 mm. long; corolla subcampanulate, usually purplish, the umbels with a short axis 1-6 mm. long. —Mountains and hills; Hokkaido, Honshu, Shikoku; variable and rather common northw.

Var. *bicolor* Makino. *M. cilicalyx* Maxim., pro parte; *M. multiflora* var. *bicolor* Makino —TSURIGANE-TSUTSUJI. Umbels usually without the axis; calyx-lobes subrounded to elliptic, 1-2 mm. long; anthers about 2 mm. long. —May-June. Mountains and hills; Hokkaido, Honshu, Shikoku.

Var. *purpurea* Makino. *M. lasiophylla* Nakai; *M. multiflora* var. *purpurea* (Makino) Ohwi —MURASAKI-TSURIGANE-TSUTSUJI. Bud-scales puberulent on the margins; leaves coarsely long-pilose on upper side; pedicels with long glandular and eglandular hairs; corolla purple; calyx-lobes short, 1-2 mm. long. —June. Mountains; Honshu (Hakone). —Forma *glabrescens* (Nakai) Ohwi. *M. lasiophylla* var. *glabrescens* Nakai —FUJI-TSURIGANE-TSUTSUJI. Leaves glabrous on upper side. —Honshu (Kai and Suruga Prov.).

4. *Menziesia purpurea* Maxim. YÖRAKU-TSUTSUJI. Shrub with glabrous branchlets; leaves ovate or obovate-elliptic, 2.5–4.5 cm. long, 1.5–2 cm. wide, obtuse, rarely retuse, entire, sparsely ciliate, minutely glandular-hairy on upper side, glaucous and sometimes sparsely glandular-puberulent beneath, the midrib beneath loosely appressed-hairy, the petioles 3–6

mm. long; flowers 4–8, umbellate, campanulate, 12–15 mm. long, rose-purple, usually 4-merous, the pedicels loosely glandular-pilose, 1.5–2.5 cm. long; calyx-lobes glandular-ciliate; capsules 3–4 mm. long, short white-hairy while young.—Mountains; Kyushu.

4. RHODODENDRON L. TSUTSUJI ZOKU

Deciduous or evergreen shrubs or sometimes small trees; leaves alternate, petiolate, entire; flowers pedicellate, usually in terminal umbellike racemes or trusses; calyx 4- to 5(–8)-parted; corolla rotate, campanulate, or infundibuliform, rarely tubular, usually slightly oblique or regular, 4- to 5(–8)-lobed; stamens as many as or twice as many as the corolla-lobes, the anthers usually opening by terminal pores; ovules many; style slender, the stigma capitate; capsules ovoid or oblong, septicidally dehiscent, 4- to 8-valved; seeds minute, the testa loose and protruding at each end.—More than 600 species, in the cooler and temperate regions of the N. Hemisphere and in high mountains of the Tropics (one in Australia).

1A. Leaves and ovary with sessile discoid glandular scales.

2A. Leaves 2–8 cm. long.

3A. Flowers pale greenish yellow; pedicels 1–1.5 cm. long. 1. *R. keiskei*

3B. Flowers rose-purple; pedicels 5–10 mm. long.

4A. Leaves obtuse to subacute, 2–4 cm. long, partly evergreen; flowers 2.5–3.5 cm. across. 2. *R. dauricum*

4B. Leaves acute to acuminate, 3–7 cm. long, deciduous; flowers 4–5 cm. across. 3. *R. mucronatum*

2B. Leaves 1–2 cm. long; flowers rose-purple. 4. *R. parvifolium*

1B. Leaves and ovary without sessile glandular scales.

5A. Leaves evergreen, thick-coriaceous, glabrous or lanate beneath, not strigose.

6A. Bud-scales deciduous.

7A. Leaves rounded to shallowly cordate at base, usually glabrous beneath. 5. *R. brachycarpum*

7B. Leaves acute at base, usually densely rusty-tomentose beneath. 6. *R. metternichii*

6B. Bud-scales persistent.

8A. Leaves thickly brown-tomentose beneath, linear-oblanccolate, 10–15 cm. long; flowers pale rose; erect shrub. ... 7. *R. makinoi*

8B. Leaves glabrous beneath, obovate-oblong, 3–5 cm. long; flowers pale greenish yellow; prostrate shrub. 8. *R. aureum*

5B. Leaves deciduous, usually membranous, rarely partially evergreen, often strigose.

9A. Flowers in umbels from nonleaf-forming buds.

10A. Flowers solitary from the lateral buds; stamens of unequal length, the 2 upper ones much shorter, densely white-barbate, the 3 lower ones glabrous, longer; petioles glandular-pilose. 9. *R. semibarbatum*

10B. Flowers 1 to several from a terminal bud.

11A. Flowers campanulate, nodding or pendulous; leaves obovate or oblong. 10. *R. nipponicum*

11B. Flowers infundibuliform, ascending or horizontal.

12A. Flowers and young vegetative shoots terminal.

13A. Branchlets strigose; leaves sometimes semi-evergreen, alternate.

14A. Corolla white, pilose inside, tubular, the lobes spreading, small.

15A. Corolla tubular-campanulate, short-pubescent outside; anthers longitudinally dehiscent; ovary 3-locular.

15B. Corolla short-tubular to infundibuliform-campanulate, glabrous outside; anthers opening by pores; ovary 4- to 5-locular. 11. *R. tsusiophyllum*

14B. Corolla usually colored, glabrous inside, infundibuliform, large, 1.5–6 cm. across. 12. *R. tschonoskii*

16A. Bud-scales not viscid; calyx and pedicels without glandular hairs.

17A. Leaves glabrescent, coriaceous and often evergreen; flowers rose-colored, glabrous. 13. *R. tashiroi*

17B. Leaves strigose or long-hairy, deciduous or sometimes partially evergreen.

18A. Leaves glabrous beneath except on midrib; flowers solitary, terminal; corolla about 1.5 cm. across.

14. *R. serpyllifolium*

18B. Leaves pilose beneath; corolla 2–6 cm. across.

19A. Flowers with the leaves in June and July.

20A. Leaves lanceolate, acute; stamens 5; anthers dark purple. 15. *R. indicum*

20B. Leaves elliptic (summer leaves obovate); stamens 9 or fewer; anthers light in color, not dark purple.

16. *R. tamurae*

19B. Flowers with or before the leaves in April and May.

21A. Stamens 6–9; flowers rose-purple; leaves deciduous. 17. *R. komiyamae*

21B. Stamens 5(–8).

22A. Leaves usually lanceolate, acute, semi-evergreen; flowers rose-purple, 2–3 cm. across. ... 18. *R. tosaense*

22B. Leaves ovate, elliptic, or obovate.

23A. Flowers 4–5 cm. across, red; branches erect or ascending. 19. *R. kaempferi*

23B. Flowers 2–3 cm. across, rose-purple; branches spreading. 20. *R. kiusianum*

16B. Bud-scales viscid, at least on the inner side; calyx and pedicels with glandular hairs.

24A. Young branches and leaves appressed-strigose.

25A. Calyx-lobes appressed-hairy, subacute; leaves not coriaceous, mostly deciduous; flowers rose-purple, fragrant.

21. *R. yedoense* var. *poukhanense*

25B. Calyx-lobes glandular-ciliate, obtuse; leaves coriaceous, deep green and lustrous above, evergreen; flowers red, inodorous. 22. *R. scabrum*

- 24B. Young branches with appressed nonglandular hairs and spreading, somewhat glandular-tipped hairs.
 26A. Stamens 5; ovary glandular-pilose. 23. *R. macrosepalum*
 26B. Stamens 10; ovary strigose. 24. *R. ripense*
 13B. Branchlets glabrous or pilose; leaves fully deciduous, mostly fasciculate at ends of branchlets.
 27A. Leaves in 3's, terminal on the branchlets.
 28A. Ovary short glandular-pubescent, sometimes eglandular on the upper part.
 29A. Stamens 5; leaves glandular-dotted, glabrous or sparingly pubescent on upper side. 25. *R. dilatatum*
 29B. Stamens 10; leaves while young with long straight hairs.
 30A. Leaves broadly rhombic; petioles glandular-pilose; young branchlets glabrous. 26. *R. decandrum*
 30B. Leaves ovate, acute; petioles with long eglandular hairs; young branchlets hairy. 27. *R. visciatulum*
 28B. Ovary densely hirsute, the hairs eglandular.
 31A. Flowers usually after the leaves, red to deep rose; stamens nearly equal in length.
 32A. Leaves lustreless; petioles with loose coarse hairs, the pedicels with coarse hairs only on the lower portion; flowers red, before or with the leaves, April and May. 28. *R. weyrichii*
 32B. Leaves lustrous; pedicels, petioles, and capsules appressed woolly-pubescent; flowers after the leaves, May to July.
 33A. Flowers deep rose, May and June; pedicels 5-8 mm. long. 29. *R. sanctum*
 33B. Flowers red, July; pedicels 6-13 mm. long. 30. *R. amagianum*
 31B. Flowers usually before the leaves, rose-purple; stamens unequal in length.
 34A. Petioles glabrous at least on the lower part.
 35A. Pedicels and calyx densely pilose; leaves glabrous beneath. 31. *R. mayebarae*
 35B. Pedicels glabrous on upper part or loosely pilose; leaves with white appressed-hairs beneath while young.
 36A. Midrib of leaves beneath glabrous or short pilose; capsules thickly cylindric, 4-5 mm. across. 32. *R. kiyotsumense*
 36B. Midrib of leaves beneath densely barbate near the base; capsules slenderly cylindric, 2-3 mm. across. 33. *R. nudipes*
 34B. Petioles pilose throughout.
 37A. Petioles, pedicels, and young branchlets appressed-pubescent; midrib of leaves beneath glabrous or glabrescent; capsules ovoid, 7-10 mm. in diameter. 34. *R. reticulatum*
 37B. Petioles and basal part of leaf midrib beneath densely long-pubescent.
 38A. Style with short glandular hairs on lower half; capsules short-cylindric. 35. *R. wadanum*
 38B. Style glabrous; capsules ovoid-cylindric. 36. *R. lagopus*
 27B. Leaves in 5's, verticillate, terminal on the branchlets; flowers white. 37. *R. quinquefolium*
 12B. Flowers from a terminal bud, the vegetative shoots lateral.
 39A. Leaves in 5's, terminal on the branchlets, elliptic, 2.5-4.5 cm. long; branchlets quite glabrous; flowers 1 or 2, deep rose-colored; ovary glabrous. 38. *R. pentaphyllum*
 39B. Leaves alternate, the upper ones more or less approximate, oblanceolate to obovate, 5-10 cm. long; branchlets coarsely pilose while young; flowers 2-8; ovary densely pilose.
 40A. Flowers rose-purple; stamens 10. 39. *R. albrechtii*
 40B. Flowers orange-yellow, sometimes vermillion, or clear yellow; stamens 5. 40. *R. japonicum*
 9B. Flowers in loose erect racemes on leafy shoots of current growth; bracts partially persistent. 41. *R. camtschaticum*

1. *Rhododendron keiskei* Miq. *R. keiskei* var. *cordifolium* Masam.—HIKAGE-TSUTSUI. Evergreen shrub to about 1 m. high, with yellow discoid sessile scales; leaves somewhat coriaceous, lanceolate to broadly so, or rarely narrowly oblong, 4-8 cm. long, 1.2-2 cm. wide, abruptly acute to shallowly cordate at base, mostly glabrous, often puberulent on the upper side near base, sparsely scaly beneath, entire, the margin slightly recurved, the petioles 2-6 mm. long; flowers 2-5, nearly umbellate, pale greenish yellow, the pedicels 1-1.5 cm. long; calyx small, with 5 undulate teeth; corolla 5-lobed, infundibuliform, 2.5-3 cm. across, with discoid sessile scales outside; stamens 10, the filaments slightly pilose near base; style glabrous; capsules cylindric, 1-1.2 cm. long, 2.5-3 mm. across.—Apr.-May. Rocky wooded slopes in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *hypoglaucum* Suto & Suzuki. URAJIRO-HIKAGE-TSUTSUI. Leaves obovate-oblong, usually slightly glaucous beneath, with sessile discoid scales on both surfaces while young, persistent only beneath; corolla puberulent outside, scarcely scaly.—May. Honshu (Mount Ozaki in Shimotsuke); rare.

2. *Rhododendron dauricum* L. EZO-MURASAKI-TSUTSUI, TOKIWA-GENKAI. Partly evergreen branched shrub, the branchlets with sessile discoid scales; leaves rather coriaceous, oblong to ovate-oblong, 2.5-4 cm. long, 1-1.5 cm. wide,

obtuse to subacute, acute at base, with dense sessile discoid brownish scales beneath, the petioles 2-5 mm. long; flowers rose-purple, solitary, the pedicels short, covered by the bud scales at anthesis, 6-8 mm. long in fruit; calyx small, with 5 undulate teeth; corolla broadly infundibuliform, about 3 cm. across, scattered puberulent outside; stamens 10, the filaments white-pubescent at the base; styles glabrous; capsules cylindric, scaly, about 1 cm. long, 2.5-3 mm. across.—May. Hokkaido.—Korea, n. China, and e. Siberia.

3. *Rhododendron mucronulatum* Turcz. *R. dauricum* var. *mucronulatum* (Turcz.) Maxim.—KARA-MURASAKI-TSUTSUI. Deciduous shrub 1-2 m. high, with sessile discoid scales throughout and often coarse hairy; leaves somewhat coriaceous, narrowly elliptic to broadly lanceolate, 3-7 cm. long, 1.2-2.5 cm. wide, pale green beneath, acute to acuminate at both ends, sometimes glabrous, the petioles 3-10 mm. long; flowers solitary, before the leaves, broadly infundibuliform, 4-5 cm. across, rose-purple, the pedicels 5-10 mm. long; calyx small, 5-toothed; corolla loosely pubescent outside; stamens 10, the filaments white-pubescent at the base; style glabrous; capsules cylindric, 1-1.5 cm. long, 3-4 mm. across.—Apr. Honshu (Chigoku Distr.), Kyushu (n. distr.).—Korea, China, and Ussuri.

4. *Rhododendron parvifolium* Adams. *R. palustre* Turcz. ex DC.—SAKAI-TSUTSUJI. Mostly erect, much-branched evergreen shrub to 1 m. high, densely clothed with sessile discoid scales, the branchlets slender, puberulous; leaves somewhat coriaceous, narrowly elliptic or lanceolate-oblong, 1–2 cm. long, obtuse to subacute, abruptly acute at base, glabrous, sometimes brownish beneath, the midrib impressed on upper side, the petioles 1–3 mm. long; flowers 2–5, 1.5–2 cm. across, rose-purple, the pedicels 3–5 mm. long in fruit; calyx-lobes broadly ovate, 1–1.5 mm. long, obtuse; corolla glabrous, infundibuliform; stamens 10; style glabrous; capsules ovoid-oblong, 5–6 mm. long, about 3 mm. across.—Wet places in lowlands; Hokkaido (near Nemuro); rare.—Sakhalin, Korea, and e. Siberia.

5. *Rhododendron brachycarpum* D. Don. *R. fauriei* Franch.; *R. brachycarpum* var. *lutescens* Koidz.; *R. fauriei* var. *lutescens* (Koidz.) Takeda; *R. brachycarpum* var. *rosae-florum* Miyoshi—HAKUSAN-SHAKUNAGE. Evergreen shrub 1–3 m. high, the young branchlets sometimes soft brown-pubescent; leaves somewhat coriaceous, narrowly oblong, 6–15 cm. long, 2–5 cm. wide, obtuse to rounded, mucronate, rounded to shallowly cordate at base, entire, slightly recurved on margins, glabrous, deep green on upper side, paler beneath, the petioles often reddish, 1–1.5 cm. long; inflorescence 5- to 15-flowered, on a very short axis, the pedicels brown-pubescent, the bracts and bud-scales deciduous; calyx very small; corolla white or pinkish, pale green spotted on inside of upper lobe, glabrous, infundibuliform, 3–4 cm. across; stamens 10, the filaments loosely white-puberulent on lower half; ovary rusty-pubescent; style 1–1.5 cm. long, glabrous, ascending; capsules short-cylindric, becoming glabrous at maturity, 1–1.7 cm. long, 5–6 mm. in diameter.—June–July. Coniferous woods in mountains; Hokkaido, Honshu (centr. and n. distr.).—*Forma nemotoanum* Makino. *R. brachycarpum* var. *nemotoanum* (Makino) Nakai—NEMOTO-SHAKUNAGE. Stamens petaloid.—Honshu.

Var. *roseum* Koidz. *R. brachycarpum* var. *roseum* (Makino) Nakai; *R. fauriei* var. *rufescens* Nakai—SHIROBANA-SHAKUNAGE. Leaves beneath with dense, short, pale brown hairs.—Occurs with the typical phase.

6. *Rhododendron metternichii* Sieb. & Zucc. *Hymen-anthes japonica* Bl.; *R. metternichii* var. *heptamerum* Maxim.—TSUKUSHI-SHAKUNAGE. Large evergreen shrub to 4 m. high, with thick terete branches rusty-tomentose while young; leaves coriaceous, oblanceolate, 8–20 cm. long, 2.5–5 cm. wide, acute at both ends, deep green, lustrous, entire, with slightly recurved margins, densely rusty-tomentose beneath, the petioles 1–2 cm. long; inflorescence many-flowered, sessile, the bracts and bud-scales deciduous, the pedicels 2–5 cm. long, rusty-pubescent while young; corolla infundibuliform, 4–5 cm. across, 7-lobed, rose-colored, glabrous; stamens 14, the filaments white granular-pubescent on the lower half; ovary densely rusty-villous; styles glabrous, 3–3.5 cm. long; capsules ovoid-cylindric, 15–25 mm. long, 7–8 mm. in diameter, with persistent brown hairs.—May–June. Dense woods in mountains; Honshu (w. Shinano and westw.), Shikoku, Kyushu.

Var. *hondoense* Nakai. HON-SHAKUNAGE. Tomentum on the under side of leaves, appressed, thinner and paler. Occurs with the typical phase.

Var. *pentamerum* Maxim. *R. degonianum* Carr.; *R. pentamerum* (Maxim.) Matsum. & Nakai—SHAKUNAGE, AZUMA-SHAKUNAGE. Shrub to 2 m. high; leaves oblanceolate to oblong-lanceolate, 8–15 cm. long, obtuse, acute at base, with pale

brown tomentum beneath; flowers 5-merous, 3–4 cm. across; styles glabrous, 2.5–3 cm. long; capsules short-cylindric, 1.5–2 cm. long, 5–7 mm. in diameter.—May–June. Woods in high mountains; Honshu (centr. and n. distr.).

Var. *yakushimanum* (Nakai) Ohwi. *R. yakushimanum* Nakai—YAKUSHIMA-SHAKUNAGE. Tomentum more dense on leaves beneath, on the pedicels, and on the ovary; flowers 5-merous.—High mountains; Kyushu (Yakushima).

7. *Rhododendron makinoi* Tagg. *R. metternichii* var. *pentamerum* forma *angustifolium* Makino; *R. stenophyllum* Makino, non Hook. f.; *R. metternichii* var. *angustifolium* (Makino) Bean—HOSOBANA-SHAKUNAGE. Erect evergreen shrub with thick, brown-pubescent branchlets, the bud-scales remaining on the branches for several years; leaves coriaceous, lustrous, deep green, linear-oblancoate, 10–15 cm. long, 1–2 cm. wide, acute at both ends, with slightly impressed veins on upper side, thickly brown-tomentose beneath, the petioles 1–2 cm. long; inflorescence rather many-flowered, the bud-scales persistent at base, the pedicels brown-villous; calyx very small; corolla pale rose-colored, 3–4 cm. across, infundibuliform, 5-lobed; stamens 10; ovary brown-villous; style glabrous, about 3 cm. long; capsules oblong, brown-pubescent.—Mountains; Honshu (Tōtomi and Mikawa Prov.).

8. *Rhododendron aureum* Georgi. *R. chrysanthum* Pall.; *R. officinale* Salisb.—KIBANA-SHAKUNAGE. Prostrate evergreen shrub, the branches thick, minutely puberulent while young or nearly glabrous, the bud-scales persistent; leaves thick-coriaceous, glabrous, deep green, slightly paler beneath, obovate-oblong, obovate, or oblong, 3–4 (–6.5) cm. long, 1.5–2 (–2.5) cm. wide, rounded to very obtuse, slightly cuneate and acute to obtuse at base, veins impressed above, the petioles 1–1.5 cm. long; inflorescence 3- to 10-flowered, sessile, terminal, the pedicels 2.5–5 cm. long, brown-pubescent; calyx very small; corolla 2.5–3.5 cm. across, pale greenish yellow, glabrous; stamens 10, puberulous toward the base of filaments; ovary brown-pubescent; style 1.5–2 cm. long, glabrous, longer than the stamens; capsules narrowly oblong, 1–1.5 cm. long.—July–Aug. Alpine slopes; Hokkaido, Honshu (centr. and n. distr.); rare.—n. Korea, Kuriles, Sakhalin, Kamchatka, and e. Siberia.—*Forma senanense* (Yabe) Hara. *R. chrysanthum* forma *senanense* Yabe—YAE-KIBANA-SHAKUNAGE. The stamens petaloid.—Honshu (centr. and n. distr.).

Rhododendron × *nikomontanum* Nakai. NIKKŌ-KIBANA-SHAKUNAGE. Hybrid of *R. aureum* × *R. brachycarpum*.

9. *Rhododendron semibarbatum* Maxim. *Azaleastrum semibarbatum* (Maxim.) Makino—BAIKA-TSUTSUJI. Deciduous shrub about 2 m. high, the young branches slender, erect or ascending, white-puberulous and glandular-pilose; leaves membranous, fasciculate and terminal on the branchlets, elliptic to narrowly so, 3–6 cm. long, 1.5–2.5 cm. wide, acute, rounded to obtuse, or sometimes subacute at base, serrulate, green on upper side, often glaucous beneath, the midrib white-puberulent on both sides and loosely glandular-pilose beneath, the petioles 5–10 mm. long, glandular-pilose; flowers about 1.5 cm. across, white, suffused rose-purple, the pedicels white-puberulous and glandular-pilose, 5–10 mm. long; calyx with 5 short lobes, glandular-pilose; corolla short-tubular, 5-lobed; stamens unequal in length, the 2 upper filaments shorter and densely white-pubescent throughout, the 3 lower stamens with longer glabrous exerted filaments; styles glabrous; capsules globose, glandular-pilose, about 5 mm. across.—June–July. Thickets in mountains; Honshu, Shikoku, Kyushu.

10. *Rhododendron nipponicum* Matsum. *Azalea nipponica* (Matsum.) Copel.—ŌBA-TSUTSUJI. Deciduous shrub 1–2 m. high, with red-brown, peeling, lustrous bark, the branches thick, glandular-pilose while young; leaves alternate, membranous, obovate or oblong, 5–12 cm. long, 3–6 cm. wide, cuneate and sessile or nearly so at base, densely spreading ciliate, coarsely pilose and often somewhat glandular-hairy; flowers few, white, in terminal umbels, the pedicels 1.5–2 cm. long, glandular-pilose; calyx-lobes 5, ovate, obtuse; corolla 5-lobed, tubular-campanulate, 1.5–2 cm. long, nodding, short-pubescent inside at base; stamens 10, scarcely exerted; style 1–1.5 cm. long, rarely glandular; capsules oblong-ovoid, oblique, glandular-pilose, about 1 cm. long, 5–6 mm. wide.—July–Aug. Mountains; Honshu (n. and Hokuriku distr.); rather rare.

11. *Rhododendron tsusiohyllum* Sugimoto. *R. tanaka* (Maxim.) Ohwi, non Hayata; *Tsusiophyllum tanaka* Maxim.—HAKONE-KOME-TSUTSUJI. Prostrate or decumbent, much-branched shrub to 0.5 m. high, the branches densely brown-strigose; leaves rather thick, nearly sessile, elliptic to narrowly so, sometimes obovate, 7–10 mm. long, 4–6 mm. wide, acute at both ends, mucronulate, brown-strigose on upper side, on margins and midrib beneath; flowers 1–3, white, umbellate, the pedicels densely brown-strigose, 1–3 mm. long; calyx minute; corolla shallowly 4- or 5-lobed, tubular-campanulate, 7–10 mm. long, white-puberulent externally; stamens 5, included, the filaments pilose, the anthers longitudinally dehiscent; style glabrous; ovary 3-locular, densely strigose; capsules broadly ovoid.—June–July. Mountains; Honshu (Sagami, Izu, Musashi, and Suruga Prov.); rare.

12. *Rhododendron tschonoskii* Maxim. *R. tschonoskii* var. *typicum* forma *pentamerum* Makino and forma *tetramerum* Makino.—KOME-TSUTSUJI. Densely branched deciduous shrub, the branches, leaves, pedicels and capsules strigose; leaves ovate, oblong, or elliptic, 7–25 mm. long, 4–12 mm. wide, acute to subacute at both ends, sessile or subsessile; flowers 2–5, white, terminal, the pedicels 3–8 mm. long; corolla short-tubular to infundibuliform-campanulate, 6–8 mm. long, 5–10 mm. across, glabrous, but puberulent inside at the base, the lobes 4 or 5, sometimes shorter than the tube; stamens 4 or 5, slightly exerted, the filaments pubescent at base; style 2–10 mm. long; ovary 4- or 5-locular; capsules ovoid-conical, obtuse, 4–5 mm. long, 3–4 mm. across.—July. Rocky places in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea (Mount Chiisan).

Var. *trinerve* (Franch.) Makino. *R. trinerve* Franch.—Ō-KOME-TSUTSUJI. Slightly larger in all parts; leaves oblong to broadly oblanceolate, 1.5–4.5 cm. long, 7–15 mm. wide, with 1 (rarely 2) pair of prominent lateral nerves; corolla 7–10 mm. long, 7–12 mm. across; stamens longer than the style; styles 7–10 mm. long, glabrous or brownish strigose near base; capsules ovoid, 4–5 mm. in diameter, brownish strigose.—July–Aug. Honshu (n. and Hokuriku distr.).

13. *Rhododendron tashiroi* Maxim. *SAKURA-TSUTSUJI*. Evergreen or partially deciduous erect shrub, the branches, petioles, pedicels, and ovary strigose; leaves rather thick, in 3's (rarely 2's), terminal on the branches, elliptic, oblong, ovate, or sometimes ovate, deep green and lustrous on upper side, acute at both ends, long appressed-pubescent on upper side while young, the hairs somewhat persistent beneath, the petioles 5–10 mm. long; flowers 2 or 3, rose-colored, terminal, in umbels, the pedicels 1–2 cm. long; calyx small, obsolete

5-lobed; corolla 5-lobed, infundibuliform, 3.5–4 cm. across, glabrous, spotted inside at tip; stamens 10, glabrous; styles glabrous, exerted, about 2.5 cm. long; capsules ovoid-oblong, oblique, 10–12 mm. long.—Thickets and woods in hills and mountains; Kyushu (s. distr.).—Ryukyus and Formosa.

14. *Rhododendron serpyllifolium* (A. Gray) Miq. *Azalea serpyllifolia* A. Gray.—UNZEN-TSUTSUJI. Much-branched deciduous small shrub, the branches, leaves, and capsules purple-brown strigose; leaves alternate, mostly clustered toward the tip of the branchlets, broadly lanceolate, 8–15 (–20) mm. long, 3–6 mm. wide, obtuse to acute, narrowed at base, glabrous beneath except the strigose midrib, strigose on the upper surface, the petioles to 2 mm. long; flowers solitary, red to nearly white, terminal, the pedicels 2–3 mm. long; calyx 5-toothed; corolla about 1.5 cm. across, infundibuliform, glabrous; stamens 5, the filaments granular-pilose in the lower part; styles glabrous, 1.5–2 cm. long, long-exserted; capsules short-pedicelled, ovoid, about 4 mm. in diameter.—Apr.–May. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

15. *Rhododendron indicum* (L.) Sweet. *Azalea indica* L.; *A. indica* var. *lateritia* Lindl.; *R. lateritium* (Lindl.) Planch.; *R. indicum* var. *lateritium* (Lindl.) DC.—SATSUKI-TSUTSUJI, SATSUKI. Semi-evergreen or deciduous, red-brown strigose, much-branched shrub to 1 m. high; leaves often clustered toward the tip of the branchlets, rather thick, lanceolate to broadly so, 2–3.5 cm. long, 5–8 (–10) mm. wide, acute, mucronate, acuminate at base, the petioles 1–3 mm. long; flowers 1 or rarely 2, usually red, following the new leaves, the pedicels about 1 cm. long; calyx-lobes 5, ovate-orbicular; corolla 2.5–3.5 cm. across, broadly infundibuliform, glabrous, 5-lobed, spotted inside on upper lobes; stamens 5, the filaments granular-pilose on lower half, the anthers dark purple; styles glabrous, 3–5 cm. long; capsules ovoid, hairy, 7–8 mm. long.—June–Aug. Rocks in ravines; Honshu (w. Kantō Distr. and westw.), Kyushu. Widely cultivated with numerous cultivars grown in gardens; also extensively used as a parent of hybrids.

16. *Rhododendron tamurae* (Makino) Masam. *R. indicum* var. *tamurae* Makino; *R. simsii* var. *tamurae* (Makino) Kaneh. & Hatus.; *R. eriocarpon* Nakai, excl. basionym.—MARUBA-SATSUKI. Resembles the preceding; plant reddish brown-strigose; vernal leaves mostly elliptic, the summer ones obovate, 2–4 cm. long, 8–15 mm. wide, obtuse to rounded or sometimes acute; petioles 2–8 mm. long; flowers 1–2, red, terminal; pedicels about 1 cm. long; calyx-lobes 5, broadly ovate, 2–3 mm. long; corolla broadly infundibuliform, 3–4 cm. across, 5-lobed; stamens 9 or fewer, the filaments short-granular, the anthers usually light-colored; styles glabrous; capsules 7–10 mm. long, densely long-hairy, narrowly ovoid.—June–July. Thickets and thin woods in hills and low elevations in the mountains; Kyushu (Southern islands including Yakushima and Tanegashima).

17. *Rhododendron komiyamiae* Makino. *ASHI-TAKA-TSUTSUJI*. Brown-strigose deciduous shrub or small tree to 10 m. high; leaves alternate, rather thin, often disposed toward the top of the branchlets, broadly lanceolate to narrowly ovate-oblong, 2–3 cm. long, 8–12 mm. wide, acute at both ends, short-petiolate; summer leaves smaller, deciduous the following spring; flowers 1–3, rose-purple, terminal, in umbels, the pedicels 5–10 mm. long; calyx-lobes ovate, about 2 mm. long; corolla infundibuliform, 2–3 cm. across, 5-lobed, glabrous;

stamens 6-9, the filaments loosely granular-pilose on lower half, the anthers light colored; styles glabrous, about 2 cm. long; capsules elongate, conical, about 8 mm. long, 3 mm. across.—May-June. Mountains; Honshu (Suruga).

18. *Rhododendron tosaense* Makino. *R. miyazawae* Nakai & Hara.—FUJI-TSUTSUJI, MEN-TSUTSUJI. Brown-strigose, semi-evergreen, much-branched shrub 1-2 m. high; leaves rather thin, dimorphic, the vernal ones lanceolate or narrowly oblong, 1.5-3 cm. long, 5-8 mm. wide, acute at both ends, short-petiolate, the summer leaves persistent, oblanceolate or broadly linear, 1-3 cm. long, 2-4 mm. wide, abruptly acute; flowers 2-3, rose-purple, in umbels, the pedicels 3-7 mm. long; calyx-lobes 5, ovate-orbicular, 1-1.5 mm. long; corolla infundibuliform, 2-3 cm. across, 5-lobed, glabrous; stamens 5, the filaments loosely white granular-pilose; style glabrous, 2-2.5 cm. long, longer than the stamens; capsules narrowly ovoid, 5-7 mm. long.—Apr.-May. Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

19. *Rhododendron kaempferi* Planch. *R. indicum* var. *kaempferi* (Planch.) Maxim.; *R. obtusum* var. *kaempferi* (Planch.) Wils.—YAMA-TSUTSUJI. Brown-strigose, much-branched shrub 1-3 m. high; leaves alternate, rather thin, the vernal ones elliptic, or sometimes oblong to broadly ovate, 3-5 cm. long, 1-2.5 (-3) cm. wide, the summer leaves smaller, narrowly obovate, acute to obtuse at both ends, the petioles 1-4 mm. long; flowers 2-3, brick-red, rarely white or purple, terminal, in umbels, the pedicels 5-20 mm. long; calyx-lobes 5, small, usually elliptic, 2-4 mm. long; corolla infundibuliform, 3-4 cm. across, 5-lobed; stamens 5, the filaments sparsely granular-pilose on lower half; styles glabrous; capsules conical.—Apr.-May. Sunny slopes in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu. Very common and variable.

Rhododendron obtusum (Lindl.) Planch. *Asalea obtusa* Lindl.—KIRISHIMA-TSUTSUJI. Widely cultivated and probably of hybrid origin involving *R. kaempferi* and several other species.

20. *Rhododendron kiusianum* Makino. *R. indicum* var. *amoenum* a *japonicum* Maxim.; *R. amoenum* var. *japonicum* (Maxim.) Zabel; *R. kaempferi* var. *japonicum* (Maxim.) Rehd.; *R. obtusum* forma *japonicum* (Maxim.) Wils.; (?) *R. sataense* Nakai; *R. indicum* var. *japonicum* (Maxim.) Makino.—MIYAMA-KIRISHIMA. Brown-strigose, low, much-branched, often prostrate or decumbent shrub about 1 m. high; vernal leaves oblong to elliptic, 8-30 mm. long, acute at both ends, very short-petiolate, the summer leaves smaller, more or less persistent, narrowly obovate-spathulate; flowers 2-3, rose-purple, terminal, in umbels; calyx-lobes 5, short, broadly ovate, 2-3 mm. long; corolla infundibuliform, 2-3 cm. across, glabrous, 5-lobed; stamens 5, the filaments loosely granular-pilose on lower half or glabrous, the anthers often purplish; capsules ovoid, about 7 mm. in diameter, the pedicels 5-8 mm. long.—May. High mountains; Kyushu.

21. *Rhododendron yedoense* Maxim. var. *poukhanense* (Lév.) Nakai. *R. poukhanense* Lév.; *R. coreanum* Rehd.—CHŌSEN-YAMA-TSUTSUJI. Brown-strigose shrub 1-2 m. high; leaves narrowly oblong or broadly oblanceolate, 3-8 cm. long, 1-3 cm. wide, acute at both ends, loosely strigose on upper side, densely so beneath especially on the nerves, the petioles 1-5 mm. long; flowers 2-3, pale rose-purple, terminal, in umbels, the pedicels 7-10 mm. long; calyx 5-lobed, the lobes narrowly ovate, subobtusely to subacute, 4-8 mm. long;

corolla 5-6 cm. across, infundibuliform, 5-lobed, with deeply colored spots inside on the upper lobes; stamens (7-10), the filaments glabrous to papillose-pilose on the lower half, the anthers purplish; styles glabrous or with appressed hairs near base; capsules ovoid, 8-10 mm. in diameter, long-pilose.—Apr.-May. Kyushu (Tsushima).—Korea.

22. *Rhododendron scabrum* G. Don. *R. sublanco-latum* Miq.; *Asalea sublanco-lata* (Miq.) O. Kuntze; *R. indicum* var. *sublanco-latum* (Miq.) Makino.—KERAMA-TSUTSUJI, TŌ-TSUTSUJI. Brown-strigose, evergreen branched shrub; leaves rather thick, narrowly elliptic or narrowly ovate-elliptic, 4-10 cm. long, 1.5-3 cm. wide, deep green and lustrous on upper side, acute at both ends, the petioles 5-10 mm. long; flowers 1-4, vermilion, terminal, in umbels, the pedicels 1-2 cm. long; calyx-lobes 5, elliptic, 3-6 mm. long, long glandular-ciliate, obtuse to rounded; corolla infundibuliform, 6-7 cm. across, 5-lobed; stamens 10, the filaments granular-pilose at base; capsules hairy, about 1 cm. long.—Mar.-Apr. Frequently planted in southern Kyushu.—Ryukyus.

23. *Rhododendron macrosepalum* Maxim. *R. lineari-folium* var. *macrosepalum* (Maxim.) Makino.—MOCHI-TSUTSUJI. Mostly deciduous shrubs about 1 m. high; vernal leaves narrowly oblong to elliptic or ovate, 4-7 cm. long, 1-3 cm. wide, dull, acute at both ends, with spreading glandless and glandular hairs especially on under side and on the petioles, the petioles 3-7 mm. long; summer leaves sometimes persistent over winter, smaller and oblanceolate, obtuse, the petioles 3-7 mm. long; flowers 1-5, pale rose-purple, terminal, the pedicels 1.5-3 cm. long, glandular-hairy; calyx-lobes green, linear-lanceolate, acute, 2-3 cm. long, viscid; corolla about 5 cm. across, infundibuliform; stamens 5, the filaments granular-pilose; styles glabrous; capsules ovoid, 1-1.2 cm. in diameter, long glandular-pilose.—May. Sunny hillsides; Honshu (Izu, Kai, and westw. to E. Chūgoku Distr.), Shikoku; common and with numerous cultivars grown in gardens.

Rhododendron × *tectum* Koidz. MIYAKO-TSUTSUJI. Hybrid of *R. kaempferi* × *R. macrosepalum*.

24. *Rhododendron ripense* Makino. *R. mucronatum* var. *ripense* (Makino) Wils.—KISHU-TSUTSUJI. Brown-sometimes glandular-hairy shrub about 1 m. high; vernal leaves lanceolate or oblanceolate, 3-5 cm. long, 8-15 mm. wide, acute at both ends, the summer leaves usually persistent over winter, smaller, oblanceolate, usually subobtusely; flowers 1-3, rose-purple, terminal, in umbels, the pedicels 1-1.5 cm. long; calyx-lobes 5, green, lanceolate, 1-2 cm. long, gradually acute, short glandular-ciliate; corolla infundibuliform, 5-lobed; stamens 10, the filaments granular-pilose; styles glabrous; capsules ovoid, about 8 mm. in diameter, strigose.—Apr.-May. Honshu (Chūgoku Distr.), Shikoku, Kyushu (n. distr.).

25. *Rhododendron dilatatum* Miq. *R. reticulatum* forma *pentandrum* Wils.—MITSUBA-TSUTSUJI. Deciduous nearly glabrous shrub 1-2 m. high, with gray-brown branches; leaves in 3's, terminal on the branchlets, broadly ovate-rhombic, 4-7 cm. long, 3-5 cm. wide, very acute, broadly cuneate to subrounded at base, often minutely glandular-dotted on both sides, glabrous or sparsely hairy on the upper side and on the upper portion of petioles, entire, the petioles 5-15 mm. long, often puberulent; flowers 1-3, purplish, terminal, before the leaves, the pedicels 5-20 mm. long, rather densely short glandular-hairy; calyx-teeth very short; corolla 3-4 cm. across, 5-lobed; stamens 5, the filaments glabrous; styles glabrous; ovary densely glandular-puberulous; capsules

ovoid-cylindric, oblique, 1-1.2 cm. long, about 4 mm. across, short-glandular.—Apr. Honshu (Kantō, Tōkaidō, and Kinki Distr.).

26. *Rhododendron decandrum* Makino. *R. dilatatum* var. *decandrum* Makino.—TOSA-NO-MITSUBA-TSUTSUJI. Much-branched shrub resembling the preceding species; leaves broadly rhombic, more prominently brown-hairy, glabrescent with age, often short glandular-puberulent on upper side, the pedicels about 1 cm. long; calyx-teeth small, glandular-pilose; stamens 10, the anthers purplish; ovary densely short glandular-pubescent; capsules about 1 cm. long, short glandular-hairy.—Mar.–Apr. Honshu (Kinki Distr.), Shikoku, Kyushu. Possibly only a geographical variant of the preceding.

27. *Rhododendron viscistylum* Nakai. TAKAKUMA-MITSUBA-TSUTSUJI. Much-branched shrub 2-3 m. high, brown-pilose while young, glabrescent; leaves in 3's, terminal on the branchlets, ovate or oblong-ovate, 1.5-4.5 cm. long, 7-13 mm. wide, very acute, broadly cuneate at base, whitish and with obscure sessile glands beneath, the petioles 3-5 mm. long; flowers 1-2, purple, the pedicels 5-6 mm. long, glandular-puberulent; calyx-teeth short; stamens 10, unequal, the filaments glabrous; ovary ovoid, glandular.—June. Mountains; Kyushu (southern distr.).

28. *Rhododendron weyrichii* Maxim. *R. shikokianum* Makino; *R. shikokianum* var. *nudistemon* Koidz.—ON-TSUTSUJI, TSUKUSHI-ARA-TSUTSUJI. Rather large shrub to 5m. high, rusty-brown pubescent while young, glabrescent, the branches purplish; leaves in 3's, terminal on the branches, broadly ovate or ovate-orbicular, sometimes broadly rhombic, 3.5-8 cm. long, 2.5-6 cm. wide, acute, broadly cuneate to rounded at base, the petioles 5-10 mm. long; flowers 1-3, red, terminal, before or with the leaves; corolla 4-5 cm. across; stamens usually 10; styles glabrous or hairy near base; capsules shortly ovoid-cylindric, about 1 cm. long, often oblique at base.—Apr.–May. Honshu (s. Kinki Distr.), Shikoku, Kyushu.—Korea (Quelpaert Isl.).

29. *Rhododendron sanctum* Nakai. JINGŪ-TSUTSUJI. Large deciduous rusty-brown pubescent shrub to 5 m. high; leaves usually in 3's, terminal on the branchlets, broadly rhombic to broadly ovate-rhombic, 4-8 cm. long, 3-6 cm. wide, slightly lustrous and long rusty-brown hairy on upper side, paler and the midrib long-hairy beneath, abruptly acute at both ends or obtuse at base, the petioles 5-10 mm. long; flowers 3-4, deep rose, in umbels, terminal, the pedicels 5-8 mm. long; calyx-teeth small, obsolete; corolla glabrous; stamens 10, the anthers purple-brown; styles glabrous; capsules ovoid-cylindric, 1-1.5 cm. long, oblique at base, densely brown-pubescent.—May–June. Mountains; Honshu (Tōkaidō to s. Kinki Distr.).

30. *Rhododendron amagianum* Makino. *Azalea amagiana* Makino.—AMAGI-TSUTSUJI. Large deciduous shrub to 5 m. high, the branches rather slender, densely white-pubescent while young; leaves in 3's, terminal on the branchlets, broadly ovate-rhombic, 5-8 cm. long and as wide, abruptly acute, obtuse to acute at base, with scattered long brown hairs on upper side, rusty-brown appressed-pubescent beneath, especially dense on the midrib, the petioles 5-10 mm. long; flowers 2-4, red, the pedicels 6-13 mm. long, densely appressed rusty-brown pubescent; calyx-teeth minute; corolla 5-6 cm. across; stamens 10; styles white-pubescent at base; capsules narrowly ovoid-cylindric, 1.5-2 cm. long, densely brown-pilose.—July. Mountains; Honshu (Izu Prov.).

31. *Rhododendron mayebarae* Nakai & Hara. NANGO-

KU-MITSUBA-TSUTSUJI. Deciduous shrub, the branchlets essentially glabrous; leaves rhombic-ovate, glabrous, long-hairy on upper side and on margin only while young, the nerves beneath brown-pubescent while young; flowers before the leaves, purple, the pedicels 1-1.5 cm. long, densely coarse brown-hairy; calyx-teeth obscure; corolla infundibuliform, about 3.5 cm. across, 5-lobed; stamens usually 10, unequal, the filaments glabrous; ovary ovoid, densely coarse brown-hairy; styles glabrous.—Apr.–May. Kyushu.

32. *Rhododendron kiyosumense* Makino. *Azalea kiyosumensis* Makino; *R. shimidzuianum* Honda ex Makino & Nemoto.—KIYOSUMI-MITSUBA-TSUTSUJI. Deciduous shrub; branches whorled, slender, glabrous; leaves broadly rhombic, 3-6 cm. long, 2-5 cm. wide, abruptly short-acuminate, rounded to broadly cuneate at base, loosely brown-pilose while young; flowers purple, before or with the leaves, the pedicels 1-1.2 cm. long, loosely appressed brown-hairy especially on lower part; calyx-teeth minute, ciliate; corolla 3-3.5 cm. across, 5-lobed; stamens 10; style glabrous; capsules short-cylindric, oblique, about 10 mm. long, 3-5 mm. wide, brown-strigose.—Apr.–May. Honshu (s. Kantō and Tōkaidō to s. Kinki Distr.).

33. *Rhododendron nudipes* Nakai. *R. nagasakiianum* Nakai; *R. yakumontanum* Masam.—SAIKOKU-MITSUBA-TSUTSUJI. Large deciduous shrub; branches glabrous; leaves broadly rhombic, 4-8 cm. long, 3-6 cm. wide, abruptly acute, broadly cuneate at base, long brown-hairy on upper side and below while young soon becoming glabrous, the midrib beneath and upper portion of petioles persistently pale-brown villous; petioles 4-8 mm. long; flowers rose-purple, solitary or in pairs, the pedicels short, 6-10 mm. long, loosely brown-pubescent; calyx minute; corolla 3-4 cm. across; stamens 10; style glabrous; ovary densely pale-brown coarse hairy; capsules about 1 cm. long, oblique, narrowly ovoid, coarsely hairy.—May. Mountains; Honshu (Echigo, n. Shinano, and westw.), Kyushu.

34. *Rhododendron reticulatum* D. Don. *R. rhombicum* Miq.—KOBANO-MITSUBA-TSUTSUJI. Deciduous branched shrub; leaves broadly ovate to ovate-rhombic, 4-7 cm. long, 2.5-4 cm. wide, abruptly acuminate to acute, sometimes rounded at base, long brown-hairy on upper side while young, pale green and pubescent beneath especially on midrib, glabrescent, the petioles 7-12 mm. long; flowers rose-purple, the pedicels 8-12 mm. long, with coarse ascending hairs; calyx-teeth depressed, minute, often obscurely glandular-dotted on margin; corolla 3-4 cm. across; stamens 10, glabrous; styles glabrous; capsules ovoid, 7-10 mm. in diameter, oblique, with ascending coarse brown hairs.—Apr.–May. Mountains; Honshu (Tōtōmi, Shinano, and westw.), Shikoku, Kyushu.—*Forma albiflorum* (Makino) Makino. *R. rhombicum* var. *albiflorum* Makino; *R. sakawanum* Makino.—SHIROBANA-KOBANO-MITSUBA-TSUTSUJI. Flowers white.

Var. *ciliatum* Nakai. ARAGE-MITSUBA-TSUTSUJI. Hairs more persistent on branches and leaves.—Occurs with the typical phase.

35. *Rhododendron wadanum* Makino. *R. glandulistylum* Komatsu.—TŌGOKU-MITSUBA-TSUTSUJI. Deciduous brown-hairy shrub 2-4 m. high, with slender nearly glabrous branchlets; leaves broadly ovate-rhombic, 3-6 cm. long, 2-5 cm. wide, acute, mucronate, broadly cuneate at base, with long deciduous brown hairs on upper side, whitish and pale brown-pubescent beneath, the petioles short, 2-5 mm. long, rather

dense brown-pubescent; flowers rose-purple, the pedicels 8–12 mm. long, with glandless and glandular hairs; corolla 3–4 cm. across; stamens 10, glabrous; style glandular on lower half; ovary densely pale brown-hairy; capsules short-cylindric, oblique, 1–1.2 cm. long, brown-hairy.—May. Mountains; Honshu (centr. and n. distr.).

36. *Rhododendron lagopus* Nakai. *R. wadanum* var. *lagopus* (Nakai) Hara.—DAISEN-MITSUBA-TSUTSUJI. Deciduous rather high shrub, with glabrous branches; leaves in 3's, terminal, broadly rhombic, 3–6.5 cm. long, 2–5 cm. wide, acute, cuneate at base, pubescent only while young, the hairs persistent on midrib beneath; flowers solitary, rose-purple, the pedicels about 1 cm. long; calyx minute; corolla about 4 cm. across; stamens 10, glabrous; styles glabrous; ovary densely white-villous; capsules shortly ovoid-cylindric, 1–1.3 cm. long, oblique at base, brown-pilose.—Mountains; Honshu (centr. distr. and westw.), Shikoku.

37. *Rhododendron quinquefolium* Biss. & Moore. GYOY-TSUTSUJI, SHIRO-YASHIO. Large deciduous shrub 4–6 m. high, with much-branched slender glabrous branches; leaves membranous, in 5's, terminal, obovate-elliptic or rhombic-elliptic, obtuse, mucronate, usually reddish, ciliate or ciliolate, cuneate below, short white-pilose especially on the midrib above and below, the petioles 1–3 mm. long; flowers white, the pedicels glabrous to brown-pilose, sometimes loosely glandular-pilose, 1.5–2.5 cm. long; calyx-lobes lanceolate to deltoid, sometimes white-pilose, 1.5–3 mm. long; corolla 3–4 cm. across; stamens 10, the filaments white-pilose on lower half; styles glabrous or soft-pilose near base; ovary glabrous, sometimes scattered soft-pilose; capsules ovoid- to oblong-cylindric, 1–1.5 cm. long, 3.5–5 mm. across, with minute external warts.—May–June. Mountains; Honshu, Shikoku.

38. *Rhododendron pentaphyllum* Maxim. *R. quinquefolium* var. *roseum* Rehd.—AKEBONO-TSUTSUJI. Branched shrub 3–4 m. high, with glabrous branchlets; leaves rather firm, elliptic, 2.5–4.5 cm. long, 1.7–2.5 cm. wide, acute at both ends, mucronulate, ciliate, loosely callose hairy on upper side, glabrous or with loose glandular hairs on midrib and near base beneath, green on both sides, the petioles 2–5 mm. long, loosely long-hispid on margin; flowers deep rose-colored, the pedicels 1–1.5 cm. long, glabrous; corolla about 5 cm. across; stamens 10, glabrous; styles and ovary glabrous; capsules narrowly oblong, 12–15(–20) mm. long, 5–7 mm. across.—Apr.–May. Mountains; Honshu (Kii Prov. and westw.), Shikoku, Kyushu.

Var. *nikoense* Komatsu. *R. nikoense* (Komatsu) Nakai; *R. pentaphyllum* var. *villosum* Koidz.—AKA-YASHIO, AKAGI-TSUTSUJI. Pedicels glandular; five of the filaments pilose on lower portion.—Honshu (Iwaki Prov. and westw.), Shikoku, Kyushu.

39. *Rhododendron albrechtii* Maxim. MURASAKI-YASHIO, MIYAMA-TSUTSUJI. Deciduous shrub 1–2 m. high, with

rather slender, glandular-pilose branchlets; leaves relatively thin, mostly clustered near the ends of the branchlets, obovate to broadly lanceolate, 5–10 cm. long, acute to obtuse or rounded at the tip, with short thickened hairs on upper side and on margin, rarely glaucescent, the nerves beneath loosely glandular-pilose while young, the midrib spreading-pilose; flowers 3–6, terminal, deep rose to rose-purple, 3–4 cm. across, the pedicels 1–2 cm. long, densely long glandular-hairy; calyx minute, 5-toothed; corolla white-pubescent on the upper side within; stamens 10, usually densely white-pubescent near the base, styles glabrous; capsules ovoid, 8–12 mm. in diameter.—May–June. Mountains; Hokkaido, Honshu (Echizen and northw.).

40. *Rhododendron japonicum* (A. Gray) Suring. *Azalea japonica* A. Gray; *R. japonicum* var. *glaucophyllum* Hara; *A. mollis* var. *glabrior* Regel; *R. glabrior* (Regel) Nakai—RENGE-TSUTSUJI. Deciduous shrub 1–2 m. high, with rather slender, loosely pilose branchlets; leaves membranous, oblanceolate, 5–10 cm. long, 1.5–3 cm. wide, obtuse, sometimes acute or rounded and mucronate, narrowed gradually toward the base, vivid-green above, sparingly ciliate, often glaucous and minutely puberulent on the nerves beneath, loosely pilose on both sides, the petioles 3–7 mm. long; flowers 2–8, terminal, with the leaves, the pedicels 1.5–3 cm. long, often minutely white-puberulent and long-spreading glandular-hairy; corolla vermilion, orange to clear golden-yellow, 5–6 cm. across, puberulent outside; stamens 5, the filaments white-pilose near the base; styles glabrous; capsules oblong-cylindric, 2–2.5 cm. long, short white- and long brown-hairy.—Apr.–June. Mountains; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; locally common and gregarious.

41. *Rhododendron camtschaticum* Pall. *Therorhodion camtschaticum* (Pall.) Small; *R. camtschaticum* var. *pallasi-anum* Komar.—EZO-TSUTSUJI. Deciduous shrub 10–30 cm. high, the young branches loosely coarse-hairy; leaves thin-chartaceous, broadly to oblong-obovate, 2–4 cm. long, 1–2 cm. wide, rounded and mucronate, cuneate, long-ciliate, loosely coarse-pilose on both sides or only on the under side; inflorescence racemose, 1- to 3-flowered, the bracts rather leaflike, green, elliptic to obovate, glandular-pilose, the pedicels 1.5–3 cm. long; calyx-lobes narrowly elliptic to broadly lanceolate, 3-nerved, rather large; corolla red, slightly tinged with purple, 2.5–3.5 cm. across; stamens 10, the filaments densely pilose at the base; style pilose at base; ovary villous; capsules narrowly ovoid.—July–Aug. Alpine regions; Hokkaido, Honshu (Mount Iwate in Rikuchu Prov.)—Sakhalin, Ochotsk Sea area, Kuriles, Kamchatka, Alaska, and Aleutians.

Var. *barbatum* (Nakai) Tatew. *Therorhodion camtschaticum* var. *barbatum* Nakai; *R. camtschaticum* subsp. *intercedens* Hult.—ARAGE-EZO-TSUTSUJI. Very glandular-hairy.—Hokkaido.

5. BRYANTHUS Gmel. CHISHIMA-TSUGAZAKURA ZOKU

Prostrate evergreen much-branched shrub; leaves small, dense, alternate, linear; inflorescence racemose, pedunculate; flowers 4-merous, rose-colored, pedicellate; calyx 4-sected; corolla 4-merous, nearly free to the base, half-open; stamens 8, the filaments filiform, glabrous, the anthers not appendaged, opening by pores; style columnar, the stigma 4-lobed; ovary 4-locular, subglobose; capsules depressed-globose, coriaceous, septicidally dehiscent, 4-valved; seeds many, ovoid.—One species, in Japan and Kamchatka.

1. *Bryanthus gmelinii* D. Don. *Andromeda bryantha* L.; *Menziesia bryantha* (L.) Sw.; *B. musciformis* Nakai—CHISHIMA-TSUGAZAKURA. Plant 2–3 cm. high, the branches minutely pubescent; leaves coriaceous, lustrous, 3–4 mm. long, nearly 1 mm. wide, lenticular in cross section, obtuse, the margin often obscurely glandular-puberulent, the midrib impressed on both sides, white-puberulent beneath while young;

inflorescence 2–4 cm. long, white-puberulent, densely few-flowered; flowers 5–6 mm. across; calyx-segments ovate, obtuse, about 1 mm. long; corolla lobes oblong, about 3 mm. long; capsules about 4 mm. across.—July–Aug. Dry gravelly and rocky alpine slopes; Hokkaido, Honshu (centr. and n. distr.); rare.—Kuriles and Kamchatka.

5. PHYLLODOCE Salisb. TSUGAZAKURA ZOKU

Small evergreen shrub; leaves many, alternate, coriaceous, linear, subobtusely, minutely toothed, the margins strongly revolute; flowers few, axillary, nearly terminal, 2-bracteate; calyx 5-lobed, acuminate; corolla urceolate or campanulate, with 5 short lobes; stamens 10, included, the filaments filiform, the anthers opening by obovate pores; styles erect, the stigmas 5-lobed; capsules ovoid to depressed-globose, 5-locular, septically dehiscent, 5-valved, the valves bifid at apex; seeds many, ovoid.—Few species, in alpine and Arctic regions of the N. Hemisphere.

- 1A. Corolla campanulate; calyx-lobes ovate, minutely ciliate, glabrous on the back; capsules depressed-globose. 1. *P. nipponica*
 1B. Corolla urceolate.
 2A. Calyx-lobes ovate, glabrous on back, minutely ciliate; corolla pink. 2. *P. × alpina*
 2B. Calyx-lobes narrowly ovate to broadly lanceolate, glandular-pilose on back especially toward the base.
 3A. Flowers pale yellowish green; calyx-lobes green, broadly lanceolate; anthers yellow, the filaments glabrous. 3. *P. aleutica*
 3B. Flowers purplish; calyx-lobes purplish, narrowly ovate; anthers purplish, the filaments ciliate at base. 4. *P. caerulea*

1. *Phyllodoce nipponica* Makino. *P. taxifolia* sensu auct. Japon., non Salisb.; *P. amabilis* Stapf; *P. empetriformis* var. *amabilis* (Stapf) Rehd.; *P. nipponica* var. *amabilis* (Stapf) Stoker.—TSUGAZAKURA. Branched, suberect, densely leafy small shrub 7–20 cm. high, the branches angular, white-puberulent in the grooves; leaves spreading, strongly revolute and flattened, sessile, broadly linear, 5–8 mm. long, about 1.5 mm. wide, abruptly obtuse, with minute gland-tipped teeth while young, the midrib impressed on upper side, white-puberulent beneath; flowers nodding, rose to white, the pedicels 2–2.5 cm. long, glandular-pilose and white-puberulent; calyx-lobes ovate, glabrous, minutely ciliate, 1.5–2 mm. long; corolla 6–7 mm. long, campanulate.—June–Aug. Rocky places, alpine; Honshu (centr. distr. and westw.), Shikoku.

Var. *oblongo-ovata* (Tatew.) Toyokuni. *P. tsugae-folia* var. *oblongo-ovata* Tatew.; *P. nipponica* var. *tsugae-folia* (Nakai) Ohwi; *P. tsugae-folia* Nakai; *P. nipponica* subsp. *tsugae-folia* (Nakai) Toyokuni.—NAGABA-TSUGAZAKURA. Plant larger; leaves 8–12 mm. long, about 2 mm. across, the pedicels 2.5–3.5 cm. long.—July–Aug. Alpine; Hokkaido, Honshu (n. distr.).

2. *Phyllodoce × alpina* Koidz. *P. hybrida* Nakai—KO-TSUGAZAKURA. Small evergreen shrub, the branches puberulent in the grooves; leaves coriaceous, lustrous, linear, 5–7 mm. long, slightly less than 1.5 mm. wide, minutely toothed, abruptly subobtusely, glabrous, the midrib white-puberulent beneath while young; flowers nodding, pink, the pedicels 2–5, erect, 2–3 cm. long, spreading glandular-hairy and white-puberulent; calyx-lobes ovate, 2.5–3 mm. long, subacute, glabrous, ciliate; corolla urceolate, 7–8 mm. long.—July–Aug. Alpine; Honshu (centr. distr.); very rare.—Hybrid of Nos. 1 and 3.

3. *Phyllodoce aleutica* (Spreng.) A. Heller. *Menziesia aleutica* Spreng.; *P. pallasiana* D. Don; *P. taxifolia* var. *aleutica* (Spreng.) Herd.—AO-NO-TSUGAZAKURA. Small evergreen ascending or decumbent shrub 10–30 cm. high, forming dense mats; branches densely leafy, puberulent; leaves linear, 8–14 mm. long, about 1.5 mm. wide, flattened, abruptly obtuse, sessile, glabrous, grooved on upper side, minutely toothed, the teeth glandular while young, the midrib beneath elevated and white-puberulent; flowers 4–7, nodding, the pedicels 2.5–4 cm. long, puberulent and glandular-pilose; calyx-lobes broadly lanceolate, 4–5 mm. long, densely glandular-pilose especially toward the base on back; corolla urceolate, 7–8 mm. long, glabrous, pale yellowish green.—July–Aug. Wet alpine slopes; Hokkaido, Honshu (centr. and n. distr.); rather common especially on Japan Sea side.—Sakhalin, Kuriles, Kamchatka, and Alaska.

4. *Phyllodoce caerulea* (L.) Bab. *Andromeda caerulea* L.; *A. taxifolia* Pall.; *P. taxifolia* (Pall.) Salisb.—EZO-NO-TSUGAZAKURA. Evergreen decumbent much-branched shrub 10–25 cm. high, with puberulent densely leafy branchlets; leaves linear, 7–12 mm. long, about 1.5 mm. wide, abruptly obtuse, minutely toothed, glabrous, grooved on upper side, the midrib raised and white-puberulent beneath; flowers 2–5, nodding, the pedicels 2–2.5 cm. long, glandular-pilose and loosely puberulent; calyx-lobes narrowly ovate, purplish, about 4 mm. long, densely glandular-pilose, especially toward the base on back; corolla urceolate, 7–8 mm. long, purplish, loosely glandular-puberulent externally, or glabrous.—July–Aug. Alpine; Hokkaido, Honshu (n. distr.).—Northern or Arctic regions of the N. Hemisphere.

7. LOISELEURIA Desv. MINEZUO ZOKU

Depressed or prostrate evergreen shrub with decumbent densely leafy branches; leaves small, coriaceous, thick, opposite, narrow, lustrous, with revolute margins; flowers small, white to rose, 4- to 5-merous, erect, in groups of 1 to 5, terminal on the branchlets, pedicelled; calyx 4- to 5-parted, coriaceous; corolla broadly campanulate, the lobes 4 or 5, rounded, imbricate in bud;

stamens 4 or 5, included, the anthers longitudinally split; ovary subglobose, 2- to 4-locular; style short, the stigma capitate; ovules many in each locule; capsules subglobose, septicidal, erect, the valves 2-4, ovate; seeds many, ovoid.—One species, in Arctic and alpine regions of the N. Hemisphere.

1. *Loiseleuria procumbens* (L.) Desv. *Azalea procumbens* L.; *Chamaeledon procumbens* (L.) Link.—MINEZUO. Branches glabrous; leaves spreading, narrowly oblong to broadly lanceolate, 6-12 mm. long, 2.5-3 mm. wide, obtuse, acute at base, entire, glabrous and with a groove above, deep green, densely white-puberulent except on the raised midrib, the petioles very short, ascending, white-puberulent on upper side; flowers 4-5 mm. across, pale rose, glabrous, the pedicels

erect, glabrous, 4-10 mm. long; calyx-lobes broadly lanceolate, obtuse, about 2 mm. long; corolla 4- to 5-lobed, the lobes deltoid-ovate; capsules ovate-globose, acute, 3-4 mm. long, the persistent style slightly shorter than the capsule.—July. Dry alpine slopes and rocky cliffs; Hokkaido, Honshu (centr. and n. distr.); rather common.—Kuriles, Sakhalin, and widely distributed in alpine and Arctic regions of the N. Hemisphere.

8. CASSIOPE D. Don IWA-HIGE ZOKU

Dwarf evergreen shrubs, the branches often 4-angled, densely scaly-leaved; leaves small, decussate, triangular, scalelike or linear, flat or grooved in the center; flowers solitary, axillary, white or pink, nodding, bracteate, pedicellate; calyx-lobes 4 or 5, free, imbricate in bud; corolla campanulate, the short lobes often recurved; stamens 4-10(-12), included, the anthers with 2 awnlike terminal dorsal appendages opening by pores; ovary 4- or 5-locular, the ovules many; capsules globose, 4- or 5-valved, loculicidally dehiscent, erect; seeds often elongate at both ends.—Few species, in Arctic and alpine regions of the N. Hemisphere.

1. *Cassiope lycopodioides* (Pall.) D. Don. *Andromeda lycopodioides* Pall.—IWA-HIGE. Decumbent much-branched evergreen shrub; branches 4-angled, very slender, densely leafy; leaves scalelike, deep green, appressed to the branches and branchlets, ovate, 1.5-2 mm. long, obtuse, with inflexed hyaline margins, convex on the back; flowers solitary, axillary, 5-merous, nodding or pendulous, pink, the pedicels 1.5-3 cm.

long; calyx-lobes ovate, about 2 mm. long, obtuse, with hyaline margins; corolla about 8 mm. long, urceolate-campanulate; capsules globose, about 3 mm. in diameter, erect.—July. Alpine rock-cliffs and crevices; Hokkaido, Honshu (centr. and n. distr.).—Kuriles, Sakhalin, Kamchatka, and n. Pacific regions.

9. ARCTERICA Cov. KOMEDA-TSUGAZAKURA ZOKU

Dwarf evergreen shrub; leaves thick-coriaceous, verticillate in 3's, small; flowers in short terminal racemes, short-pedicel, bracteate and 2-bracteolate; calyx 5-sected, the segments narrowly ovate, obtuse; corolla urceolate, small, nodding, with 5 small lobes imbricate in bud; stamens 10, the anthers opening by pores, with 2 awnlike appendages at base on back; ovary 5-locular; capsules erect, loculicidal; style columnar, the stigma 5-lobed; seeds minute, fusiform-ovoid.—One species.

1. *Arctericia nana* (Maxim.) Makino. *Andromeda nana* Maxim.; *Cassiope oxycoccoides* A. Gray; *Pieris nana* (Maxim.) Makino; *Arctericia oxycoccoides* (A. Gray) Cov.—KOMEDA-TSUGAZAKURA. Erect shrub, 5-10 cm. high with sparsely branched erect branches 1-2 mm. thick, from subterranean creeping stems or stolons; leaves short-petiolate, spreading, ovate-oblong to oblong, 5-10 mm. long, 3-5 mm. wide, obtuse with a mucronate gland at apex, flat, entire, slightly recurved on margins, deep green and lustrous with the midrib im-

pressed above, paler and glabrous beneath; flowers nodding, often in 3's, the bracts persistent, coriaceous, narrowly ovate, 3-4 mm. long, the bracteoles and calyx-segments slightly smaller and obtuse; corolla 4-5 mm. long; capsules subglobose, about 3.5 mm. across, minutely puberulent, slightly longer than the persistent style, depressed at apex.—July. Dry alpine slopes and rocky cliffs; Hokkaido, Honshu (centr. and n. distr.); rather rare.—Kuriles and Kamchatka.

10. HARRIMANELLA Cov. JI-MUKADE ZOKU

Dwarf evergreen slender procumbent shrubs with densely leafy branches; leaves alternate, entire, linear, thick, glabrous or sometimes ciliate; flowers solitary and terminal, one-sided, bractless or the pedicels bracteate; calyx-lobes 5, free, elliptic, imbricate in bud; corolla broadly campanulate, deeply 5-lobed, the lobes imbricate in bud; stamens 10, with 2 dorsal awnlike terminal appendages on the apical part of the anther; styles short, gradually thickened at base; ovary 5-locular; capsules globose, erect, loculicidally dehiscent.—Two species, in Arctic and subarctic regions of the N. Hemisphere.

1. *Harrimanella stelleriana* (Pall.) Cov. *Andromeda stelleriana* Pall.; *Cassiope stelleriana* (Pall.) DC.—JI-MUKADE. Branches wiry and elongate, prostrate, glabrous or slightly puberulent; leaves thick, spreading, narrowly obovate-oblong or broadly oblanceolate, 2-3 mm. long, about 1 mm. wide, very obtuse, upper side flat, lustrous, deep green, glabrous, sessile; flowers solitary and terminal, ebracteate, the pedicels

3-5 mm. long, puberulent; calyx lobes obovate-oblong, about 2.5 mm. long, coriaceous, deciduous in fruit, rounded, reddish, glabrous; corolla 4-5 mm. long; capsules globose, about 3.5 mm. in diameter.—July-Aug. Dry rocky slopes, alpine; Hokkaido, Honshu (centr. distr.); rare.—Kuriles, Kamchatka, and N. America.

11. CHAMAEDAPHNE Moench YACHI-TSUTSUJI ZOKU

Rather low evergreen shrub; leaves coriaceous, flat, alternate, short-petiolate; flowers small pedicelled, in bracteate racemes in the upper axils of branches; calyx-lobes 5, free, persistent, imbricate in bud, 2-bracteate at base; corolla tubular, 5-toothed, the teeth recurved; stamens 10, included, the anthers opening by short cylindric pores; ovary 5-locular, globose; style columnar; ovules many; capsules depressed-globose, loculicidal, 5-valved; seeds in 2 series in each locule, obtusely angled.—One species.

1. *Chamaedaphne calyculata* (L.) Moench. *Andromeda calyculata* L.; *Cassandra calyculata* (L.) D. Don.—YACHI-TSUTSUJI, HOROMUI-TSUTSUJI. Shrub, loosely branched, 30–100 cm. high with erect to ascending branches; leaves narrowly oblong to obovate-oblong, 1–5 cm. long, obtuse to rounded with a mucro at apex, obtuse, subrounded, or acute at base, very short-petiolate, entire or with few obscure teeth

near tip, with sessile discoid glands on both surfaces; inflorescence 4–12 cm. long, with discoid sessile glands, the flowers on one side, on short pedicels; bracts leaflike, the bracteoles smaller than the calyx-segments, subtending the calyx; calyx-segments lanceolate; corolla white, 6–7 mm. long; capsules about 4 mm. across.—May–June. Bogs; Hokkaido.—In cooler regions of the N. Hemisphere.

12. EPICAEA L. IWA-NASHI ZOKU

Small evergreen trailing or creeping subshrubs; branches coarsely hirsute; leaves alternate, short-petioled, subcoriaceous; flowers in terminal or axillary racemes or fascicles, white to rose-colored, subsessile, with persistent bracts and bracteoles; calyx-lobes 5; corolla infundibuliform or tubular-campanulate, 5-lobed; stamens 10, included, the anthers 2-locular, without appendages, longitudinally dehiscent or opening by pores; ovary 5-locular, hirsute, many-ovuled; capsules depressed-globose, loculicidally dehiscent, the placentae thickened, fleshy.—Two species, one in Japan and another in e. N. America.

1. *Epigaea asiatica* Maxim. *Parapyrola trichocarpa* Miq.—IWA-NASHI. Prostrate shrub with ascending branches 10–25 cm. long, with reddish brown gland-tipped hairs; stems slender, woody at base; leaves oblong to ovate-oblong, 4–10 cm. long, 2–4 cm. wide, abruptly cuspidate, cordate, ciliate, deep green and lustrous on upper side, the petioles 5–20 mm. long; racemes terminal, 1–2 cm. long, nodding, the bracts and

bracteoles 8–10 mm. long, chartaceous, acuminate, ascending, the pedicels short, short-pilose; calyx-lobes chartaceous, narrowly ovate, acuminate, 7–8 mm. long, glabrous, ciliate; corolla tubular-campanulate, pale roseate, about 10 mm. long; styles minutely puberulous; capsules about 1 cm. in diameter, short-papillate-hairy.—Apr.–May. Open woods in mountains; Hokkaido (sw. distr.), Honshu. The fruit is edible.

13. LEUCOTHOE D. Don IWA-NANTEN ZOKU

Deciduous or evergreen shrubs; leaves alternate, petiolate, oblong to lanceolate, usually toothed; flowers in racemes, white bracteate and bracteolate; calyx-lobes 5, acute, persistent; corolla ovoid, urceolate, or tubular, with 5 small lobes; stamens 10, the anthers narrowed above, usually ending in 2–4 awns; ovary 5-locular, the ovules many; capsules depressed-globose, loculicidally dehiscent, 5-valved, membranous; seeds small, many.—About 35 species, in N. and S. America, Madagascar, Himalayas, and e. Asia.

1A. Leaves evergreen, toothed; inflorescence on last year's growth; corolla tubular, 1.5–2 cm. long; anthers with 4 awns. 1. *L. keiskei*

1B. Leaves deciduous, entire; inflorescence on the new growth; corolla urceolate, about 4 mm. long; anthers awnless. 2. *L. grayana*

1. *Leucothoe keiskei* Miq. *Paraleucothoe keiskei* (Miq.) Honda.—IWA-NANTEN. Glabrous evergreen shrub with elongate, often declined branches; leaves thick, lustrous, deep green, narrowly ovate to broadly lanceolate, 5–8 cm. long, 1.5–3 cm. wide, caudate, shallowly toothed, the petioles 5–8 mm. long; inflorescence racemose, terminal and axillary, nodding or drooping, 3–5 cm. long; flowers bracteate and bracteolate, the pedicels 1–1.5 cm. long; calyx-lobes broadly ovate, about 2.5 mm. long, subacute, ciliate; corolla white, 1.5–2 cm. long; filaments pilose; capsules erect, 7–8 mm. in diameter, the pedicels curved upward in fruit; styles 1–1.5 cm. long.—July–Aug. Shaded wet rocky cliffs in mountains; Honshu (Kantō, Tokaidō, and Kinki Distr.).

2. *Leucothoe grayana* Maxim. var. *oblongifolia* (Miq.) Ohwi. *L. chlorantha* var. *oblongifolia* Miq.; *Eubotryoides grayana* var. *oblongifolia* (Miq.) Hara.—HANAHIRI-NO-KI.

Deciduous erect glabrous shrub 30–100 cm. high; leaves elliptic to obovate or ovate-oblong, rarely broadly lanceolate, 3–8 cm. long, 1.5–5 cm. wide, acute to obtuse, ciliate, glabrous or loosely pilose on both sides, sometimes glaucescent beneath, the petioles to 3 mm. long; inflorescence a many-flowered, one-sided, leafy, ascending raceme 5–15 cm. long, the pedicels 3–10 mm. long; flowers nodding, pale green; calyx-segments ovate, with few glandular hairs on margin; corolla urceolate, 4–5 mm. long; filaments pilose; ovary glabrous to pilose; capsules depressed-globose, erect, 4–5 mm. in diameter.—July–Aug. Sunny slopes in mountains; Hokkaido, Honshu (centr. and n. distr.).

Var. *grayana*. *L. grayana* var. *typica* H. Boiss.; *Eubotryoides grayana* (Maxim.) Hara.—HIRO-HA-HANAHIRI-NO-KI. Leaves larger and broader.—Hokkaido, Honshu (n. distr.).

14. PIERIS D. Don ASEBI ZOKU

Evergreen glabrous or puberulent shrubs or small trees; leaves alternate, coriaceous, petiolate, toothed or rarely entire; inflorescence a terminal axillary panicle or raceme, the bracts single, the bracteoles 2 or absent; calyx-lobes 5, valvate in bud, persistent; corolla ovoid or urceolate, 5-toothed; stamens 10, the anthers longitudinally dehiscent on upper half, with 2 reflexed awn-like dorsal appendages at base; ovary 5-locular; capsules loculicidally dehiscent, the valves not thickened on margin; seeds small, many.—About 8 species, in e. Asia, Himalayas, and N. America.

1. *Pieris japonica* (Thunb.) D. Don. *Andromeda japonica* Thunb.—ASEBI. Shrub 2-4 m. high; leaves thick, broadly oblanceolate, 3-8 cm. long, 1-2 cm. wide, lustrous, deep green, serrulate, glabrous, the petiole short; inflorescence pendulous, densely many-flowered, minutely puberulent;

flowers white, nodding, short-pedicellate; calyx-segments broadly lanceolate; corolla 6-8 mm. long; filaments short-pilose; capsules depressed-globose, erect, 5-6 mm. in diameter. —Apr.—May. Sunny hills; Honshu, Shikoku, Kyushu; rather common.

15. LYONIA Nutt. NEJIKI ZOKU

Evergreen or deciduous shrubs or small trees, the branches sometimes angled; leaves alternate, petiolate, entire or serrulate, sometimes scaly-pubescent; inflorescence terminal; flowers in axillary fascicles, racemes, or panicles, the bracts single, the bracteoles 2 or absent; calyx 4- to 8-lobed, the lobes valvate in bud, persistent; corolla ovoid, urceolate, or tubular-campanulate, short-toothed; stamens 8-16, the filaments with or without 2 short appendages near the top, the anthers obtuse, without appendages, opening by pores; capsules subglobose or ovoid, loculicidally dehiscent, the valves thickened and ligneous on margin; seeds small.—About 30 species, Himalayas, e. Asia, and N. America.

1. *Lyonia ovalifolia* (Wall.) Drude var. *elliptica* (Sieb. & Zucc.) Hand-Mazz. *Andromeda elliptica* Sieb. & Zucc.; *Pieris ovalifolia* sensu auct. Japon., non D. Don; *P. ovalifolia* var. *elliptica* (Sieb. & Zucc.) Rehd. & Wils.; *P. elliptica* (Sieb. & Zucc.) K. Koch; *L. elliptica* (Sieb. & Zucc.) Okuyama; *L. neziki* Nakai & Hara.—NEJIKI. Small deciduous tree or large shrub with smooth yellow-brown bark and terete branches; leaves chartaceous, broadly ovate, ovate-elliptic, or narrowly ovate-oblong, 6-10 cm. long, 2-6 cm. wide,

abruptly acuminate, rounded to subcordate at base, white-pilose beneath especially near base; racemes 3-6 cm. long, few-leaved toward the base, from axillary buds of the last year's shoots, the bracts and bracteoles caducous, the pedicels short; calyx-lobes ovate, acute; corolla white, tubular-urceolate, 8-10 mm. long, loosely puberulent; ovary sparsely pilose; capsules 3-4 mm. in diameter, glabrous.—June. Hills and low elevations in the mountains; Honshu, Shikoku, Kyushu; common.—Formosa and China.

16. ANDROMEDA L. HIME-SHAKUNAGE ZOKU

Small bog shrubs; stems erect, simple or sparsely branched; leaves coriaceous, alternate, short-petiolate, broadly linear to lanceolate, entire and revolute, glaucous beneath; flowers small, white to rose-colored, pendulous, few in terminal sessile umbels, the pedicels bracteate and 2-bracteolate; calyx deeply 5-fid, valvate, the lobes ovate, acute; corolla urceolate, 5-toothed; stamens 10, the anthers with 2 reflexed awns at apex; ovary 5-locular, many-ovuled; capsules subglobose, loculicidally dehiscent; seeds small, obtuse.—Two species, in bogs of the N. Hemisphere.

1. *Andromeda polifolia* L. HIME-SHAKUNAGE. Small glabrous, glaucous shrub, 10-30 cm. high, the ascending stems sparingly branched; leaves broadly linear to oblong-lanceolate, 1.5-3.5 cm. long, 3-7 mm. wide, acute, very short-petiolate, with recurved margins, glaucous beneath; corolla 5-6 mm.

long, the pedicels erect, 1-2 cm. long, slender, usually reddish; capsules 3-4 mm. across, ovate-globose.—May-July. Bogs; Hokkaido, Honshu (centr. and n. distr.).—Widely distributed in the cooler regions of the N. Hemisphere.

17. ENKIANTHUS Lour. DÖDAN-TSUTSUJI ZOKU

Usually deciduous or sometimes evergreen shrubs; leaves oblanceolate to ovate-elliptic, serrulate or entire; flowers small, pendulous, in umbels or corymbose-racemes, white to red; calyx 5-fid, the segments persistent; corolla urceolate to campanulate, 5-toothed, the teeth entire or laciniate, the tube rounded or with 5 gibbosities at base; stamens 10, the anthers ventrally dehiscent with 2 awnlike dorsal appendages on back near apex; ovary 5-locular; ovules few in each locule; capsules ellipsoidal, loculicidally dehiscent; seeds few, oblong, rather large, often winged on the margins.—More than 10 species, in e. Asia and the Himalayas.

1A. Flowers in umbels, before or with the leaves; corolla with 5 gibbosities at base, the lobes entire. 1. *E. perulatus*
1B. Flowers in racemes after the leaves.

2A. Corolla urceolate; capsules pendulous; seeds wingless.

3A. Racemes white-pilose.

3B. Racemes glabrous.

2B. Corolla campanulate; capsules erect; seeds winged.

4A. Corolla-lobes entire.

4B. Corolla-lobes irregularly laciniate.

2. *E. subsessilis*

3. *E. nudipes*

4. *E. campanulatus*

5. *E. cernuus*

1. *Enkianthus perulatus* (Miq.) C. K. Schn. *Andromeda perulata* Miq.; *E. japonicus* Hook. f.; *E. perulatus* var. *japonicus* (Hook. f.) Nakai.—DÖDAN-TSUTSUJI. Much-branched deciduous shrub with glabrous branchlets; leaves obovate or elliptic-ovate, 2-4 cm. long, 1-1.5 cm. wide, abruptly acute, cuneate at base, serrulate, glabrous, the midrib puberulous on upper side, white-puberulent beneath, the petioles 5-8 mm. long; calyx-lobes linear-lanceolate, acuminate,

about 2 mm. long, glabrous; corolla pale green, ovoid-urceolate, about 8 mm. long, the pedicels 1-2 cm. long, glabrous, recurved in flower, erect in fruit; capsules narrowly oblong, erect, about 8 mm. long.—Apr. Honshu (Izu, Tōkaidō distr.), Shikoku, Kyushu. Frequently cultivated.

2. *Enkianthus subsessilis* (Miq.) Makino. *Andromeda subsessilis* Miq.; *A. nikoensis* Maxim.; *E. nikoensis* (Maxim.) Makino; *Meisteria subsessilis* (Miq.) Nakai; *Tritomodon sub-*

sessilis (Miq.) F. Maekawa—ABURA-TSUTSUJI. Much-branched erect shrub 1–3 m. high; leaves obovate or elliptic, 2–3 cm. long, 1–1.5 cm. wide, acute, acuminate at base, serrulate, white-pilose on midrib on upper side, loosely brownish pilose beneath, the petioles 1–3 mm. long, short-pilose; racemes pendulous, 5- to 10-flowered, the axis 2–3 cm. long, with short spreading white pubescence, the bracts minute, the pedicels slender, 1–2.5 cm. long, glabrous except at base; calyx-lobes ovate, about 2 mm. long, acuminate, short-awned, white-ciliate; corolla white, urceolate, about 5 mm. long; capsules glabrous, ellipsoidal, about 4 mm. long, pendulous; styles 3–3.5 mm. long; seeds narrowly oblong, about 3 mm. long, not winged.—May–July. Mountains; Honshu (centr. and n. distr.).

3. *Enkianthus nudipes* (Honda) Ohwi. *Meisteria nudipes* Honda; *Tritomodon nudipes* (Honda) Honda—KO-ABURA-TSUTSUJI. Closely allied to the preceding; leaves elliptic or obovate-elliptic, 2–3 cm. long, 1–1.5 cm. wide, acute, acuminate to long-acuminate at base, minutely serrate, glabrous on upper side, except short white-hairy on the midrib when young, pale brown appressed-pubescent beneath, the petioles 1–2 mm. long, glabrescent; racemes glabrous, pendulous, 5- to 10-flowered; calyx-lobes very acute; capsules globose-ellipsoidal, 3.5 mm. long; styles 2.5–3 mm. long.—July. Mountains; Honshu (Mikawa and Mino Prov., westw. to s. Kinki).

4. *Enkianthus campanulatus* (Miq.) Nichols. *Andromeda campanulata* Miq.; *Meisteria campanulata* (Miq.) Nakai; *Tritomodon campanulatus* (Miq.) F. Maekawa—SARASA-DÖDAN, FÜRIN-TSUTSUJI. Deciduous shrub 4–5 m. high; leaves obovate-elliptic or obovate, 3–7 cm. long, 1.5–3.5 cm. wide, subacute, serrulate, loosely pilose to glabrous on upper side, sparsely tufted brown-hairy on the nerve axils beneath, the petioles 5–12 mm. long; racemes 5- to 15-flowered, pendulous, with scattered pale brown crisp hairs, the pedicels 1–2 cm. long; calyx-lobes broadly lanceolate, acuminate, about 3 mm. long; corolla campanulate, 8–12 mm. long, pale yellow with dark red striations, the limb shallowly 5-toothed on upper quarter; style included, 5–6 mm. long; capsules elliptic, 5–7 mm. long.—June. Mountains; Hokkaido, Honshu (Kinki Distr. and eastw.).—Forma *albiflorus* (Makino) Makino. *E. campanulatus* var. *albiflorus* Makino; *Meisteria campanulata* var. *albiflora* (Makino) Nakai; *Tritomodon campanulatus* forma *albiflorus* (Makino) Hara—SHIROBANA-FÜRIN-TSUTSUJI. Flowers white.

Var. *longilobus* (Nakai) Makino. *E. longilobus* (Nakai)

Ohwi; *Meisteria longiloba* Nakai; *Tritomodon longilobus* (Nakai) Honda—TSUKUSHI-DÖDAN. Leaves elliptic to broadly so; corolla 5-toothed on upper 1/3 to 1/2; styles 4–5 mm. long.—Mountains; Kyushu.

Var. *palibinii* (Craib) Bean. *E. rubicundus* Matsum. & Nakai; *E. ferrugineus* Craib; *E. palibinii* Craib; *Meisteria rubicunda* (Matsum. & Nakai) Nakai; *E. campanulatus* var. *rubicundus* (Matsum. & Nakai) Makino—BENI-SARASA-DÖDAN. Leaves obovate to broadly so or oblong; corolla 5-toothed on upper 1/3; styles 3–4 mm. long; capsules about 4 mm. long.—June–July. Mountains; Honshu (n. Kantō and Echigo).

Var. *sikokianus* Palib. *E. sikokianus* (Palib.) Ohwi; *Meisteria sikokiana* (Palib.) Nakai; *Tritomodon sikokianus* (Palib.) Honda—KAINAN-SARASA-DÖDAN. Leaves obovate to broadly so; calyx-lobes narrowly ovate; corolla broadly campanulate, rose-colored, 5-toothed; styles slightly exserted, 4–5 mm. long.—May–June. Honshu (s. Kinki Distr.), Shikoku.

5. *Enkianthus cernuus* (Sieb. & Zucc.) Makino. *Meisteria cernua* Sieb. & Zucc.; *Tritomodon japonicus* Turcz.; *E. meisteria* Maxim.; *Andromeda cernua* (Sieb. & Zucc.) Miq.; *E. nipponicus* Palib.; *Tritomodon cernuus* (Sieb. & Zucc.) Honda—SHIRO-DÖDAN. Much-branched deciduous shrub; leaves obovate, 2–5 cm. long, 1–2 cm. wide, subacute, acute to acuminate at base, serrulate, pilose on upper side, brown-pubescent on nerves beneath especially dense near base, the petioles 3–7 mm. long; racemes pendulous, 5- to 12-flowered, loosely brown-pubescent, the pedicels 7–15 mm. long; calyx-lobes ovate, about 2 mm. long, abruptly long-acuminate; corolla broadly campanulate, 6–8 mm. long, white, the limb 5-toothed, the teeth laciniate; styles sometimes very slightly exserted, 4.5–5.5 mm. long; capsules 5–6 mm. long.—May–June. Mountains; Honshu (w. distr.), Shikoku, Kyushu.—Forma *rubens* (Maxim.) Ohwi. *Andromeda cernua* var. *rubens* Maxim.; *Tritomodon cernuus* var. *rubens* (Maxim.) Honda—BENI-DÖDAN. Flowers rubescent.

Var. *matsudae* (Komatsu) Makino. *E. matsudae* Komatsu; *Meisteria matsudae* (Komatsu) Nakai; *Tritomodon matsudae* (Komatsu) F. Maekawa—CHICHIBU-DÖDAN. Leaves broadly lanceolate to narrowly ovate, rather coarsely serrulate, slightly brown-pilose especially on midrib beneath; calyx-lobes narrowly ovate to broadly lanceolate; corolla broadly campanulate, deep red; style slightly exserted.—Apr.–May. Honshu (from Kantō to Kinki Distr.).

18. GAULTHERIA L. SHIRATAMA-NO-KI ZOKU

Small evergreen shrubs, occasionally epiphytic, often decumbent, frequently coarsely hirsute; leaves coriaceous, alternate, toothed; flowers small, in axillary racemes, rarely solitary by reduction, white or reddish, bracteate and bracteolate, the bracteoles alternate or opposite, sometimes connate, deciduous or persistent; calyx 5-lobed, usually accrescent after anthesis and surrounding the capsule; corolla urceolate or campanulate, the limb 5-toothed; stamens 10, the anthers 2-locular, the locules tubulose at tip and usually 1- or 2-awned, rarely unappended; capsules covered by the fleshy calyx, loculicidally dehiscent, 5-valved; seeds small, many.—More than 100 species, in e. and s. Asia, N. and S. America, and Australia.

1A. Flowers in racemes; fruit white when mature; anthers 4-awned; plant nearly glabrous. 1. *G. miqueliana*
1B. Flowers solitary; fruit red when mature; anthers unappended; stems, inflorescence, and calyx spreading red-brown coarse hairy.

2. *G. adenothrix*

1. *Gaultheria miqueliana* Takeda. *G. pyroloides* Hook. & Thoms. ex Miq., pro parte—SHIRATAMA-NO-KI, SHIRO-MONO. Small, erect, deep green sparingly branched ever-

green shrub, with creeping subterranean stems; leaves coriaceous, lustrous, pale green beneath, oblong to obovate-oblong, obtuse, subacute at the base, toothed, loosely puberulent on the

midrib on upper side, the veinlets reticulate, impressed on upper side, slightly raised beneath; inflorescence 2-6 cm. long, few-flowered, puberulent, the pedicels recurved, 5-7 mm. long, the bracts broadly ovate, obtuse, the bracteoles broadly lanceolate; calyx-lobes deltoid, obtuse, accrescent after anthesis, becoming white and fleshy when mature, glabrous; corolla globose, white, about 6 mm. across; styles about 3 mm. long; fruit globose, about 6 mm. across.—June-July. Coniferous woods and subalpine thickets; Hokkaido, Honshu (centr. and n. distr. and Mount Daisen in Hoki Prov.).—Sakhalin, Kuriles, and Aleutians.

2. *Gaultheria adenothrix* (Miq.) Maxim. *Andromeda adenothrix* Miq.; *Diplycosia adenothrix* (Miq.) Nakai—

AKA-MONO. Brownish red hairy small shrub with subterranean creeping stems; aerial stems 10-30 cm. long, sparingly branched, red-brown and glandular-tipped hairy; leaves coriaceous, lustrous, broadly ovate, 1.5-3 cm. long, 1-2 cm. wide, acute to short-acuminate, undulate-toothed, glabrate, the veinlets prominent, the petioles 1-2 mm. long; flowers solitary, on nodding peduncles 2-4 cm. long, the bracts and bracteoles several, ovate, acute; calyx-lobes ovate, long-hirsute, red and fleshy when mature, surrounding the capsule; corolla campanulate, white, 7-8 mm. long; capsules about 8 mm. across.—May-July. Coniferous woods and subalpine thickets; Hokkaido, Honshu, Shikoku.

19. ARCTOUS Niedenzu URASHIMA-TSUTSUJI ZOKU

Dwarf creeping subshrubs; leaves mostly fasciated at top of branchlets, alternate, petiolate, toothed, persisting over winter although not green; flowers few, pedicellate, in terminal sessile umbels, nodding; calyx 4- or 5-lobed; corolla urceolate, with 4 or 5 short lobes; stamens 8 or 10, the anthers 2-locular, opening by pores, with 2 protuberances on back; ovary 4- or 5-locular, 1-ovuled in each locule; drupe globose, black or red, juicy, 4- or 5-stoned.—About 3 species, in arctic and alpine regions of the N. Hemisphere.

1. *Arctous alpinus* (L.) Niedenzu var. *japonicus* (Nakai) Ohwi. *A. alpinus* sensu auct. Japon., non Niedenzu; *Arctous japonicus* Nakai; *Arctostaphylos alpina* var. *japonica* (Nakai) Hult.; *Arctous ruber* Nakai excl. syn.—URASHIMA-TSUTSUJI. Stems creeping, the plants matted, 2-5 cm. high; leaves thickish, mostly terminal on the branches, obovate to broadly so, 3-7 cm. long, 1-2.5 cm. wide, obtuse to rounded, with prominently impressed veinlets on upper side, serrulate,

puberulent at base of the midrib on upper side, pale green and glabrous beneath, the petioles winged; flowers white; corolla about 4 mm. long, pilose inside; drupe glabrous, black, 7-8 mm. in diameter.—June-July. Dry alpine slopes; Hokkaido, Honshu (centr. and n. distr.); rather rare.—Kuriles, Sakhalin. The typical phase occurs in Siberia, Europe, and N. America.

20. CHIOGENES Salisb. HARIGANE-KAZURA ZOKU

Slender evergreen creeping subshrubs; leaves small, alternate, very short-petiolate; flowers small, axillary, solitary, nodding, the pedicels bibracteolate; calyx-tube adnate to the lower half of the ovary, 4-lobed; corolla short-campanulate, deeply 4-fid; stamens 8, the filaments short and broad, the anthers short, 2-locular, each locule barely 2-pointed and opening by a large median chink; ovary 4-locular, many-ovuled; berry globose or obovoid; seeds minute, rather flattened.—Two species, one in Japan, another in e. N. America.

1. *ChioGENES japonica* A. Gray. *C. hispidula* var. *japonica* (A. Gray) Makino; *Gaultheria japonica* (A. Gray) Sleumer—HARIGANE-KAZURA. Prostrate; stems very slender, much branched, hardly more than 1 mm. in diameter; leaves elliptic or obovate-elliptic, 5-10 mm. long, 3-6 mm. wide, obtuse, undulate-margined, glabrous on upper side,

scattered puberulent beneath, the petioles less than 1 mm. long; flowers white, nodding, the pedicels glabrous, about 2 mm. long, bibracteolate; fruit obovoid, 5-7 mm. in diameter, white, deflexed.—Coniferous woods; Honshu (centr. and n. distr.); very rare.

21. VACCINIUM L. SU-NO-KI ZOKU

Evergreen or deciduous shrubs or subshrubs; leaves usually alternate, simple, entire or toothed, sessile or petiolate, linear-lanceolate to suborbicular; flowers solitary or in axillary or terminal leafy racemes, bracteate and bracteolate; calyx-teeth 4 or 5, sometimes obsolete; corolla tubular, urceolate, or campanulate, the limb 4- or 5-toothed or parted nearly to the base, the teeth recurved; stamens 8 or 10, the anthers sometimes spurred on back, opening by pores; ovary inferior, 4- to 10-locular; berry red, purple-black, or white, several- to many-seeded, the calyx-lobes persistent.—About 150 species, in cooler and Arctic regions of the N. Hemisphere and at high elevations in the Tropics.

1A. Corolla urceolate, campanulate, or tubular, the lobes short, not recurved.

2A. Evergreen shrubs.

3A. Large shrub 1-3 m. high; leaves 2.5-6 cm. long, acuminate; racemes 2-5 cm. long; berry purple-black. 1. *V. bracteatum*

3B. Small shrub 5-20 cm. high; leaves 1-2.5 cm. long, rounded to very obtuse; racemes less than 2 cm. long; berry red. 2. *V. vitis-idaea*

2B. Deciduous shrubs.

4A. Ovary 4- or 5-locular.

5A. Anthers awnless; dwarf subshrub 2-5 cm. high; corolla campanulate; fruit red. 3. *V. praestans*

5B. Anthers awned; shrubs more than 5 cm. high; corolla urceolate.

- 6A. Branches angled; flowers solitary in axils of new shoots.
 7A. Leaves membranous, vivid green in dried specimens; fruit red. 4. *V. yatabei*
 7B. Leaves chartaceous, brownish in dried specimens, sometimes glaucouscent.
 8A. Leaves entire, elliptic to broadly ovate, the veinlets slender and only slightly raised beneath. 5. *V. ovalifolium*
 8B. Leaves serrulate, broadly ovate to ovate-orbicular or sometimes elliptic, the veinlets prominently raised and reticulate beneath. 6. *V. shikokianum*
 6B. Branches terete; flowers 1-3(-4) in short terminal corymbs from shoots of previous season; leaves obovate or obovate-orbicular, rarely elliptic, entire; fruit purple-black. 7. *V. uliginosum*
 4B. Ovary 10-locular.
 9A. Inflorescence few-flowered, on previous year's branchlets; small shrubs.
 10A. Branches slightly flattened, glabrous; leaves lanceolate to narrowly ovate, nearly glabrous; fruit purple-black. 8. *V. yakushimense*
 10B. Branches terete, more or less puberulent; leaves broadly lanceolate to broadly ovate, puberulent.
 11A. Calyx-tube and young fruit 5-angled; fruit red, the receptacle rather broad. 9. *V. hirtum*
 11B. Calyx-tube and young fruit terete, not angled; fruit black, the receptacle rather narrow. 10. *V. smallii*
 9B. Inflorescence many-flowered, racemose, terminal on the new branchlets; large shrubs.
 12A. Inflorescence and young branchlets with stipitate glands; leaves chartaceous, callose-hairy toward the margin, the hairs gland-tipped only while young; bracts rather small, thinly chartaceous. 11. *V. oldhamii*
 12B. Inflorescence and young branchlets short-pubescent or glabrescent, not glandular-pilose; leaves rather coriaceous, scarcely pilose above; bracts usually large, chartaceous.
 13A. Plant mostly pilose. 12. *V. ciliatum*
 13B. Plant mostly glabrous. 13. *V. sieboldii*
 1B. Corolla deeply 4-parted, the lobes recurved.
 14A. Erect shrub; leaves deciduous, usually toothed. 14. *V. japonicum*
 14B. Usually creeping subshrubs; leaves evergreen, entire.
 15A. Leaves 5-12 mm. long; peduncles puberulent. 15. *V. oxycoccum*
 15B. Leaves 3-6 mm. long; peduncles usually glabrous. 16. *V. microcarpum*

1. *Vaccinium bracteatum* Thunb. *V. buergeri* Miq.; *V. donianum* var. *ellipticum* Miq.; *V. idzuroei* Fr. & Sav.; *V. taquetii* Lévl.; *Pieris fauriei* Lévl.; *P. coreana* Lévl.—SHASHAMBO. Much-branched large evergreen shrub or small tree, 1-3 m. high, the branches rather slender, gray-brown or gray, glabrous or punctate-puberulent while very young; leaves coriaceous, lustrous, elliptic-ovate or narrowly elliptic, 2.5-6 cm. long, 1-2.5 cm. wide, obsoletely serrulate, acuminate, with 2 glands near the base, glabrous or puberulent on the midrib on upper side, the petioles 2-4(-6) mm. long; racemes 2-5 cm. long, puberulent, more than 10-flowered, the bracts lanceolate, the flowers nodding; corolla white, tubular-ovoid, 5-7 mm. long, puberulent or glabrous; fruit globose, about 5 mm. in diameter, purple-black, glaucouscent, the calyx-teeth persistent.—July. Low elevations in the mountains; Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu.—s. Korea, Ryukyus, and China.

Var. *lanceolatum* Nakai. NAGABA-SHASHAMBO. Leaves broadly oblanceolate, 4-8 cm. long, 1-2 cm. wide.—Occurs with the typical phase.

2. *Vaccinium vitis-idaea* L. *V. vitis-idaea* var. *minus* Lodd.; *V. jesoense* Miq.—KOKEMOMO. Dwarf evergreen subshrub, 5-20 cm. high, simple to sparingly branched, with long-creeping subterranean stems; leaves coriaceous, 1-2.5 cm. long, 5-13 mm. wide, obovate-elliptic to obovate, rounded to very obtuse, lustrous, deep green on upper side, paler with dark spots beneath, glabrous on both sides, slightly recurved on margin, the petioles 0.5-1.5 mm. long; flowers nodding, in short terminal racemes; corolla campanulate, 6-7 mm. long, 4-lobed, white to reddish; berries globose, red, 4-7 mm. in diameter.—June-July. Coniferous woods and alpine slopes; Hokkaido, Honshu, Shikoku, Kyushu; common northward, rare in Shikoku and Kyushu.—Korea, Kuriles, Sakhalin to Europe, and N. America.

3. *Vaccinium praestans* Lamb. IWA-TSUTSUJI. Dwarf deciduous scarcely branched glabrous subshrub, 2-5 cm. high, with long-creeping subterranean branches; leaves chartaceous

to submembranous, broadly ovate, broadly elliptic, or obovate-orbicular, 3-6 cm. long, 3-5 cm. wide, rounded to acute, serrulate, often loosely pilose on margin and on nerves beneath; flowers 1-3, terminal, puberulent, the bracts and bracteoles herbaceous, the pedicels rather short; corolla campanulate, 5-6 mm. long, white to reddish; berries globose, about 1 cm. in diameter, red, the receptacles 4-5 mm. across.—June-July. Coniferous woods; Hokkaido, Honshu (centr. and n. distr.); rare.—Kuriles, Sakhalin, Kamchatka, Amur, and Ussuri.

4. *Vaccinium yatabei* Makino. *V. myrtillosum* sensu auct. Japon., non L.; *V. myrtillosum* var. *yatabei* (Makino) Matsum. & Komatsu—HIME-USU-NO-KI, AO-JIKU-SU-NO-KI. Small glabrous branched deciduous shrub 10-20 cm. high, the stems 2-4 mm. across at base, the branches green becoming gray-brown in age, acutely 4-angled; leaves thinly membranous, ovate to broadly so, 1-2 cm. long, 7-13 mm. wide, acute, mucronate, vivid green when dried, serrulate, sparingly puberulent on the nerves, very short-petioled; flowers with the leaves, solitary, the pedicels glabrous, short; calyx-teeth short; corolla greenish white, urceolate, 4-5 mm. long; berry globose, red.—May-June. Coniferous woods; Honshu (centr. distr. and Kantō); rare.

5. *Vaccinium ovalifolium* J. E. Smith. *V. axillare* Nakai; (?) *V. yesoense* Koidz.; *V. ovalifolium* var. *membranaceum* H. Boiss.—KURO-USUO. Glabrous much-branched deciduous shrub 30-100 cm. high; stems 5-15 mm. thick near base, the branches yellow-brown, acutely 4-angled; leaves sub-chartaceous, elliptic to broadly ovate, 2-4 cm. long, 1.5-2.5 cm. wide, obtuse, acute to obtuse at base, glabrous, entire, slightly glaucouscent beneath, weakly nerved on both sides, subsessile; flowers solitary, nearly terminal, nodding, the pedicels ebracteate, 7-12 mm. long, glabrous; calyx-limb short, obsoletely toothed; corolla urceolate, about 5 mm. long, pale green; berries blue-black, globose, bloomy, 8-10 mm. in diameter, sweet and edible.—June-July. Alpine; Hokkaido, Honshu (centr. and n. distr.); rather common.—c. Asia and N. America.—Forma *obovoideum* (Takeda) Hara. *V.*

axillare var. *obovoideum* Takeda.—NAGAMI-KURO-USUGO. Berries obovoid.—Forma *platyanthum* (Nakai) Hara. *V. axillare* var. *platyanthum* Nakai.—MIYAMA-KURO-USUGO. Corolla depressed-urceolate.

Var. *coriaceum* H. Boiss. *V. axillare* var. *coriaceum* (H. Boiss.) Hara; *V. chamissoni* sensu auct. Japon., non Bong.—EZO-KURO-USUGO. Leaves broadly ovate, serrulate, especially on lower half.—Occurs with the typical phase.—Forma *angustifolium* (Nakai) Ohwi. NAGABA-KURO-USUGO. Narrow-leaved phase.

6. *Vaccinium shikokianum* Nakai. *V. ovalifolium* var. *coriaceum* H. Boiss. pro parte.—MARUBA-USUGO, SHIKOKU-USUGO. Closely resembles the preceding; branches gray-brown, glabrous, acutely angled; leaves subcoriaceous, broadly ovate to ovate-obicular, or sometimes broadly elliptic, 1.5–2.5 cm. long, 1–2.5 cm. wide, rounded to obtuse, sometimes shallowly cordate at base, serrulate, glabrous, glaucous and with prominently raised veinlets beneath, subsessile; flowers solitary, opening with the leaves, pale greenish, nodding, the pedicels 5–7 mm. long, naked; calyx-limb short; corolla urceolate, about 5 mm. long; awns of the anthers slightly exceeding the anther length; berries blue, globose, about 8 mm. in diameter.—Alpine; Honshu (n. distr. and Japan Sea side of centr. distr.); rare.

7. *Vaccinium uliginosum* L. KURO-MAME-NO-KI. Branched deciduous shrub 30–70 cm. high; stems to 1–2 cm. across, the branches terete, glabrous, brownish; leaves thick-chartaceous, obovate to obovate-obicular, rarely elliptic, 1.5–2.5 cm. long, 1–2 cm. wide, rounded to very obtuse, acute to subcuneate at base, entire, whitish and with raised veinlets beneath, the petioles 1–2 mm. long; flowers few, glabrous, the pedicels 5–7 mm. long; calyx-teeth deltoid; corolla 5–7 mm. long, urceolate, greenish to pinkish; berries globose, 6–7 mm. in diameter, blue-black, bloomy.—June–July. Alpine; Hokkaido, Honshu (centr. and n. distr.).—Mountainous regions of the N. Hemisphere.

8. *Vaccinium yakushimense* Makino. AKU-SHIBA-MODOKI. Nearly glabrous branched deciduous shrub, branches green, slightly flattened, with a deep groove on each side; leaves lanceolate to narrowly ovate, 3–6 cm. long, 1–1.5 cm. wide, long-acuminate, acute to subrounded at base, serrulate, glabrous except the midrib puberulent on the upper side; flowers 1 or 2 near the top of last year's branchlets, the pedicels glabrous, about 3 mm. long; corolla small, urceolate; berries obovoid-globose, purple-black, about 9 mm. in diameter.—High mountains; Kyushu (Yakushima); rare.

9. *Vaccinium hirtum* Thunb. *V. buergeri* Miq., pro parte; *V. buergeri* var. *minor* Miq.; *V. pterocarpum* Nakai; *V. kiusianum* Koidz.; *V. hirtum* var. *kiusianum* (Koidz.) Hara; *V. motoukanum* Koidz.; *V. usunoki* Nakai; *V. buergeri* var. *usunoki* (Nakai) Koidz.—USU-NO-KI, KAKUMI-SU-NO-KI. Much-branched erect shrub to 1 m. high, the young branchlets green, rather slender, curved-puberulent, obscurely 2-grooved; leaves slightly bitter in taste, membranous, narrowly to broadly ovate, sometimes broadly lanceolate, 2–5 cm. long, 1–2.5 cm. wide, acuminate, usually rounded at base, serrulate, vivid green and sometimes reddish, usually rounded at base, puberulent especially the midrib on upper side, white-pubescent beneath near base; flowers 1–3, on shoots of last year, greenish to pinkish; calyx 5-toothed; berries obovoid-globose or subglobose, red.—May. Thickets and pine woods in hills and low elevations in the mountains; Hokkaido, Honshu, Shikoku,

Kyushu; rather common and very variable.—Forma *lasiocarpum* (Koidz.) Ohwi. *V. hirtum* var. *lasiocarpum* Koidz.; *V. lasiocarpum* (Koidz.) Nakai.—KE-USU-NO-KI. Prominently white-pubescent throughout.

10. *Vaccinium smallii* A. Gray. *V. hirtum* var. *smallii* (A. Gray) Maxim.—OBA-SU-NO-KI. Much-branched erect shrub about 1 m. high, the branches terete, the branchlets slender, often shallowly 2-grooved, usually curved-puberulent; leaves membranous, slightly acid in taste, oblong, elliptic, or broadly ovate, 3–8 cm. long, 1.5–3 cm. wide, acuminate to acute, acute to obtuse at base, serrulate, puberulent on the midrib on upper side and somewhat so on the midrib beneath, the petioles 1–1.5 mm. long; flowers 1–3, on the shoots of last year, nodding, pedicellate, greenish white to pinkish; calyx-tube not angled, the teeth oval to obtuse-deltoid, commonly with few minute stipitate glands on margin; corolla campanulate, 6–7 mm. long; berries globose, 7–8 mm. in diameter, not angled, purple-black, the receptacle narrow.—Apr.–May. Thickets and sunny places in mountains; Hokkaido, Honshu (centr. and n. distr.); rather common.—s. Kuriles and Sakhalin.

Var. *glabrum* Koidz. *V. politum* Koidz.; *V. hirtum* var. *versicolor* Koidz.; *V. versicolor* (Koidz.) Nakai; *V. versicolor* var. *glabrum* (Koidz.) Hara; *V. versicolor* var. *minus* (Nakai) Hara; *V. kansaiense* Koidz.—SU-NO-KI. Leaves rather small, 2–4 cm. long, 1–2 cm. wide, usually less hairy.—Thickets and pine woods in hills and low elevations in the mountains; Honshu, Shikoku.

11. *Vaccinium oldhamii* Miq. NATSU-HAZE. Erect shrub 1–3 m. high, the branches dark brown, the branchlets gray-brown, short curved-puberulent and stipitate-glandular while young, terete, rather slender; leaves elliptic, oblong or ovate, 3–8 cm. long, 2–4 cm. wide, acute to short-acuminate, acute or rarely rounded at base, serrulate with glandular-tipped teeth, puberulent on midrib and often scattered coarse hairy on upper side, pale green and coarsely pilose on midrib beneath, with 2 sessile glands on the margin near base, the petioles 1–2.5 mm. long, puberulent; racemes 3–6 cm. long, terminal on young new shoots, rather densely many-flowered, curved-puberulent and stipitate glandular, the bracts lanceolate to narrowly ovate, 4–7 mm. long, acuminate, somewhat persistent in fruit, the pedicels 1–3 mm. long; calyx-teeth depressed-deltoid; corolla campanulate, 4–5 mm. long, pale yellow-brown and reddish, glabrous, 5-toothed; berries black, bloomy, globose, 6–7 mm. in diameter, the calyx-teeth persistent.—May–June. Thickets and woods at low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—s. Korea and China.

12. *Vaccinium ciliatum* Thunb. *V. santanense* Koidz.—ARAGE-NATSU-HAZE. Large erect shrub, the branches dark brown or gray brown, terete, short-puberulent while young; leaves elliptic, obovate-elliptic, or broadly ovate, 3–5 (–8) cm. long, 2–3 (–4.5) cm. wide, acute to subobtusate, acute or rarely subrounded at base, entire, puberulent on midrib on upper side, spreading coarse-hairy beneath, the petioles 1–3 mm. long; racemes elongate, 3–7 cm. long, terminal on new shoots, rather densely many-flowered, the bracts narrowly ovate to lanceolate, the pedicels 3–4 mm. long, puberulent; berries globose, black, bloomy, 5–7 mm. in diameter.—Honshu (Tango, Suwō, and Nagato Prov.), Kyushu.

13. *Vaccinium sieboldii* Miq. *V. danianum* var. *elliptica* Miq.; *V. longeracemosum* Fr. & Sav.; *V. nagurae* Makino;

FIG. 11.—*Vaccinium sieboldii* Miq. 1, Flowering branch; 2, fruiting branch; 3, berry; 4, flower; 5, 6, stamens; 7, style; 8, flower.

V. ciliatum var. *sieboldii* (Miq.) Okuyama—NAGABO-NATSUHAZE. FIG. 11. Large shrub, the branches usually gray-brown, the branchlets terete, with loose whitish curved hairs while young; leaves elliptic, ovate-elliptic, or obovate, 4–8 cm. long, 2–4 cm. wide, acuminate to acute, acute at base, entire, deep green and loosely puberulent on midrib on upper side, glabrous or the midrib scattered coarse-hairy beneath with 2 sessile glands on margin near base, the petioles 2–4 mm. long, usually glabrous; racemes 5–10 cm. long, rather densely many-flowered, glabrous or scattered white-pilose, the pedicels 4–8 mm. long, the bracts lanceolate to ovate, 5–10 mm. long; corolla tubular-campanulate, 4–5 mm. long; berries globose, bloomy, 5–6 mm. in diameter.—Honshu (Mikawa and Kii Prov.), reported to occur in Kyushu (Satsuma).

14. *Vaccinium japonicum* Miq. *Oxycoccus japonicus* (Miq.) Makino; *Hugeria japonica* (Miq.) Nakai; *Oxycoccoides japonicus* (Miq.) Nakai; *V. japonicum* var. *fairiei* Sleumer; *Hugeria incisa* F. Maekawa—AKU-SHIBA. Deciduous sparingly branched shrub 30–60 cm. high, the branches green, the branchlets terete or often slightly flattened, with 2 shallow grooves, usually glabrous or sometimes puberulent; leaves ovate to broadly lanceolate, 2–6 cm. long, 1–3 cm. wide, acuminate, rounded to subcordate at base, vivid green and puberulent on midrib on upper side, often whitish or sometimes pale green and glabrous beneath, serrulate, subsessile, the teeth glandular while young; flowers solitary in leaf axils, the peduncles slender, 1–2 cm. long, glabrous, linear-bracteolate near the base; calyx-teeth short-deltoid; corolla 7–10 mm. long, white or pink, lobed nearly to the base, the lobes lanceolate, strongly recurved; stamens 8, the anthers red-brown, yellow at apex, linear, the filaments white-pilose; berries red, about 7 mm. in diameter; seeds impressed-punctate.—June–July. Woods in mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu.—s. Korea.

Var. *ciliare* Matsum. *Oxycoccus japonicus* var. *ciliaris* (Matsum.) Makino & Nemoto; *Hugeria japonica* var. *ciliaris*

(Matsum.) Nakai—KE-AKU-SHIBA. Leaves usually smaller and the young branchlets and peduncles glandular-pilose.—Honshu (w. distr.) and Shikoku.

15. *Vaccinium oxycocum* L. *Oxycoccus vulgaris* Hill; *O. quadripetalus* Gilib.; *O. palustris* Pers.—TSURU-KOKE-MOMO. Stems very slender, long-creeping, sparsely branched, puberulent while young, becoming dark red-brown; leaves coriaceous, oblong to narrowly ovate, obtuse to subacute, rounded at base, glabrous, lustrous and deep green, paler and glaucous beneath, entire, the margins slightly recurved, the midrib impressed on upper side, slightly raised beneath, the petioles about 1 mm. long; flowers nodding, the peduncles 3–4 cm. long, deflexed at tip, with 2 small linear bracteoles near the middle; corolla 7–10 mm. long, rose-colored, the segments broadly lanceolate, obtuse, strongly recurved; berries red, globose, about 1 cm. in diameter; seeds longitudinally rugose.—June–July. Sphagnum bogs; Hokkaido, Honshu (centr. and n. distr.).—Kuriles, Sakhalin, and widely distributed in the cooler regions of the N. Hemisphere.

16. *Vaccinium microcarpum* (Turcz.) Schmalh. *Oxycoccus microcarpum* Turcz.; *O. palustris* var. *pusillus* Dunal; *O. pusillus* (Dunal) Nakai—HIME-TSURU-KOKE-MOMO. Resembles the preceding but much slenderer; stems about 0.5 mm. across, puberulent while young, becoming dark-brown; leaves coriaceous, oblong-ovate, 3–6 mm. long, 2–2.5 mm. wide, obtuse to subacute, deep green and lustrous on upper side, glabrous, entire, paler and glaucous beneath, the margins slightly recurved, the petioles less than 1 mm. long; flowers nodding, rose-colored, the peduncles about 2 cm. long, slender, nearly glabrous, deflexed at tip, the bracteoles 2, minute, on lower half of the peduncles; corolla-segments broadly lanceolate, strongly recurved, obtuse, 6–7 mm. long; anthers yellow; styles slender, longer than the stamens; berries red, nodding, globose, 6–7 mm. in diameter.—Sphagnum bogs; Hokkaido, Honshu (Shinano and northw.); rare.—Kuriles, Sakhalin, N. Korea, and widely distributed in the N. Hemisphere.

Fam. 160. MYRSINACEAE

YABU-KŌJI KA

Myrsine Family

Mostly small evergreen shrubs or small trees, sometimes suffrutescent undershrubs; leaves simple, usually alternate, rarely opposite, entire or toothed, without stipules; inflorescences axillary or in terminal panicles, racemes, or fascicles, often on special articulating lateral branches; flowers bisexual, sometimes unisexual, 4- to 5(–6)-merous, white or pink; calyx persistent, 4- to 5(–6)-lobed; corolla gamopetalous, campanulate, cup-shaped, or rotate; stamens inserted on corolla-tube or at the base, always opposite the lobes, the anthers longitudinally splitting or opening by pores; ovary superior or semi-inferior (in *Maesa* only), 1-locular, the ovules 1 to many, imbedded in a basal or free central placenta; style simple, the stigma entire, lobed, or fringed; fruit a drupe or berry; seeds 1 or many (in *Maesa*), the endosperm fleshy or horny.—About 25 genera, with about 1,000 species, chiefly in tropical and subtropical regions.

- 1A. Ovary and fruit semi-inferior; flowers bibracteolate; seeds many. 1. *Maesa*
 1B. Ovary and fruit superior; flowers without bracteoles; seeds solitary, globose.
 2A. Corolla-lobes dextrorsely contorted; flowers bisexual; inflorescence paniculate, corymbose, or subumbellate. 2. *Ardisia*
 2B. Corolla-lobes valvate or imbricate in bud, not contorted; flowers fasciated in axils, usually unisexual, rarely bisexual. 3. *Myrsine*

1. MAESA Forsk. IZU-SENRYŌ ZOKU

Erect or decumbent, evergreen shrubs or small trees; leaves toothed or entire, glabrous or pubescent, usually glandular within; inflorescence terminal or axillary, racemose or paniculate; flowers small, bisexual or unisexual, 5-merous, with 2 bracteoles at base or on the pedicels; calyx-lobes persistent on sides or near apex of semi-inferior ovary; corolla tubular, cup-shaped or campanulate, the lobes glandular-striate within; stamens inserted on the corolla-tube, the filaments distinct, nearly as long as the ovoid to reniform anthers; ovary with a globose placenta, many-ovuled; style columnar, slender, the stigma entire or 3- to 5-lobed; fruit a globose to ovoid, fleshy berry; seeds small, many, angular.—About 100 species, chiefly in the Tropics of the Old World, a few in Australia and Africa.

- 1A. Corolla tubular-campanulate, the tube 2 or 3 times longer than the ascending or erect lobes; bracteoles broadly ovate to reniform, rounded to very obtuse. 1. *M. japonica*
 1B. Corolla broadly campanulate, the tube nearly as long as the spreading lobes; bracteoles lanceolate, small, acute. 2. *M. tenera*

1. *Maesa japonica* (Thunb.) Moritz. *Doraena japonica* Thunb.; *M. doraena* (Thunb.) Bl.; *M. coriacea* Champ. —IZU-SENRYŌ. Dioecious shrub about 1 m. high, with much-elongate arcuate-declining branches; branchlets glabrous, green, loosely lenticellate; leaves oblong to elliptic, sometimes broadly lanceolate or broadly elliptic, 5–17 cm. long, 2–5 cm. wide, acuminate, rounded to acute at base, loosely short-toothed or subentire, deep green and slightly lustrous on upper side, glabrous on both sides except for loose brownish granular short hairs while very young, the lateral nerves 5–8 pairs, weak, ending in the teeth, the petioles 1–1.5 cm. long; racemes axillary, sometimes compound in the staminate ones, 1–2 cm. long; bracteoles broadly ovate to reniform, rounded or obtuse, glandular-striate; flowers about 5 mm. long; calyx-teeth deltoid; corolla yellowish white, tubular-campanulate, the lobes about 1/3 as long as the tube; fruit globose, about 5 mm. across, milky white, brownish striate.—Apr.–June.

Woods in low mountains; Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and Indochina.

2. *Maesa tenera* Mez. *M. formosana* Mez; *M. sinensis* sensu auct. Formos., non DC.—SHIMA-IZU-SENRYŌ, KARABAGANE. Glabrous branched shrub; leaves elliptic or oblong, 8–13 cm. long, 3–5 cm. wide, acute at both ends, coarsely undulate-toothed or subentire, the petioles 1–1.5 cm. long; inflorescence axillary, a simple or rarely a compound raceme, 1–5 cm. long; bracteoles lanceolate, acute; calyx-teeth ovate; corolla 2.5–3 mm. long, white or slightly purplish, the tube about as long as the spreading rounded lobes; fruit globose, 3.5–4 mm. across, obsolete striate, the upper 1/4–1/3 exerted beyond the calyx-lobes.—Mar.–Apr. Woods and thickets in hills and low mountains; Kyushu (Osumi, Satsuma Prov., incl. Koshiki Isl.).—Ryukyus, Formosa, and China.

2. ARDISIA Sw. YABU-KŌJI ZOKU

Trees or shrubs or creeping suffrutescent undershrubs; leaves usually alternate, sometimes opposite or subverticillate in the suffrutescent species, entire, undulate or sometimes toothed, usually with marginal glands; inflorescence a terminal or axillary panicle, corymb, or umbellate corymb; flowers small, bisexual or polygamous, 4- or 5-merous, white or pink, usually glandular; sepals almost free or more or less united at base, dextrorsely contorted, sometimes imbricate or valvate; corolla gamopetalous, the lobes dextrorsely contorted; stamens inserted at base of corolla-tube, the filaments short, the anthers erect, dehiscing by longitudinal slits or rarely by pores; ovary superior, 1-locular, the placenta globose, bearing 3–12 ovules in 1–3 series; fruit a berrylike globose drupe, with a solitary seed, the persistent style simple, slender, the stigma apiculate, punctate.—About 250 species, chiefly in the Tropics of Asia and America, few in Australia.

- 1A. Small shrubs with long slender, more or less creeping stems, the aerial stems ascending, scarcely branched, 5–30 cm. long, 2–4 mm. in diameter; leaves verticillately arranged; inflorescence lateral, leafless.
 2A. Creeping stems without leaves; stem-leaves rather coriaceous, 6–13 cm. long, many-toothed.
 3A. Stems and peduncles with very short and minute glandular hairs; peduncles 1–1.5 cm. long; calyx-lobes broadly ovate, abruptly acute. 1. *A. japonica*
 3B. Stems and peduncles with very short and minute glandular hairs as well as spreading multicellular hairs about 0.5 mm. long; peduncles 1.5–2.5 cm. long; calyx-lobes ovate, acuminate. 2. *A. montana*
 2B. Creeping stems leafy; stems slender; leaves chartaceous, 2–6 cm. long, with less than 10 coarse teeth on each side; plant with long multicellular hairs. 3. *A. pusilla*
 1B. Small shrubs or trees without creeping stems, the erect stems usually branched; leaves alternate; inflorescence lateral or subterminal, usually on special lateral branches, these sometimes leafless.
 4A. Leaves with distinctive aluminous marginal glands, toothed or entire; fruit red; small sparsely branched shrubs.
 5A. Leaves oblong, acute to abruptly acuminate with an obtuse tip; stems and inflorescence glabrous; flowering branches few, on the upper part of the stems, spreading; inflorescence terminal, sessile. 4. *A. crenata*
 5B. Leaves lanceolate or broadly so, gradually narrowed to an obtuse tip, green; upper part of stem and the inflorescence more or less minutely granular-puberulent; inflorescence axillary and long-peduncled. 5. *A. crispa*
 4B. Leaves without distinctive marginal glands, entire or slightly undulate; fruit dark purplish; large much-branched shrubs.
 6A. Branches and peduncles rather thick; calyx-segments broadly ovate, subobtus; leaves pale grayish brown when dried, the midrib not prominent. 6. *A. sieboldii*
 6B. Branches and peduncles rather slender; calyx-segments deltoid, short, subacute; leaves darkened when dried, dark purplish brown beneath, the midrib rather slender. 7. *A. quinquegona*

1. *Ardisia japonica* (Thunb.) Bl. *Bladhia japonica* Thunb.—YABU-KŌJI. Usually a low unbranched suffrutescent shrub with minute hairs on upper part of stems, inflorescence, and young petioles; creeping stems elongate, sparingly branched, leafless; stems ascending, 10–30 cm. long, 2–3 mm. in diameter, terete, with few whorls of verticillate leaves; leaves oblong or narrowly so, 6–13 cm. long, 2–5 cm. wide, acute at both ends, short mucronate-toothed, lustrous, deep green, glabrate, the petioles 7–13 mm. long; inflorescence in the axils of leaves or scalelike leaves, the peduncles slender,

spreading, 1–1.5 cm. long, the pedicels 2–5, subumbellate, 7–10 mm. long; flowers white, nodding, 6–8 mm. across, rotate; calyx-segments broadly ovate, abruptly acute, ciliolate; fruit globose, red, 5–6 mm. across.—July–Aug. Woods in hills and low mountains; Hokkaido (Okushiri Isl.), Honshu, Shikoku, Kyushu.—Korea, China, and Formosa.

Var. *angusta* (Nakai) Makino & Nemoto. *Bladhia japonica* var. *angusta* Nakai.—HOSOGA-YABU-KŌJI. Leaves lanceolate, 2–5 cm. long, 6–20 mm. wide.—Honshu (Izuoshima), Kyushu (Yakushima).

2. *Ardisia montana* (Miq.) Sieb. ex Fr. & Sav. *A. japonica* var. *montana* Miq.; *Bladhia montana* (Miq.) Nakai —ÔTSURU-KÔJI. Resembles the preceding; creeping stems elongate, the ascending stems simple, 10–30 cm. long, 2–3 mm. in diameter, terete, with spreading pale brown multicellular hairs on the upper part; leaves subcoriaceous, in a few whorls on upper part of stems, usually in 3's or in 4's, obovate-oblong to oblong, 5–13 cm. long, 2–4 cm. wide, acute, rather coarsely and acutely toothed, with spreading hairs on midrib beneath while young, the petioles 7–15 mm. long; peduncles usually from axils of scalelike leaves between the whorls of ordinary leaves, 1.5–2.5 cm. long, slender, the pedicels 7–12 mm. long; flowers 2–6, white, 6–8 mm. across; calyx-segments ovate or narrowly so, short-acuminate, ciliate; fruit red, 5–6 mm. across, globose.—May. Woods; Honshu (Awa Prov., Izu-shichito Isl. and westw.), Kyushu. Intermediate between *A. japonica* and *A. pusilla*.

3. *Ardisia pusilla* A. DC. *Bladhia villosa* Thunb.; *A. villosa* (Thunb.) Mez, non Roxb.—TSURU-KÔJI. Creeping stems long and loosely branched, with whorls of verticillate leaves, the ends or branches becoming aerial shoots, densely hirsute with long, soft, spreading, reddish brown, multicellular hairs; leaves chartaceous, in verticils of 3's to 5's, ovate to ovate-oblong, 2–6 cm. long, 1.5–3 cm. wide, acute at base, with a few coarse subacute dentate teeth on each side, long-hirsute on both sides, the lateral nerves rather prominent beneath, ending in teeth, the petioles 5–10 mm. long; inflorescence from the axils of scalelike leaves, 2–3 cm. long, slender, long-pilose and minutely granular-puberulent; flowers 2–4, the pedicels 7–12 mm. long; calyx-segments lanceolate, acuminate; corolla white, 6–7 mm. across; fruit globose, red, 5–6 mm. across.—June–Aug. Woods; Honshu (Izu Is. and Awa Prov. westw.), Shikoku, Kyushu.—s. Korea, Ryukyus, Formosa, China, and Philippines.—Forma *liukiensis* (Nakai) Ohwi. *Bladhia villosa* var. *liukiensis* Nakai; *A. villosa* var. *liukiensis* (Nakai) Makino & Nemoto—RÛKYÛ-TSURU-KÔJI. Leaves with many prominent teeth.—Occurs in the warmer parts of our area.

4. *Ardisia crenata* Sims. *A. lentiginosa* Ker-Gawl.; *A. crispa* DC., excl. syn.; *Bladhia crenata* (Sims) Hara; *B. lentiginosa* (Ker-Gawl.) Nakai—MANRYÔ. Glabrous shrub 30–60 cm. high; stems erect, grayish brown, simple except for a few spreading special flowering and articulating branches in upper part; leaves alternate, thick, oblong, 7–12 cm. long, 2–4 cm. wide, green on upper side, reddish brown when dry, acute to short-acuminate with an obtuse tip, gradually narrowed and acuminate at base, undulately toothed with an albuminous gland between the teeth, with pellucid dots and dark brown inner glands, the lateral nerves weak and not prominent, the petioles 5–10 mm. long; inflorescence terminal on the special lateral flowering branches, sessile, or the branches leafless and becoming pedunclelike, sometimes corymbosely branched, the pedicels 1–1.5 cm. long; calyx-segments ovate, subacute or subobtusate, not ciliate, spreading; corolla about 8 mm. across, white; fruit globose, red, about 6 mm. across.—July. Woods in low mountains; Honshu (s. Kantô Distr. and westw.), Shikoku, Kyushu.—Ryukyus,

Formosa, Korea, China to India.—Forma *taquetii* (Lév.) Ohwi. *A. crispa* var. *taquetii* Lév.; *A. taquetii* Lév. ex Nakai; *Bladhia crenata* var. *taquetii* (Lév.) Hara—ÔMI-MANRYÔ. A robust phase.

5. *Ardisia crispa* (Thunb.) DC. *Bladhia crispa* Thunb.; *A. hortorum* Maxim.; *A. punctata* sensu auct. Japon., non Lindl.—KARA-TACHIBANA. Small shrub, minutely brown granular-puberulent on young stems and inflorescence; stems simple, erect, 20–40 cm. long, terete; leaves alternate, lanceolate to broadly so, 8–18 cm. long, 1.5–3.5 cm. wide, gradually narrowed to an obtuse tip, acute at base, undulately toothed, with a resinous marginal gland in sinus, vivid green, slightly paler beneath, smooth, glabrous, the petioles 8–10 mm. long; inflorescence about 10-flowered, umbellate on ends of special articulate flowering pedunclelike branches 4–7 cm. long, these usually bearing a few leaves or leaflike bracts, the pedicels about 10 mm. long; flowers white, 7–8 mm. across; calyx-lobes narrowly oblong, obtuse, not ciliate, recurved above; fruit globose, red, 6–7 mm. across.—July. Woods in hills and low mountains; Honshu (Awa Prov. and westw.), Shikoku, Kyushu.—Formosa, Ryukyus, and China.

6. *Ardisia sieboldii* Miq. *Bladhia sieboldii* (Miq.) Nakai—MOKU-TACHIBANA. Large erect loosely branched shrub, the branches grayish brown or reddish gray, rather thick, terete; leaves rather thick, broadly oblanceolate to narrowly obovate-oblong, 7–12 cm. long, 2.5–4 cm. wide, rounded with an abrupt obtuse tip, acuminate to acute at base, entire, lustreless and grayish brown when dried, with scattered obscure pellucid dots, with pale brown scurfy pilose hairs beneath while young, the midrib rather thick, impressed on upper side, raised beneath, the lateral nerves obliquely spreading, many, weak, the petioles 5–8 mm. long; inflorescence subterminal on special articulating lateral pedunclelike rather thick branches 2.5–4.5 cm. long, the pedicels 7–10 mm. long; calyx-segments broadly ovate, obtuse, pale brown-scurfy, ciliate; corolla about 7 mm. across; fruit globose, dark purple, 7–8 mm. across.—Shikoku, Kyushu.—Ryukyus, Formosa, and China.

7. *Ardisia quinquegona* Bl. *Bladhia quinquegona* (Bl.) Nakai; *A. pentagona* DC.; *B. pseudoquinquegona* Masam.—SHISHI-AKUCHI, MIYAMA-AKUCHI. Large branched shrub, the branches grayish brown, the branchlets rather slender, terete, brown-scurfy while young, purplish brown when dried; leaves alternate, rather thin, elliptic or oblanceolate to narrowly obovate, 6–10 cm. long, 2–3.5 cm. wide, long-acuminate to abruptly acute with an acute to obtuse tip, acuminate at base, entire, dark brown when dried, slightly purplish beneath, brown-scurfy when very young, with obscure glands within, the midrib slender, raised beneath, impressed on the upper side, the lateral nerves many, parallel, obliquely spreading, not prominent; inflorescence axillary, umbellate, sometimes branched, on slender peduncles 3–4 cm. long; calyx-segments deltoid or narrowly so, short, rather acute; corolla about 6 mm. across; fruit obtusely 5-angled or globose or depressed-globose, with obsolete longitudinal striations when dried, 4–6 mm. across.—Kyushu (Yakushima and Tanegashima).—Ryukyus, Formosa, s. China, and Indochina.

3. MYRSINE L. TAIMIN-TACHIBANA ZOKU

Evergreen, sometimes deciduous shrubs or trees; leaves alternate, entire or toothed; inflorescence at nodes or in axils of leaves, fasciculate or umbellate; flowers bisexual or unisexual, small, 4- or 5(–6)-merous; calyx-segments imbricate or valvate;

corolla deeply parted; stamens with short filaments, the anthers splitting longitudinally; ovary ovoid, 1-locular; style short, the stigma punctate, flat, lobed or ligulate; fruit a globose berry, with crustaceous endocarp; seed solitary, with entire or ruminate endosperm.—Several species, in tropical and subtropical regions from Africa to E. Asia.

- 1A. Prostrate stoloniferous shrub with slender branches; fruit red. 1. *M. stolonifera*
 1B. Large erect shrub with thick branches; fruit purplish black. 2. *M. seguinii*

1. *Myrsine stolonifera* (Koidz.) Walker. *Anantia stolonifera* Koidz.; *M. marginata* sensu auct. Japon., non Hook. & Arn.; *Rapanea stolonifera* (Koidz.) Nakai; *A. mezii* Masam.—TSURU-MANRYŌ, TSURU-AKAMI-NO-KI. Glabrous shrub, sparingly branched, the branches prostrate or decumbent, slender, 1-1.5 m. long, elongate, terete, reddish brown, becoming dark brown in age; leaves alternate, somewhat coriaceous, oblong, broadly lanceolate to narrowly obovate, 3-8 cm. long, 1-3 cm. wide, acute at both ends, entire or with few mucronate teeth near tip, deep green, paler beneath, with impressed obsolete glands, the midrib slightly raised, the petioles 5-10 mm. long; flowers few, fasciculate in leaf-axils, the pedicels 3-4 mm. long, with a small bract at base; calyx-segments narrowly ovate-oblong, about 1 mm. long; corolla-lobes oblanceolate, obtuse, 2-2.5 mm. long; style rather thickened at base, the stigma punctate; fruit red, globose, about 5 mm. across.—Nov.-Dec. Thickets in hills; Honshu (Yamato and Suwō Prov.), Kyushu (Yakushima); very rare.—Formosa and China.

2. *Myrsine seguinii* Lév. *Rapanea neriifolia* Mez; *M. neriifolia* Sieb. & Zucc., non Casar.; *M. capitellata* sensu auct. Japon., non Wall.; *M. capitellata* var. *neriifolia* Kanitz; *Athruphyllum seguinii* (Lév.) Nakai; *A. neriifolia* (Mez) Hara.—TAIMIN-TACHIBANA. Large erect dioecious shrub or small tree, the branches rather thick, erect, the young branchlets dark purple; leaves evergreen, coriaceous, oblanceolate or lanceolate, 5-12(-19) cm. long, 1-2.5(-4) cm. wide, obtuse, gradually narrowed at base, entire, glabrous, deep green and lustrous on upper side, the midrib raised beneath, the lateral nerves slender, not prominent, the petioles 2-13 mm. long; flowers few, fasciculate in axils of the last year's leaves, the pedicels 1-3 mm. long, with scalelike bracts at base; calyx-segments ovate, subobtusely ciliate; corolla greenish white, the lobes ovate, spreading-recurved; style thick and short, the stigma ligulate; fruit globose, 6-7 mm. across, purplish black.—Apr. Honshu (Awa Prov. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and Indochina.

Fam. 161. PRIMULACEAE

SAKURA-SŌ KA

Primrose Family

Herbs often with creeping rhizomes; leaves simple, exstipulate, radical or cauline, alternate, opposite, or verticillate, rarely pinnately lobed; flowers in racemes, or panicles, or in simple or superposed verticils, bisexual, usually actinomorphic; calyx 4- to 9-, usually 5-lobed, usually persistent; corolla rotate, hypocrateriform, or infundibuliform, sometimes subcampanulate, rarely absent, imbricate in bud, the limb 4- to 9-lobed; stamens as many as the corolla-lobes and opposite them, inserted on the tube, staminioid alternate with the stamens, rarely present; ovary superior, 1-locular; ovules many, the placentation free-central; seeds small, many, the endosperm copious.—About 30 genera, with about 500 species, chiefly in the N. Hemisphere, few in the Tropics and the S. Hemisphere.

- 1A. Corolla-lobes contorted, or the corolla absent.
 2A. Capsules circumscissile, the top falling off as a lid; prostrate annual; flowers scarlet or blue. 1. *Anagallis*
 2B. Capsules longitudinally dehiscent.
 3A. Corolla absent; stamens inserted at the base of ovary; rather fleshy saline herbs with small opposite leaves and axillary flowers. 2. *Glaux*
 3B. Corolla present; stamens inserted on the corolla-tube or at the base of corolla.
 4A. Corolla 7 (5-9)-parted; testa loosely inclosing the seeds. 3. *Trientalis*
 4B. Corolla 5(-6)-lobed; testa closely adherent to the seed. 4. *Lysimachia*
 1B. Corolla-lobes imbricate in bud.
 5A. Ovary superior.
 6A. Stamens inserted at the base of the corolla-tube; leaves all radical; inflorescence umbellate, scapose. 5. *Cortusa*
 6B. Stamens inserted on the corolla-tube.
 7A. Leaves radical and sometimes rosulate; inflorescence umbellate or verticillate, scapose.
 8A. Flowers large, the corolla-tube longer than the calyx. 6. *Primula*
 8B. Flowers small, the corolla-tube shorter than to as long as the calyx. 7. *Androsace*
 7B. Leaves cauline, alternate; inflorescence a leafy raceme. 8. *Stimpsonia*
 5B. Ovary subinferior; leaves cauline, alternate; flowers small, in racemes. 9. *Samolus*

1. ANAGALLIS L. RURI-HAKOBE ZOKU

Usually glabrous erect or creeping annuals or perennials; leaves cauline, opposite, ternate, or sometimes all or the upper ones alternate, entire, sessile or short-petiolate; flowers rather small, axillary, pedicellate, blue-purple to red, bisexual; calyx 5-parted, the segments lanceolate or broadly linear, spreading; corolla 5-parted, rotate, the lobes contorted; stamens inserted at the base of corolla-lobes, the filaments filiform or subulate, hairy, the anthers obtuse; ovary glabrous; style filiform; capsules globose, circumscissile; seeds small, many, conical, flat on back.—About 24 species, in Europe, Africa, Asia, and temperate S. America.

1. *Anagallis arvensis* L. *A. femina* Mill.; *A. coerulea* Schreb.—RURI-HAKOBE. Glabrous whitish or glaucous annual or biennial; stems much branched, 4-angled, 10-30 cm.

long; leaves opposite, ovate to narrowly lanceolate, 1-2.5 cm. long, 5-15 mm. wide, spreading, entire, acute to subobtusely rounded at base, sessile; flowers solitary, axillary, the pedicels

2-3 cm. long; calyx-segments linear-lanceolate, long-acuminate, 4-6 mm. long, 1-ribbed; corolla blue-purple to reddish, 1-1.3 cm. across, the lobes obovate-orbicular, often ciliate; capsules globose, about 4 mm. in diameter; seeds dark brown, about 1

mm. across, densely warty.—Mar.-May. Honshu (Izu Islands and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and temperate and tropical regions generally.

2. GLAUX L. UMI-MIDORI ZOKU

Rhizomatous rather fleshy glabrous perennial; stems terete, erect or decumbent at base; leaves opposite or rarely somewhat ternate, small, entire; flowers axillary, subsessile, rather small, white to rose; calyx broadly campanulate, 5-lobed, the lobes oblong, obtuse, persistent, imbricate in bud; corolla absent; stamens perigynous, alternate with the calyx-segments, the filaments nearly filiform, the anthers cordate, dorsifixed; ovary ovoid, with a filiform style at apex; ovules semi-anatropous; capsules 5-valved, with the persistent style base at apex, covered on lower half with the calyx; seeds few, flat on the dorsal side, convex and with a hilum on the ventral side, the testa brown.—One species, along seashores and estuaries and in wet alkaline soils in the N. Hemisphere.

1. *Glaux maritima* L. var. *obtusifolia* Fern. *G. maritima* sensu auct. Japon., non L.—UMI-MIDORI, SHIO-MATSUBA. Plant glabrous, lustrous, deep green and slightly glaucous; stems erect or ascending at base, simple or slightly branched, 5-20 cm. long; leaves rather dense on the stems, spreading, broadly lanceolate to obovate-oblong, 6-15 mm. long, 3-6 mm. wide, rounded to obtuse, obtuse at base, sessile, with impressed

dots beneath, the midrib and nerves indistinct; flowers 6-7 mm. across; capsules globose, glabrous, 3-4 mm. across.—May-Aug. Wet places by the sea near high tide mark; Hokkaido, Honshu (centr. and n. distr.).—Kuriles, Sakhalin, and generally in e. Asia to N. America. The typical phase is widespread in Eurasia and N. America.

3. TRIENTALIS L. TSUMA-TORI-SŌ ZOKU

Delicate glabrous perennials with slender creeping rhizomes; stems simple slender; leaves in a single whorl near top of the stem; flowers erect, white; calyx deeply 5- to 9-fid, the segments linear-lanceolate, green, spreading, persistent; corolla rotate, deeply 7(5-9)-lobed, the lobes narrowly ovate, entire, contorted in bud; stamens 5-9, inserted on the throat of the corolla-tube, the filaments filiform, the anthers linear, obtuse; ovary globose; style slender; ovules many; seeds few, the testa loose, coriaceous, finely reticulate.—Two species, in the cooler regions of the N. Hemisphere.

1. *Trientalis europaea* L. var. *europaea*. *T. europaea* var. *eurasiatica* R. Knuth.—TSUMA-TORI-SŌ. Stems erect, terete, 7-25 cm. long, with a few scalelike or small leaves at base; leaves 5-10 in a whorl near the top, spreading, broadly oblanceolate, lanceolate, or elliptic, sometimes ovate or obovate-oblong, 2-7 cm. long, 1-2.5 cm. wide, acute to subobtuse, acuminate at base, entire, subsessile, the lateral nerves incurved on upper part, each confluent with the upper one; peduncles slender, 2-3 cm. long; flowers 1.5-2 cm. across; calyx-segments 4-7 mm. long, acuminate; corolla-lobes acute; fruit globose,

2.5-3 mm. in diameter.—June-July. Coniferous woods; Hokkaido, Honshu (centr. and n. distr.), Shikoku.—Kuriles, Sakhalin, Korea, to Eurasia, Alaska, and e. N. America.—Forma *ramosa* Iljinsky ex Hegi. *T. ramosa* Koidz.—Ō-TSUMA-TORI-SŌ. Rare phase with branched stems.

Var. *arctica* (Fisch.) Ledeb. *T. arctica* Fisch.—KOTSUMA-TORI-SŌ. Upper cauline leaves gradually larger, the apical leaves smaller, obovate-cuneate, obtuse to subrounded.—Coniferous woods; Hokkaido, Honshu (centr. and n. distr.); rare.—Sakhalin, Kuriles, e. Siberia, and N. America.

4. LYSIMACHIA L. OKA-TORA-NO-O ZOKU

Erect or prostrate, glabrous to pubescent, sometimes glandular-dotted herbs; leaves opposite, alternate, or verticillate, entire; flowers axillary or terminal, solitary or in racemes, corymbs, or panicles, white, yellow, or red, rarely blue-purple, (4-)-5- to 6-merous; calyx-lobes persistent; corolla infundibuliform, hypocrateriform, or broadly campanulate, (4-)-5- to 6-lobed, the tube often very short, the lobes contorted in bud; stamens inserted on the tube, sometimes with staminodia in an alternate whorl, the anthers obtuse; ovary globose or ovoid; style simple, filiform; capsules longitudinally dehiscent or indehiscent; seeds few to many, with a thin testa.—About 110 species, chiefly in the temperate regions of the N. Hemisphere, few in the Tropics, Australia, N. America, and Africa.

1A. Flowers yellow.

2A. Leaves opposite, rarely verticillate.

3A. Flowers in racemes or panicles; stems erect; leaves narrow, subsessile.

4A. Flowers in axillary spikelike racemes; style and stamens long-exserted; corolla-lobes linear-oblancheolate. 1. *L. thyrsiflora*

4B. Flowers in terminal panicles; style and stamens shorter than the narrowly ovate corolla-lobes. 2. *L. vulgaris* var. *daurica*

3B. Flowers solitary and axillary or rarely few together and terminal; stems decumbent or prostrate; leaves distinctly petiolate.

5A. Leaves usually longer than wide, without brown striations and dots; calyx-segments linear-lanceolate.

6A. Leaves ovate to broadly so, acute; corolla 5-7 mm. long; stems ascending at first, then creeping; calyx-segments acuminate.

6B. Leaves broadly ovate to broadly ovate-elliptic, rounded to very obtuse; corolla about 15 mm. long; stems creeping from the first; calyx-segments obtuse. 3. *L. japonica*

5B. Leaves shorter than to slightly longer than wide; calyx-segments oblanceolate to obovate-spathulate. 4. *L. tashiroi*

7A. Leaves with dark brown glandular striations and dots; corolla without striations. 5. *L. tanaqae*

- 7B. Leaves without glandular striations; corolla glandular-striate. 6. *L. ohsumiensis*
 2B. Leaves alternate; flowers solitary on long slender axillary peduncles. 7. *L. sikokiana*
 1B. Flowers white.
 8A. Mountain or lowland plants; bracts linear to filiform.
 9A. Stems angled; racemes loosely flowered.
 10A. Leaves narrowly oblanceolate to broadly linear, 3–5 mm. wide, obtuse. 8. *L. leucantha*
 10B. Leaves broadly lanceolate to narrowly ovate, 1–3 cm. wide, acuminate. 9. *L. acroadenia*
 9B. Stems terete, not angled; racemes densely flowered.
 11A. Racemes erect, symmetrical, radially flowering, the axis glabrous or minutely glandular-puberulent; flowers 5–6 mm. across; leaves oblanceolate to oblong-oblanceolate, obtuse, mucronate. 10. *L. fortunei*
 11B. Racemes nodding or ascending above, asymmetrical and one-sided, the axis usually more or less pubescent; flowers 7–12 mm. across.
 12A. Leaves lanceolate or oblanceolate, 8–15 mm. wide, obtuse to subacute, brownish pubescent. 11. *L. barystachys*
 12B. Leaves broadly oblong-oblanceolate to narrowly ovate, 2–5 cm. wide, acuminate, glabrescent. 12. *L. clethroides*
 8B. Seaside plant; bracts lanceolate to ovate, rather leaflike. 13. *L. mauritiana*

1. *Lysimachia thyrsiflora* L. *Naumburgia guttata* Moench; *N. thyrsiflora* (L.) Reichenb.; *L. kamtschatica* Gand. —YANAGI-TORA-NO-O. Perennial with long-creeping rhizomes; stems erect, terete, simple or sometimes sparsely branched, 30–60 cm. long, with reduced scalelike leaves at base; leaves opposite, oblanceolate or broadly so, 4–10 cm. long, 1.5–2.5 cm. wide, obtuse or subobtusely, entire, sessile, glabrous and green, paler and long brownish tomentose beneath, black-spotted; racemes spike-like, densely many-flowered, axillary midway on the stems, the peduncles 2–3 cm. long, erect; corolla yellow, the lobes broadly linear-oblanceolate, 4–5 mm. long, obtuse, with few black spots on upper part; capsules globose, black-spotted, about 2.5 mm. in diameter, the persistent style about 4 mm. long.—May–July. Bogs and wet places; Hokkaido, Honshu (Hitachi, Kotsuke, Shimotsuke, Echizen, and northw.).—Kuriles, Sakhalin, Korea, and cooler parts of the N. Hemisphere.

2. *Lysimachia vulgaris* L. var. *davurica* (Ledeb.) R. Knuth. *L. davurica* Ledeb.; *L. vulgaris* var. *typica* R. Knuth, pro parte, and auct. Japon.—KUSA-REDAMA. Perennial herb, rhizomatous and stoloniferous; stems terete, erect, 40–80 cm. long, simple or sparsely branched, minutely glandular-puberulent on upper part; leaves opposite, rarely verticillate in 3's or 4's, lanceolate to narrowly ovate, 4–12 cm. long, 1–4 cm. wide, acuminate, acute to subobtusely at base, sessile, entire, deep green, often whitish beneath, black-spotted; flowers in a many-flowered terminal leafy panicle or in whorls in the upper axils, the pedicels 7–12 mm. long, bracteate; flowers yellow, 12–15 mm. across; calyx-segments narrowly ovate-deltoid, acuminate, with a line of black glands near margin; corolla-lobes narrowly ovate, granular-papillose inside; capsules globose, about 4 mm. in diameter; style persistent, 5–6 mm. long.—July–Aug. Wet places; Hokkaido, Honshu, Kyushu (mountains).—Temperate regions of e. Asia.

3. *Lysimachia japonica* Thunb. KO-NASUBI. Pubescent perennial; stems soon creeping, leafy; leaves opposite, ovate or broadly so, 1.25(–3) cm. long, 7–20 mm. wide, with pellucid dots, acute, entire, rounded at base, the petioles 5–10 mm. long; flowers solitary, axillary, yellow, 5–7 mm. across, erect in anthesis, soon deflexed, the pedicels 3–8(–12) mm. long; calyx-segments linear-lanceolate, acuminate, as long as the corolla or slightly accrescent after anthesis; corolla-lobes ovate-deltoid, 5–7 mm. long; capsules globose, 4–5 mm. across, long-pubescent at tip; seeds black, ellipsoidal, 1-ridged, densely warty, about 1 mm. long.—May–June. Thickets and roadsides in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, China, and Malaysia.

4. *Lysimachia tashiroi* Makino. ONI-KO-NASUBI. Long-creeping, brownish pubescent perennial; stems loosely branched, 5–10 cm. long; leaves opposite, broadly ovate to broadly ovate-elliptic, 2–4 cm. long, 1.5–3 cm. wide, rounded to very obtuse, entire, pubescent, the petioles 7–12 mm. long; flowers 1–4 toward the top of stems, yellow, about 15 mm. across, the pedicels 15–20 mm. long; calyx-segments linear-lanceolate, 7–10 mm. long, obtuse, long-pubescent; corolla-lobes ovate-oblong or oblong, about 15 mm. long, much longer than the calyx-lobes; ovary short-pubescent; style about 6.5 mm. long.—July. Kyushu (Buzen Prov.); rare.

5. *Lysimachia tanakae* Maxim. MIYAMA-KO-NASUBI. Long-creeping herb, brownish hairy on the stems, petioles, and flowers; leaves reniform-obcordate or ovate-cordate, 1–2 cm. in diameter, pubescent while young, rounded to retuse, mucronate, entire, black-dotted and striate, the petioles 5–15 mm. long; calyx-segments oblanceolate, obtuse, 5–6 mm. long; corolla yellow, 8–10 mm. across, about 1.5 times as long as the calyx, the lobes ovate-oblong, the pedicels 2–3.5 cm. long.—June–Aug. Honshu (Kii Prov.), Shikoku, Kyushu; rare.

6. *Lysimachia ohsumiensis* Hara. HETSUKA-KO-NASUBI. Stems long-creeping, often rooting at the nodes, pubescent with soft-spreading long hairs; leaves ovate-cordate, 7–13 mm. long, 6–10 mm. wide, acutish, rounded to slightly cordate at base, pubescent, petioled; pedicels axillary, slender, solitary, 15–30 cm. long; calyx-segments obovate-spathulate, 3–4 mm. long; short-acuminate; corolla about 1 cm. wide, yellow, glandular-striate; anthers oblong, about 1.2 mm. long.—Kyushu (Ohsumi Prov.).

7. *Lysimachia sikokiana* Miq. MOROKOSHI-SŌ, YAMAKUNEMBO. Fragrant when dry; rhizomes short; stems erect or ascending at base, angled, 30–80 cm. long, simple or sparingly short-branched, minutely glandular-hairy; leaves alternate, ovate to broadly lanceolate, acuminate at both ends, entire, glabrescent, deep green, pale green beneath, the petioles 1–2.5 cm. long; flowers yellow, 1–1.2 cm. across, the peduncles slender, 4–8 cm. long, axillary, solitary, ebracteate; calyx-segments ovate-deltoid, acuminate, minutely glandular-ciliate; corolla 2 or 3 times as long as the calyx, the lobes narrowly oblong; anthers about 4 mm. long, erect; capsules globose, whitish, about 6 mm. in diameter, deflexed, the valves crustaceous.—Woods at low elevations in the mountains; Honshu (Awa, Izu Prov. and westw.), Shikoku, Kyushu.—Ryukyus and Formosa.

8. *Lysimachia leucantha* Miq. *L. candida* var. *samolina* R. Knuth; *L. candida* var. *leucantha* (Miq.) Makino —SAWA-TORA-NO-O, MIZU-TORA-NO-O. Glabrous, erect perennial, 40–60 cm. high, usually unbranched; stems angled; leaves nar-

rowly oblanceolate to broadly linear, 2-4.5 cm. long, 3-5 mm. wide, obtuse, entire, black-dotted, sessile or subsessile; inflorescence racemose, terminal, many-flowered, erect, the bracts linear, the pedicels 12-20 mm. long, 2 or 3 times as long as the bracts; calyx-segments lanceolate, acuminate, entire; corolla white, about 5 mm. across, the lobes obovate, obtuse; capsules small.—Apr. Wet places, near ponds and rivers in lowlands; Honshu, Kyushu; rare.—Korea.

9. *Lysimachia acroadenia* Maxim. *L. keiskeana* Miq.; *L. decurrens* sensu auct. Japon., saltem pro parte, non G. Forst.; *L. decurrens* var. *acroadenia* (Maxim.) Makino—MIYAMA-TAGOH, GINREI-KA. Erect perennial herb 30-60 cm. high, with short rhizomes; stems slightly branched, angled, green, minutely glandular-hairy in upper part; leaves broadly lanceolate to narrowly ovate, usually narrowly ovate-oblong, 5-10 cm. long, 1-3 cm. wide, acuminate at both ends, glabrous, entire, green, paler and with minute red-brown spots beneath, the petioles 1-2 cm. long; racemes to 30 cm. long, terminal, loosely 10- to 30-flowered, the bracts linear, filiform, the pedicels 1-1.5 cm. long, obliquely spreading in fruit; flowers white to pinkish, partially open, 5-6 mm. long; calyx-segments lanceolate, acuminate; corolla-lobes suberect, cuneate, rounded; capsules globose, 4-5 mm. in diameter, the valves somewhat crustaceous.—June-July. Wet places in mountain woods; Honshu, Shikoku, Kyushu; not abundant.—Korea (Quelpaert Isl.).

10. *Lysimachia fortunei* Maxim. *L. fortunei* forma *suboppositifolia* Honda—NUMA-TORA-NO-O. Rhizomatous and stoloniferous; stems 40-70 cm. long, simple or sparingly branched, reddish above the base; leaves oblanceolate to oblong-ob lanceolate, 4-7 cm. long, 1-1.5 cm. wide, obtuse, mucronate, entire, sessile, pellucid-dotted, pale green beneath; racemes erect, rather densely many-flowered, 10-20 cm. long, glabrous or minutely glandular-puberulent, the pedicels obliquely spreading, 3-4 mm. long, the bracts linear, as long as the pedicels; flowers white, 5-6 mm. across; calyx-segments ovate-oblong, obtuse, black-dotted on back; corolla-lobes spreading, obovate, rounded; capsules globose, 2-2.5 mm. in diameter.—July-Aug. Wet margins of rivers and ponds in lowlands; Honshu, Shikoku, Kyushu.—Korea, China, Formosa, and Indochina.

11. *Lysimachia barystachys* Bunge. NOJI-TORA-NO-O. Perennial 70-100 cm. high, reddish above the base; stems terete, simple or sparingly branched, scattered brownish pubescent; leaves many, lanceolate to oblanceolate, 6-10 cm. long, 8-15 mm. wide, obtuse to subacute, entire, with pale inner glands, thinly brownish pubescent on margins, the lower and

often the upper subsessile; racemes terminal, to 30 cm. long, one-sided, densely many-flowered, the pedicels ascending, 4-7 mm. long, the bracts linear, as long as to slightly longer than the pedicels; calyx-segments narrowly ovate-oblong, obtuse; corolla white, 7-12 mm. across, the lobes narrowly oblong, about 4 times as long as the calyx; capsules globose, about 2.5 mm. across.—June-July. Sunny hills and low elevations in the mountains; Honshu (centr. and s. distr.); common.—Korea, n. China, and Manchuria.

12. *Lysimachia clethroides* Duby. *L. sororia* Miq.; *L. clethroides* var. *sororia* (Miq.) R. Knuth—OKA-TORA-NO-O. Perennial herb with long creeping rhizomes; stems terete, reddish above the base, 50-100 cm. high, rather stout, usually simple, erect, glabrous or loosely pubescent on upper part; leaves broadly lanceolate to narrowly ovate, 2-5 cm. wide, acuminate, entire, often short-pilose on upper side, pale green and usually glabrous beneath, with pale inner glands, sessile or subsessile; racemes densely many-flowered, erect, 10-20 cm. long in anthesis, to 40 cm. long in fruit, the pedicels obliquely spreading, 6-10 mm. long; calyx-segments narrowly ovate-oblong, obtuse; corolla white, 8-12 mm. across, the lobes narrowly oblong, spreading; capsules ovoid-globose, about 2.5 mm. in diameter.—June-July. Sunny hills and low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Korea, Manchuria, China, and Indochina.

Lysimachia pilophora (Honda) Honda. *L. fortunei* var. *pilophora* Honda.—INU-NUMA-TORA-NO-O. Alleged hybrid of *L. clethroides* and *L. fortunei*.—Honshu (Kantō Distr.).

13. *Lysimachia mauritiana* Lam. *L. lineariloba* Hook. & Arn.; *L. lubinioides* Sieb. & Zucc.; *L. nebeliana* Gilg—HAMA-BOSSU. Glabrous slightly fleshy biennial; stems few together or solitary, often reddish, erect, 10-40 cm. long, stout, terete, often short-branched in upper part; leaves obovate-oblong to obovate or spatulate-ob lanceolate, 2-5 cm. long, 1-2 cm. wide, obtuse to rounded, entire, lustrous, with black inner glands, sessile or subsessile; racemes erect, terminal, often compound-panicleate, very densely flowered, 4-12 cm. long in fruit, the pedicels spreading, 1-2 cm. long, about as long as the leaflike bracts; flowers white to pinkish, 1-1.2 cm. across; calyx-segments broadly lanceolate, obtuse, often with a few black glandular dots on back; corolla-lobes narrowly cuneate-oblong, obliquely spreading; capsules globose, 4-6 mm. in diameter.—May-July. Near the sea; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Ryukyus, Formosa, China, Pacific Islands, and India.

5. CORTUSA L. SAKURA-SŌ-MODOKI ZOKU

Pubescent perennial with short-creeping rhizomes; leaves radical, long-petiolate, orbicular-cordate, palmately 7- to 9-lobed, dentate and incised; stems scapose, the pedicels slender, with a small bract at base; flowers umbellate, usually rose-purple; calyx broadly campanulate, deeply 5-fid, the lobes persistent; corolla infundibuliform-campanulate, short-tubular, appendaged on the throat, the lobes 5, spreading, obtuse, imbricate in bud; stamens 5, inserted at the base of the corolla, the filaments very short, connate by a membrane, the anthers acuminate; ovary superior, ovoid; style simple, filiform; ovules many; capsules ovoid-globose, 5-valved; seeds many.—Few species, in Europe, n. Asia, Himalayas, and e. Asia.

1. *Cortusa matthioli* L. var. *jozana* (Miyabe & Tatew.) Hara. *C. jozana* Miyabe & Tatew.; *C. coreana* var. *jozana* (Miyabe & Tatew.) Hara—EZO-NO-SAKURA-SŌ-MODOKI. Radical leaves reniform-orbicular, 6-10 cm. long, 8-10 cm. wide, shallowly and palmately lobed, loosely long-pubescent on up-

per side, on nerves beneath, and on petioles, the lobes 9-13, ovate to narrowly so, usually again shallowly 3-lobed and loosely toothed, the petioles 8-12 cm. long; scapes 20-35 cm. long, long-pubescent especially on the lower half, longer than the leaves, erect; inflorescence umbellate, terminal, the pedicels

minutely glandular-hairy, the bracts oblanceolate, few-toothed; calyx-lobes lanceolate, acuminate, 3-4 mm. long, nearly as long as the tube, glabrous; corolla rose-purple, 15-17 mm. across, the lobes 5, narrowly ovate, obtuse, 5-7 mm. long; anthers 5-6 mm. long, shorter than the style.—June. Mountains; Hokkaido (Jozankei).

Var. *congesta* (Miyabe & Tatew.) Ohwi. *C. sachalinensis* var. *congesta* Miyabe & Tatew.; *C. coreana* var. *congesta* (Miyabe & Tatew.) Hara—REBUN-SAKURA-SÔ-MODOKI.

6. PRIMULA L. SAKURA-SÔ ZOKU

Perennials with short rhizomes; leaves usually radical, rarely densely arranged on short caudiculi, obovate-spathulate or ovate-orbicular and subsessile or reniform-orbicular and long-petiolate, entire or palmately lobed, usually toothed; flowers in terminal umbels or superimposed on the scapes, rarely solitary, white to lavender or rose-purple, rarely yellow, the bracts small, without bracteoles; calyx tubular to infundibuliform, 5-lobed; corolla salverform or campanulate, often with appendages on the throat, the limb 5-lobed, imbricate in bud, entire or again 2-lobed; stamens inserted on the tube or throat, included, the filaments very short, the anthers obtuse; ovary globose or ovoid; style simple, slender; capsules globose to cylindric, 5-valved; seeds many, petelately attached.—More than 200 species, in Europe, Asia, Malaysia, especially abundant in w. China and the Himalayas, few in N. and S. America.

- 1A. Leaves glabrous, sometimes farinose, decurrent below to the petiole or sessile.
- 2A. Small herbs with leaves less than 10 cm. long; scapes 6-20 cm. long; flowers in single, terminal umbels.
- 3A. Leaves with few coarse teeth on upper margin, rather fleshy, not farinose, quite glabrous and green, without raised nerves beneath; capsules elliptic or ovoid-globose, shorter or slightly longer than the calyx; bud-scales with incurved margins; plants of wet slopes and bogs in high mountains.
- 4A. Flowers rather large, fully expanding, usually rose-purple, the tube 7-8 mm. long; corolla-lobes obtriangular or obovate-deltoid, rather deeply bifid, the lobes ascending. 1. *P. cuneifolia*
- 4B. Flowers smaller, not fully expanding, white with a yellow eye, the tube about 5 mm. long; corolla-lobes elliptic or obovate, shallowly bifid, the lobes not divergent. 2. *P. nipponica*
- 3B. Leaves with small obtuse teeth on upper margin, yellow- or white-farinose or sometimes glabrous, with raised midrib and nerves beneath; capsules short-cylindric, usually longer than the calyx; bud-scales with recurved margins; plants not of bogs.
- 5A. Leaves not farinose, broadly ovate, abruptly narrowed to a petiolelike base. 3. *P. macrocarpa*
- 5B. Leaves white- to yellow-farinose beneath.
- 6A. Meallness prominent, yellow. 4. *P. modesta*
- 6B. Meallness thin, white. 5. *P. yuparensis*
- 2B. Rather large herb with leaves 15-40 cm. long; scapes 40-80 cm. long; flowers in superimposed umbels. 6. *P. japonica*
- 1B. Leaves and scapes pubescent, not farinose, ovate to reniform-orbicular, long-petiolate, incised or lobulate and toothed.
- 7A. Leaves ovate to ovate-elliptic; calyx broadly infundibuliform, much longer than the depressed-conical capsule. 7. *P. sieboldii*
- 7B. Leaves ovate-orbicular to reniform; calyx tubular to tubular-campanulate, shorter to longer than the oblong to cylindric capsule.
- 8A. Rhizomes rather long-creeping, the scales persistent. 8. *P. hidaikana*
- 8B. Rhizomes tufted or short-creeping, the scales membranous, soon withering and not persistent.
- 9A. Scapes 15-40 cm. long, much longer than the leaves; leaves deeply incised to lobed.
- 10A. Leaves incised and minutely toothed; flowers usually rose-purple, salverform; corolla-lobes spreading, the tube 12-14 mm. long. 9. *P. jesoana*
- 10B. Leaves deeply incised or lobed, scarcely toothed; flowers white, infundibuliform; corolla-lobes obliquely spreading, the tube 6-8 mm. long. 10. *P. takekana*
- 9B. Scapes 5-10(-15) cm. long, scarcely longer than the leaves; leaves scarcely lobed.
- 11A. Calyx 10-15 mm. long, the lobes prominently long-pubescent. 11. *P. kisoana*
- 11B. Calyx 5-8 mm. long, the lobes glabrescent or glabrous.
- 12A. Leaves usually without multicellular long hairs above; corolla-tube 12-20 mm. long. 12. *P. tosaensis*
- 12B. Leaves pubescent above, at least while young, with long whitish hairs; corolla-tube 8-10 mm. long. 13. *R. reinii*

1. *Primula cuneifolia* Ledeb. *P. cuneifolia* var. *dubyi* Pax—EZO-KOZAKURA. Glabrous, rather fleshy, vivid green perennial with short rhizomes; leaves 7-10, radical, obovate-cuneate, 2-4 cm. long, 1-1.5 cm. wide, rounded, cuneately narrowed to a petiolelike base, flat, without distinct nerves, with a few coarse teeth on upper margin; scapes 5-15 cm. long, umbellately 3- to 6-flowered, the bracts linear, entire, small, the pedicels 5-10 mm. long, minutely glandular-dotted; flowers rose-purple, about 2 cm. across, fully expanding; calyx 4-6 mm. long, 5-cleft, the teeth lanceolate, obsoletely mucronate; corolla-tube 7-8 mm. long, shorter than the limb; capsules broadly ovoid-ellipsoidal, about 5 mm. long, as long as to slightly shorter than the calyx.—July-Aug. Wet alpine slopes; Hok-

leaves more densely pubescent and deeply cordate; flowers rather dense.—Hokkaido (Rishiri and Rebun Is.).

Var. *yezoensis* (Miyabe & Tatew.) Hara. *C. sachalinensis* var. *yezoensis* Miyabe & Tatew.; *C. coreana* var. *yezoensis* (Miyabe & Tatew.) Hara—SAKURA-SÔ-MODOKI. Leaves rather densely pubescent and the teeth larger and more acute.—Mountains; Hokkaido (Oshima and Ishikari Prov.). The species in the broad sense occurs from Sakhalin, Korea, and n. China to Europe.

kaido.—Kuriles, Sakhalin, Ochotsk Sea region, Aleutians, and Alaska.

Var. *hakusanensis* (Franch.) Makino. *P. hakusanensis* Franch.; *P. cuneifolia* sensu auct. Japon, non Ledeb.; *P. cuneifolia* var. *tanigawaensis* Tatew.—HAKUSAN-KOZAKURA. Larger; leaves 3-8 cm. long, 1-2.5 cm. wide, the teeth more numerous, unequal, narrower; scapes 5-20 cm. long, 1- to 10-flowered, the pedicels 1-2 cm. long.—Wet alpine slopes; Honshu (centr. and n. distr.).

Var. *heterodonta* (Franch.) Makino. *P. heterodonta* Franch.; *P. hakusanensis* var. *heterodonta* (Franch.) Takeda—MICHINO-KU-KOZAKURA. Plant larger and the leaves broader.—Mount Iwaki in Honshu.

2. *Primula nipponica* Yatabe. HINAZAKURA. Resembles *P. cuneifolia* but smaller; radical leaves 5–10, rather fleshy, cuneate or obovate-cuneate, 2–4 cm. long, 5–15 mm. wide, very obtuse, with few coarse teeth toward the tip, flat, without distinct nerves; scapes 7–15 cm. long, 1- to 8-flowered, the bracts small, linear, the pedicels 1–2 cm. long, loosely granular-dotted; flowers not fully expanding, 12–15 mm. across; calyx narrowly cup-shaped, about 4 mm. long, 5-toothed to the middle; corolla white, the tube about 5 mm. long, yellow on the throat, the lobes obliquely spreading; capsules broadly ovoid-ellipsoid, slightly longer than to as long as the calyx.—Wet alpine slopes; Honshu (Uzen, Rikuchū, and northw.).

3. *Primula macrocarpa* Maxim. *P. farinosa* var. *mistasinica* sensu auct. Japon., non Pax; *P. hayaschinei* Petit.—HIME-KOZAKURA. Small, glabrous perennial with short rhizomes; leaves few, not farinose, broadly ovate or oval, 1.3–(5) cm. long inclusive of the petiolelike base, irregularly toothed on the upper margin, nerves very slightly impressed on upper side; scapes 5–10 cm. long; flowers 1–4, terminal, the bracts linear, the pedicels erect, 7–20 mm. long; calyx tubular, 4–6 mm. long, 5-toothed to about the middle; corolla white, about 10 mm. across, the tube as long as the calyx; capsules cylindric, 6–8 mm. long.—June. Alpine; Honshu (Mount Hayachine in Rikuchū); rare.

4. *Primula modesta* Biss. & Moore. *P. farinosa* var. *luteofarinosa* forma *japonica* Fr. & Sav.; *P. farinosa* var. *modesta* (Biss. & Moore) Makino; *P. modesta* var. *shikokumontana* Miyabe & Tatew.—YUKIWARISŌ. Rhizomes short, often covered with the persistent marcescent leaves of the previous season; leaves broadly cuneate-oblancheolate, 3–6–(10) cm. long, 1–1.5 cm. wide, obtuse or subobtusely, gradually long-narrowed to a petiolelike base, glabrous and not farinose on upper side, densely yellow-farinose beneath, short-toothed on the slightly recurved margin; scapes 7–15 cm. long, 3- to 10-flowered; flowers small, terminal, the pedicels about 1 cm. long in flower, 1.5–3–(4) cm. long in fruit, loosely farinose; calyx about 5 mm. long, short-tubular, 5-toothed to the middle; corolla about 15 mm. across, rose-colored, the tube about 6 mm. long; capsules short-cylindric, 5–8 mm. long.—May–June. Mountains; Hokkaido, Honshu (centr. and n. distr.), Shikoku, Kyushu.

Var. *fauriei* (Franch.) Takeda. *P. fauriei* Franch.; *P. farinosa* var. *fauriei* (Franch.) Miyabe; *P. fauriei* var. *samanimontana* Tatew.; *P. modesta* var. *samanimontana* (Tatew.) Nakai.—YUKIWARISŌ-KOZAKURA. Smaller, the leaves broadly ovate, obsoletely toothed, prominently recurved on the margin, abruptly narrowed and long-decurrent on the petiolelike base; pedicels 1–2 cm. long.—June–July. Mountains and rocky cliffs near the sea; Hokkaido, Honshu (n. distr.).—s. Kuriles.

Var. *matsumurae* (Petitm.) Takeda. *P. matsumurae* Petitm.—REBUN-KOZAKURA. Rather stout; leaves oblanceolate, obscurely toothed, gradually narrowed to the base; scapes stouter, about 10-flowered; capsules slightly longer.—Hokkaido (Rebun Isl. and Teshio Prov.).

5. *Primula yuparensis* Takeda. YŪBARI-KOZAKURA. Resembles somewhat the preceding species; rhizomes short; leaves few, broadly lanceolate to spatulate-cuneate, 1.5–3 cm. long, 1–1.5 cm. wide, obtuse to very obtuse, minutely toothed, decurrent on a petiolelike base, slightly recurved toward the tip, slightly white-farinose beneath; scapes 4–6 cm. long, 2-

3-flowered at the top, the bracts narrow, small, slightly inflated at base on back, the pedicels about 1 cm. or sometimes to 2 cm. long; calyx about 7 mm. long, slightly white-farinose, short-tubular, 5-toothed to the middle; corolla pale rose-purple, about 1.5 cm. across, the tube twice as long as the calyx; capsules slightly longer than the calyx.—July–Aug. Alpine regions; Hokkaido (Mount Yubari); rare.

Primula sorachiana Miyabe & Tatew. SORACHI-KOZAKURA. Flowers 3–10–(17) on the scape, the pedicels slightly declined; calyx 4–5 mm. long, the tube half as long as the lobes; corolla 10–13 mm. across; capsules nearly as long as the calyx.—Reported from Kanayama, at the foot of Mount Yubari in Hokkaido. This may be only a variant of *P. yuparensis*.

6. *Primula japonica* A. Gray. KURIN-SŌ. Rhizomes stout and branched, loosely tufted; leaves few, glabrous, obovate-oblong to oblong-oblancheolate, 15–40 cm. long, 5–13 cm. wide, very obtuse, gradually narrowed below to a petiolelike often reddish base, with short deltoid teeth, the midrib thick, white, usually reddish on under side; scapes terete, 40–80 cm. long, glabrous, the flowers whorled at intervals, the bracts linear, the pedicels obliquely spreading, ascending in fruit, 2–3 cm. long; calyx narrowly cup-shaped, 6–8 mm. long, slightly accrescent after anthesis, 7–10 mm. long in fruit, 5-toothed; corolla rose-purple, rarely white, 2–2.5 cm. across, the tube narrow, 15–17 mm. long, the lobes spreading; capsules globose, as long as to slightly shorter than the calyx, 7–8 mm. long.—June–July. Wet places along streams in mountains; Hokkaido, Honshu, Shikoku, Kyushu; frequently cultivated.—Formosa.

7. *Primula sieboldii* E. Morren. *P. cortusoides* sensu auct. Japon., non L.; *P. cortusoides* var. *patens* Turcz.; *P. cortusoides* var. *sieboldii* (E. Morren) Nichols.; *P. gracilis* Stein.—SAKURA-SŌ. White-pubescent perennial; rhizomes short-cheeping; leaves ovate to ovate-elliptic, 4–10 cm. long, 3–6 cm. wide, obtuse, cordate at base, shallowly incised and irregularly toothed, more or less wrinkled on the upper surface especially while young, the petioles 1–4 times as long as the blades; scapes 15–40 cm. long, umbellately 7- to 20-flowered at the top, the bracts narrowly lanceolate, the pedicels 2–3 cm. long in fruit, minutely puberulent; calyx 8–10–(12) mm. long, tubular in anthesis, infundibuliform in fruit, 5-cleft; corolla rose-colored, sometimes white, rarely rose-purple in cultivated races, 2–3 cm. across, the tube 10–13 mm. long; capsules depressed conical-globose, about 5 mm. across.—Apr.–May. Wet grassy places in lowlands along rivers; Hokkaido (s. distr.), Honshu, Kyushu. Much cultivated.—Korea, Manchuria, and e. Siberia.

8. *Primula hidakana* Miyabe & Kudo. HIDAKA-ITWAZAKURA. Rhizomes creeping, covered with brown marcescent scales and persistent leaf bases; leaves 1–3, orbicular to deeply reniform-orbicular, 1.5–4.5 cm. long, 2.5–5.5 cm. wide, loosely pilose on upper side, or glabrous, pilose on the nerves beneath, shallowly 7-lobed, the lobes depressed-deltoid, irregularly toothed, the petioles 3–17 cm. long; scapes 5–12 cm. long, longer than the leaves, glabrous, 1- to 2-flowered, the bracts lanceolate, ciliate, small, the pedicels 1–2 cm. long; calyx scattered short-pilose, nearly tubular, 6–7 mm. long, 5-cleft, the lobes subobtusely, ciliate; corolla rose-colored, about 2.5 cm. across, the tube about 1 cm. long, the lobes minutely ciliate, the throat yellow; capsules oblong-cylindric, 11–13 mm. long, about twice as long as the calyx.—May. Rocky cliffs and ravines, alpine; Hokkaido (Hidaka Prov.); rare.

Var. *kamuiana* (Miyabe & Tatew.) Hara. *P. kamuiana* Miyabe & Tatew.—KAMUI-KOZAKURA. Petioles, underside of leaves, and scapes more densely pubescent; pedicels and calyx pubescent; corolla lobes ciliate.—Alpine; Hokkaido (Ishikari Prov.).

9. *Primula jesoana* Miq. *P. hondonensis* Nakai & Kitag.; *P. jesoana* var. *glabra* Takeda—ŌSAKURA-SŌ. Rhizomes short-creeping; leaves membranous, cordate to reniform, 4–8 cm. long, 6–12 cm. wide, shallowly 7- to 9-lobed, glabrous on upper side, thinly puberulent beneath, the lobes deltoid or again lobulate, mucronate, the petioles glabrous; scapes 20–40 cm. long, 1.5–2.5 times as long as the leaves, glandular-puberulent in upper part; flowers several, in one or sometimes 2 whorls, the bracts broadly linear, small, obtuse, the pedicels 1–2 cm. long; calyx nearly tubular, 7–8 mm. long, 5-cleft, the lobes lanceolate, obtuse; corolla 1.5–2.5 cm. across, rose-purple, the tube 12–14 mm. long; capsules 7–12 mm. long, ovoid-oblong.—July–Aug. High mountains; Hokkaido (w. distr.), Honshu (centr. and n. distr.); rare.

Var. *pubescens* (Takeda) Takeda & Hara. *P. jesoana* forma *pubescens* Takeda; *P. yesomontana* Nakai & Kitag.; *P. yesomontana* var. *nudiuscula* Nakai & Kitag.—EZO-ŌSAKURA-SŌ. Leaves shallowly lobed, long-pubescent on the nerves beneath and on lower part of scapes and petioles.—Hokkaido.

10. *Primula takedana* Tatew. TESHIO-KOZAKURA. Leaves reniform-orbicular, 3.5–4 cm. long, 4.5–5(6) cm. wide, short-pilose on upper side, long-pubescent beneath, deeply incised, the lobes usually 3- to 5-lobulate, without or with few teeth, the petioles 6–12 cm. long, long-pubescent; scapes about 15 cm. long, longer than the leaves, long-pubescent at the base, puberulent in upper part, the pedicels longer than the calyx; calyx 5–7 mm. long, 5-cleft; corolla white, infundibuliform, the tube 6–8 mm. long, the lobes slightly shorter than the tube, ascending; capsules short-cylindric, about 12 mm. long, longer than the calyx.—May–June. High mountains; Hokkaido (Teshio Prov.).

11. *Primula kisoana* Miq. *P. shikokiana* (Makino) Nakai; *P. kisoana* var. *shikokiana* Makino—KAKKO-SŌ, KISO-KOZAKURA. Rhizomes short; leaves reniform-orbicular, 5–10 cm. in diameter, rather prominently wrinkled, slightly recurved on margin, vivid to deep green, short-pubescent on upper side, long-pubescent beneath, shallowly incised, the lobes obtuse, mucronate, the nerves strongly impressed on upper side, the petioles deeply long-pubescent; scapes 10–15 cm. long, rather stout, densely long-pubescent, umbellately 2- to 8-flowered at the top, the bracts lanceolate, pubescent; flowers usually rose-purple; calyx 10–12 mm. long, densely crisp-pubescent, 5-cleft, the lobes linear-lanceolate; corolla 2–3 cm. across,

the tube 15–20 mm. long; capsules shorter than the calyx, ovoid-globose, about 5 mm. long.—May. Honshu (Kantō and south centr. distr.), Shikoku; rare.

12. *Primula tosaensis* Yatabe. IWAZAKURA, TOSAZAKURA. FIG. 12. Rhizomes short; leaves orbicular to ovate-cordate, 4–7 cm. in diameter, rounded, glabrate on upper side, loosely long-pubescent on the nerves beneath, shallowly incised and toothed, the petioles once to twice as long as the leaves, long-pubescent; scapes 10–15 cm. long, long-pubescent on the lower part, glabrous above, the bracts broadly linear, the pedicels 2–5, usually umbellate, 1–2.5 cm. long; flowers rose-purple, 2.5–3 cm. across; calyx 6–8 mm. long, 5-cleft, the lobes gradually narrowed, obtuse, callose-pointed; corolla-tube 15–20 mm. long, narrow; capsules long-cylindric, 1.5–2.5 cm. long, erect, 2 or 3 times as long as the calyx.—Apr.–May. Wet shaded rocks in mountains; Honshu (s. Kinki Distr. and Mino Prov.), Shikoku, Kyushu; rare.

Var. *brachycarpa* (Hara) Ohwi. *P. tosaensis* forma *brachycarpa* Hara; *P. senanensis* Koidz.; *P. reinii* var. *brachycarpa* (Hara) Ohwi; *P. reinii* var. *ovatifolia* Ohwi—SHINANO-KOZAKURA. Leaves orbicular or ovate-cordate; corolla tube about 15 mm. long; capsules oblong-cylindric to oblong, 5–13 mm. long.—Wet rocky cliffs in mountains; Honshu (south centr. distr. and Kantō); rare.

Var. *rhodotricha* (Nakai & F. Maekawa) Ohwi. *P. rhodotricha* Nakai & F. Maekawa—CHICHIBU-IWAZAKURA. Leaves orbicular-cordate, obsoletely incised; capsules about 10 mm. long.—Rocky wet shady cliffs in mountains; Honshu (south centr. distr. and Kantō); rare.

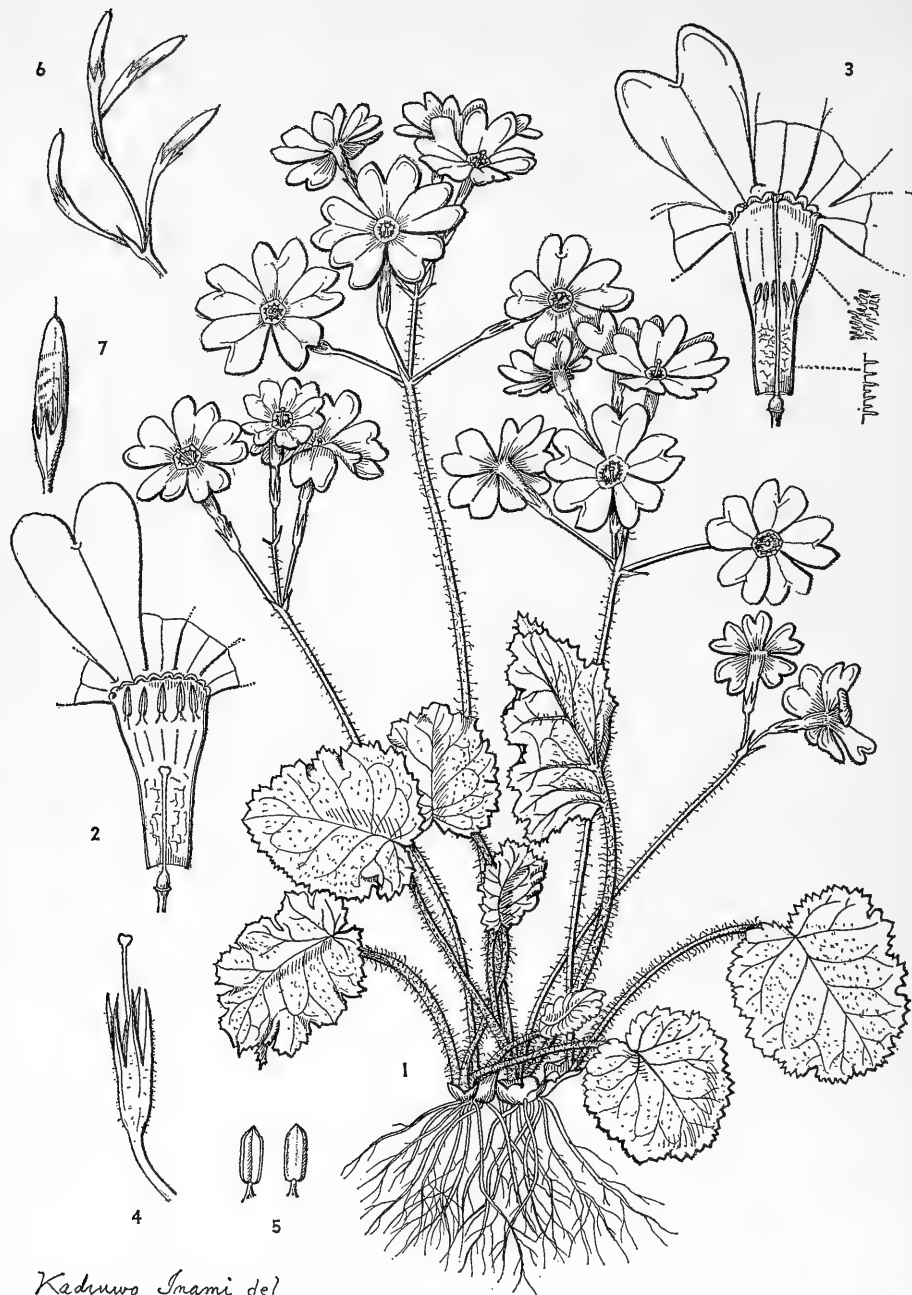

13. *Primula reinii* Fr. & Sav. *P. okamotoi* Koidz.; *P. hakonenis* Nakai—KO-IWAZAKURA. Rhizomes slender, short; leaves few, reniform to orbicular-cordate, 1–2(–6) cm. long, 1–3(–7) cm. wide, the margins recurved, shallowly 7- to 9-lobulate, pubescent above at least while young, pale green and long-pubescent especially on the nerves beneath, the petioles 3–10 cm. long, soft-pubescent; scapes 5–10 cm. long, slender, long-pubescent at base, 1- to 5-flowered at the apex, the pedicels 1–2 cm. long in fruit, the bracts lanceolate; flowers rose-purple, salverform, 2–3 cm. across; calyx 5–8 mm. long, 5-cleft; corolla-tube 8–10 mm. long; capsules as long as to slightly longer than the calyx, oblong to short-cylindric, 5–13 mm. long.—May. Wet shaded rocky cliffs in mountains; Honshu (Kantō and centr. distr. westw. to Mount Omine in Yamato); rare.

Var. *kitadakensis* (Hara) Ohwi. *P. kitadakensis* Hara; *P. hisauchi* Miyabe & Tatew.—KUMOI-KOZAKURA. Leaves and petioles less densely pubescent, the blades with acute lobes and teeth.—Honshu (Kantō and centr. distr.).

7. ANDROSACE L. TOCHINAI-SŌ ZOKU

Delicate, low annuals or perennials; stems or cauliculi absent or short and much branched, densely leafy; flowers solitary or more commonly umbellate on scapes, small, white or pink; calyx 5-lobed or -cleft, persistent, the lobes erect, incurved or spreading in fruit; corolla salverform or infundibuliform, the tube short, not exerted beyond the calyx, constricted on the throat, the limb 5-lobed; stamens 5, included, the filaments very short, the anthers obtuse; style usually short; ovules few to many, semi-anatropous; capsules globose or ovoid, dehiscent, 5-valved; seeds flattened dorsally, the testa wrinkled.—About 100 species, mostly alpine or montane, few in the warmer regions of the N. Hemisphere.

- 1A. Annual or biennial; stemless; leaves radical, depressed-orbicular to nearly round, toothed, truncate at base and abruptly petiolate; pedicels 2–4 cm. long; calyx cleft nearly to the base, the lobes spreading, ovate. 1. *A. umbellata*
- 1B. Perennial; stems short and much branched, leaves cauline, verticillate, broadly oblanceolate, entire, gradually narrowed to a short petiolelike base; pedicels 2–3.5 mm. long; calyx cleft half way, the lobes erect, short-deltoid. 2. *A. lehmanniana*

Kadzuwo Inami del.

FIG. 12.—*Primula rosaensis* Yatabe. 1, Habit; 2, flower with short style; 3, flower with long style; 4, calyx; 5, stamens; 6, portion of inflorescence in fruit; 7, capsule.

1. *Androsace umbellata* (Lour.) Merr. *Drosera umbellata* Lour.; *A. saxifragae* Bunge; *A. patens* Wright ex A. Gray.—RYŪKYŪ-KOZAKURA. Annual or biennial, with short spreading pubescence; leaves radical, 10–30, spreading, subrounded or sometimes ovate-rounded, 5–15 mm. in diameter, flat, deltoid-toothed, truncate and abruptly petiolate, the petioles 1–2 cm. long; scapes 1–25, 5–10 cm. long, the bracts ovate to lanceolate, 4–7 mm. long, the pedicels 4–10, spreading, slender, 2–3.5 cm. long; calyx accrescent after anthesis, spreading, 5-parted nearly to the base, the lobes green, ovate, 2–3 mm. long in anthesis, 4–5 mm. long in fruit, acute; corolla white, 4–5 mm. across, 5-lobed; capsules ovoid-globose, about 4 mm. in diameter, 5-valved, the valves white, membranous. —Mar.–Apr. Lowlands; Honshu (Chūgoku Distr.), Shikoku, Kyushu.—Korea, Formosa, and se. Asia.

2. *Androsace lehmanniana* Spreng. *A. villosa* var. *latifolia* Ledeb.; *A. chamaejasme* var. *capitata* R. Knuth, and var.

arctica R. Knuth; *A. chamaejasme* var. *paramushirensis* Kudo; *A. chamaejasme* subsp. *lehmanniana* (Spreng.) Hult.—TOCHINAI-SŌ, CHISHIMA-KOZAKURA. Small perennial, loosely white-pubescent; stems short, slender, much-branched, with several dense whorls of leaves near top; leaves thick, pale yellow-green, broadly oblanceolate to narrowly obovate, 5–12 mm. long, 2–5 mm. wide, very obtuse, narrowed to a short petiolelike base, entire, loosely long-pubescent, without a distinct midrib; scapes 3–4 cm. long, white-pubescent; flowers 2–4, umbellate, white, 5–6 mm. across, the bracts narrowly oblong, obtuse, 2–3 (–4) mm. long, the pedicels 3–5 mm. long, slightly glandular; calyx cup-shaped, 5-lobed on upper half, the lobes ovate, obtuse, erect; corolla salverform, with a yellow center, the limb spreading, the lobes broadly elliptic; capsules enveloped by the calyx.—July. Alpine; Hokkaido, Honshu (Mount Hayachine in Rikuchu); rare.—Kuriles, Sakhalin, and N. Korea to Alaska, n. China, Siberia, and Turkestan.

8. STIMPSONIA C. Wright ex A. Gray HOZAKIZAKURA ZOKU

Glandular-pilose small annual with erect or ascending, rather simple leafy stems; leaves alternate; inflorescence a loose terminal raceme; flowers small, solitary in axils of bractlike leaves; calyx 5-parted, the lobes linear-oblong, spreading in fruit; corolla hypocrateriform, the tube slightly longer than the calyx, not constricted, hairy on the throat, the lobes 5, imbricate in bud; stamens 5, on the tube, the filaments short-filiform, the anthers not exerted, obtuse; ovary globose; ovules many, semi-anatropous; capsules globose, 5-valved to the base; seeds small, many.—One species in e. Asia.

1. *Stimpsonia chamaedryoides* C. Wright. *Primula veronicoides* Petitm.—HOZAKIZAKURA. Plant 3–12 cm. high, with multicellular spreading glandular hairs; stems simple, erect; radical and lower few cauline leaves elliptic to broadly ovate, 1–2 cm. long, 7–12 mm. wide, rounded at base, obtusely toothed, the petioles about as long or shorter than the blades;

upper leaves sessile, ovate-orbicular, almost duplicate-toothed, the upper bracteal leaves lanceolate, 2–5 mm. long, entire; flowers 2–10, 4–5 mm. across, white, short-pedicellate; calyx 2–3 mm. long; corolla-tube about 2.5 mm. long, about as long as the lobes; capsules about 2.5 mm. across.—Apr. Kyushu (Yakushima); rare.—Ryukyus, Formosa, and China.

9. SAMOLUS L. HAI-HAMA-BOSSU ZOKU

Glabrous herbs, rarely suffrutescent; leaves radical and cauline, alternate, linear to obovate, entire; flowers small, white, in terminal racemes or corymbs, the pedicels often bracteate near the middle; calyx-tube adnate to the lower part of ovary, the limb persistent, 5-lobed; corolla subcampanulate, with a short tube, the limb 5-lobed; stamens 5, inserted on the tube, alternate with the stamens, the filaments short, the anthers obtuse to acuminate; ovary globose, the style short; ovules many, semi-anatropous; capsules ovoid-globose, 5-valved; seeds minute.—About 10 species, chiefly in the S. Hemisphere, few in the N. Hemisphere.

1. *Samolus parviflorus* Raf. *S. floribundus* H. B. K.; *S. valerandi* var. *floribundus* (H. B. K.) Reichenb.; *S. valerandi* sensu auct. Japon., non L.—HAI-HAMA-BOSSU. Glabrous perennial 10–30 cm. high, ascending to decumbent, with slender short rhizomes; radical leaves obovate or broadly elliptic, 2–6 cm. long, 1–2 cm. wide, entire, rounded to very obtuse, gradually narrowed to a petiolelike base, minutely brown-spotted, the cauline leaves abruptly narrowed to a short petiole-

like base, 1–3 cm. long; racemes often leafy at base, loosely 10- to 20-flowered, 4–10 cm. long, the pedicels ascending-spreading, slender, 1–2 cm. long, the bracts minute, near the middle of the pedicel; flowers white, about 1.5 mm. across; calyx accrescent after anthesis, the teeth deltoid, minute; capsules globose, about 2.5 mm. across.—June–Aug. Hokkaido, Honshu.—N. America.

Fam. 162. PLUMBAGINACEAE ISO-MATSU KA Leadwort Family

Herbs or shrubs, sometimes scrambling or scandent, exstipulate; flowers bisexual, actinomorphic, often in one-sided racemes or umbels, the bracts often sheathing, scarious; calyx frequently ribbed, often scarious between the lobes; corolla-lobes imbricate, usually small, persistent; stamens 5, opposite the corolla-lobes and more or less inserted on the tube, the anthers 2-locular, longitudinally dehiscent; ovary superior, 1-locular; styles 5, free or connate; ovules solitary, pendulous; fruit a utricle, sometimes circumscissile; seeds with or without endosperm; embryo large, erect.—About 10 genera, chiefly in the Mediterranean region and centr. Asia, a few in N. America.

1. LIMONIUM Mill. ISO-MATSU ZOKU

Perennials or rarely annuals, acaulescent or with short, thick, branched stems; leaves rosulate, dense, alternate, flat, entire or pinnately divided; scapes or peduncles often branched; inflorescence a cyme, corymb, or panicle, the bracts scalelike, with a bonelike midrib and broad scarious margins; calyx usually infundibuliform or tubular, 5- or 10-ribbed, scarious, plicate at base;

petals distinct or united only at base; stamens inserted at base of petals; styles usually free; fruit enclosed in the calyx, indehiscent or variously dehiscent, the endosperm scanty or copious.—About 120 species, chiefly of deserts, seashores, and high mountains of the N. Hemisphere, few in Australia, and S. Africa.

- 1A. Herbaceous biennial; leaves radical, 8–15 cm. long, 1.5–3 cm. wide; scapes 20–50 cm. long; corolla yellow. 1. *L. tetragonum*
 1B. Shrubby perennial; leaves fascicled and terminal on the branches, 2–4 cm. long, 4–7 mm. wide; scapes 7–15 cm. long; corolla pinkish. 2. *L. wrightii*

1. **Limonium tetragonum** (Thunb.) Bullock. *Statice tetragona* Thunb.; *S. japonica* Sieb. & Zucc.; *L. japonicum* (Sieb. & Zucc.) O. Kuntze.—HAMA-SAJI. Glabrous biennial; leaves radical, rather thick and firm, rosulate, oblong-spathulate, 8–15 cm. long, 1.5–3 cm. wide, obtuse, mucronate, entire, 3-nerved with very weak veins; scapes few, erect, 20–50 cm. long, much branched from the base, the bracts narrowly deltoid, acute, 2–3 mm. long; inflorescence spicate, 2–4 cm. long, the bracts scarious-margined, rounded, cuspidate, about 4 mm. long; flowers few, axillary, the bracteoles 2, small, scarious; calyx 5–6 mm. long, pink in upper part, with short appressed white hairs on back, 5-ribbed, the ribs cuspidate; corolla yellow, slightly longer than the calyx; fruit fusiform, 2.5 mm. long.—Sept.–Nov. Sandy places near the sea; Hon-

shu (Rikuchu Prov. and southw.), Shikoku, Kyushu.—Korea and Manchuria.

2. **Limonium wrightii** (Hance) O. Kuntze. ISO-MATSU, MURASAKI-ISO-MATSU. Glabrous shrubby perennial 5–10 cm. high, much branched; leaves fascicled and terminal on the branches, thick-coriaceous, oblanceolate, 2–4 cm. long, 4–7 mm. wide, rounded at apex, clasping at the base, entire, the nerves and midrib obscure; scapes terminal on the branches, 7–15 cm. long; inflorescence spicate, 1–2 cm. long, one-sided, the bracts scarious-margined, rounded at apex, about 5 mm. long; corolla pinkish; calyx about 5 mm. long, with 5 appressed-pilose ribs.—Aug.–Oct. Rocks along the sea; Honshu (Izu Isls.), Kyushu (Yakushima). A yellow-flowered variety, var. *luteum* (Hara) Hara occurs in the Bonins, Ryukyus, and Formosa.

Fam. 163. EBENACEAE KAKI-NO-KI KA Ebony Family

Usually dioecious shrubs or trees; leaves alternate, simple, entire, exstipulate; calyx 3- to 6-lobed, persistent, often accrescent after anthesis; corolla 3- to 6-lobed; stamens inserted at base of corolla, 2–4 times as many or rarely as many as the corolla-lobes and alternate with them (staminodia usually present in pistillate flowers), the filaments free or connate into pairs, the anthers 2-locular, introrse, longitudinally dehiscent; ovary superior, with 3 or more locules; styles often free; ovules 1–2 in each locule, pendulous and anatropous; fruit a berry; seeds with a thin pericarp, the embryo straight, about half as long as the endosperm.—About 6 genera, with about 300 species, in the Tropics and subtropics of both hemispheres.

1. DIOSPYROS L. KAKI-NO-KI ZOKU

Dioecious shrubs or trees; leaves alternate, petiolate; inflorescence axillary, produced on the new growth, sometimes 1-flowered; flowers polygamous; calyx 3- to 7-lobed, hairy, accrescent after anthesis; corolla urceolate, tubular, campanulate or rotate, more or less pubescent externally, 3- to 7-lobed, the lobes contorted in bud; fertile stamens 4 to many, commonly 16, inserted at the base of the tube, the filaments shorter than the anthers, free or variously connate; staminodia in pistillate flowers much-reduced; ovary globose or conical-globose, the locules either twice as many as the styles and 1-ovuled, or as many as the styles and 2-ovuled; styles 1–4, often connate at base, rarely obscure; fruit globose or ovoid, fleshy; seeds oblong, lustrous, somewhat laterally compressed.—About 200 species, mainly tropical, a few temperate.

- 1A. Leaves evergreen; young branchlets grayish puberulent; calyx-lobes not reflexed. 1. *D. morrisiana*
 1B. Leaves deciduous; young branchlets glabrous or brownish pilose; calyx-lobes reflexed.

- 2A. Young branchlets glabrous or glabrescent; leaves lustrous on upper side, often whitish beneath; corolla glabrous outside; fruit 1.5–2 cm. across. 2. *D. lotus*
 3A. Young branches short-pubescent; petioles 8–12 mm. long. 2. *D. lotus*
 3B. Young branches glabrous; petioles 1–2 cm. long. 3. *D. japonica*
 2B. Young branchlets brownish pilose; leaves scarcely lustrous on upper side, pale green beneath; corolla pubescent especially on outside of lobes; fruit 4–8 cm. across. 4. *D. kaki*

1. **Diospyros morrisiana** Hance. *D. nipponica* Nakai —TOKIWAGAKI. Evergreen small tree or large shrub; branches lenticellate, the branchlets grayish puberulent; leaves coriaceous, narrowly elliptic to oblong, 6–9 cm. long, 2–3.5 cm. wide, short-acuminate with an obtuse tip, acuminate at base, glabrous, deep green on upper side, brownish appressed-hairy beneath while very young, entire; flowers short-pedicelled, pale yellow; calyx-lobes deltoid, brownish pilose; corolla campanulate, 7–8 mm. long, glabrous outside; ovary glabrous; fruit globose, 1.5–2 cm. across.—June. Honshu (Izu Prov. and westw. through Tōkaidō and Kii Prov. to Chigōku Distr.), Shikoku, Kyushu.—Ryukyus, Formosa, and S. China.

2. **Diospyros lotus** L. MAMEGAKI. Deciduous tree; branches grayish, the branchlets short-appressed yellow-gray

puberulent while very young; leaves elliptic, oblong, or ovate-elliptic, 6–12 cm. long, 5–7 cm. wide, abruptly acute, entire, soft-pubescent while very young, glaucous and grayish white-pubescent especially on nerves beneath, the petioles 8–12 mm. long; flowers pale yellow, axillary; calyx-lobes short-pilose outside while young, regularly pilose inside; corolla campanulate; fruit globose, about 1.5 cm. across.—June. Frequently cultivated in our area.—Korea and China to Asia Minor.

3. **Diospyros japonica** Sieb. & Zucc. *D. lotus* var. *glabra* (DC.) Makino; *D. kaki* var. *glabra* A. DC.; *D. lotus* var. *japonica* (Sieb. & Zucc.) Franch.—SHINANOGAKI. Branches glabrous; leaves glabrous or nearly so, the petioles 1–2 cm. long.—June. Honshu (Izu Prov. and westw.), Shikoku, Kyushu.—Ryukyus and China.

4. *Diospyros kaki* Thunb. *D. kaki* var. *domestica* Makino—KAKI-NO-KI. Deciduous tree, the branches lenticellate, gray-brown or gray-white, young branchlets prominently brownish pilose; leaves broadly elliptic, obovate or ovate-elliptic, 7-17 cm. long, 4-10 cm. wide, abruptly acute, rounded to broadly cuneate or acute at base, entire, puberulent on midrib on upper side, usually brownish pilose beneath, the petioles 1-1.5 cm. long; flowers pale yellow; corolla campanu-

late, pubescent especially on the outside of lobes; fruit globose, ovoid, 4-8 cm. in diameter.—June. Widely cultivated in Honshu, Shikoku, Kyushu.

Var. *sylvestris* Makino. YAMAGAKI. Wild phase, more densely pubescent; leaves rather small and narrower; ovary pilose.—Honshu (w. distr.), Shikoku, Kyushu.—S. Korea and China.

Fam. 164. SYMPLOCACEAE HAI-NO-KI KA Symplocos Family

Evergreen or deciduous shrubs or trees; leaves simple, alternate, exstipulate; flowers in axillary or terminal spikes, racemes, or panicles, or sometimes solitary, actinomorphic, bisexual or rarely polygamous; calyx-lobes 5, valvate in bud; corolla 3- to 11-parted or -divided; stamens inserted on the corolla, 4 to many, free or variously connate, in 1-4 series, the anthers 2-locular, longitudinally dehiscent; ovary inferior or subinferior, 2- to 5-locular; ovules 2-4 in each locule, pendulous; style single, slender; fruit a drupe or berry, crowned with the persistent calyx-lobes; seeds solitary in each locule, endosperm copious; embryo straight or curved.—One genus with about 300 species, in Asia, Australia, and America, sometimes divided into several smaller genera.

1. SYMPLOCOS Jacq. HAI-NO-KI ZOKU

Characters of the family. The Japanese species are sometimes placed into the segregate genera *Palura* Hamilt. ex Miers, and *Dicalys* Lour. (*Bobua* DC.).

- 1A. Deciduous trees and shrubs; inflorescence paniculate; flowers polygamous "*Palura*."
 - 2A. Leaves broadly obovate, 3-5 cm. wide, caudate, coarsely serrate; fruit bluish black. 1. *S. coreana*
 - 2B. Leaves obovate to oblong, usually narrower, the teeth smaller and incurved.
 - 3A. Leaves obovate-cuneate, sometimes oblong or elliptic, abruptly acute to short-acuminate; fruit bluish, rarely white.
 2. *S. chinensis* var. *leucocarpa*
 3. *S. paniculata*
 - 3B. Leaves oblong to elliptic, acuminate to acute at both ends, or ovate and rounded at the base; fruit black. 4. *S. myrtacea*
- 1B. Evergreen trees and shrubs; inflorescence spicate or racemose; flowers bisexual.
 - 4A. Inflorescence racemose; pedicels 8-15 mm. long, as long as to longer than the flowers. 4. *S. myrtacea*
 - 4B. Inflorescence spicate or capitate; pedicels absent or shorter than the flowers.
 - 5A. Flowers sessile; inflorescence spicate, headlike or elongate; bracts and bracteoles persistent.
 - 6A. Spikes elongate, 1-7 cm. long; fruit 5-6 mm. long.
 - 7A. Branchlets yellow-brown pilose; leaves chartaceous, rather thin, 4-6 (-8) cm. long, long-caudate, slightly lustrous beneath; petioles 2-4 mm. long; spikes 1-3 cm. long, simple, yellow-brown pilose; corolla-lobes about 2 mm. long; fruit broadly ellipsoidal. 5. *S. lancifolia*
 - 7B. Branchlets glabrous or brownish appressed-pilose while young; leaves coriaceous, whitish and dull beneath; petioles 7-12 mm. long; spikes 3-7 cm. long, often branched at base, brown-pilose; corolla-lobes about 3 mm. long; fruit urceolate.
 - 8A. Leaves 10-15 cm. long, with slender, scarcely raised lateral nerves beneath; branches slender; fruit about 5 mm. long.
 6. *S. theophrastae* folia
 7. *S. kotoensis*
 - 8B. Leaves 15-23 cm. long, with raised lateral nerves beneath; branches thick; fruit about 6 mm. long. 7. *S. kotoensis*
 - 9A. Young branchlets, petioles, and midrib of leaves beneath reddish; leaves oblong-lanceolate to broadly oblanceolate, glaucous beneath, deep green on upper side. 8. *S. glauca*
 - 9B. Young branchlets, petioles, and midrib of leaves beneath yellow-green; leaves elliptic to narrowly oblong, pale green beneath, vivid- to yellow-green on upper side. 9. *S. tanakae*
 - 10A. Leaves 10-15 cm. long, the midrib not raised on upper side; branches often slightly angled; fruit 2-2.2 cm. long. 10. *S. lucida*
 - 10B. Leaves 4-7 cm. long, with a raised midrib on upper side; branches distinctly trigonous while young; fruit 1-1.5 cm. long. 11. *S. prunifolia*
 - 5B. Flowers short-pedicelled; bracts and bracteoles caducous; young branchlets glabrous, trigonous, gray-brown; leaves narrowly elliptic, 5-8 cm. long, coriaceous, with an impressed midrib on upper side; fruit ovoid-oblong, 7-8 mm. long. 11. *S. prunifolia*

1. *Symplocos coreana* (Lév.) Ohwi. *S. crataegoides* forma *major* Fr. & Sav.; *Cotoneaster coreanus* Lév.; *S. argutidens* Nakai; *Palura argutidens* (Nakai) Nakai; *Palura coreana* (Lév.) Nakai—TANNA-SAWA-FUTAGI. Large deciduous shrub, with exfoliating bark; branches gray-brown, glabrous; leaves broadly obovate, 5-8 cm. long, 3-5 cm. wide, caudate, broadly cuneate at base, coarsely serrate, pale green and pilose especially on nerves beneath, the petioles 3-7 mm. long; panicles 4-7 cm. long, pilose or glabrous; flowers white, 6-7 mm. across, on short slender pedicels; calyx-teeth membranous, ovate-rounded; stamens slightly longer than the corolla, more or less fasciculate in 5 groups; fruit obliquely ovoid, bluish

black, 6-7 mm. in diameter.—June. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Korea (Quelpaert Isl.).

2. *Symplocos chinensis* (Lour.) Druce var. *leucocarpa* (Nakai) Ohwi. *S. paniculata* var. *leucocarpa* Nakai; *Palura paniculata* var. *leucocarpa* (Nakai) Nakai; *S. crataegoides* var. *leucocarpa* (Nakai) Makino & Nemoto; *Palura chinensis* var. *leucocarpa* (Nakai) Hara.—SHIROMI-NO-SAWA-FUTAGI. Large deciduous shrub, with longitudinally fissured bark; branches gray-brown, short curved-hairy while young, glabrescent; leaves obovate-cuneate, sometimes oblong or elliptic, 4-7(-10) cm. long, abruptly acute to short-acuminate, sometimes rounded at apex, with short incurved teeth, scattered-

pilose on both surfaces and on the nerves beneath, the petiole 3–8 mm. long; panicles 3–6 cm. long, pilose, the bracts membranous, linear, small, caducous; flowers white, 7–8 mm. across; calyx-teeth ovate-rounded, membranous; stamens slightly longer than the corolla; fruit obliquely ovoid, 6–7 mm. long, white.—May–June. Honshu; rare.—*Forma pilosa* (Nakai) Ohwi. *S. crataegoides* sensu auct. Japon., non Hamilt.; *Palura paniculata* var. *pilosa* Nakai; *P. ciliata* Nakai; *P. pilosa* Nakai ex Honda; *P. chinensis* var. *pilosa* (Nakai) Nakai.—SAWA-FUTAGI, RUKIMI-NO-USHI-KOROSHI, NISHIGORI. Fruit blue.—Common in mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and China. The typical phase occurs in Formosa, s. China, Indochina, Philippines, and the Himalayas.

3. *Symplocos paniculata* (Thunb.) Miq. *Prunus paniculata* Thunb.; *Palura paniculata* (Thunb.) Nakai.—KURUMI-NO-NISHIGORI, SHIRO-SAWA-FUTAGI, NISHIGORI. Large deciduous shrub with exfoliating bark, branches glabrous; leaves oblong or elliptic, rarely somewhat ovate, 5–10 cm. long, 2.5–4 cm. wide, acuminate to acute at both ends, incurved-toothed, the petioles 5–10 mm. long; inflorescence 3–7 cm. long, nearly glabrous; flowers white, about 8 mm. across, short-pedicellate; calyx-teeth ovate, rounded, membranous; fruit ovoid-globose, black, 6–7 mm. in diameter.—May–June. Honshu (centr. distr. westw.).

Var. *pubescens* (Nakai) Ohwi. *Palura paniculata* var. *pubescens* Nakai; *P. chinensis* var. *pubescens* (Nakai) Nakai; *S. tanakana* Nakai; *P. tanakana* (Nakai) Nakai.—KURUMI-NO-SAWA-FUTAGI. Bark transversely fissured; young branchlets and underside of leaves pilose.—Honshu (w. distr.), Shikoku, Kyushu.—s. Korea.

4. *Symplocos myrtacea* Sieb. & Zucc. *Bobua myrtacea* (Sieb. & Zucc.) Miers; *Dicalyx myrtacea* (Sieb. & Zucc.) Hara.—HAI-NO-KI. Small glabrous evergreen tree; branches dark brown, slender, the young branchlets terete, pale green to vivid green when dried; leaves thinly coriaceous, ovate or narrowly so, 4–7 cm. long, 1.5–2.5 cm. wide, caudate, abruptly mucronate, rounded to abruptly acute at base, obtuse-toothed, lustrous, pale green beneath, the petioles slender, 8–15 mm. long; racemes 3- to 6-flowered, loose, nearly corymbose, the pedicels 8–15 mm. long, slender, the bracteoles lanceolate, membranous, long-hairy on back, slightly longer than the calyx, caducous; calyx-limb short, the teeth ovate-deltoid, small, less than 1 mm. long; corolla about 12 mm. across; stamens nearly as long as the corolla; fruit narrowly ovoid, 7–8 mm. in diameter.—May. Honshu (sw. Kinki Distr. and westw.), Shikoku, Kyushu.

5. *Symplocos lancifolia* Sieb. & Zucc. *S. leptostachys* Sieb. & Zucc.; *S. lancifolia* var. *leptostachys* (Sieb. & Zucc.) Miq.; *Bobua lancifolia* (Sieb. & Zucc.) Miers; *B. leptostachys* (Sieb. & Zucc.) Miers; *Dicalyx lancifolia* (Sieb. & Zucc.) Hara.—SHIROBAT. Small evergreen tree with slender, terete, gray-brown branches, the branchlets yellow-brown pilose; leaves narrowly ovate to broadly lanceolate, 4–6(–8) cm. long, 1.5–2.5(–3) cm. wide, caudate, mucronate, acute or sometimes rounded at base, deep green and lustrous with the midrib puberulent on upper side, slightly paler and appressed-hairy beneath while young, undulate-toothed, the petioles 2–4 mm. long; inflorescence spicate, 1–3 cm. long, densely yellow-brown pilose; flowers 10–15, sessile, about 4 mm. across, the bracts and bracteoles broadly deltoid, as long as the calyx-tube; calyx-teeth elliptic, 0.7 mm. long; fruit broadly obovoid-ellipsoidal,

5–6 mm. long, black.—Sept.–Oct. Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Ryukyus.

6. *Symplocos theophrastaeifolia* Sieb. & Zucc. *S. spicata* sensu auct. Japon., non Roxb.; *Bobua theophrastaeifolia* (Sieb. & Zucc.) Miers; *Dicalyx theophrastaeifolia* (Sieb. & Zucc.) Hara.—KANZABURŌ-NO-KI. Small evergreen tree with terete, rather slender, brownish branches, the branchlets brown, appressed-pilose while young; leaves coriaceous, narrowly elliptic or narrowly oblong, sometimes broadly lanceolate, 10–15 cm. long, 3–5 cm. wide, caudate to acuminate, acute to acuminate at base, undulate-toothed, pale green or sometimes very slightly glaucous beneath, glabrous on both surfaces, the petioles 7–12 mm. long; spikes often branched at base, 3–5 cm. long, densely brown-pilose; flowers sessile, 7–8 mm. across, the bracts and bracteoles broadly deltoid, as long as the calyx-tube, densely brown-pilose; calyx-teeth subrounded, ciliate; fruit depressed-urceolate, about 5 mm. long.—Aug.–Sept. Honshu (Suruga Prov. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

7. *Symplocos kotoensis* Hayata. *S. lithocarpoides* Nakai; *Bobua lithocarpoides* (Nakai) Nakai; *B. kotoensis* (Hayata) Yamamoto; *Dicalyx kotoensis* (Hayata) Hara.—AOBA-NO-KI. Resembles the preceding, the branches thick, terete, appressed brown-pubescent while young; leaves vivid green, coriaceous, elliptic to narrowly oblong, sometimes broadly lanceolate, 15–23 cm. long, 3.5–8 cm. wide, short-caudate to short-acute, acute at base, glabrous and lustrous on upper side, scattered-pilose, pale green and somewhat glaucous beneath, entire to obsoletely undulate-toothed near tip, midrib and lateral nerves raised beneath, the petioles 7–12 mm. long, stout; spikes often branched at base, 4–7(–10) cm. long, sparsely woolly in anthesis, the bracts and bracteoles densely brown-pubescent; fruit black, ovoid-urceolate, about 6 mm. long, the calyx persistent.—Aug.–Sept. Kyushu (Yakushima and Tanegashima).—Ryukyus and Formosa.

8. *Symplocos glauca* (Thunb.) Koidz. *Laurus glauca* Thunb.; *S. neriifolia* Sieb. & Zucc.; *Bobua neriifolia* (Sieb. & Zucc.) Miers; *Myrsine thunbergii* T. Tanaka; *B. glauca* (Thunb.) Nakai; *Dicalyx glauca* (Thunb.) Migo.—MIMITSUBAI. Small evergreen tree with stout terete red-brown branches, thinly brown-pubescent while young; leaves thick, oblong-lanceolate to broadly oblanceolate, 8–15 cm. long, 2–3.5 cm. wide, acute to acuminate, acute at base, entire or with few short teeth on upper margin, deep green and lustrous, glaucous and the midrib reddish beneath, the petioles 1–1.5 cm. long; inflorescence very short, axillary, densely brown-woolly; flowers sessile, about 6 mm. across; anthers purplish; fruit oblong-ovoid, 12–15 mm. in diameter.—July–Aug. Honshu (Awa Prov. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and Indochina.

9. *Symplocos tanakae* Matsum. *Bobua tanakae* (Matsum.) Masam.; *Dicalyx tanakae* (Matsum.) Hara.—HIROHA-NO-MIMITSUBAI. Small glabrous evergreen tree, yellow-green when dry, the branchlets rather stout, slightly angled; leaves narrowly oblong, 10–15 cm. long, 2–4 cm. wide, acute with an obtuse tip, acuminate at base, lustrous above, undulate-toothed on upper margin, the midrib slightly impressed or flat on upper side, the midrib raised beneath; flowers 8–10 mm. across, sessile, in axillary headlike spikes, the bracts and bracteoles depressed-cordate, glabrous, ciliate; calyx-teeth broadly elliptic, about 3 mm. long, obsoletely ciliate; fruit ellipsoid-globose, 2–2.2 cm. in diameter, black.—Dec.

Shikoku, Kyushu (Hiuga Prov., Yakushima and Tanegashima).—Ryukyus.

10. *Symplocos lucida* Sieb. & Zucc. *Laurus lucida* Thunb.; *Hopea lucida* (Thunb.) Thunb.; *S. japonica* DC.; *S. japonica* var. *lucida* (Sieb. & Zucc.) K. Koch; *Bobua japonica* (DC.) Miers; *B. lucida* (Sieb. & Zucc.) Kaneh. & Sasaki, non Miers.—KURO-KI. Resembles the preceding but smaller, more densely branched, the young branches trigonous, rather stout, yellow-green when dry; leaves coriaceous, elliptic or oblong, 4–7 cm. long, 2–3.5 cm. wide, acute or obtuse, acute at base, scarcely undulate-toothed near tip, the midrib slightly raised on both sides, the petioles 7–15 mm. long, rather thick; flowers sessile, in dense axillary heads, gray-brown, hairy, the axis very short, the bracts and bracteoles depressed-cordate; calyx-teeth cordate, ciliate; corolla about 8 mm. across; fruit oblong, black, about 15 mm. long.—Mar.–Apr. Honshu (Izu and westw.), Shikoku, Kyushu; rather common.—Ryukyus, Formosa, and Korea (Quelpaert Isl.).

11. *Symplocos prunifolia* Sieb. & Zucc. *Bobua prunifolia* (Sieb. & Zucc.) Miers; *Dicalyx prunifolia* (Sieb. & Zucc.)

Hara.—KUROBAI. Small, much-branched evergreen, glabrous tree, with branches terete, grayish to dark brown, rather thick; leaves coriaceous, narrowly elliptic, narrowly ovate-elliptic, or oblong, 5–8 cm. long, 2–3 cm. wide, caudate, acute at base, undulate-toothed, yellow-green beneath, the midrib flat or slightly impressed on upper side, raised beneath, the petioles usually purplish brown, 1–1.5 cm. long; racemes simple, 10- to 30-flowered, rather dense, 3–7 cm. long, brownish puberulent, the pedicels 1.5–3 mm. long, the bracts orbicular, 3 mm. long, the bracteoles ovate, membranous, shorter than the calyx; calyx-teeth depressed-orbicular, ciliate; fruit narrowly ovate, black, 6–7 mm. long.—Apr.–May. Honshu (Kazusa and Awa Prov. and westw.), Shikoku, Kyushu.—s. Korea and Ryukyus.—Forma *uiiae* (Makino) Ohwi. *S. prunifolia* var. *uiiae* Makino; *Bobua prunifolia* var. *uiiae* (Makino) Nakai; *B. uiiae* (Makino) Nakai; *Dicalyx prunifolia* var. *uiiae* (Makino) Hara.—MARUBA-KUROBAI. Leaves elliptic to orbicular, 3–5 cm. long, 2.5–4.5 mm. wide, rounded at both ends.—Kii Prov. in Honshu.

Fam. 165. STYRACACEAE

EGO-NO-KI KA

Styrax Family

Shrubs or trees usually with stellate hairs; leaves alternate, simple, exstipulate; flowers actinomorphic, bisexual, in terminal, axillary, sometimes compound racemes; calyx-tube more or less adnate to the ovary, the teeth valvate in bud; corolla 4- to 7-lobed, valvate or imbricate in bud; stamens as many as and alternate with the corolla-lobes or twice as many, usually inserted on the tube, the anthers 2-locular, longitudinally dehiscent; ovary superior or inferior, 3- to 5-locular; ovules 1 to many in each locule, anatropous; style slender, 3- to 5-lobed; fruit a drupe or capsule, the calyx persistent; seeds sometimes winged, the endosperm copious.—About 8 genera, with about 100 species, chiefly in the warmer and tropical regions of the N. Hemisphere, few in Africa.

- 1A. Ovary superior; flowers in terminal or axillary racemes. 1. *Styrax*
1B. Ovary inferior; flowers in paniculate one-sided racemes. 2. *Pterostyrax*

1. STYRAX L.

EGO-NO-KI ZOKU

Shrubs or trees with stellate hairs, very rarely glabrous; leaves evergreen or deciduous, simple, entire or toothed; flowers usually white, in terminal or axillary racemes, usually pendulous; calyx campanulate, adnate at base to ovary or free, the limb entire or minutely 5-toothed; corolla actinomorphic, 5-lobed, the lobes valvate or imbricate in bud; stamens 10, inserted at the base or on the tube of the corolla, the filaments free or connate at base; ovary superior, 3-valved, the ovules few; styles slender; fruit 1- or 2-seeded, irregularly dehiscent, the pericarp dry or fleshy.—About 100 species, in temperate regions of the N. Hemisphere.

- 1A. Flowers few, on long slender pedicels; buds not covered by the base of the petioles; leaves ovate to narrowly oblong, 4–8 cm. long, 2–4 cm. wide, simple-hairy to glabrous beneath. 1. *S. japonica*
1B. Flowers few to many, short-pedicelled; buds enclosed within the inflated base of the petioles; leaves obovate- to ovate- or rhombic-orbicular, 1.5 times as long as wide or less, stellate-pubescent beneath.
2A. Leaves 10–20 cm. long; flowers rather many, in long racemes; pedicels longer than the calyx; corolla deeply 5-cleft, the tube slightly longer than the calyx and much shorter than the lobes. 2. *S. obassia*
2B. Leaves 5–8 cm. long; flowers few, in short racemes; pedicels 0–3 mm. long, much shorter than the calyx; corolla shallowly 5-lobed, the tube longer than the lobes and calyx. 3. *S. shiraiana*

1. *Styrax japonica* Sieb. & Zucc. *Cyrtia japonica* (Sieb. & Zucc.) Miers.—EGO-NO-KI. Much-branched small tree; branchlets minutely stellate-pubescent while young; leaves membranous, ovate to narrowly oblong, 4–8 cm. long, 2–4 cm. wide, acuminate to acute, acute at base, undulately toothed, usually glabrous and vivid green on upper side, pale green with tufts of axillary hairs beneath, the lateral nerves of 3–5 pairs, the petioles 3–7 mm. long; flowers 1–4, pendulous, in axillary terminal or corymbose racemes, the pedicels 2–3 cm. long; calyx 4–5 mm. long; corolla about 2.5 cm. across, the tube not exceeding the calyx in length, the lobes narrowly ovate, densely white stellate-puberulent externally; fruit ovoid or ellipsoidal,

1–1.2 cm. in diameter, mucronate.—May–June. Thickets and thin woods in mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Ryukyus(?), Korea, China, Formosa, and Philippines.

Var. *jippei-kawamurae* (Yanagita) Hara. *S. jippei-kawamurae* Yanagita.—OBA-EGO-NO-KI. Larger plant with leaves 5–10 cm. long, 3–5 cm. wide; flowers slightly larger.—Honshu (Izu Isl.).

2. *Styrax obassia* Sieb. & Zucc. HAKU-UNBOKU. Small tree with horizontally spreading stellate-pubescent branches while young, becoming dark brown and the outer layer exfoliating; leaves membranous, ovate to obovate-orbicular, 10–

20 cm. long, 8–20 cm. wide, abruptly acute, usually rounded at base, mucronate-toothed, vivid green and usually glabrous above, densely white stellate-hairy beneath, lateral nerves of 7–8 pairs, the petioles 5–25(–30) mm. long; racemes 10–20 cm. long, rather many-flowered, the flowers stellate-pubescent; calyx-limb mucronate; corolla about 2 cm. long, deeply 5-lobed; fruit white, stellate-pubescent, ovoid, mucronate.—May–June. Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea, Manchuria, and China.

3. *Styrax shiraiana* Makino. *Strigilia shiraiana* (Makino) Nakai.—KO-HAKUUNBOKU. Large shrub, the young branches stellate-pubescent, becoming gray-brown or purple-brown, the outer layer of bark often exfoliating; leaves broadly

rhombic to broadly rhombic-obovate, 5–8 cm. long, 4–7 cm. wide, rounded to obtuse, broadly cuneate at base, abruptly mucronate, deep green on upper side, irregularly large-toothed near the tip, pale green and stellate-hairy while young beneath, the petioles 7–15 mm. long, stellate-hairy; racemes 3–6 cm. long, few-flowered, densely stellate-hairy, the bracts and bracteoles persistent; linear, shorter than the calyx, the pedicels 0–3 mm. long; calyx-teeth narrowly deltoid; corolla 15–20 mm. long; filaments connate at base into a short tube; fruit ellipsoidal, 1–1.2 cm. long, stellate-hairy, mucronate.—June. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rare.

2. PTEROSTYRAX Sieb. & Zucc. ASAGARA ZOKU

Small deciduous stellate-hairy trees or shrubs; leaves alternate, simple, rather large, membranous, toothed, petiolate; flowers many, in one-sided paniculate racemes, white, bisexual, actinomorphic; calyx narrowly obconic or campanulate, 5-toothed; petals 5, scarcely connate at base, imbricate in bud; stamens 10, the filaments nearly free to connate and forming a tube; ovary inferior or sometimes subinferior, 3- to 5-locular; ovules 4, in 2 series in each locule; styles slender, slightly longer than the stamens; fruit a dry angular or winged 1- to 2-seeded drupe.—About 4 species, in e. Asia.

- 1A. Leaves 7–13 cm. long, pale green beneath, without long hairs, with 5–7 pairs of lateral nerves; fruit 5-angled, densely gray-white, stellate-hairy. 1. *P. corymbosa*
 1B. Leaves grayish 10–20 cm. long, long white-hairy along the nerves beneath, especially in the axils, with (6–) 8–12 pairs of lateral nerves; fruit 10-angled, hispid and minutely stellate-hairy. 2. *P. hispida*

1. *Pterostyrax corymbosa* Sieb. & Zucc. *Halesia corymbosa* (Sieb. & Zucc.) Nichols.—ASAGARA. Small much-branched tree with gray-brown branches, loosely appressed stellate-hairy while young; leaves elliptic, or sometimes broadly ovate or broadly obovate, rarely oblong, 7–13 cm. long, 4–8 cm. wide, abruptly acute, rounded or sometimes broadly cuneate at base, minutely toothed or subentire, loosely appressed-stellate hairy on both sides, the petioles 1–3 cm. long; panicles nodding, 8–12 cm. long, white stellate-hairy; flowers white, subsessile, pendulous; calyx-teeth elongate-deltoid; corolla white, 8–10 mm. long, semi-expanding, the petals broadly oblanceolate; stamens tubular-connate, the longer ones alternate with the shorter; fruit obovoid, 8–12 mm. long, 5-winged, stellate-hairy and villous, the style base persistent.—May–June. Mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—China.

2. *Pterostyrax hispida* Sieb. & Zucc. *P. micrantha* Sieb.

& Zucc.; *Halesia hispida* (Sieb. & Zucc.) Mast.; *Decavienia hispida* (Sieb. & Zucc.) Koidz.; *D. micrantha* (Sieb. & Zucc.) Koidz.; *D. japonica* Koidz.—ŌBA-ASAGARA. Small tree with pale brown glabrous branches; leaves oblong, obovate-oblong, or narrowly elliptic, 10–20(–25) cm. long, 5–8(–10) cm. wide, abruptly acute to short-acuminate, acute to subrounded at base, mucronate-toothed, green and glabrous on upper side, except for scattered stellate hairs on the nerves, usually whitish and puberulent or nearly glabrous beneath, the nerves white-pubescent, the petioles 7–25 mm. long; panicles nodding, 10–20 cm. long, villous and white stellate-hairy; flowers nearly sessile, pendulous; calyx-teeth deltoid; corolla semi-expanding, 6–8 mm. long, the lobes oblanceolate, 6–8 mm. long; fruit narrowly obovoid, 7–8 mm. long, 10-ribbed, rather densely long-spreading yellow-hispid, the style base persistent.—June. Mountains; Honshu, Shikoku, Kyushu.

Fam. 166. OLEACEAE MOKUSEI KA Olive Family

Evergreen or deciduous trees, shrubs, or rarely vines; leaves opposite, very rarely alternate, simple or pinnate; stipules absent; flowers bisexual or unisexual, actinomorphic; calyx lobed or toothed, rarely reduced; corolla usually 4-lobed, or the petals 4 and free or rarely absent, imbricate or rarely induplicate in bud; stamens 2, rarely 4, disc absent; ovary superior, 2-locular; ovules 2 in each locule, pendulous or ascending, the placentation axile; fruit a capsule or berry or drupelike; seeds usually with endosperm.—About 20 genera, with more than 400 species, chiefly in temperate and tropical regions.

- 1A. Fruit a berry or drupelike; leaves simple.
 2A. Corolla-lobes much longer than the tube. 1. *Chionanthus*
 2B. Corolla-lobes as long as to shorter than the tube.
 3A. Flowers in terminal panicles; corolla-lobes valvate in bud. 2. *Ligustrum*
 3B. Flowers in axillary fascicles or in cymes; corolla-lobes imbricate in bud. 3. *Osmanthus*
 1B. Fruit a dry capsule or samara.
 4A. Fruit a capsule; leaves simple or rarely pinnate.
 5A. Flowers yellow; corolla-lobes imbricate in bud; branches hollow or with lamellate pith; leaves toothed or entire, simple or ternate.
 5B. Flowers white, rose-purple, or lilac, in terminal and axillary much-branched thyrsoid panicles; corolla-lobes valvate in bud; branches with solid pith; leaves usually simple, entire, rarely pinnatifid. 5. *Syringa*
 4B. Fruit a samara; leaves pinnately compound. 6. *Fraxinus*

1. CHIONANTHUS L. HITOTSUBA-TAGO ZOKU

Shrubs or trees, glabrous or pubescent; leaves opposite, entire, sometimes toothed; flowers in trichotomous panicles; calyx minute, 4-lobed; corolla white, the lobes linear, much longer than the tube; stamens 2, on the tube, the filaments short, the anthers exerted or included, the connective mucronate; ovary 2-locular; ovules 2 in each locule, pendulous; style short, the stigma thick, retuse or subfifid; drupe ellipsoidal, with a firm endocarp; seeds solitary, rarely 2 or 3, the endosperm fleshy.—Two or three species, in e. Asia and N. America.

1. *Chionanthus retusus* Lindl. & Paxt. *C. chinensis* Maxim.; *C. serrulatus* Hayata; *C. retusus* var. *serrulatus* (Hayata) Koidz.—HITOTSUBA-TAGO. Tree with gray-brown branches, puberulent while young; leaves oblong, elliptic, or ovate, 5–10 (–15) cm. long, 2.5–6 cm. wide, obtuse or acute, entire or doubly toothed in the young leaves, green and glabrous on upper side, puberulent on the impressed midribs, brownish pubescent on lower part of the midrib beneath, the

petioles 1.5–3 cm. long, puberulent; panicles terminal, 7–12 cm. long, glabrous, the pedicels 7–10 mm. long; calyx deeply 4-lobed, 2–3 mm. long, the lobes lanceolate, acuminate; corolla white, the tube 1–1.5 times as long as the calyx, the lobes linear-oblancheolate, 1.5–2 cm. long, 2–4 mm. wide; fruit ellipsoidal, black, about 1 cm. long.—May. Honshu (centr. distr. incl. Kantō), Kyushu (Tsushima); rare.—Korea, China, and Formosa.

2. LIGUSTRUM L. IBOTA-NO-KI ZOKU

Evergreen or deciduous shrubs or trees; leaves opposite, entire; flowers white, small, in terminal, much-branched or sometimes reduced panicles; calyx cup-shaped or short-tubular, truncate or shortly 4-toothed; corolla infundibuliform or tubular, with ascending or spreading lobes, valvate in bud; stamens 2, on the tube, the filaments short, the anthers often exerted; ovary 2-locular, the ovules 2 in each locule, pendulous; fruit drupelike, somewhat juicy, the endocarp membranous or chartaceous; seeds 1–3, with fleshy endosperm.—About 50 species, in temperate to warmer regions of Eurasia, also in Malaysia and Australia.

- 1A. Corolla-tube as long as the lobes or nearly so; anthers oblong, rounded at both ends, 1.2–2 mm. long, shorter than the filaments; styles exerted from the tube.
 2A. Evergreen; leaves coriaceous, lustrous.
 3A. Leaves elliptic or ovate-elliptic, 5–8 (–10) cm. long; corolla-lobes slightly shorter than the tube; fruit usually ellipsoidal. 1. *L. japonicum*
 3B. Leaves ovate to broadly so, 6–10 (–12) cm. long; corolla-lobes half as long as the tube; fruit ellipsoid-globose. 2. *L. lucidum*
 2B. Deciduous; leaves herbaceous, not lustrous, puberulent beneath while young or glabrous on both sides, narrowly obovate to broadly oblanceolate. 3. *L. salicinum*
 1B. Corolla-tube usually 2–3 times or rarely only slightly longer than the lobes; anthers broadly lanceolate, narrowed to the tip, 2–4 mm. long, longer than the filaments; style not exerted from the tube.
 4A. Anthers as long as to longer than the corolla-lobes.
 5A. Panicles much branched; leaves half-evergreen, somewhat coriaceous, 4–10 cm. long, 2–5 cm. wide. 4. *L. ovalifolium*
 5B. Panicles reduced, racemose; leaves deciduous, herbaceous to membranous, 2–5 (–8) cm. long, 1–2 (–3.5) cm. wide. 5. *L. tschonoskii*
 4B. Anthers about half as long as the corolla-lobes.
 6A. Leaves oblong, usually obtuse; racemes 2–3 cm. long, elongate, several- to rather many-flowered, densely pilosulous. 6. *L. obtusifolium*
 6B. Leaves rhombic-ovate or elliptic, mostly acute; racemes 1–1.5 cm. long, headlike, 4- to 8-flowered, sparsely pilose, peduncled. 7. *L. ibota*

1. *Ligustrum japonicum* Thunb. *Ligustridium japonicum* (Thunb.) Spach; *Ligustrum kellerianum* Vis.; *Ligustrum taquetii* Lévl.—NEZUMI-MOCHI, TAMA-TSUBAKI. Large evergreen glabrous shrub; branches gray-brown or grayish; leaves thick-coriaceous, elliptic or broadly ovate-elliptic, rarely ovate, 5–8 (–10) cm. long, 2.5–4.5 cm. wide, entire, acute at both ends or sometimes subrounded at base, dark green and lustrous on upper side, yellow-green and obscurely punctulate beneath, the midrib impressed on upper side, often raised and reddish brown beneath, the petioles 5–12 mm. long; panicles pyramidal, 5–12 cm. long and as wide; corolla 5–6 mm. long, the tube as long as to slightly longer than the lobes; anthers oblong, 1.5–2 mm. long, filaments nearly as long as the corolla-lobes; styles exerted, 4–5 mm. long; fruit purple-black, ellipsoidal, 8–10 mm. long.—June. Woods and thickets in lowlands and hills; Honshu (centr. distr. and westw.), Shikoku, Kyushu. A few cultivars of this plant are grown in gardens.

Var. *pubescens* Koidz. *L. rotundifolium* var. *pubescens* (Koidz.) Hatus.—KE-NEZUMI-MOCHI. Inflorescence and

young branches puberulent.—Occurs with the typical phase.

Var. *crassifolium* Hisauchi. *L. iwaiki* Hisauchi, in syn.—IWAOKI. Branchlets puberulent; leaves thicker, elliptic to suborbicular, 1–5 cm. long, 1–4 cm. wide, obtuse to very obtuse.—Cultivated in our area, possibly spontaneous in the Ryukyus.

Var. *rotundifolium* Bl. *L. coriaceum* Carr.; *L. lucidum* var. *coriaceum* (Carr.) Decne.; *L. japonicum* var. *coriaceum* Bl. ex Lavall.—FUKURO-MOCHI. Shrub with puberulent branches; leaves ovate-elliptic to nearly orbicular, rather short-petioled, densely arranged on the branchlets; panicles narrow, very dense and interrupted, the axis puberulent, 3–6 cm. long, with very short branches; corolla-tube rather elongate; filaments short, the anthers shorter than the corolla-lobes.—Cultivated.

2. *Ligustrum lucidum* Ait. Tō-NEZUMI-MOCHI. Resembles the preceding, but larger, sometimes a small tree; leaves coriaceous, ovate to broadly so, 6–10 (–12) cm. long, 3–5 cm. wide, gradually narrowed to the acute tip, rounded to subacute

at base, lustrous, pale green and obscurely punctulate beneath, the petioles brownish, 1–2 cm. long; panicles pyramidal, 10–18 cm. long and as wide; corolla 3–4 mm. long, the tube slightly shorter than the lobes; anthers oblong, 1.2–1.5 mm. long, the filaments elongate; styles 2.5–3 mm. long; fruit ellipsoid-globose, purple-black, 8–10 mm. in diameter.—June–July. Chinese species widely cultivated in our area.

3. *Ligustrum salicinum* Nakai. *L. mayebaruanum* Koidz. —YANAGI-IBOTA, HANA-IBOTA. Small deciduous tree, the branchlets sparsely puberulent; leaves narrowly obovate to broadly oblanceolate, sometimes oblong, 6–10 (–12) cm. long, 2–3.5 (–6.5) cm. wide, usually gradually narrowed at both ends, deep green and glabrous above, paler and puberulent while young beneath, the petioles 8–15 mm. long; panicles large, elongate, 15–20 cm. long, 10–15 cm. wide, puberulent, sometimes nearly glabrous; corolla-lobes as long as to slightly shorter than the tube, the filaments longer than the lobes; anthers oblong, about 1.5 mm. long, half as long as the filaments; styles exerted from the tube, about 4 mm. long; fruit oblong, purple-black, 8–10 mm. long.—May. Honshu (Kinki Distr. and westw.), Kyushu; rare.—s. Korea.

4. *Ligustrum ovalifolium* Hassk. *L. japonicum* var. *ovalifolium* (Hassk.) Bl.; *L. medium* Fr. & Sav.; *L. tsushimensis* Nakai; *L. hisauchii* Makino —ŌBA-IBOTA, OKA-IBOTA. Semi-evergreen glabrous shrub; leaves thick, lustrous, elliptic, obovate, or ovate, 4–10 cm. long, 2–5 cm. wide, acute or sometimes obtuse at both ends, deep green and the midrib impressed on upper side, pale green and the midrib raised beneath, the petioles 3–10 mm. long; panicles pyramidal-deltoid, 5–10 cm. long and as wide; corolla-lobes about half as long as the tube, slightly longer than the filaments; anthers broadly lanceolate, about 2.5 mm. long, longer than the filaments; fruit nearly globose, purple-black, about 8 mm. in diameter.—June–July. Thickets near the sea; Honshu, Shikoku, Kyushu; rather common.

Var. *heterophyllum* (Bl.) Nakai. *L. ciliatum* var. *heterophyllum* Bl.; *L. medium* var. *pubescens* Koidz.; *L. hisauchii* var. *pubescens* Makino; *L. macrocarpum* var. *pubescens* (Makino) Nakai; *L. medium* var. *psilorrhachis* Nakai —KE-ŌBA-IBOTA, YABU-IBOTA, KE-OKA-IBOTA. Panicles and young branches puberulent.—Honshu (Kantō Distr.).—Korea.

Var. *pacificum* (Nakai) Mizushima. *L. pacificum* Nakai —HACHIŌ-IBOTA. Corolla-tube as long as to slightly longer than the lobes.—Thickets near the sea; Honshu (Izu Is.).

5. *Ligustrum tschonoskii* Decne. *L. acuminatum* Koehne; *L. yesoense* Nakai; *L. ciliatum* var. *tschonoskii* (Decne.) Mansf.; *L. rufum* Nakai; *L. yuhkianum* Koidz. —MIYAMA-IBOTA. Much-branched deciduous shrub with gray branches and slender gray-pilousulous branchlets; leaves membranous, broadly lanceolate to ovate, or sometimes rhombic-ovate, 2.5 (–8) cm. long, 1–2 (–3.5) cm. wide, usually acute, sometimes acuminate or obtuse at both ends, usually appressed-puberulent above, pale green and pilousulous especially on the nerves beneath, the petioles 2–5 mm. long, usually pilousulous; panicles narrowly pyramidal, subracemose, slender, 3–5 (–7) cm. long, 1.5–2.5 cm. wide, rather densely puberulent; corolla 6–7 mm. long, the tube rather slender, 1.5–2 times as long as the lobes; filaments shorter than the corolla-lobes, the anthers lanceolate, 2.5–3.5 mm. long; styles 2–3 mm. long; fruit globose, purple-black, about 8 mm. in diameter.—June–July. Thickets and thin woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable.

Var. *glabrescens* Koidz. *L. acuminatum* var. *glabrum* Koidz.; *L. yesoense* var. *glabrum* (Koidz.) Nakai —EZO-IBOTA. Glabrescent; leaves pilousulous only on the nerves beneath.—Occurs with the typical phase.

Var. *macrocarpum* (Koehne) Mansf. *L. macrocarpum* Koehne; *L. acuminatum* var. *macrocarpum* (Koehne) C. K. Schn.—ŌMI-IBOTA. Leaves larger and fruit to 12 mm. long.—Occurs with the typical phase.

Var. *kiyozumianum* (Nakai) Ohwi. *L. kiyozumianum* Nakai.—KIYOZUMI-IBOTA. Leaves broadly ovate, obovate, or broadly elliptic, and slightly pilousulous; panicles pilousulous, narrow, 3–7 cm. long, 2–4 cm. wide.—Honshu (se. Kantō Distr.).

Var. *epile* Ohwi. *L. kiyozumianum* var. *glabrescens* Nakai —KE-NASHI-KIYOZUMI-IBOTA. Glabrous variant of the preceding variety, and occurs with it.

6. *Ligustrum obtusifolium* Sieb. & Zucc. *L. ibota* Sieb., nom. seminud., non Sieb. & Zucc.; *L. ibota* var. *angustifolium* Bl.; *L. ibota* var. *obovatum* Bl.; *L. ciliatum* var. *spathulatum* Bl.; *L. ibota* var. *obtusifolium* (Sieb. & Zucc.) Koidz. —IBOTA-NO-KI. Much-branched deciduous shrub with slender grayish pilousulous branches while young; leaves membranous, oblong-lanceolate, narrowly oblong, or broadly oblanceolate, 2–5 (–7) cm. long, 7–20 (–25) mm. wide, obtuse or sometimes subacute at both ends, the petioles 1–2 mm. long; panicles racemose, 2–3 cm. long, densely flowered, densely pilousulous; calyx usually pilousulous; corolla 7–9 mm. long, the tube 1.5–2.5 times as long as the lobes; filaments very short, the anthers broadly lanceolate, 2–2.5 mm. long, about half as long as the corolla-lobes; styles 3–4 (–4.5) mm. long; fruit nearly globose, purple-black, 5–6 mm. in diameter.—June. Thickets and thin woods in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—Ryukyus and Korea.

Var. *leiocalyx* (Nakai) Hara. *L. tschonoskii* var. *leiocalyx* Nakai —SETSU-IBOTA. Calyx glabrous.—Occurs with the typical phase.

Var. *regelianum* (Koehne) Rehd. *L. regelianum* Koehne; *L. ibota* var. *regelianum* (Koehne) Rehd. —ONI-IBOTA. Plant prominently pilose.—Occurs with the typical phase.

Var. *velutinum* (Bl.) Hara. *L. ibota* var. *velutinum* Bl. —BIRŌDO-IBOTA. Leaves prominently pilousulous beneath.—Occurs with the typical phase.

7. *Ligustrum ibota* Sieb. ex Sieb. & Zucc. *L. ciliatum* Sieb. ex Bl.; *L. ibota* var. *ciliatum* (Sieb.) Decne.; *L. ibota* forma *glabrum* Nakai —SAIKOKU-IBOTA. Deciduous shrub with slender, gray-brown spreading branches, puberulent on young growth; leaves membranous, ovate, elliptic, or oblong, 1–4 cm. long, 7–25 mm. wide, acute or sometimes obtuse, rounded to acute at base, glabrous to thinly appressed-pilousulous above, pale green and pilose at least on the midrib beneath, the petioles 1–2 mm. long; panicles very much reduced, racemose, few-flowered, headlike, the axis 3–8 mm. long, thinly pilousulous; calyx glabrous; corolla 7–8 mm. long, the tube 3–4 times as long as the lobes; filaments very short, the anthers about 2.5 mm. long; styles slender, 3–3.5 mm. long; fruit globose, about 7 mm. across, purple-black.—May–June. Mountains; Kyushu.

Var. *microphyllum* Nakai. *L. ciliatum* var. *microphyllum* Nakai —KŌBA-NO-IBOTA. A small-leaved phase, occurring with the species.

3. OSMANTHUS Lour. MOKUSEI ZOKU

Glabrous evergreen dioecious trees or large shrubs; leaves coriaceous, opposite, simple, penninerved, petiolate, entire or toothed; flowers small, unisexual or polygamous, axillary, fasciculate, short-racemose; calyx short, 4-toothed; corolla short-tubular, 4-lobed, imbricate in bud; stamens 2, rarely 4, the filaments short, the anthers ovoid, subexserted; ovary 2-locular, superior; styles short, the stigma entire; ovules 2 in each locule; drupe ellipsoidal or globose, the endocarp thick; seeds solitary, with a thin testa, endosperm fleshy.—More than 10 species in e. Asia, one in se. U.S.A.

- 1A. Leaves entire or serrulate, the midrib impressed above, the lateral nerves distinctly raised beneath; wild and cultivated species.
- 2A. Leaves narrowly oblong or broadly oblong-lanceolate; flowers yellow to orange. 1. *O. aurantiacus* var. *thunbergii*
- 2B. Leaves oblong or narrowly ovate-oblong; flowers white. 2. *O. fragrans*
- 1B. Leaves entire or coarsely spiny-toothed, the midrib flat above, the lateral nerves slightly raised beneath; indigenous species.
- 3A. Leaves 3-5(-7) cm. long, with few large teeth or entire. 3. *O. heterophyllus*
- 3B. Leaves 7-15 cm. long, usually entire, or sometimes with large teeth in young specimens.
- 4A. Leaves relatively thin to subcoriaceous, long-acuminate. 4. *O. insularis*
- 4B. Leaves very thickly coriaceous, abruptly acute. 5. *O. rigidus*

1. *Osmanthus aurantiacus* (Makino) Nakai var. *thunbergii* (Makino) Honda. *Osmanthus intermedius* Nakai; *Olea fragrans* Thunb.; *Osmanthus fragrans* var. *thunbergii* Makino —USUGI-MOKUSEI. Large glabrous evergreen shrub with pale gray-brown branches; leaves narrowly oblong or broadly oblong-lanceolate, 7-12 cm. long, 2.5-4 cm. wide, acuminate, acute at base, deep green above, serrulate especially toward the tip or subentire, the petioles 7-15 mm. long; flowers about 5 mm. across, pale yellow, the pedicels 7-10 mm. long.—Sept. Kyushu (s. distr.); planted chiefly in the western parts of our area.—China and India.

Var. *aurantiacus*. *O. fragrans* var. *aurantiacus* Makino; *O. aurantiacus* (Makino) Nakai; *O. fragrans* forma *aurantiacus* (Makino) P. S. Green.—KIN-MOKUSEI. Flowers orange-yellow. Commonly cultivated in our area.

2. *Osmanthus fragrans* Lour. *O. asiaticus* Nakai; *O. fragrans* var. *latifolius* Makino; *O. latifolius* (Makino) Koidz.—GIN-MOKUSEI. Large glabrous shrub with grayish branches; leaves coriaceous, oblong, sometimes narrowly so or narrowly ovate-oblong, 8-13 cm. long, 3-5 cm. wide, abruptly acuminate, acute to nearly rounded at base, deep green, serrulate or entire, the petioles 7-13 mm. long; flowers about 5 mm. across, white, the pedicels 7-10 mm. long.—Sept. Thought to be spontaneous in mountains of Kyushu; widely cultivated in our area.—China.

3. *Osmanthus heterophyllus* (G. Don) P. S. Green. *Ilex aquifolium* nec. Thunb., non L.; *I. heterophylla* G. Don; *Olea ilicifolia* Hassk.; *Olea aquifolium* Sieb. & Zucc.; *Osmanthus aquifolium* Sieb.; *I. odora* Sieb. ex Miq.; *Olea aquifolium* var. *subintegra* (Miq.) Miq.; *Osmanthus heterophyllus* Hort. ex Koch; *Olea aquifolium* var. *ilicifolia* Hort. ex Dipp.; *Osmanthus ilicifolius* (Hassk.) Hort. ex Carr.; *Osmanthus diversifolius* Hort. ex Mouill.; *O. aquifolium* f. *subangulatus* Makino; *O. integrifolius* Hayata; *O. ilicifolius* var. *subangulatus* (Makino) Makino; *O. ilicifolius* undulatifolius Makino; *O. ilicifolius* f. *subangulatus* (Makino) Makino & Nemoto.—HIIRAGI. Much-branched large shrub or tree; branches pale grayish brown, branchlets minutely papillose, puberulent while young; leaves coriaceous, dimorphic, elliptic, ovate, oblong, or obovate-elliptic, 3-5(-7) cm. long, 2-3 cm.

wide, acuminate, lustrous and dark green above, pale green or yellowish green beneath, glabrous, coarsely spiny-toothed in young and vigorous individuals, entire and obtuse in adult trees, the petioles 7-12 mm. long; flowers white, 4-5 mm. across, the pedicels 5-12 mm. long; calyx-lobes ovate-deltoid, entire; fruit elliptic, purple-black, 12-15 mm. long.—Oct.-Dec. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Formosa. Several cultivars are grown in gardens.

Osmanthus × *fortunei* Carr. *Olea japonica* Sieb., nom. nud.; *Osmanthus fortunei* var. *cordifolius* Carr.; *O. fortunei* var. *ovatus* Hort. ex Carr.; *O. ilicifolius* var. *latifolius* Hort. ex Mouill.; *O. latifolius* Hort. ex Mouill. pro syn.; *O. aquifolium* var. *ilicifolius* *latifolius* Hort. ex Nichols.; *O. japonicus* Sieb. ex Makino; *O. aquifolium* var. *japonicus* (Sieb. ex Makino) Makino.—HIIRAGI-MOKUSEI. Leaves rather large, semi-lustrous, elliptic, 6-10 cm. long, 3-5 cm. wide, entire or coarsely spiny-toothed; calyx-lobes denticulate.—Hybrid of *O. fragrans* × *O. heterophyllus*. Much cultivated.

4. *Osmanthus insularis* Koidz. *O. zentaroanus* Makino; *O. hachijoensis* Nakai.—NATAORE-NO-KI, SATSUMA-MOKUSEI. Glabrous evergreen tree with grayish branches and often slightly flattened branchlets; leaves relatively thin to subcoriaceous, narrowly oblong or ovate-oblong, 7-10(-12) cm. long, 2.5-4(-5) cm. wide, acuminate, acute to acuminate at base, entire, or with 3-10 coarse spiny teeth on each side in young individuals, the petioles 1.5-2.5 cm. long, dilated in upper part; flowers white, the pedicels 7-10 mm. long; calyx-lobes deltoid, minutely toothed; fruit ellipsoidal, black, 15-20 mm. long.—Nov.-Dec. Honshu (Wakasa Prov. and westw. and Izu Isls.), Shikoku, Kyushu.—Ryukyus, Bonins, s. Korea (Hamilton Is.).

5. *Osmanthus rigidus* Nakai. Ô-MOKUSEI. Glabrous evergreen large shrub with gray-white branches and thick, lenticellate branchlets; leaves very thick-coriaceous, oblong, 8-15 cm. long, 3-6 cm. wide, acute at both ends, entire, the petioles reddish, 2-3 cm. long, dilated in upper part; flowers white, 6-7 mm. across, the pedicels about 1 cm. long, recurved in fruit; calyx-lobes deltoid, entire.—Oct.-Nov. Kyushu (s. distr.); possibly not spontaneous.—Tokara Isls. (according to S. Hatusima).

4. FORSYTHIA Vahl RENGÛ ZOKU

Deciduous shrubs; branches hollow or with lamellate pith; leaves simple or 3-foliate, opposite, entire or toothed; flowers heterostylous, precocious, short-pedicelled, yellow; calyx-tube short, the lobes 4; corolla 4-lobed, with a short broad tube, the limb spreading, the lobes much longer than the tube, imbricate in bud; stamens 2, inserted at base of corolla, the filaments short, the anthers scarcely exerted; ovary 2-locular, with 4- to 10-ovules in each locule; capsules 2-valved; seeds winged, endosperm wanting.—About 6 species, 1 in Albania, the others in e. Asia.

1A. Internodes hollow; leaves sometimes ternately compound; calyx-lobes oblong, (5-) 6-7 mm. long, as long as the corolla-tube.

1. *F. suspensa*

1B. Internodes with lamellate pith; leaves undivided; calyx-lobes elliptic, 2.5-3.5 mm. long, shorter than the corolla-tube.

2A. Leaves glabrous; branches rather distinctly 4-angled. 2. *F. viridissima*

2B. Leaves with persistent pubescence beneath; branches nearly terete, with 2 shallow obsolete grooves. 3. *F. japonica*

1. *Forsythia suspensa* (Thunb.) Vahl. *Ligustrum suspensum* Thunb.; *Syringa suspensa* Thunb.; *Lilac perpensa* Lam.; *Rangium suspensum* (Thunb.) Ohwi; *F. sieboldii* Dipp.; *F. suspensa* var. *sieboldii* (Dipp.) Zabel.—RENGYŌ. Glabrous, somewhat sprawly shrub; internodes hollow, the nodes with solid pith; leaves simple or ternately compound, ovate to broadly so, or elliptic-ovate, 4-8 cm. long, 3-5 cm. wide, acute, rounded to broadly cuneate at base, acutely toothed except at base, deep green, pale yellow-green beneath, the petioles 1-1.5 cm. long; flowers solitary from a lateral bud, the pedicels 1-1.5 cm. long, usually longer than the bud-scales; calyx-lobes oblong, 6-7 mm. long, ciliate; corolla about 2.5 cm. across, the lobes obovate-elliptic, about 1.5 cm. long, 8-10 mm. wide; fruit ovoid, about 1.5 cm. long, with scattered warty lenticles.—Mar.-Apr. Chinese shrub much cultivated in our area.

2. *Forsythia viridissima* Lindl. *Rangium viridissimum* (Lindl.) Ohwi.—SHINA-RENGYŌ. Glabrous deciduous shrub with 4-angled, gray-brown branches, the pith lamellate; leaves rather thick, oblong to lanceolate, rarely ovate-oblong, 6-10 cm. long, 1-3 cm. wide, broadest at or above the middle, acute, cuneate at base, short-toothed on the upper half, deep green, pale green beneath, the petioles 7-10 mm. long; pedicels 5-10 mm. long, as long as to slightly longer than the bud-scales;

calyx-lobes elliptic, ciliate, 2.5-3 mm. long, erect, half as long as the corolla-tube; corolla 2-2.5 cm. across, the lobes narrowly oblong, about 15 mm. long, about 7 mm. wide, slightly recurved on margin; fruit broadly ovoid, about 1.5 cm. long, nearly rounded at base.—Apr. Chinese shrub rarely cultivated in our area.

Forsythia koreana Nakai. *F. viridissima* var. *koreana* (Nakai) Rehd.—CHŌSEN-RENGYŌ. Leaves usually broadest on lower half; calyx slightly shorter than the corolla-tube, the lobes obliquely ascending.—Rarely cultivated.—Korea.

3. *Forsythia japonica* Makino. *Rangium japonicum* (Makino) Ohwi.—YAMATO-RENGYŌ. Deciduous shrub; branches grayish yellow-brown, nearly terete, with 2 shallow obscure grooves or indistinctly 4-striate, glabrous; leaves membranous, ovate to broadly so, 7-12 (-15) cm. long, 4-6 (-8) cm. wide, short-acuminate, usually toothed, glabrous, pale green and more or less white-hairy, especially on the nerves beneath, the petioles 6-8 mm. long, white-pubescent; pedicels 2-3 mm. long, slightly shorter than the bud-scales; calyx-lobes elliptic, 2.5-3 mm. long, ciliate; corolla about 2.5 cm. across, the lobes narrowly oblong, about 12 mm. long, 5-6 mm. wide; fruit broadly ovoid, about 1 cm. long.—Apr. Mountains; Honshu (Chūgoku Distr.); rare.

5. SYRINGA L. HASHIDOI ZOKU

Shrubs or trees, glabrous or pubescent; branches with solid pith; leaves opposite, petiolate, entire or rarely pinnatifid; inflorescence a panicle or thyrse; flowers white, rose-purple or lilac, rather small; calyx campanulate, small, irregularly toothed; corolla tubular, the lobes 4, longer or shorter than the tube, valvate in bud; stamens 2, inserted on the throat or on the tube of corolla, the filaments short or rather long; ovary 2-locular; stigma bifid; ovules 2 in each locule; capsules narrowly oblong, terete or flattened, 2-valved; seeds flat, winged on back, the endosperm fleshy.—About 30 species in Eurasia.

1. *Syringa reticulata* (Bl.) Hara. *Ligustrum reticulatum* Bl.; *Ligustrina amurensis* var. *japonica* Maxim.; *S. amurensis* var. *japonica* (Maxim.) Fr. & Sav.; *S. japonica* Maxim. ex Decne.—HASHIDOI. Deciduous small tree with glabrous, gray-brown branches; leaves ovate to broadly so, or ovate-orbicular, 6-8 (-12) cm. long, 3.5-6 (-9) cm. wide, abruptly acuminate or acute, rounded to shallowly cordate or sometimes abruptly acute at base, entire, deep green and glabrous above, pale green and short, white-pubescent beneath especially on the midrib, the veins reticulate beneath; panicles large and rather broad, 15-25 cm. long, 10-15 cm. wide,

densely many-flowered, glabrous or puberulent; flowers white, fragrant, about 5 mm. across, short-pedicellate; calyx-teeth depressed; corolla subinfundibuliform, the lobes ovate, about 2.5 mm. long, longer than the tube; filaments slightly longer than the corolla-lobes, the anthers ellipsoidal, about 1.5 mm. long; capsules narrowly oblong, 15-20 mm. long, smooth to loosely lenticellate; seeds flat, wing-margined.—June-July. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.

Syringa vulgaris L. *Lilac vulgaris* Lam. MURASAKI-HASHIDOI. Often cultivated.—Introduced from se. Europe.

6. FRAXINUS L. TONERIKO ZOKU

Deciduous, rarely evergreen, often dioecious trees; leaves opposite, pinnately compound, very rarely simple, petiolate, toothed or entire; flowers small, in terminal or axillary panicles or racemes, polygamous or unisexual; calyx minute, 4-lobed; petals 2, 4, or absent, free or united at base; stamens 2; ovary 2-locular, with 2-ovules in each locule; samara winged, 1-seeded; seeds narrowly oblong.—About 70 species, widely distributed in the N. Hemisphere, also in Mexico and Java.

1A. Panicles from lateral buds, without leaves at base; leaflets sessile.

2A. Leaf-rachis and inflorescence glabrous; samara about 4 cm. long, 8-15 mm. wide. 1. *F. spaethiana*

2B. Leaf-rachis and inflorescence red-brown woolly; samara about 2.5-3.5 cm. long, 7-8 mm. wide. 2. *F. mandshurica* var. *japonica*

1B. Panicles on young shoots, with few pairs of leaves at base.

3A. Petals absent; calyx small, cup-shaped, with small teeth, persistent; leaflets usually petiolate, often with multicellular crisped hairs at base.

4A. Leaflets abruptly acute to short-acuminate. 3. *F. japonica*

4B. Leaflets long-acuminate to caudate. 4. *F. longicuspis*

- 3B. Petals present; calyx minute or nearly absent, rarely with few small narrow deciduous teeth; leaflets usually sessile, with unicellular, spreading hairs at base or glabrous.
- 5A. Bud-scales closely appressed.
- 6A. Young branches, petioles, and inflorescence with very minute spreading hairs and minute often stipitate glands. 5. *F. sieboldiana*
- 6B. Young branches, petioles, and inflorescence glabrous or pilose with spreading stiff hairs. 6. *F. lanuginosa*
- 5B. Outer 2 bud-scales spreading at tip; young branches, petioles, and inflorescence glabrous. 7. *F. apertisquamifera*

1. *Fraxinus spaethiana* Lingelsh. *F. mandshurica* var. *shioji* Kudo; *F. commemoralis* Koidz.; *F. verecunda* Koidz. —SHIOJI. Tall deciduous tree with stout, glabrous, grayish yellow-brown branchlets; leaves 25–30 cm. long, 7- to 9-foliolate, mostly glabrous or occasionally scattered-hairy on the leaflets beneath, the petioles shallowly and rather narrowly grooved on upper side, dilated at base and somewhat clasping; terminal leaflets petiolate, narrowly cuneate at base, 8–15 cm. long, 3–7 cm. wide, the lateral ones gradually smaller, broadly oblanceolate, rarely narrowly oblong, sessile, slightly oblique, minutely toothed, acuminate to abruptly acute; panicles 10–15 cm. long, glabrous; flowers apetalous; calyx cup-shaped, irregularly toothed; samaras pendulous, broadly lanceolate, 4 cm. long, 8–15 mm. wide, usually narrowed at both ends, the pedicels 5–10 mm. long. —Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *nipponica* (Koidz.) Hara. *F. nipponica* Koidz. —YAMA-SHIOJI, KAI-SHIJI-NO-KI. Petioles and leaf-axis puberulent. —Honshu (Kai and Harima Prov. and elsewhere).

2. *Fraxinus mandshurica* Rupr. var. *japonica* Maxim. *F. excelissima* Koidz.; *F. mandshurica* sensu auct. Japon., non Rupr. —YACHI-DAMO. Large deciduous tree; branches 4-angled; leaves 7- to 11-foliolate, the leaflets sessile except the terminal one, narrowly oblong, 5–15 cm. long, 3–4 cm. wide, acuminate, toothed, obliquely cuneate at base, rusty-brown woolly at the attachment, spreading-pilulous along midrib and nerves beneath, usually glabrous above; calyx minute, obconical, deciduous and not persistent in fruit; corolla absent; samaras broadly oblanceolate, obtuse, narrowly cuneate toward the base, 2.5–3.5 cm. long, 7–8 mm. wide. —Apr.–May. Wet places in mountains; Hokkaido, Honshu (centr. and n. distr.). —The typical phase with the base of leaflets less densely woolly occurs in Sakhalin, Korea, Manchuria, and northern E. Asia.

3. *Fraxinus japonica* Bl. *F. kantoensis* Koidz.; *F. nakaiana* Koidz. —TONERIKO. Deciduous tree with thick, slightly flattened branchlets; leaves 20–35 cm. long inclusive of the petioles, 5- or 7-(9)-foliolate, the leaflets narrowly to broadly ovate or broadly lanceolate, 5–15 cm. long, 3–6 cm. wide, spreading white-pilose along the midrib beneath, abruptly acute to short-acuminate, toothed, obliquely rounded to cuneate at base, petiolate; calyx small, cuplike, irregularly toothed, persistent; corolla absent; samaras oblanceolate, 3–4 cm. long, 5–7 mm. wide, usually obtuse, narrowly long-cuneate at base. —Wet places in lowlands and mountains; Honshu (centr. and n. distr.); often planted on borders of paddy fields. —Forma *intermedia* (Nakai) Hara. *F. intermedia* Nakai; *F. koshiensis* Koidz. —NAGAMI-NO-TONERIKO. Samaras narrower than in the typical phase.

Var. *stenocarpa* (Koidz.) Ohwi. *F. stenocarpa* Koidz.; *F. spaethiana* sensu auct. Japon., non Lingelsh. —DEWA-NO-TONERIKO. Leaflets oblong to broadly oblanceolate; samaras narrowly lanceolate. —Honshu (Dewa Prov.).

4. *Fraxinus longicuspis* Sieb. & Zucc. *F. yamatensis* Na-

kai; *F. borealis* Nakai —YAMOTO-AO-DAMO. Deciduous tree; branches gray-brown, pale brown crisped-hairy while young; leaves 15–25 cm. long inclusive of the petioles, 5- or 7-foliolate, the rachis and petioles crisped-hairy while young, usually slightly reddish, the leaflets broadly lanceolate, broadly oblanceolate or sometimes oblong-lanceolate, 5–10 cm. long, 2–3 cm. wide, long-acuminate to caudate, short-toothed, narrowed toward the base, petiolate; calyx cup-shaped, minutely toothed, persistent; corolla absent; samaras oblanceolate, 3–4 cm. long, about 6 mm. wide, retuse to obtuse. —Mountains; Honshu, Shikoku, Kyushu.

Var. *pilosella* (Honda) Hara. *F. borealis* var. *pilosella* Honda —URAGE-Ō-TONERIKO. Leaflets pubescent beneath. —Occurs with the typical phase.

Var. *latifolia* Nakai. (?) *F. pubinervis* Bl.; (?) *F. obovata* Bl.; (?) *F. satsumana* Koidz. —HIRO-HA-AO-DAMO, TSUKUSHI-TONERIKO. Leaflets broader, ovate to narrowly so. —Occurs with the typical phase.

5. *Fraxinus sieboldiana* Bl. *F. sieboldiana* var. *angustata* Bl.; *F. angustata* (Bl.) Hatus.; *F. tobana* Honda; *F. longicuspis* var. *sieboldiana* (Bl.) Lingelsh. —MARUBA-AO-DAMO. Deciduous tree; buds closed, the scales gray-puberulent to nearly glabrous outside; branchlets slender, gray-brown, spreading-puberulent while young; leaves 5-(7)-foliolate, 10–15-(20) cm. long inclusive of the petioles, the petioles and rachis puberulent while young, the leaflets narrowly to broadly ovate, sometimes broadly lanceolate, 5–10-(13) cm. long, 1.5–3.5 cm. wide, long-acuminate, glabrous or with spreading white hairs along the midrib beneath, toothed or nearly entire, subsessile; calyx minutely toothed; petals 4, 6–7 mm. long, free, linear-oblanceolate, white; samaras oblanceolate to linear-oblanceolate, 2.5–3 cm. long, about 5 mm. wide. —Apr.–May. Mountains and hills; Honshu, Shikoku, Kyushu; common. —Korea.

6. *Fraxinus lanuginosa* Koidz. *F. sieboldiana* var. *pubescens* Koidz. —AO-DAMO, KOBAN-NO-TONERIKO. Closely related to the preceding; young branches, inflorescence, and petioles glabrous or pilose with spreading stiff hairs; buds smooth or pilose with spreading stiff unicellular (rarely bi-cellular) hairs; leaflets generally distinctly serrate and sometimes larger. —Mountains; Hokkaido, Honshu, Shikoku, Kyushu.

7. *Fraxinus apertisquamifera* Hara. *F. sambucina* Koidz., excl. syn. —MIYAMA-AO-DAMO. Deciduous small tree with rather slender, glabrous branchlets; leaves rather thin, 10–20 cm. long inclusive of the petioles, (5-)7-foliolate, glabrous or nearly so, the leaflets broadly lanceolate to narrowly ovate or oblong, 5–12 cm. long, 2–4 cm. wide, long-acuminate, sessile except the terminal one, acutely toothed, obliquely acute to rounded at base, hairy along the midrib beneath; panicles glabrous; calyx minute or absent; petals 4, free, very narrow, white; samaras narrowly oblanceolate, obtuse to retuse, 2.5–3 cm. long, about 5 mm. wide. —Mountains; Honshu.

Fam. 167. LOGANIACEAE FUJI-UTSUGI KA Logania Family

Herbs, shrubs, or trees; leaves opposite, rarely alternate or verticillate, entire or toothed, simple, stipulate; inflorescence cymose to thyrsiform, many-flowered, rarely reduced to 1-3 flowers; flowers bisexual, actinomorphic, 4- to 5-merous; calyx-lobes valvate, rarely imbricate in bud; corolla tubular, 4- to 10-lobed, the lobes contorted, imbricate, or valvate in bud; stamens on the tube, as many as the lobes, and alternate with them, rarely solitary; ovary superior, (1-)2- to 4-locular; ovules 1 to many in each locule, the placentation axile or parietal in a unilocular ovary; styles solitary; fruit a capsule, berry, or drupe; embryo straight, the endosperm fleshy or bony.—About 30 genera, with about 800 species, of wide distribution in the Tropics and subtropics.

1A. Fruit a many-seeded capsule; erect herbs or woody plants.

2A. Herbs; corolla-lobes valvate in bud. 1. *Mitrasacme*

2B. Shrubs; corolla-lobes imbricate in bud. 2. *Buddleia*

1B. Fruit a few-seeded berry; scandent evergreen shrubs. 3. *Gardenia*

1. MITRASACME Labill. AI-NAE ZOKU

Small or delicate herbaceous annuals or perennials; leaves opposite, small, entire, the petioles joined by a very short sheath from the adjacent one; flowers small, in terminal and axillary fascicles or umbels, 1 to many, white or yellowish; calyx campanulate, 4-lobed; corolla campanulate or cup-shaped, 4-lobed, valvate in bud; stamens 4, inserted on the tube, the anthers usually not exerted from the tube; ovary 2-locular; ovules many; styles 2, connate while young, later becoming bifid to the base; capsules truncate to bifid at the apex; seeds small.—About 30 species, chiefly in Australia, few in the Pacific Islands and tropical Asia.

1A. Stems leafy only on lower part, papillose-hairy toward the base; leaves ovate to oblong, 7-15 mm. long. 1. *M. pygmaea*
1B. Stems leafy throughout, nearly glabrous; leaves lanceolate to broadly linear, 3-8 mm. long. 2. *M. alsinoides* var. *indica*

1. *Mitrasacme pygmaea* R. Br. *M. nudicaulis* Reinw.; *M. chinensis* Griseb.; *M. polymorpha* sensu auct. Japon., non R. Br.—AI-NAE. Delicate annual, 5-15 cm. high; stems branched at base or simple, terete, with few pairs of leaves at base, scapellike in upper part; leaves ovate or oblong, 7-15 mm. long, 3-6 mm. wide, acute or obtuse, obsoletely 3-nerved, often short-pilousulous on both sides, always so on the margin; flowers 3-5, verticillate, erect, white, about 3 mm. across, the pedicels 1-4 cm. long; capsules globose, bifid, about 3 mm. long.—Aug.-Oct. Sunny places in lowlands; Honshu, Shikoku, Kyushu.—Korea, Ryukyus, Formosa, China, India, Malaysia, and Australia.

2. *Mitrasacme alsinoides* R. Br. var. *indica* (Wight) Hara. *M. alsinoides* sensu auct. Japon., non R. Br.; *M. indica* Wight—HIME-NAE. Delicate annual, 5-15 cm. high; stems often branched at base, leafy to the apex, loosely granular-puberulent on upper part; leaves of few pairs, spreading, lanceolate to broadly linear, 3-8 mm. long, 1-2 mm. wide, acute to acuminate, mucronate, obsoletely 1-costate, glabrous; flowers white, about 2.5 mm. across, the pedicels 7-20 mm. long; capsules globose, bifid; style about 2.5 mm. long.—Aug.-Oct. Wet grassy places in lowlands; Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, India, Malaysia, and Australia.

2. BUDDLEIA L. FUJI-UTSUGI ZOKU

Shrubs or trees, rarely herbs, usually pubescent; leaves opposite, rarely alternate or verticillate, entire or toothed; inflorescence spiciform, panicleate, or thyrsoid, densely flowered; flowers small, white, yellowish, or blue-purple, 4-merous; calyx campanulate, 4-toothed; corolla tubular, the lobes 4, spreading, imbricate in bud; stamens inserted on tube or throat, the anthers subsessile; ovary 2-locular, many-ovuled; capsules septicidally dehiscent, the valves sometimes bifid; seeds many, often winged.—About 100 species, in tropical and subtropical regions of Asia, America, and S. Africa.

1A. Branches 4-winged; anthers below the middle of the tube. 1. *B. japonica*
1B. Branches nearly terete, scarcely angled; anthers above the middle of the tube. 2. *B. venenifera*

1. *Buddleia japonica* Hemsl. *B. insignis* sensu auct. Japon., non Carr.—FUJI-UTSUGI. Deciduous, branched shrub 50-150 cm. high, the branches 4-winged, loosely pale brown stellate-hairy while young; leaves broadly lanceolate to narrowly ovate, 8-20 cm. long, 2-5 cm. wide, long-acuminate, loosely mucronate-toothed or entire, green and glabrate above, pale green and usually stellate-hairy beneath, the petioles 2-3 mm. long; panicles narrow, 10-25 cm. long, one-sided, many-flowered; corolla pale purple, 15-20 mm. long, pale brown-tomentose externally, the tube gently curved; fruit ovoid, 6-8 mm. long, with persistent corolla and calyx.—July-Oct. Sunny slopes and thickets in mountains; Honshu, Shikoku.

2. *Buddleia venenifera* Makino. *B. curviflora* sensu auct. Japon., saltem pro parte, non Hook. & Arn.; *B. curviflora* var. *venenifera* (Makino) Makino—URAJIRO-FUJI-

UTSUGI. Densely stellate-tomentose shrub, except the leaves on upper side; branches terete; leaves narrowly ovate, sometimes broadly lanceolate, 7-15 cm. long, 3-6 cm. wide, caudate, rounded to subacute at base, entire or obsoletely undulate-toothed, very thinly pubescent on upper side while young, the petioles 5-15 mm. long; panicles 10-30 cm. long, one-sided and densely many-flowered, declined in upper part, spiciform; corolla pale purple, densely stellate-hairy externally, the tube gently curved, about 15 mm. long; anthers above the middle of the tube; capsules ovoid, 5-6 mm. long.—July-Nov. Sunny slopes and waste grounds in hills and low elevations in the mountains; Shikoku, Kyushu.—Forma *calvescens* Ohwi. *B. venenifera* forma *kojufii* Ohwi—KO-FUJI-UTSUGI. Leaves green on both surfaces.

3. GARDNERIA Wall. HÔRAI-KAZURA ZOKU

Glabrous, scandent, evergreen shrubs; leaves opposite, entire; flowers axillary, solitary or in trichotomous cymes or panicles, rather small; calyx 4- to 5-parted; corolla nearly rotate, deeply 4- or 5-lobed, thick, valvate in bud; stamens 4 or 5, inserted on the throat, the anthers erect, subsessile, free and approximate, or slightly connate; ovary 2-locular, the ovules 1 to few in each locule; berry with fleshy pulp; seeds rather flat.—About 6 species, in India, China, Formosa, Japan, and Korea.

- 1A. Flowers in groups of 3-10; corolla-lobes glabrous inside, spreading; anthers glabrous, 2.5-3 mm. long, about half as long as the corolla-lobes; leaves narrowly oblong to broadly oblanceolate, 7-12 cm. long. 1. *G. multiflora*
 1B. Flowers 1(-3); corolla-lobes puberulous inside, recurved; anthers with a dense tuft of hairs on back at base, 5-6 mm. long, slightly shorter than the corolla-lobes; leaves ovate to ovate-oblong, 5-10 cm. long. 2. *G. nutans*

1. *Gardneria multiflora* Makino. *Pseudogardneria multiflora* (Makino) Pampan.—CHITOSE-KAZURA. Glabrous, evergreen, scandent shrub, the branches terete, with a pulvinuslike leaf-scar on each side of the node; leaves narrowly oblong to broadly oblanceolate, rarely lanceolate, 7-12 cm. long, 1.5-3.5 cm. wide, acuminate, subobtusate at base, deep green and lustrous, entire, the petioles 7-10 mm. long; inflorescence trichotomously 3- to 10-flowered, the peduncle 1-2 cm. long, the bracts small; calyx-lobes semicircular, ciliate, about 0.6 mm. long; corolla about 12 mm. across, yellow, 5-parted nearly to the base, the lobes glabrous inside, linear-oblong, spreading, obtuse; anthers glabrous, narrowly oblong, 2.5-3 mm. long, about half as long as the corolla-lobes.—June. Honshu (Chûgoku Distr.).—China.

2. *Gardneria nutans* Sieb. & Zucc. *Pseudogardneria nutans* (Sieb. & Zucc.) Racib.—HÔRAI-KAZURA. Glabrous,

evergreen, scandent shrub, the branches nearly terete, elongate, with a raised pulvinus like leaf-scar on each side; leaves rather thick, ovate or ovate-oblong, 5-10 cm. long, 2-4 cm. wide, abruptly acuminate to acute, abruptly acute at base, deep green and lustrous above, entire, the petioles 7-12 mm. long; inflorescence usually 1-flowered, rarely 3-flowered; flowers pendulous, white, the peduncles 1-2 cm. long; calyx-lobes semicircular, ciliate, less than 1 mm. long; corolla 5-parted nearly to the base, the lobes deltoid-lanceolate, puberulous inside; anthers erect, 5-6 mm. long, with a dense tuft of hairs on back; fruit globose, red, about 1 cm. across, 3- or 4-seeded.—July. Honshu (Awa Prov. and westw.), Shikoku, Kyushu; rather rare.

Gardneria insularis Nakai, EISHÛ-KAZURA, is reported to occur in Kyushu (Tsushima and Buzen Prov.).—s. Korea.

Fam. 168. GENTIANACEAE

RINDÔ KA

Gentian Family

Perennials or annuals, sometimes aquatic; leaves opposite or alternate, exstipulate; flowers bisexual, rarely polygamous, actinomorphic, usually showy; calyx tubular or of separate sepals, the segments imbricate in bud; corolla 4- to 12-lobed, the lobes contorted, rarely imbricate or induplicate in bud; stamens inserted on the tube, as many as and alternate with the lobes; ovary superior, usually 1(-2)-locular, the placentae parietal; fruit a capsule, rarely a berry; seeds usually many, the endosperm copious.—About 60 genera, with about 800 species, chiefly in temperate to subarctic, and sometimes subtropical regions.

- 1A. Leaves opposite or rarely verticillate, simple, entire; corolla-lobes contorted in bud; terrestrial.
 2A. Style filiform, usually deciduous; anthers spirally contorted. 1. *Centaureum*
 2B. Style short and thick, persistent, sometimes absent; anthers erect, not spirally contorted.
 3A. Corolla without glands or glandular-grooves at base of lobes.
 4A. Scandent, slender; leaves petiolate; flowers not erect.
 5A. Fruit berrylike; flowers 3-merous. 2. *Tripterispermum*
 5B. Fruit a capsule; flowers 4-merous. 3. *Pterygocalyx*
 4B. Erect, not scandent; leaves sessile or nearly so; flowers erect. 4. *Gentiana*
 3B. Corolla with large glands or glandular-grooves at base of lobes.
 6A. Corolla not spurred at base, rotate or rarely campanulate, the lobes dextrorsely contorted. 5. *Suertia*
 6B. Corolla spurred at base, campanulate, the lobes sinistrorsely contorted. 6. *Halenia*
 1B. Leaves alternate, sometimes trifoliate, entire or toothed; corolla-lobes induplicate in bud; aquatic or marsh herbs.
 7A. Leaves 3-foliate or reniform, not floating; capsules dehiscent; marsh plants.
 8A. Leaves 3-foliate; flowers in racemes; capsules 2-fid. 7. *Menyanthes*
 8B. Leaves simple, reniform; flowers in cymes; capsules 4-fid. 8. *Fauria*
 7B. Leaves ovate to orbicular, deeply cordate, floating; capsules indehiscent; aquatic. 9. *Nymphoides*

1. CENTAURIUM Hill

SHIMA-SEMBURI ZOKU

Erect, annual or perennial herbs; leaves opposite, sometimes clasping; cymes often subsapiculate; flowers axillary, rose, yellowish, or white, rather small; calyx tubular, 4- or 5-lobed; corolla salverform or rotate, the lobes 4 or 5, spreading, contorted in bud; stamens inserted on the tube, the anthers spirally contorted; ovary 1-locular; style filiform, the stigma 2, lamellate; capsules bifid; seeds many, small.—About 30 species, in temperate to subtropical regions of the N. Hemisphere and Australia.

1. *Centaureum japonicum* (Maxim.) Druce. *Erythraea japonica* Maxim.; *E. australis* sensu auct. Japon., non R. Br.; *E. spicata* sensu auct. Japon., non Pers.—SHIMA-SEMBURI. Glabrous, glaucescent annual 10-40 cm. high; stems simple or branched, leafy throughout, erect, angled; leaves oblong, elliptic, or obovate, 1-2.5 cm. long, 5-10 mm. wide, obtuse,

spreading, sessile, entire; flowers sessile, axillary; calyx 6-8 mm. long, 5-lobed nearly to the base; corolla-tube as long as the calyx, the lobes narrowly oblong, 3-4 mm. long; anthers half as long as the corolla-lobes; capsules oblong-cylindric, 8-10 mm. long, longer than the calyx, sessile.—July-Aug. Kyushu (Yakushima).—Ryukyus and Formosa.

2. TRIPTEROSPERMUM Bl. TSURU-RINDŌ ZOKU

Scandent or trailing glabrous perennials; leaves opposite, usually 3-nerved, petiolate; flowers 1-3, blue-purple or white, terminal and axillary, 5-merous; calyx tubular, 5-winged or -angled, the lobes narrow; corolla tubular or tubular-campanulate, broadened toward tip, the lobes contorted, often plaited between the lobes; stamens inserted on the tube, the filaments filiform; ovary stipitate, 1-locular; style slender, the stigmas 2, lamellate; berry globose to ellipsoidal; seeds many, small, 3-winged.—Few species, e. Asia, India, and Malaysia.

1. *Tripterospermum japonicum* (Sieb. & Zucc.) Maxim. *Convolvulus trinervis* Thunb.; *Crawfordia japonica* Sieb. & Zucc.; *Crawfordia trinervis* (Thunb.) Makino, non Dietr. nec Hassk.; *Gentiana trinervis* (Thunb.) Marq.—TSURU-RINDŌ. Scandent or trailing perennial, 40-80 cm. high, with short, slender, creeping rhizomes; stems slender, simple or sparingly branched, purplish; leaves deltoid-ovate to lanceolate, 4-8 cm. long, 12-35 mm. wide, gradually acuminate, shallowly cordate to rounded at base, 3-nerved, deep green above, pale

green and often purplish beneath, the petioles 5-15 mm. long; flowers pale blue-purple; calyx-tube 6-8 mm. long, narrowly 5-winged, the lobes linear, as long as to slightly longer than the tube; corolla about 3 cm. long, gradually narrowed at base, the lobes narrowly deltoid, plaited; fruit ellipsoid-globose, red-purple, about 8 mm. across, slightly exserted from the corolla, the style 1.5-2 cm. long; stigma linear-lanceolate.—Aug.-Oct. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—s. Kuriles, Sakhalin, Korea, Formosa, and China.

3. PTERYGOCALYX Maxim. HOSOBANO-TSURU-RINDŌ ZOKU

Glabrous, scandent or trailing perennials; leaves opposite, usually 3-nerved, petiolate; flowers blue-purple or white, solitary, terminal and axillary, 4-merous, sometimes 5-merous; calyx tubular; corolla tubular, 4- to 5-lobed, the lobes contorted; stamens inserted on the corolla-tube; ovary 1-locular, stipitate; style short, the stigmas 2, lamellate; capsules 2-valved, dehiscent, many-seeded; seeds small, winged on margin.—Few species, in e. Asia, India, and China.

1. *Pterygocalyx volubilis* Maxim. *Crawfordia pterygocalyx* Hemsl.; *C. volubilis* (Maxim.) Makino—HOSOBANO-TSURU-RINDŌ. Resembles *Tripterospermum japonicum* in habit; leaves broadly lanceolate to linear-lanceolate, 2-4 cm. long, 5-10 mm. wide, long-acuminate, acute at base, subtrinerved, entire, petiolate; flowers short-pedicellate; calyx-tube 1.5-2 cm. long, 5-winged and often deeply fissured on one

side, the lobes 4, broadly linear, 3-5 mm. long, laterally flattened and winglike; corolla 3-3.5 cm. long, shallowly 4-cleft, the lobes not plaited; style slender, 2-3 mm. long; capsules narrowly oblong, about 10 mm. long, the style slightly shorter than the capsule; seeds minute, thin-winged on margin.—Sept.-Oct. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; rare.—Korea, Manchuria, n. China, and Ussuri.

4. GENTIANA L. RINDŌ ZOKU

Erect perennials or sometimes annuals; leaves opposite, rarely verticillate, sessile, entire; flowers 4- to 7-merous, axillary or terminal, sessile or pedunculate, erect, usually large, blue-purple, blue, white, or rarely yellow; calyx tubular, rarely fissured on one side; corolla tubular, salverform or infundibuliform, sometimes narrowly campanulate, the lobes contorted in bud, rarely ciliate; stamens inserted on the corolla-tube, usually included; ovary 1-locular, often stipitate at base; style short, the stigmas 2, lamellate; capsules sessile or stipitate, 2-valved; seeds many.—About 500 species, widely distributed in temperate zones, and high mountains of the Tropics.

1A. Annuals or biennials without rhizomes, erect.

2A. Corolla without plait between the lobes; capsules sessile or short-stipitate.

3A. Corolla-lobes without a fringe at junction with throat; seeds brown, ellipsoidal, densely spinulose-tuberculate.

4A. Corolla-lobes fimbriate; plant 5-40 cm. high; flowers 2.5-3.5 cm. long, the peduncles (1-5) 5-12 cm. long. 1. *G. yabei*

4B. Corolla-lobes entire; plant 5-10 cm. high; flowers about 15 mm. long, the peduncles 7-15 mm. long. 2. *G. contorta*

3B. Corolla-lobes with a fringe at junction with throat; seeds pale brown, globose, smooth.

5A. Calyx-lobes ovate-cordate, obtuse, auriculate, as long as broad. 3. *G. auriculata*

5B. Calyx-lobes linear-lanceolate to oblong-lanceolate, not auriculate, acute to acuminate, much longer than broad.

6A. Crown at the base of the corolla-lobes, laciniate into capillary filaments.

7A. Calyx-lobes nearly as long as the tube; cauline leaves minutely papillose on margin; flowers 16-22 mm. long; calyx about half as long as the corolla. 4. *G. takeda*

7B. Calyx-lobes 3-6 times as long as the tube; cauline leaves smooth on margin; flowers 2.5-3 cm. long; calyx half to nearly as long as the corolla. 5. *G. yuparensis*

6B. Crown at the base of the corolla-lobes, finely laciniate into slender, stouter, straight filaments ending in an obtuse tip; stems simple or branched from the base; flowers 15-17 mm. long; calyx 5-6 mm. long, $\frac{1}{3}$ - $\frac{1}{2}$ as long as the corolla-tube, divided nearly to the base. 6. *G. secta*

2B. Corolla plaited between the lobes; capsules long-stipitate.

8A. Calyx-lobes ovate or obovate, gradually spreading or slightly reflexed; leaves rosulate at base; cauline leaves smaller and ascending, spreading in those above, ovate or narrowly so, short awn-tipped. 7. *G. squarrosa*

8B. Calyx-lobes lanceolate or narrowly deltoid, erect.

9A. Rosulate leaves present; cauline leaves appressed to the stem.

10A. Leaves smooth, acute, not awn-tipped; peduncles 1-3 cm. long; corolla 2-2.5 times as long as the calyx. 8. *G. thunbergii*

10B. Leaves papillose on margin in the lower ones, awn-tipped; flowers sessile or short-pedunculate; corolla 1.5 times as long as the calyx. 9. *G. aquatica*

- 9B. Rosulate leaves absent; cauline leaves gradually spreading. 10. *G. zollingeri*
- 11B. Perennial herbs with rhizomes or creeping stems.
- 11A. Leaves opposite; flowering stems single or few together.
- 12A. Rhizomes absent or obscure; stems creeping; leaves 7–15 mm. long, 3–6 mm. wide; seeds ellipsoid-fusiform, smooth.
- 13A. Plaits of corolla deltoid, incurved and covering the throat; corolla-tube narrow, not dilated. 11. *G. jamezii*
- 13B. Plaits of corolla spreading at anthesis; corolla-tube gradually dilated in upper part. 12. *G. nipponica*
- 12B. Rhizomes short or elongate, sometimes stout; creeping stems absent; leaves longer (except in No. 13) and wider.
- 14A. Flowers short-pedunculate; rhizomes with short innovation shoots with leaves rosulate at apex; seeds rather flat, winged.
- 15A. Rosette and cauline leaves about the same size, 8–17 mm. long; flowers pale blue, about 2 cm. long; capsules long-stipitate. 13. *G. glauca*
- 15B. Rosette leaves 8–15 cm. long, the cauline leaves few, 2–5 cm. long; flowers pale yellow, blue-green spotted, 3.5–5 cm. long; capsules short-stipitate. 14. *G. algida*
- 14B. Flowers sessile; rhizomes without rosulate leaves; seeds lanceolate, with a short tail at each end.
- 16A. Stems with few pairs of leaves; leaves ovate to rhombic-oblong or obovate, subpetiolate; calyx-lobes ovate or ovate-cordate, spreading. 15. *G. sikokiana*
- 16B. Stems with few to many pairs of leaves; leaves lanceolate to broadly so, sessile; calyx-lobes erect, linear to linear-lanceolate.
- 17A. Leaves green, papillose on margin in the upper ones; stems usually red-brown. 16. *G. scabra* var. *buergeri*
- 17B. Leaves glaucous, nearly smooth; stems scarcely red-brown.
- 18A. Flowers 22–30 mm. long; corolla-lobes not fully spreading. 17. *G. makinoi*
- 18B. Flowers 4–5 cm. long; corolla-lobes spreading. 18. *G. triflora*
- 11B. Leaves verticillate in 4's, linear-lanceolate, 1–2 cm. long, 2–3 mm. wide; stems 7–30 cm. long; flowers 6- to 8-merous. 19. *G. yakushimensis*

1. *Gentiana yabei* Takeda & Hara. *G. detonsa* var. *albiflora* Yabe; *Gentianella yabei* Hara, in syn.—SHIROUMA-RINDŌ. Smooth biennial; stems erect, few-flowered, 5–40 cm. long, simple or sparingly branched, with few pairs of leaves; lower leaves obovate-spathulate, obtuse to rounded, the median ones largest, ovate-oblong or broadly lanceolate, 2–7 cm. long, 1–2.5 cm. wide, subacute, sessile, ascending, the upper leaves smaller and narrower; flowers 4- to 5-merous, 2.5–3.5 cm. long, the peduncles (1–)5–12 cm. long, the bracts absent; calyx-tube 1–1.5 cm. long, 4- or 5-angled, the lobes erect, deltoid-lanceolate, unequal, usually shorter than the tube, acuminate; corolla 25–35 mm. long, pale blue, the lobes short, obtuse, fimbriate near base; capsules shorter than the corolla, short-stipitate; seeds minutely spinulose.—Aug.–Sept. Alpine slopes; Honshu (Mount Shirouma in Shinano); rare.

2. *Gentiana contorta* Royle. *Gentianella contorta* (Royle) H. Smith; *Gentianopsis contorta* (Royle) Ma; *G. yamatsutae* Kitag.—HIRO-HA-HIGE-RINDŌ, CHICHIBU-RINDŌ. Smooth, erect, biennial herb; stems simple to sparingly branched, 5–10 cm. long, obsoletely 6-striate, loosely few-leaved; median cauline leaves ovate- to obovate-elliptic, 1–1.5 cm. long, 8–10 mm. wide, rounded to very obtuse, abruptly narrowed at base, sessile, flat, spreading, entire, 1-nerved, the lower leaves smaller, the upper ones slightly smaller and obtuse at base; flowers solitary, about 15 mm. long, the peduncles 7–15 mm. long; calyx 13–15 mm. long, tubular, slightly narrowed at base, 4-ribbed, the lobes 4, deltoid-lanceolate, 3–4 mm. long, acuminate, slightly unequal, keeled, erect; corolla tubular, about 18 mm. long, the lobes 4, about 4 mm. long, oblong, obtuse, entire.—Sept. Rocks in mountains; Honshu (Mount Jumonjotoge in Chichibu); rare.—Manchuria, China, and Himalayas.

3. *Gentiana auriculata* Pall. *G. jaurici* Lév. & Van't.—CHISHIMA-RINDŌ. Smooth, glabrous biennial; stems erect, 4-angled, 5–20 cm. long, sparingly branched or simple; basal leaves small, oblanceolate-spathulate; cauline leaves narrowly ovate to broadly lanceolate, 1–3 cm. long, 5–15 mm. wide, subacute, sessile, obliquely spreading; flowers few, blue, subsessile or pedunculate, 2.5–3 cm. long; calyx-tube 7–10 mm. long, narrowly 5-winged, the lobes ovate-cordate, obtuse, auriculate, 5–7 mm. across, minutely papillose on the margin; co-

rolla about twice as long as the calyx, the lobes 5, nearly half as long as the tube, their crown deltoid-ovate, finely laciniate; capsules sessile, as long as the corolla; seeds globose, smooth.—Aug. Hokkaido.—Sakhalin, Kuriles, northern regions of e. Asia to the Aleutian Is.

4. *Gentiana takedae* Kitag. *G. amarella* var. *uliginosa* sensu auct. Japon., non Griseb.; *G. amarella* sensu auct. Japon., non L.—ONOE-RINDŌ. Glabrous annual or biennial; stems erect, 5–25 cm. long, simple or sparingly branched, somewhat 4-angled, smooth, few-flowered; basal leaves small, oblanceolate, narrowed at base; cauline leaves broadly lanceolate or narrowly oblong, 1–3 cm. long, 5–10 mm. wide, obtuse, minutely papillose on margin, sessile; flowers pale blue-purple, 16–22 mm. long, 4- to 5-merous, the peduncles 0–2 cm. long; calyx-tube 4–6 mm. long, the lobes unequal, lanceolate, acute, nearly as long as the tube; corolla about twice as long as the calyx, the lobes about 1/4–1/3 as long as the tube; their crown about 2/3 as long as the corolla-lobes, whitish, finely laciniate; capsules as long as the corolla, sessile; seeds globose, pale brown, smooth.—Aug.–Sept. Alpine; Honshu (mountains of Shinano Prov.); rare.

5. *Gentiana yuparensis* Takeda. *G. yezoalpina* Koidz.; *G. yuparensis* var. *yezoalpina* (Koidz.) Kudo.—YŪBARI-RINDŌ, EZO-ONOE-RINDŌ. Glabrous biennial; stems 10–20 cm. long, 4-angled; basal leaves obovate-spathulate; cauline leaves oblong to narrowly ovate, 1.5–3 cm. long, 7–12 mm. wide, obtuse, sessile, smooth; flowers 1–10, 2.5–3 cm. long, rose-purple, 5-merous, the peduncles 5–10 mm. long; calyx with hairlike papillae on the angles and on margins of the lobes, the tube 2–4 mm. long, the lobes very unequal, 3–6 times as long as the tube, lanceolate, 8–15 mm. long, acuminate or acute, often recurved; corolla 1½–2 times as long as the calyx-lobes, the lobes 1/3 as long as the tube; crown of the corolla-lobes about 2/3 as long as the corolla-lobes, deeply cut into capillary filaments, whitish.—Aug. Alpine; Hokkaido.

6. *Gentiana secta* (Satake) Ohwi. *G. takedae* var. *secta* Satake; *Gentianella secta* (Satake) Satake; *Gentianella pulmonaria* subsp. *secta* (Satake) Toyokuni.—SAMPUKU-RINDŌ. Glabrous biennial; stems 5–20 cm. long, somewhat 4-angled, simple or branched; cauline leaves narrowly oblong or broadly

lanceolate in the upper ones, 1-2.2 cm. long, 4-8 mm. wide, obtuse, sessile, spreading; flowers 1-20, 15-17 mm. long, 5-merous, pale blue, the peduncles 5-15 mm. long; calyx 5-6 mm. long, the tube 0.5-1 mm. long, the lobes unequal, erect, lanceolate, 4-5 mm. long, subobtusely, minutely papillose on margin; corolla 2.5-3 times as long as the calyx, the lobes about 1/3 as long as the tube, ovate, obtuse; crown of the corolla-lobes whitish, erect, about half as long as the primary corolla-lobes, bifid and finely laciniate; capsules sessile, scarcely exserted beyond the persistent corolla; seeds creamy yellow, globose, smooth.—Aug.-Sept. Alpine; Honshu (Akaishi Mts.); rare.

7. *Gentiana squarrosa* Ledeb. *G. aquatica* sensu Thunb., non L.—*KOKE-RINDŌ*. Small biennial, 2-10 cm. high, usually branched from the base and somewhat tufted, minutely papillose; basal leaves rosulate, rhombic-ovate to narrowly so, 1-4 cm. long, 5-12 mm. wide, spreading, rather thick, acuminate, awn-pointed; cauline leaves ovate to narrowly so, 5-10 mm. long, 2-5 mm. wide, awn-tipped, sessile and short-sheathing at base; flowers few to rather numerous, short-pedunculate; calyx-tube 4-6 mm. long, the lobes ovate or obovate, gradually spreading or slightly reflexed, awn-pointed, about half as long as the tube, 2-4 mm. long; corolla 12-15 mm. long, pale blue, about twice as long as the calyx, the plaits of the corolla slightly smaller than the lobes, sometimes 2-fid; capsules long-stipitate, exserted; seeds broadly fusiform, nearly smooth.—Mar.-June. Sunny fields in lowlands; Honshu, Kyushu; rather common.—Korea, Formosa, n. India, China, and Siberia.

8. *Gentiana thunbergii* (G. Don) Griseb. *Ericala thunbergii* G. Don; *G. japonica* Maxim., non Roem. & Schult.—*HARU-RINDŌ*. Glabrous biennial, 5-15 cm. high, usually branched from the base; basal leaves rosulate, spreading, ovate to narrowly so, or rhombic-ovate, 1-3 cm. long, 7-22 mm. wide, acute, entire, rather narrowly translucent on margin, the cauline leaves ovate-lanceolate, 5-12 mm. long, 2-8 mm. wide, ascending, short-sheathed at the base; flowers blue, 5-merous, 2.5-3.5 cm. long, few, the peduncles 1-3 cm. long; calyx-tube 8-10 mm. long, 5-angled, the lobes erect, deltoid-lanceolate, acuminate, about 1/3 as long as the tube; corolla 2-2.5 times as long as the calyx, the plaits subrounded, toothed; capsules long-stipitate, exserted; seeds fusiform, indistinctly reticulate.—Mar.-May. Sunny places in lowlands and mountains; Honshu, Shikoku, Kyushu; rather common.—Korea, Manchuria, and China.

Var. *minor* Maxim. *G. minor* (Maxim.) Nakai.—*TATE-YAMA-RINDŌ*. Stems few or solitary; flowers 1.5-2 cm. long, pale blue; seeds slightly larger.—Wet boggy places in mountains; Hokkaido, Honshu (centr. and n. distr.).

9. *Gentiana aquatica* L. *G. humilis* Stev.; *G. pseudohumilis* Makino.—*HINA-RINDŌ*. Glabrous, dwarf biennial, 3-5 cm. high; basal leaves rosulate, obovate, elliptic, or nearly orbicular, 4-8 mm. long, 2-4 mm. wide, acute, recurved awn-tipped, papillose on margin; cauline leaves spatulate to broadly oblanceolate, few, 4-7 mm. long, ascending, short-sheathed at base; flowers pale blue, 1 to few, 10-16 mm. long, 5-merous, sessile or short-pedunculate; calyx-tube 8-12 mm. long, 5-angled, the lobes erect, deltoid-ovate or broadly lanceolate, acuminate, 1/6-1/3 as long as the tube; corolla about 1 1/2 times as long as the calyx; capsules short, long-stipitate, exserted; seeds fusiform, longitudinally lined on one side.—June. Alpine; Honshu (Mount Yatsugatake); very rare.—Caucasus and Siberia.

Var. *laeviuscula* (Ohwi) Ohwi. *G. pseudohumilis* var. *laeviuscula* Ohwi.—*KO-HINA-RINDŌ*. Radical leaves broader, 8-15 mm. long, 6-12 mm. wide; flowers smaller.—Alpine; Honshu (Mts. Akaishi in Shinano and Nikko in Shimotsuke); rare.

10. *Gentiana zollingeri* Fawc. *G. aomorenensis* Lév.—*FUDE-RINDŌ*. Biennial, 5-10 cm. high; basal leaves small, few; cauline leaves relatively thick, ovate to broadly so, 5-15 mm. long, 4-10 mm. wide, short-sheathed at base, abruptly cuspidate, often red-purple beneath, the margins whitish and thickish; flowers relatively few, subsessile or very short-pedunculate; calyx-tube 5-7 mm. long, the lobes broadly lanceolate, about half as long as the tube, acuminate, awn-tipped; corolla 18-25 mm. long, 2-2 1/2 times as long as the calyx, blue; capsules short, stipitate, exserted; seeds very minute, fusiform, rather lustrous.—Apr.-May. Sunny slopes in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea, Sakhalin, s. Kuriles, Manchuria, and China.

11. *Gentiana jamesii* Hemsl. *G. nipponica* var. *kawakamii* Makino; *G. kawakamii* (Makino) Makino.—*RISHIRI-RINDŌ*, *KUMOMA-RINDŌ*. Glabrous, erect perennial, 5-12 cm. high; stems 4-angled, often red-purple, creeping at base; cauline leaves rather thick, broadly lanceolate to oblong, 7-15 mm. long, 3-6 mm. wide, obtuse, sessile, whitish on margin; flowers few, dark blue-purple, sessile, 2.5-3 cm. long; calyx-tube 6-8 mm. long, the lobes ovate, obtuse, spreading, 1/4-1/3 as long as the tube; corolla tube narrow, the lobes 1/4-1/3 as long as the tube, the plaits deltoid, deeply toothed, incurved and closing the throat; capsules long-stipitate, slightly exserted; seeds fusiform, smooth.—July-Sept. Alpine; Hokkaido.—Korea, Kuriles.

Var. *robusta* (Hara) Ohwi. *G. nipponica* var. *robusta* Hara.—*IDŌ-RINDŌ*. Somewhat larger; leaves 3-7 mm. wide; flowers 22-30 mm. long; calyx-lobes erect or ascending; corolla-tube slightly thicker.—Wet places, alpine; Honshu (Mount Iide in Iwashi Prov.).

12. *Gentiana nipponica* Maxim. *G. makinoi* Lév. & Van't., non Kusn.—*MIYAMA-RINDŌ*. Resembles the preceding species but smaller, 5-10 cm. high; stems obsoletely 4-angled; leaves broadly lanceolate to narrowly ovate-oblong, 5-12 mm. long, 3-5 mm. wide, obtuse, with a translucent margin, rather thick and deep green, short-sheathed at base; flowers 1-4, blue, 15-22 mm. long, sessile; calyx-lobes narrowly ovate, acute and recurved, about 1/3 as long as the tube; corolla 2-2 1/2 times as long as the calyx, the tube gradually broadened in upper part, the plaits spreading in anthesis.—Aug.-Sept. Wet places, alpine; Hokkaido, Honshu (centr. and n. distr.).

13. *Gentiana glauca* Pall. *G. glauca* var. *major* Ledeb.—*YOKOYAMA-RINDŌ*. Glabrous, erect perennial, 5-10 cm. high, short-creeping at the base and densely covered with old leaves; leaves rather thick, elliptic or oblong, 8-17 mm. long, 6-12 mm. wide, obtuse, slightly glaucous, sessile; flowers 1 to few, pale blue, about 2 cm. long, the peduncles 0-3 mm. long; calyx-tube 4-5 mm. long, the lobes half as long as the tube, deltoid-lanceolate, subacute; plaits of corolla entire, about 1/4 as long as the corolla-lobes, obtuse, deltoid; capsules long-stipitate, exserted, broadly lanceolate; seeds reticulate, with irregular small wings.—Aug.-Sept. Alpine; Hokkaido (Ishikari Prov.); rare.—Kuriles, Kamchatka, Ochotsk Sea region, and western N. America.

14. *Gentiana algida* Pall. *G. frigida* var. *algida* (Pall.) Froel.; *G. algida* var. *sibirica* KUSN.—TÖYAKU-RINDŌ. Yellowish green, glabrous perennial, 10–25 cm. high, with short rhizomes; stems scapose, few-leaved, angled; rosette leaves rather thick, linear-oblanolate to broadly linear, 8–15 cm. long, 5–10 mm. wide, subobtusely, gradually narrowed and sheathed at the base, the cauline leaves few, lanceolate, 2–5 cm. long, 5–10 mm. wide, short-sheathed at base; flowers 3.5–5 cm. long, few, pale yellow with blue-green spots, the peduncles 0–10 (–20) mm. long; calyx half as long as the corolla, the lobes unequal, about half as long as the tube, deltoid-lanceolate, suberect, acute; plaits of corolla short, few-toothed; capsules short-stipitate, scarcely exerted; seeds reticulate, with 3–4 narrow wings.—Alpine slopes; Honshu (centr. and n. distr.).—Korea, Siberia, and N. America.—Forma *igarashii* (Miyabe & Kudo) Toyokuni. *G. algida* var. *igarashii* Miyabe & Kudo; *G. igarashii* Miyabe & Kudo.—KUMOT-RINDŌ. Plant low, about 10 cm. high; flowers 1–3, larger, to 5 cm. long.—Alpine; Hokkaido.

15. *Gentiana sikokiana* Maxim. ASAMA-RINDŌ. Glabrous, erect perennial, 7–20 cm. high, with slender, short rhizomes; leaves spatulate, ovate, rhombic-ovate, or obovate, 3–8 cm. long, 1.5–4 cm. wide, acute or subacuminate, green above, pale green beneath, 3-nerved, slightly undulate-margined; flowers 3–10, nearly terminal, 4–5 cm. long, blue, with green spots, 5-merous; calyx-tube 6–10 mm. long, the lobes broadly ovate or ovate-cordate, spreading, rather unequal; plaits of corolla nearly entire; capsules lanceolate, stipitate, not exerted; seeds lanceolate, reticulate, narrowly winged.—Oct.–Nov. Woods in mountains; Honshu (s. Kinki Prov.), Shikoku, Kyushu.

16. *Gentiana scabra* Bunge var. *buergeri* (Miq.) Maxim. *G. buergeri* Miq.; *G. scabra* var. *intermedia* KUSN.; *G. scabra* var. *buergeri* subvar. *saxatilis* Honda; *G. saxatilis* (Honda) Honda; *G. scabra* var. *orientalis* Hara; *G. subpetiolata* Honda.—RINDŌ. Rhizomes rather short; stems 20–100 cm. long, with 10–20 pairs of leaves, 4-strict, sometimes decumbent or ascending, commonly red-brown tinged; leaves lanceolate to narrowly deltoid-ovate, 4–8 cm. long, 1–3 cm. wide, gradually acuminate, 3-nerved, green above, paler beneath, usually sessile, papillose on margin in the upper ones, the bracts narrowly lanceolate, rather small; flowers sessile, 4.5–6 cm. long, few to rather numerous, blue; calyx-tube 12–18 mm. long, the lobes rather unequal, linear-lanceolate; plaits of corolla deltoid, often toothed; capsules stipitate, not exerted; seeds broadly lanceolate, short-caudate at both ends.—Sept.–Nov. Thickets, grassy places, and wet meadows in lowlands and low elevations in the mountains; Honshu, Shikoku, Kyushu; common. The typical phase occurs in Korea, Manchuria, and n. China.—Forma *stenophylla* (Hara) Toyokuni. *G. scabra* var. *buergeri* forma *angustifolia* KUSN., non *G. scabra* var. *bungeana* forma *angustifolia* KUSN.; *G. scabra* var. *stenophylla* Hara.—HOSOBAR-RINDŌ. Narrow-leaved phase, the leaves linear to linear-lanceolate. Often growing in wet places. Known hybrids are: *Gentiana* × *brevidentis* Fr. & Sav. (*G. makinoi* × *G. scabra* var.), and *Gentiana* × *iseana* Makino. ISE-RINDŌ (*G. scabra* var. × *G. sikkokiana*).

17. *Gentiana makinoi* KUSN. OYAMA-RINDŌ. Glabrous, slightly glaucous erect perennial, 30–60 cm. high, with thick stout rhizomes; stems terete, with 10–20 pairs of leaves; lower leaves reduced to short sheaths, the upper leaves broadly lanceolate to narrowly ovate, 3–6 cm. long, 8–25 mm. wide, gradually narrowed to the tip, obtuse, broadly cuneate to rounded at base, glaucescent, entire, 3-nerved, sessile; bracts leaflike; flowers 1–7, on upper part of stem, sessile, 22–30 mm. long, dark blue; calyx-tube 6–8 mm. long, subtruncate at apex, the lobes rather unequal, very short to short-linear; plaits of corolla truncate; capsules stipitate, broadly lanceolate, as long as the corolla; seeds minutely reticulate, caudate at both ends.—Aug.–Sept. Wet slopes and bogs in high mountains; Honshu (centr. distr.).

18. *Gentiana triflora* Pall. var. *japonica* (KUSN.) Hara. *G. rigescens* var. *japonica* KUSN.; *G. axillariflora* LÉV. & VAN'T; *G. naitoana* LÉV. & FAURIE; *G. jesoana* NAKAI; *G. axillariflora* var. *naitoana* (LÉV. & FAURIE) KOIDZ.—EZO-RINDŌ. Glabrous, slightly glaucescent, erect perennial, 30–80 cm. high, with thick rhizomes; stems pale green to very slightly brownish red; lower few pairs of leaves reduced to short sheaths; upper leaves lanceolate to broadly so, 6–10 cm. long, 1–2.5 cm. wide, 3-nerved, gradually narrowed to the tip, entire, sessile, glaucescent beneath; bracts linear-oblanolate, shorter than the calyx or sometimes leaflike and longer than the calyx; flowers 4–5 cm. long, dark blue, sessile; calyx-tube subtruncate at the apex, 12–15 mm. long, the lobes unequal, erect, sometimes toothlike or leaflike; plaits of corolla short, nearly truncate; capsules stipitate, not exerted from the corolla; seeds minutely reticulate, caudate at both ends.—Aug.–Sept. Lowlands and mountains; Hokkaido, Honshu (n. distr. to n. Kinki Distr. along the Japan Sea side).—s. Kuriles and Sakhalin. The typical phase occurs in Sakhalin, Korea, and e. Siberia.

Var. *montana* (Hara) Hara. *G. axillariflora* var. *montana* Hara.—ETO-OYAMA-RINDŌ. Stems low, few-flowered; flowers 3.5–4.5 cm. long.—Alpine; Hokkaido, Honshu (n. distr.).—s. Kuriles and Sakhalin.

Var. *horomuiensis* (Kudo) Hara. *G. horomuiensis* Kudo; *G. axillariflora* var. *horomuiensis* (Kudo) Hara.—HOROMUI-RINDŌ. Leaves linear-lanceolate.—Boggy places; Hokkaido.

19. *Gentiana yakushimensis* Makino. *Kudoa yakushimensis* (Makino) MASAM.—YAKUSHIMA-RINDŌ. Glabrous, tufted, erect perennial, 7–30 cm. high, with stout elongate rhizomes; stems few, simple, striate, densely many-leaved; leaves verticillate in 4's, thick and lustrous, linear-lanceolate to linear-oblong, 1–2 cm. long, 2–3 mm. wide, obtuse, short-sheathed at base, deep green, whitish beneath; flowers solitary, terminal, sessile, 3.5–4 cm. long, blue-purple; calyx about 1 cm. long, subtruncate at apex, the lobes 6–8, lanceolate, obtuse, shorter than the tube; corolla-lobes 6–8, the plaits bifid, linear; capsules short-stipitate, included; seeds angled, about 3.5 mm. long including the filiform tail at one end.—Aug. Alpine; Kyushu (Yakushima); rare.

5. SWERTIA L. SEMBURI ZOKU

Simple or branched perennials and annuals; leaves opposite, radical and cauline; flowers blue or purple, sometimes yellow, in cymes, panicles, or corymbs, 4- to 5-merous; calyx 4- to 5-parted, the lobes linear or lanceolate, 1- to 3-nerved; corolla rotate, rarely campanulate, the lobes dextrorsely contorted, glandular-grooved at the base, the grooves naked or covered with fleshy hairs; stamens inserted on the base of the corolla; ovary 1-locular; style short or absent, the stigmas 2, lamellate; capsules septicidally dehiscent, 2-valved; seeds many, often wing-margined.—About 80 species, in Europe, Asia, Africa, and America.

- 1A. Stigma sessile, decurrent on the ovary; nerves of corolla-lobes yellowish red, also when dried; small annual or biennial. 1. *S. carinthiaca*
- 1B. Stigma sessile or stalked, not decurrent on the ovary; nerves of corolla-lobes not yellowish red; small or rather large annuals or perennials.
- 2A. Annuals or biennials without rhizomes; seeds not winged.
- 3A. Radical leaves not well developed; cauline leaves linear to broadly lanceolate; seeds smooth or nearly so.
- 4A. Glandular-grooves of corolla-lobes solitary; flowers small, 4-merous. 2. *S. tetrapetala*
- 4B. Glandular-grooves of corolla-lobes in pairs; flowers rather large, usually 5-merous.
- 5A. Calyx-lobes lanceolate to broadly so, gradually and slightly narrowed at base; leaves usually oblanceolate, 3-10 mm. wide; plant not bitter to taste. 3. *S. diluta* var. *tosaensis*
- 5B. Calyx-lobes linear or broadly so, not narrowed at base; leaves linear to lanceolate, 1.5-8 mm. wide; plants bitter to taste.
- 6A. Stems, margin of calyx-lobes, and upper portion of pedicels minutely punctate; hairs around the glandular grooves undulately striate under magnification. 4. *S. pseudochinensis*
- 6B. Plant usually smooth; hairs around the glandular-grooves smooth under magnification. 5. *S. japonica*
- 3B. Radical leaves large; cauline leaves ovate to oblong, or lanceolate; seeds muricate.
- 7A. Radical leaves persistent through anthesis, the cauline leaves much smaller; flowers nodding; glandular-grooves solitary. 6. *S. tashiroi*
- 7B. Radical leaves withering before anthesis, the cauline leaves broader and prominent; flowers erect; glandular-grooves in pairs.
- 8A. Glandular-grooves naked; flowers in panicles; calyx-lobes broadly oblanceolate, about $\frac{1}{3}$ as long as the corolla; seeds less than 1 mm. long; style absent. 7. *S. bimaculata*
- 8B. Glandular-grooves hairy on margin; flowers fasciculate in leaf-axils; calyx-lobes linear, as long as the corolla; seeds 3-3.5 mm. long; style distinct. 8. *S. swertopsis*
- 2B. Rhizomatous perennial; glandular-grooves of corolla in pairs on each lobe; seeds wing-margined. 9. *S. perennis*

1. *Swertia carinthiaca* Wulfen. *Lomatogonium carinthiacum* (Wulfen) Reichenb.; *Pleurogyna carinthiaca* G. Don; *Gentiana stelleriana* Cham. & Schtdl.; *Lomatogonium carinthiacum* var. *stellerianum* (Cham. & Schtdl.) Fern.—HIME-SEMBURI. Glabrous annual or biennial 2-10 cm. high; stems simple or branched; lower leaves obovate-spathulate, small, the median and upper ones oblong to ovate, 1-1.5 cm. long; flowers pale blue, pedicelled; calyx deeply 4- to 5-parted, the segments unequal, oblong, elliptic, or ovate, subacute, 3-nerved, 4-7 mm. long; corolla deeply 4- to 5-lobed, the tube very short, glabrous, the lobes oblong, about 1 cm. long, yellow-red nerved, with 2 small pocketlike glands at base; capsules as long as or slightly longer than the corolla; stigma decurrent on the ovary; seeds fusiform or oblong, smooth, about 0.6 mm. long.—Aug.-Sept. Alpine; Honshu (centr. distr.); very rare.—Widely distributed in the alpine regions of the N. Hemisphere.

2. *Swertia tetrapetala* Pall. *S. pallasii* G. Don; *Ophelia papillosa* Fr. & Sav.; *O. yessoensis* Fr. & Sav.; *S. yessoensis* (Fr. & Sav.) Matsum.; *S. bisetii* S. Moore & Burkill.—CHISHIMA-SEMBURI. Glabrous erect annual or biennial; stems simple or sparingly branched, 4-angled; basal leaves broadly oblanceolate-spathulate, the median and upper leaves spreading, deltoid-lanceolate or lanceolate, 2-3.5 cm. long, 7-15 mm. wide, gradually narrowed to the tip, acute to obtuse, sessile; flowers in a rather dense terminal panicle, 8-12 mm. across, blue, dark purple-spotted, pedicelled, 4-merous; calyx-segments lanceolate, about $\frac{1}{3}$ as long as the corolla, acute; corolla-lobes elliptic or ovate-oblong, glandular-grooved near the center, with thick flexuous hairs; capsules slightly longer than to as long as the corolla; seeds smooth, subovoid, slightly flattened, brown.—Aug.-Sept. Sandy grassy slopes near the sea; Hokkaido; rare.—Kuriles, Sakhalin, Ochotsk Sea region, and Kamchatka.

Var. *yezoalpina* (Hara) Hara. *S. yezoalpina* Hara; *S. chrysanthra* var. *yezoalpina* (Hara) Satake; *S. micrantha* Takeda; *S. chrysanthra* Honda & Tatew.—TAKANE-SEMBURI. Inflorescence rather loosely flowered; flowers pale blue, about 7 mm. across, the glandular-grooves usually slightly broader, naked or with few hairs on margin; capsules longer than the corolla.—Aug.-Sept. Alpine slopes; Hokkaido (Hidaka

Prov.), Honshu (centr. and n. distr.); rare.—Korea and ? e. Siberia.

3. *Swertia diluta* (Turcz.) Benth. & Hook. f. var. *tosaensis* (Makino) Hara. *S. tosaensis* Makino.—INU-SEMBURI. Glabrous annual or biennial; stems often branched from the base, 4-angled; radical leaves small, broadly oblanceolate to obovate, the cauline leaves oblanceolate, oblong-lanceolate, or rarely lanceolate, 2-5 cm. long, 3-10 mm. wide, obtuse; inflorescence a narrow panicle; flowers white, 5-merous, pedicelled; calyx-segments lanceolate to broadly so, obtuse, about half as long to as long as the corolla; corolla-lobes 8-12 mm. long, the glandular-grooves in pairs, lanceolate, with long flexuous hairs on margin; capsules slightly longer than the corolla, narrowly ovoid; seeds nearly globose, almost smooth.—Honshu, Shikoku, Kyushu.—Korea and China.

4. *Swertia pseudochinensis* Hara. *S. chinensis* sensu auct. Japon.; *S. chinensis* forma *violacea* Makino.—MURASAKI-SEMBURI. Annual or biennial; stems often branched, dark purple, minutely papillose; radical leaves oblanceolate, small, the cauline leaves lanceolate or linear-lanceolate, 2-4 cm. long, 3-5(-8) mm. wide, acute; flowers few to many, pedicelled, pale blue-purple, 5-merous; calyx-segments broadly linear to linear-lanceolate, half as long to nearly as long as the corolla; corolla-lobes 1-1.5 cm. long, with dark-colored nerves, the glandular-grooves in pairs, each surrounded by fleshy, flexuous hairs; capsules nearly as long as the corolla, broadly lanceolate; seeds nearly globose, smooth.—Aug.-Oct. Thickets in lowlands and hills; Honshu, Shikoku, Kyushu.—Korea, n. China, Manchuria, and Amur.

5. *Swertia japonica* (Roem. & Schult.) Makino. *Gentiana japonica* Roem. & Schult.; *Ophelia japonica* (Schult.) Griseb.—SEMBURI. Glabrous annual or biennial; stems simple or branched from the base, 4-angled, purplish; radical leaves small, oblanceolate, the cauline linear or broadly so, rarely linear-oblanceolate, 1.5-3.5 cm. long, 1-3 mm. wide, acute or subobtuse, the margins revolute; flowers in dense terminal panicles, 5-merous; calyx-segments linear to linear-lanceolate, $\frac{1}{2}$ - $\frac{2}{3}$ as long as the corolla; corolla-lobes broadly lanceolate, 12-17 mm. long, white, with purple nerves, the glandular-grooves in pairs, with long fleshy hairs on margin; capsules slightly longer than the corolla, lanceolate; seeds

nearly smooth, subglobose.—Aug.–Oct. Sunny slopes and thickets in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea, and China.

6. *Swertia tashiroi* (Maxim.) Makino. *Ophelia tashiroi* Maxim.; *S. tashiroi* var. *cruciata* F. Maekawa.—HETSUKARINDŌ. Rather stout glabrous erect biennial 30–60 cm. high; stems terete, subscapose; leaves rosulate, oblong or obovate-spathulate, 8–30 cm. long, 3–8 cm. wide, acute to short-acuminate, entire, rather fleshy; cauline leaves ovate to narrowly lanceolate, 2–5 cm. long, 5–20 mm. wide, the upper ones becoming bracteate; panicles terminal, few-flowered, the bracts small, 1–10 mm. long, the pedicels deflexed, thickened above; calyx-segments 4–5, narrowly deltoid, acuminate, 2–4 mm. long, about as long as the tube; corolla-lobes 4–5, broadly oblanceolate, 12–15 mm. long, acuminate, greenish, with an orbicular gland about 3 mm. across slightly above the center, purple-brown spotted on the upper half; capsules as long as the corolla, 2-valved, sessile; seeds small, oblong-cylindrical, short-tubercled.—Dec.–Jan. Kyushu (s. distr. incl. Yakushima and Tanegashima).—Ryukyus (Amami-Oshima).

7. *Swertia bimaculata* (Sieb. & Zucc.) Hook. f. & Thoms. *Ophelia bimaculata* Sieb. & Zucc.—AKEBONO-SŌ. Glabrous erect annual or biennial 50–80 cm. high; stems often much branched, with 4 elevated striations; rosulate leaves oblong, large, long-attenuate to a petiolelike base, with several parallel nerves; lower cauline leaves ovate to broadly lanceolate, 5–12 cm. long, 1–6 cm. wide, acuminate, cuneate or acuminate at base; flowers erect, 5-merous, in rather loose panicles, the pedicels 1–5 cm. long; calyx-segments broadly oblanceolate, obtuse, much longer than the tube, about half as long as the corolla; corolla-lobes broadly cuneate-oblanceolate, 10–13 mm. long, creamy white with green spots on upper half and a pair of orbicular, brownish glands slightly above the center, about 1.5 mm. across; capsules slightly longer than the corolla; seeds small, dark brown, with minute warty papillae.—Sept.–Oct. Wet grassy places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu.

8. *Swertia swertopsis* Makino. *Swertopsis umbellata* Makino; *Swertia umbellata* (Makino) Makino, non Ruiz & Pav.—SHINONOME-SŌ. Glabrous erect annual or biennial; stems simple or sparingly branched, 4-striate; cauline leaves ovate to narrowly so, or oblong, acute to acuminate, 5(–7)-nerved, acutely narrowed to a petiolelike base; flowers white, fasciculate, 5-merous, the pedicels 5–10 mm. long; calyx-segments linear, as long as the corolla, keeled on back; corolla subcampanulate, 8–10 mm. long, the lobes ovate, with purple spots inside, the glands paired, surrounded by filiform hairs; capsules less than 1 cm. long, narrowly ovoid; seeds rather large, oblong, 3–3.5 mm. long, densely warty.—Aug. Mountains; Honshu (Izu Prov. and westw.), Shikoku, Kyushu; rare.

9. *Swertia perennis* L. var. *cuspidata* Maxim. *S. obtusa* Ledeb. var. *cuspidata* (Maxim.) Hara; *S. cuspidata* (Maxim.) Kitag.—MIYAMA-AKEBONO-SŌ. Glabrous rhizomatous erect perennial 12–30 cm. high; stems simple, solitary, striate; leaves alternate or opposite, the radical few, broadly ovate or elliptic, 3–8 cm. long, 2.5–4 cm. wide, obtuse to acute, 5- to 7-nerved, with a long petiolelike base 1–3 times as long as the leaf-blade, the cauline leaves small; inflorescence few-flowered, corymbose, often slightly branched, the bracts broadly lanceolate, the pedicels 1–3 cm. long; flowers 5-merous; calyx-lobes unequal, broadly linear, 1/2–2/3 as long as the corolla; corolla-lobes lanceolate, 17–20 mm. long, dark blue, with dark purple nerves, the glands paired, small, near the base of the corolla-lobes, surrounded by hairs about 2 mm. long; capsules 2/3 as long as the corolla; seeds wing-margined.—Aug.–Sept. Alpine; Hokkaido, Honshu (centr. and n. distr.).

Var. *stenopetala* (Regel & Tiling) Maxim. *S. obtusa* var. *stenopetala* Regel & Tiling.—EZO-MIYAMA-AKEBONO-SŌ. Flowers smaller, about 12 mm. long; corolla-lobes less prominently narrowed toward tip.—Hokkaido.—Sakhalin, Kuriles, e. Siberia, and Alaska.

6. HALENIA Borkh. HANA-IKARI ZOKU

Annuals, biennials, or perennials; leaves opposite, entire; cymes axillary and terminal, few-flowered or sometimes compound and paniculate; flowers yellowish, sometimes purplish, 4-merous; calyx deeply 4-parted, the lobes lanceolate; corolla campanulate, rarely rotate, 4-lobed, the lobes spurred near base, ovate or oblong, sinistrorsely contorted in bud; stamens inserted near the base of corolla; ovary 1(–2)-locular; style short or absent; stigmas 2, lamellate; capsules 2-valved; seeds smooth, globose or ellipsoidal.—About 20 species, in e. Europe, Asia, N. and S. America.

1. *Halenia corniculata* (L.) Cornaz. *Swertia corniculata* L.; *H. sibirica* Borkh.; *H. japonica* Gand.; *H. deltoides* Gand.—HANA-IKARI. Glabrous, erect annual or biennial, 10–60 cm. high; stems erect, often branched, 4-angled; leaves oblong to narrowly ovate, 3–10 cm. long, 1.5–4 cm. wide, acuminate, narrowed to a petiolelike base, 3(–5)-nerved, minutely papillose on nerves beneath and on margin; flowers 4-merous, short-pedicelled, pale yellow, greenish after anthesis;

calyx divided nearly to the base, the segments linear, minutely papillose, 1/2–2/3 as long as the corolla; corolla narrowly ovoid, 6–10 mm. long, the spur 3–7 mm. long, rarely absent; capsules lanceolate, as long as the corolla, sessile; seeds ellipsoidal, smooth, terete, about 1 mm. long.—Sept. Sunny slopes in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—e. Europe, Siberia, Korea, Manchuria, Kuriles, Sakhalin, and Kamchatka.

7. MENYANTHES L. MITSU-GASHIWA ZOKU

Glabrous, rather soft, slightly thickened perennial herb growing in wet places and in shallow water, with thick, creeping-rhizomes; leaves radical, long-petiolate, alternate, 3-foliate, the petioles sheathed at base; flowers white or bluish, 5-merous, in a terminal simple raceme on radical scapes, with membranous bracts; calyx deeply parted; corolla infundibuliform, 5-lobed, the lobes induplicate in bud, barbed on inner side; stamens inserted on the corolla-tube; ovary 1-locular, with 5 glands at base; style slender, with 2 lamellate stigmas; capsules globose, 2-lobed; seeds few, orbicular, flat, lustrous, salmon-red, rather large.—One species throughout the cooler regions of the N. Hemisphere.

1. *Menyanthes trifoliata* L. *M. palustris* S. F. Gray—MIZU-GASHIWA, MITSU-GASHIWA. Rhizomes 7–10 mm. across, few-leaved in upper part; leaflets rather thick, oblong, ovate-elliptic, or rhombic-elliptic, sessile, 4–8 cm. long, 2–5 cm. wide, obtuse, obtusely toothed, or nearly entire, sessile; scapes terete,

20–40 cm. long, the bracts broadly ovate, 3–8 mm. long, the pedicels 1–2.5 cm. long; flowers 1–1.5 cm. across; calyx short, the lobes elliptic; capsules 5–7 mm. across; seeds 2.5–3 mm. across.—Apr.–Aug. Wet boggy places and margins of lakes and ponds; Hokkaido, Honshu, Kyushu; rather common.

8. FAURIA Franch. IWA-ICHŌ ZOKU

Glabrous, rather fleshy scapose perennial of wet slopes, with stout creeping leafy rhizomes; leaves radical, rather thick and soft, obtusely denticulate, petiolate, sheathing at base; inflorescence terminal, a dichotomous or trichotomous 10- to 30-flowered cyme, the bracts herbaceous; flowers 5-merous; calyx-tube adnate to the ovary; corolla infundibuliform, deeply 5-lobed, the lobes induplicate in bud, with longitudinal ridges inside; stamens inserted on the corolla-tube; ovary semi-inferior, 1-locular, with 5 glands at base; style with a peltate stigma; capsules cylindric, 2-valved, the valves 2-lobed; seeds ellipsoidal, rather flat, gray-white, lustrous, rather numerous.—One species, in Japan and w. N. America.

1. *Fauria crista-galli* (Menz, ex Hook.) Makino. *Menyanthes crista-galli* Menzies ex Hook.; *Villarsia crista-galli* (Menzies) Griseb.; *Fauria japonica* Franch.; *Nephrophyllidium crista-galli* (Menzies ex Hook.) Gilg.—IWA-ICHŌ. Leaves long-petiolate, reniform, 3–6 cm. long, 4–10 cm. wide, somewhat retuse, cordate, obtusely denticulate, pedately 7- to 15-nerved, the petioles 2–5 times as long as the blades; scapes

15–40 cm. long; flowers pedicelled, white, about 12 mm. across, the bracts broadly lanceolate, obtuse; calyx-lobes deltoid-ovate, obtuse, about 8 mm. long; capsules cylindric, 1–1.5 cm. long; seeds about 2.5 mm. long.—July–Aug. Wet alpine slopes; Hokkaido, Honshu (n. and centr. distr. on Japan Sea side).—s. Kuriles and w. N. America.

9. NYMPHOIDES Hill ASAZA ZOKU

Floating aquatic perennial herbs; leaves alternate, petiolate, ovate to orbicular, deeply cordate, sometimes peltate, entire or undulate; flowers 1 to many, in fascicles, yellow or white, 5-merous, pedicellate; calyx-lobes oblong or lanceolate; corolla rotate, the lobes induplicate in bud, hairy on margin or on inner side; stamens inserted at base of corolla, the filaments short; ovary 1-locular, with 5 small glands at base; style short or elongate, the stigmas 2(–3), lamellate; capsules ovoid or oblong, indehiscent or irregularly ruptured; seeds hairy or glabrous, sometimes tubercled or winged.—About 20 species, chiefly in the Tropics, especially abundant in s. Asia.

- 1A. Flowers yellow, large; calyx 8–15 mm. long; seeds flat, with long tubercles on margin; leaves often with the lower edges slightly united, subpetate; petioles sheathed at base. 1. *N. peltata*
- 1B. Flowers white, small; calyx 3–6 mm. long; seeds plump, smooth, lustrous; leaves alternate, not united on lower margin; petioles auriculate at base. 2. *N. indica*
- 2A. Leaves large, 7–20 cm. across; pedicels 3–7(–10) cm. long; flowers about 1.5 cm. across; corolla with long hairs inside; capsules not longer than the calyx. 2. *N. indica*
- 2B. Leaves small, 2–6 cm. across; pedicels 1–3 cm. long; flowers about 8 mm. across; corolla-lobes ciliate; capsules slightly longer than the calyx. 3. *N. coreana*

1. *Nymphoides peltata* (Gmel.) O. Kuntze. *Menyanthes nymphoides* L.; *N. flava* Hill; *Limnanthemum peltatum* Gmel.; *L. nymphoides* (L.) Hoffmanns. & Link; *L. nymphoides* var. *japonica* Miq.; *N. nymphoides* (L.) Britt. & Brown.—ASAZA. Rhizomes creeping; stems elongate, remotely leaved; leaves floating, rather thick and soft, ovate to orbicular, 5–10 cm. across, deeply cordate with overlapping lobes or sometimes slightly peltate, undulately toothed, the petioles elongate, dilated and sheathing at base, the pedicels 2–12 cm. long; calyx 8–15 mm. long, the lobes broadly lanceolate, obtuse, rather thick; corolla yellow, 3–4 cm. across, long-ciliate; capsules narrowly ovoid, slightly longer than the calyx, narrowed at apex; style about 3 mm. long; seeds flat, obovate, about 3 mm. long, tubercled on margin, minutely scabrous on both sides.—June–Aug. Ponds and shallow lakes in lowlands; Honshu, Shikoku, Kyushu; common.—Korea, Formosa, China, and generally in the temperate regions of the N. Hemisphere.

2. *Nymphoides indica* (L.) O. Kuntze. *Menyanthes indica* L.; *Limnanthemum indicum* (L.) Griseb.—GAGA-BUTA. Stems slender, remotely 1- to 3-leaved; leaves orbicular-cordate or ovate-orbicular, 7–20 cm. across, subentire, deeply

lobed, the petioles decurrent on the stem, 1–2 cm. long, auriculate, clasping; flowers few, fasciculate, white, about 1.5 cm. across, the pedicels 3–10 cm. long; calyx-lobes broadly lanceolate, subobtusely, 4–6 mm. long; corolla-lobes long-hairy inside; capsules oblong, 4–5 mm. long, not exerted beyond the calyx; style about 2 mm. long; seeds gray-brown, lustrous, nearly globose, smooth, about 0.8 mm. across.—July–Sept. Ponds and shallow water in lowlands; Honshu, Shikoku, Kyushu; common.—Korea, Formosa, China, s. Asia to Australia, and Africa.

3. *Nymphoides coreana* (Lév.) Hara. *Limnanthemum coreanum* Lév.; *L. parvifolium* sensu Miki, non Griseb.—HIME-SHIRO-ASAZA. Stems slender, elongate, 1- to 2-leaved; leaves ovate-cordate or orbicular-cordate, 2–6 cm. across, deeply 2-lobed, entire, the petioles decurrent on the stem, unequal in length, 1–10 cm. long, auriculate; flowers few, white, about 8 mm. across, fasciculate, the pedicels 1–3 cm. long; calyx-lobes broadly lanceolate, subacute, 3–4 mm. long, membranous; corolla-lobes ciliate; capsules ellipsoidal, 4–5 mm. long, slightly longer than the calyx; style a little less than 1 mm. long.—Aug. Ponds and shallow water; Honshu, Shikoku, Kyushu.—Korea and Ryukyu.

Fam. 169. APOCYNACEAE KYŌCHIKU-TŌ KA Dogbane Family

Usually evergreen woody plants, sometimes herbs, often scandent, with milky juice; leaves opposite, rarely verticillate or alternate, simple, entire, without stipules; flowers bisexual, actinomorphic; calyx often glandular inside, 4- to 5-lobed, imbricate in bud; corolla salverform or infundibuliform, the lobes contorted in bud, very rarely valvate; stamens 4 or 5, inserted on the tube, the filaments usually free, the anthers sagittate, free or connivent around the stigma, the pollen granular; ovary superior, 1-locular, with 2 parietal placentae, or of 2 free carpels; style solitary; ovules more than 2 in each carpel; fruit a follicle, berry, or drupe; seeds usually with endosperm, often winged or comose.—About 300 genera, with about 1,100 species, warm-temperate to subtropical and tropical.

1A. Herbs, sometimes somewhat woody near the base.

2A. Anthers free from the stigma, not appendaged at base; corolla salverform, villous on the tube inside, the lobes sinistrorsely contorted in bud; styles filiform; seeds not comose. 1. *Amsonia*

2B. Anthers adherent to the stigma, appendaged at base; corolla campanulate, glabrous, the lobes dextrorsely contorted in bud; styles very short or absent; seeds comose. 2. *Apocynum*

1B. Shrubs or woody vines.

3A. Scandent; corolla 1–3 cm. wide, the throat naked; leaves opposite.

4A. Calyx with 5 or 10 glands inside; stamens inserted on the upper part of the corolla-tube; seeds without a beak; inflorescence corymbose, few-flowered. 3. *Trachelospermum*

4B. Calyx without glands or with small glands inside; stamens inserted near the base of the corolla-tube; seeds beaked; inflorescence paniculate, many-flowered. 4. *Anodendron*

3B. Shrubs or small trees; corolla 4–5 cm. wide, the throat appendaged; leaves in 3's or 4's at the nodes. 5. *Nerium*

1. AMSONIA CHŌJI-SŌ ZOKU

Glabrous or hairy erect herbs or subshrubs; leaves alternate, membranous; flowers 5-merous, usually blue, in terminal corymbs or panicles; calyx 5-parted, without glands, the segments narrow; corolla salverform, the tube cylindric, narrow, slightly inflated in upper part, villous within, without scales on the throat, the lobes narrow, sinistrorsely contorted; anthers obtuse, unappendaged on the tube, free; carpels 2, follicular; style solitary, filiform, the stigma thick, with a reflexed membranous appendage; ovules many, in 2 series; follicles 2, cylindric; seeds many, oblong, obliquely truncate at both ends, not comose.—Few species, in N. America and Japan.

1. *Amsonia elliptica* (Thunb.) Roem. & Schult. *Tabernaemontana elliptica* Thunb.—CHŌJI-SŌ. Glabrous perennial; stems erect, 40–80 cm. high, terete, slightly branched in upper part; leaves alternate or opposite, lanceolate, 6–10 cm. long, 1–2 cm. wide, acuminate, subsessile, deep green; inflorescence cymose, many-flowered, terminal; flowers blue, about 13 mm. across; calyx-lobes 1–2 mm. long; corolla-tube

about 8 mm. long, the lobes narrowly oblong, nearly as long as the tube; follicles obliquely spreading, 5–6 cm. long, glabrous, terete; seeds narrowly oblong, 7–10 mm. long, obliquely truncate at both ends, brown, irregularly rugose.—May–June. Grassy places along rivers in lowlands; Hokkaido, Honshu, Kyushu.—Korea and China.

2. APOCYNUM L. BASHI-KURUMON ZOKU

Usually glaucescent perennial herbs or subshrubs; leaves alternate or opposite, with weak, pinnate nerves; flowers small, in dense to loose cymes; calyx small, deeply 5-lobed, without glands inside, the lobes acute; corolla campanulate, 5-lobed, with 5 short appendages inside, glabrous, dextrorsely contorted; stamens alternate with the appendages of the corolla, inserted on the lower portion of corolla-tube, the filaments very short, the anthers convergent, slightly adherent to stigma, the anther-locules appendaged at base; carpels 2; stigma sessile; follicles elongate; seeds comose, small.—Few species, in s. Europe, Asia, and N. America.

1. *Apocynum basikurumon* Hara. *A. venetum* sensu auct. Japon., non L.; *A. venetum* var. *basikurumon* Hara, in syn.; *Trachomitum venetum* var. *basikurumon* (Hara) Hara—BASHI-KURUMON. Glabrous except the flowers; rhizomes thick; stems 40–80 cm. long, branched, reddish; leaves of the main stems alternate, those of the branches opposite, oblong-ovate to oblong, 2–5 cm. long, 7–15 mm. wide, rounded to

obtuse, mucronate, broadly cuneate at base and short-petiolate, callose on the margin; inflorescence a terminal panicle, the bracts thinly membranous, narrow, caducous; calyx deeply 5-parted, slightly puberulent, the lobes about 2 mm. long; corolla pale rose, 6–7.5 mm. long, papillose-puberulous on both sides, 5-lobed.—July. Near seashores; Hokkaido (sw. distr.), Honshu (Japan Sea side from Mutsu to Echigo Prov.).

3. TRACHELOSPERMUM Lem. TEIKA-KAZURA ZOKU

Scandent evergreen, woody or rarely herbaceous, glabrous or sometimes pilose; leaves opposite, penninerved; cymes loosely flowered, terminal and axillary; flowers white, often changing to yellow; calyx small, 5-parted, with 5 or 10 glands inside; corolla salverform, without scales on the throat, the lobes 5, spreading, falcate-obovate; stamens 5, on the tube within, the anthers acuminate, partially exerted from the throat, connate and adnate to the stigma; carpels 2, with a single elongate style; ovules many; follicles elongate, cylindric; seeds comose.—More than 10 species, chiefly in the warmer and subtropical regions of e. Asia, few in N. America.

- 1A. Stamens inserted on the middle of the corolla tube or slightly above on the corolla-tube; anthers wholly included within the tube; calyx rather large, the lobes broader above the middle, longer than the narrow part of the corolla-tube; corolla puberulent on the throat. 1. *T. jasminoides* var. *pubescens*
- 1B. Stamens inserted on the upper part of the tube; anthers slightly exserted from the throat; calyx small, the lobes broadest at the middle or on the lower half; corolla usually glabrous on the throat.
- 2A. Corolla-tube 7–8 mm. long; calyx-lobes broadly lanceolate, 2–3 mm. long, usually glabrous. 2. *T. asiaticum*
- 2B. Corolla-tube 6–7 mm. long; calyx-lobes ovate-obicular, not more than 1 mm. long, white-ciliate. 3. *T. liukiuense*

1. *Trachelospermum jasminoides* (Lindl.) Lem. var. *pubescens* Makino. *T. asiaticum* var. *pubescens* (Makino) Nakai.—KE-TEIKA-KAZURA. Scandent, woody evergreen, the inflorescence, young branches, and underside of leaves pubescent; leaves elliptic to narrowly so, 4–8 cm. long, 2–4.5 cm. wide, obtuse or acute, short-petiolate; flowers white, changing to yellow, 2–2.5 cm. across; calyx thin, loosely pilose, 5–6 mm. long, the lobes obtuse and spreading; corolla-tube 7–8 mm. long, the narrow part as long as the broadened upper portion or somewhat shorter, the lobes obliquely obtriangular; anthers included within the tube; style short, not exceeding the calyx; follicles 10–15 cm. long.—May. Honshu (centr. and w. distr.); Shikoku, Kyushu.—Korea, and China.

2. *Trachelospermum asiaticum* (Sieb. & Zucc.) Nakai. *Malouetia asiatica* Sieb. & Zucc.; *Parechites thunbergii* A. Gray; *Rhynchospermum japonicum* Sieb. ex Lavall.; *T. divaricatum* Kanitz; *T. crocostomum* Stapf; *T. majus* Nakai.—TEIKA-KAZURA. Scandent, glabrous or pubescent on young branches; leaves elliptic or narrowly so, sometimes broadly oblanceolate, 3–6(–8) cm. long, 1.5–3 cm. wide, acute with an obtuse tip, acute and short-petiolate at base, lustrous above; flowers white,

changing to yellow, 2–2.5 cm. across, fragrant; calyx 3–4 mm. long, about half as long as the narrow portion of the corolla-tube, the lobes narrowly ovate to broadly lanceolate, obtuse to acute, often white-puberulent, with an ascendingly recurved tip; corolla-tube 7–8 mm. long, the narrow portion about twice as long as the broadened portion, the lobes narrowly falcate-obtriangular; style elongate, about twice as long as the calyx; follicles rather slender, elongate.—May–June. Thickets in hills and low mountains; Honshu, Shikoku, Kyushu; common; variable.—Korea.

3. *Trachelospermum liukiuense* Hatus. *T. divaricatum* var. *brevispalum* K. K. Schn., pro parte—RYŪKYŪ-TEIKA-KAZURA, OKINAWA-TEIKA-KAZURA. Nearly glabrous except the young branches; leaves obovate-oblong or elliptic, 4–6 cm. long, 1.5–3 cm. wide, acute with an obtuse tip, acute and petiolate at base; flowers white, about 1.5 cm. across; calyx about 2 mm. long, much shorter than the corolla-tube, the lobes ovate-obicular or broadly ovate, obtuse, not more than 1 mm. long, white-ciliate, suberect; corolla-tube 6–7 mm. long, the narrow portion 2–3 times as long as wide; style elongate, about 3 times as long as the calyx.—Kyushu (s. distr.).—Ryukyus.

4. ANODENDRON A. DC. SAKAKI-KAZURA ZOKU

Scandent, evergreen, woody scrambler; leaves opposite, penninerved; inflorescence paniculate; flowers small, the bracts and bracteoles persistent; calyx 5-lobed, small, without glands or with 5 small glands inside; corolla salverform, 5-lobed, the tube inflated at base, the throat narrow, unappended; stamens inserted near base of corolla-tube, the filaments very short, the anthers connate and adnate to the stigma, short-appended at base; carpels 2, free, with a solitary very short style; ovules many; follicles divaricate, narrowed to the tip; seeds flat, beaked, comose.—Few species, in India, China, and Japan.

1. *Anodendron affine* (Hook. & Arn.) Druce. *Holarhaena affinis* Hook. & Arn.; (?) *Aganosma laevis* Champ.; *Anodendron laeve* (Champ.) Maxim.; *Anodendron suishaense* Hayata.—SAKAKI-KAZURA. Glabrous woody climber; leaves coriaceous, oblanceolate to oblanceolate-oblong, 6–8(–10) cm. long, 1–2.5 cm. wide, acute with an obtuse tip, acute at base, entire, dark green above, pale green beneath, the petioles 5–10 mm. long; inflorescence depressed-pyramidal, short-pedunculate, the bracts and bracteoles narrowly deltoid, small; flowers

pale yellow; calyx about 3 mm. long, deeply 5-parted; corolla 8–10 mm. across, the tube 4–5 mm. long, about as long as the lobes, the lobes narrowly falcate-oblong, white papillose-hairy inside; follicles deltoid-lanceolate, broadened at base, horizontally spreading, 8–10 cm. long, 18 mm. across at base; seeds many, long comose.—May–June. Honshu (warmer parts of Awa and Sagami Prov. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and India.

5. NERIUM L. KYŌCHIKU-TŌ ZOKU

Evergreen trees or large shrubs; leaves in 3's, rarely opposite or in 4's; inflorescence cymose, flowers short-pedicelled, 5-merous; calyx 5-parted, with numerous glands inside at base; corolla salverform or infundibuliform, large, 4–5 cm. across, the upper portion of the throat with many long hairlike scaly appendages; stamens inserted on the upper portion of the tube, the anthers connate, adnate to the stigma, with a long filiform appendage at the apex, callose-appendaged at the base; carpels free, with a long common style; follicles long and firm; seeds villous, comose.—Few species, in subtropical Asia to the Mediterranean.

1. *Nerium indicum* Mill. *N. odorum* Soland. ex Ait. —KYŌCHIKU-TŌ. Large shrub with green, rather stout, puberulous branches; leaves narrowly lanceolate, 7–15 cm. long, 8–20 mm. wide, acuminate at both ends; flowers 4–5 cm.

across, usually red, rose, or rarely yellowish, often double in cultivars; follicles linear, erect; seeds comose and long pale brown-villous.—Aug. Indian plant long cultivated in our area.

Fam. 170. ASCLEPIADACEAE GAGA-IMO KA Milkweed Family

Perennial herbs or shrubs, often scandent, sometimes succulent; leaves opposite, verticillate, rarely alternate, simple, exstipulate; flowers cymose, bisexual, actinomorphic; calyx-lobes imbricate or open in bud; corolla 5-lobed, the lobes contorted or

valvate in bud, with 5, sometimes 1 or many appendages (corona) adnate to the corolla-tube or to the stamens; stamens 5, the filaments free or coherent in a tube, the anthers 2-locular, adnate to the stigma and forming a gynostegium, the pollen coherent into waxy or granular masses (pollinia); ovary superior; carpels 2, with a marginal placenta; styles free, the stigma conical, sometimes discoid; fruit a follicle; seeds usually comose, the endosperm scanty.—About 220 genera, with about 2,000 species, in the Tropics and warmer regions, especially abundant in Africa.

1A. Pollinia pendulous on caudicles.

2A. Corona short and depressed, much shorter than the gynostegium, the lobes alternate with the stamens; stigma long-beaked; cymes racemelike. 1. *Metaplexis*

2B. Corona as long as to longer than the gynostegium; cymes usually umbellike. 2. *Cynanchum*

1B. Pollinia erect on caudicles.

3A. Pollinia small, discoid. 3. *Tylophora*

3B. Pollinia large, usually pyriform.

4A. Leaves very thick, fleshy; inflorescence umbellate; corolla rotate. 4. *Hoya*

4B. Leaves membranous to coriaceous; corolla-tube prominent.

5A. Corolla campanulate. 5. *Marsdenia*

5B. Corolla salverform. 6. *Stephanotis*

1. METAPLEXIS R. Br. GAGA-IMO ZOKU

Scandent herbs or subshrubs; leaves opposite, petiolate, cordate; cymes racemelike; flowers rather small; calyx 5-parted, with 5 glands inside at the base; corolla rotate-campanulate, deeply 5-lobed, the lobes narrow, contorted in bud, long-hairy inside; corona annular, the lobes 5, alternate with the stamens and inserted on the stamen-tube; stamens coherent into a short tube, the anthers with an incurved cordate membrane at the apex, the pollinia solitary in each anther-locule, ovoid-ellipsoidal, pendulous on the apex of a short caudicle; stigma entire or elongate to a long bifid beak; follicles rather thick; seeds comose.—Few species, in e. Siberia and e. Asia.

1. *Metaplexis japonica* (Thunb.) Makino. *Pergularia japonica* Thunb.; *M. stauntonii* Schult.; *Urostelma chinense* Bunge; *M. chinensis* Decne.—GAGA-IMO. Sparsely white-pubescent scandent perennial herb, woody at base; leaves ovate-cordate, 5–10 cm. long, 3–6 cm. wide, acute, abruptly cuspidate, cordate, glaucous beneath, the petiole shorter than the blade; racemes 2–5 cm. long, pedunculate, the bracts linear, shorter than the pedicel; calyx 4–5 mm. long, 5-parted nearly to the base, the segments deltoid-lanceolate, membranous, as

long as to slightly shorter than the pedicels, acuminate; corolla pale purple or white, about 1 cm. across, broadly campanulate, deeply 5-lobed, the lobes lanceolate, recurved at tip, villous inside; follicles puberulent or glabrous, 8–10 cm. long, about 2 cm. across, broadly lanceolate; seeds flat, obovate, 6–8 mm. long, narrowly winged, with short, radiating striations on both surfaces.—Aug. Sunny slopes and thickets in hills and low mountains; Hokkaido, Honshu, Shikoku, Kyushu.—s. Kuriles, Korea, China, and Manchuria.

2. CYNANCHUM L. KAMOMEZURU ZOKU

Erect or scandent herbs, rarely subshrubs; leaves usually opposite, petiolate or sessile; cymes umbellike, sometimes racemelike, often branched, usually pedunculate; flowers small, white, greenish, or purplish; calyx 5-parted; corolla rotate or campanulate-rotate, deeply 5-lobed, the lobes contorted, rarely valvate in bud, the corona inserted at base of the stamen-tube, truncate to 5-parted, as long as to longer than the gynostegium, often with secondary inner lobes inside; anthers with a membranous appendage at apex, the pollinia solitary in each anther-locule, pendulous or sometimes horizontal on the caudicle; follicles thick or slender; seeds comose.—More than 100 species, in warm-temperate and subtropical regions.

1A. Leaves ovate-cordate; rhizomes long-creeping; corona-lobes highly adnate on the ventral side to the gynostegium; membranous appendage of the anthers relatively large and prominent.

2A. Corolla-lobes slightly reflexed; corona-lobes oblong or narrowly obovate, with an appendage inside much longer than the gynostegium. 1. *C. caudatum*

2B. Corolla-lobes obliquely spreading; corona-lobes obovate-orbicular, slightly shorter than the gynostegium, without an appendage inside. 2. *C. wilfordii*

1B. Leaves linear to narrowly deltoid-ovate, rarely cordate; rhizomes short; corona-lobes fleshy, as long as the gynostegium or much shorter; membranous appendage of anthers small, white at apex.

3A. Plant erect; leaves linear to narrowly lanceolate, acuminate at both ends, the petioles 1–3 mm. long; flowers yellow-brown. 3. *C. paniculatum*

3B. Plants erect, with broad leaves, or more or less scandent; flowers white, purple-brown, or sometimes yellowish.

4A. Leaves sessile, or short-petiolate and clasping at base.

5A. Leaves glaucous, glabrous, sessile. 4. *C. amplexicaule*

5B. Leaves yellow-green, crisped-hairy on both surfaces, the petioles 3–4 mm. long. 5. *C. krameri*

4B. Leaves usually distinctly petiolate, not clasping at base.

6A. Leaves large, 3–15 cm. wide, of few pairs, more or less approximate toward the top of the stems or the stems more elongate and becoming scandent with remote pairs of smaller leaves.

7A. Larger leaves ovate-orbicular to broadly elliptic, 7–15 cm. wide, rounded at base.

8A. Corolla-lobes thinly white-pubescent inside; stems often elongate and scandent; follicles horizontally spreading to slightly deflexed. 7. *C. grandifolium*

8B. Corolla-lobes glabrous on both sides; stems erect; follicles ascending. 8. *C. magnificum*

- 7B. Larger leaves oblong to narrowly so, 3–5 cm. wide; corolla-lobes glabrous on both sides. 9. *C. katoi*
 6B. Leaves smaller and usually narrower, 1–7 cm. wide, of many pairs.
 9A. Stems erect from base, barely scandent at the tip.
 10A. Corolla-lobes thinly pubescent outside, glabrous inside; leaves densely soft-pubescent. 10. *C. atratum*
 10B. Corolla-lobes glabrous outside; leaves glabrous or slightly pubescent on nerves.
 11A. Leaves oblong, ovate, or elliptic, with few pairs of lateral nerves prominently arcuate at tip; corolla-lobes glabrous inside.
 12A. Leaves obtuse, mucronate. 11. *C. japonicum*
 12B. Leaves acuminate.
 13A. Inflorescence usually pedunculate, terminal; pedicels 1–3 cm. long; corolla about 15 mm. across. 12. *C. ascyrifolium*
 13B. Inflorescence sessile, axillary; pedicels 7–10 mm. long; corolla about 7 mm. across. 13. *C. inaequum*
 11B. Leaves lanceolate, with 8–15 pairs of lateral nerves; corolla-lobes glabrous or puberulent inside. 6. *C. multinerve*
 9B. Stems scandent from the base or on upper half.
 14A. Stems erect on lower half; lower leaves ovate-oblong to broadly lanceolate; flowers few.
 15A. Corolla-lobes glabrous on both surfaces; inflorescence nearly sessile; corona half as long as the gynostegium.
 15B. Corolla-lobes puberulent, especially on inner side; inflorescence short-pedunculate; corona nearly as long as the gynostegium. 15. *C. doianum*
 14B. Stems scandent from near the base, much elongate; lower leaves linear to broadly ovate-cordate; flowers rather numerous.
 16A. Corolla yellow-green, the lobes white-puberulent inside; corona-lobes yellowish, deltoid, obtuse, about as long as the gynostegium; leaves 5–10 mm. wide, the petioles 3–8 mm. long. 16. *C. ambiguum*
 16B. Corolla yellowish to purple-brown, the lobes nearly glabrous.
 17A. Corona-lobes as long as the gynostegium, broadly ovate, yellowish; leaves narrowly ovate-deltoid, rather prominently puberulent beneath. 17. *C. austrojapaneseum*
 17B. Corona-lobes much shorter than the gynostegium, usually purplish or brownish. 18. *C. sublaevigatum*

1. *Cynanchum caudatum* (Miq.) Maxim. *Endotropis caudata* Miq.; *C. ikema* (Sieb.) Ohwi—Ikema. Stems branched, scandent, minutely crisped-pubescent while young, glabrescent; leaves membranous, ovate-cordate, abruptly short-caudate, vivid green above, whitish beneath, the petiole shorter than the blade; cymes racemelike, many-flowered, the peduncles 2–2.5 times as long as the petioles, the pedicels slender, 1–2 cm. long, puberulent on inner side; flowers white; calyx-segments ovate, obtuse; corolla-lobes slightly reflexed, with revolute margins, narrowly oblong, 4–5 mm. long, obtuse, puberulent inside; corona yellow, the lobes highly adnate to the gynostegium for more than half the length of the corolla; follicles 8–10 cm. long, 8–10 mm. wide, usually solitary; seeds obconate-ovate, 7–8 mm. long, flat, winged, rounded and toothed on basal margin.—July–Aug. Hokkaido, Honshu, Shikoku, Kyushu.—s. Kuriles and China.

2. *Cynanchum wilfordii* (Maxim.) Hemsl. *Cynotonum wilfordii* Maxim.; *Vincetoxicum wilfordii* (Maxim.) Fr. & Sav.—Ko-Ikema. Much-branched, nearly glabrous scandent herb, puberulent while very young; leaves thick-membranous, broadly ovate, 5–10 cm. long, 4–8 cm. wide, shortly acuminate to abruptly acute, deeply cordate, the petiole shorter than the blade; flowers umbellate, the peduncles as long as to shorter than the petioles, 1–4 cm. long, the pedicels 5–8 mm. long; flowers pale yellow-green; calyx-lobes broadly lanceolate, acute; corolla-lobes broadly ovate, about 3 mm. long, rather thick, obliquely spreading, incurved on margin, puberulent inside; follicles lanceolate, about 8 cm. long, about 1 cm. wide.—July–Aug. Grassy hillsides; Honshu, Shikoku, Kyushu.—Korea and Manchuria.

3. *Cynanchum paniculatum* (Bunge) Kitag. *Asclepias paniculata* Bunge; *Pycnostelma chinense* Bunge ex Decne.; *P. paniculatum* (Bunge) K. Schum.; *Vincetoxicum pycnostelma* Kitag.—SUZU-SAIKO. Erect, glabrous perennial; stems nearly simple, 40–100 cm. long, loosely leaved; leaves rather thick, ascending, narrowly lanceolate to linear, 6–12 cm. long, 4–15 mm. wide, acuminate at both ends, deep green above, whitish beneath, slightly recurved and scabridulous on margin, the petioles 1–3 mm. long; peduncles axillary and terminal, slightly branched; cymes rather loosely flowered, the

pedicels slender; calyx-segments broadly lanceolate; corolla yellow-brown, the lobes narrowly ovate, 7–8 mm. long, glabrous; corona-lobes ovate, obtuse, erect, slightly shorter than the gynostegium; follicles narrowly lanceolate, 6–8 cm. long; seeds narrowly ovate, 4–5 mm. long, entire, narrowly winged, smooth.—July–Aug. Grassy slopes in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea, Manchuria, China, and Dahuria.

4. *Cynanchum amplexicaule* (Sieb. & Zucc.) Hemsl. *Vincetoxicum amplexicaule* Sieb. & Zucc.; *V. brandtii* Fr. & Sav.; *C. brandtii* (Fr. & Sav.) Matsum.—ROKUN-SO. Erect, glabrous perennial; stems erect, sometimes branched, 40–100 cm. long; leaves rather firm, elliptic, ovate-oblong, or oblong, 4–8 cm. long, 2–4 cm. wide, rounded to subacute, mucronate, subauriculate and clasping at base, sessile, glaucous above, duller beneath; inflorescence as long as the leaves, pedunculate, sparsely branched, densely flowered, the pedicels rather short, 3–7 mm. long; calyx-segments narrowly ovate, sometimes ciliate; corolla yellowish, the lobes narrowly ovate, about 3 mm. long; corona-lobes subrounded, short; follicles narrowly lanceolate, about 5 cm. long, 6–7 mm. wide.—July–Aug. Shikoku, Kyushu.—Korea, Manchuria, Mongolia, and China.—Forma *castaneum* (Makino) Ohwi. *C. amplexicaule* var. *castaneum* Makino—KUROBANA-ROKUN-SO. Flowers purplish brown.

5. *Cynanchum krameri* (Fr. & Sav.) Matsum. *Vincetoxicum krameri* Fr. & Sav.; *V. amplexicaule* var. *krameri* (Fr. & Sav.) Maxim.—MARUBA-NO-FUNABARA-SO. Resembles the preceding; stems crisped pubescent; leaves obovate, rounded to emarginate, cordate-truncate at base, shortly crisped pubescent on both sides, the petioles 3–4 mm. long, the upper ones sessile; cymes umbellate, few-flowered, the peduncles not exceeding the leaves; calyx-segments densely pubescent, deltoid-lanceolate; corolla-lobes short-pilose on both surfaces, the pedicels as long as the flowers; corona as long as the gynostegium, the lobes ovate-orbicular, rather fleshy, pale brown.—Reported from Honshu (Nagato Prov.) and Kyushu (Hirato Isl.).

6. *Cynanchum multinerve* (Fr. & Sav.) Matsum. *Vincetoxicum multinerve* Fr. & Sav.—HOSOBANA-ROKUN-SO.

Stems erect, about 30 cm. long, short-pubescent; leaves lanceolate, 9–10 cm. long, 2–3.5 cm. wide, acuminate, obtuse at base, short-pilose on both surfaces especially on nerves beneath, with 8–15 pairs of lateral nerves, the petioles 4–7 mm. long; cymes short-pedunculate, few-flowered, short-pubescent; flowers about 1.5 cm. across; calyx-segments glabrous to puberulent, lanceolate; corolla whitish, glabrous on both surfaces, the lobes oblong, rounded at apex; corona as long as the gynostegium, brown, the lobes ovate-orbicular.—Reported to occur in Honshu.

Var. *kiyohikoanum* (Honda) Ohwi. *C. kiyohikoanum* Honda.—AKI-NO-KUSA-TACHIBANA. Flowers dark purple; corolla-lobes puberulent inside.—Honshu (Aki Prov.).

7. *Cynanchum grandifolium* Hemsl. *Vincetoxicum macrophyllum* Sieb. & Zucc.; *C. macrophyllum* (Sieb. & Zucc.) Matsum., non Thunb.; *C. kusianum* Nakai; *C. lasiocarpum* Koidz.—TSUKUSHI-GASHIWA, Ô-TACHI-GASHIWA. Stems 50–100 cm. long, scandent, puberulent or nearly glabrous, with the largest leaves below the middle, those above remote and smaller; larger leaves thinly membranous, sparsely puberulent, ovate-orbicular to ovate or broadly elliptic, 12–25 cm. long, 10–15 cm. wide, abruptly acuminate, rounded to subacute at base, the petioles 3–6 cm. long; inflorescence axillary and terminal, usually short-pedunculate, much branched, rather large, puberulent, the pedicels 1–2 cm. long; calyx-segments lanceolate, acuminate; corolla purple-brown or dark purple, 8–10 mm. across, the lobes lanceolate, obtuse, white crisped-pubescent inside; follicles spreading to slightly deflexed, linear-lanceolate, usually puberulent, 5–8 cm. long, about 4 mm. wide; seeds broadly lanceolate, about 12 mm. long, flat, wingless, smooth.—Mountains; Honshu (w. distr.), Shikoku, Kyushu.

Var. *nikoense* (Maxim.) Ohwi. *Vincetoxicum macrophyllum* var. *nikoense* Maxim.; *C. nikoense* (Maxim.) Makino; *C. macrophyllum* var. *nikoense* (Maxim.) Matsum.—TSURUGASHIWA. Inflorescence short, rather few-flowered; follicles more puberulent.—Woods in mountains; Honshu, Shikoku.

8. *Cynanchum magnificum* Nakai. *C. nikoense* Makino, excl. syn.—TACHI-GASHIWA. Closely resembles the preceding species; stems 30–60 cm. long, erect, usually loosely puberulent, with few pairs of larger leaves, close together near the top; larger leaves ovate-orbicular to rhombic-elliptic, or broadly elliptic, 10–15 cm. long, 7–13 cm. wide, abruptly acute or shortly acuminate, the petioles 2–5 cm. long; inflorescence near the top of the stems, rather densely flowered, small, puberulent, the pedicels 1–2 cm. long; corolla-lobes lanceolate, glabrous on both sides, obtuse, about 5 mm. long; corona small, the lobes semicircular; follicles narrowly lanceolate, 5–7 cm. long, 5–6 mm. wide, nearly glabrous, ascending to suberect.—May–June. Woods in mountains; Honshu, Shikoku.

9. *Cynanchum katoi* Ohwi. KUSANAGI-OGOKU. FIG. 13. Rather slender, thinly puberulent perennial; stems 30–100 cm. long, usually becoming somewhat scandent; largest leaves thinly membranous, of few pairs close together below the middle of the stem, narrowly elliptic or oblong, 7–15 cm. long, 3–5 cm. wide, acuminate, acute to acuminate at base, the petioles 7–12 mm. long, the upper smaller leaves of few pairs; inflorescence loosely rather many-flowered, rather large, branched, glabrous or nearly so, the pedicels 5–18 mm. long, filiform; calyx-segments lanceolate; corolla purplish, 7–9 mm. across, the lobes oblong, glabrous on both sides; corona-lobes ovate-deltoid, obtuse, small; follicles lanceolate, 4–5 cm. long, 7–8 mm. wide;

seeds oblong, 6–7 mm. long, obsoletely dark-spotted.—June. Honshu (Tôkaidô and c. Kinki Distr.); rather rare.—*Forma albescentis* (Hara) Ohwi. *C. katoi* var. *albescentis* Hara.—SHIROBANA-KUSANAGI-OGOKU. Flowers white.

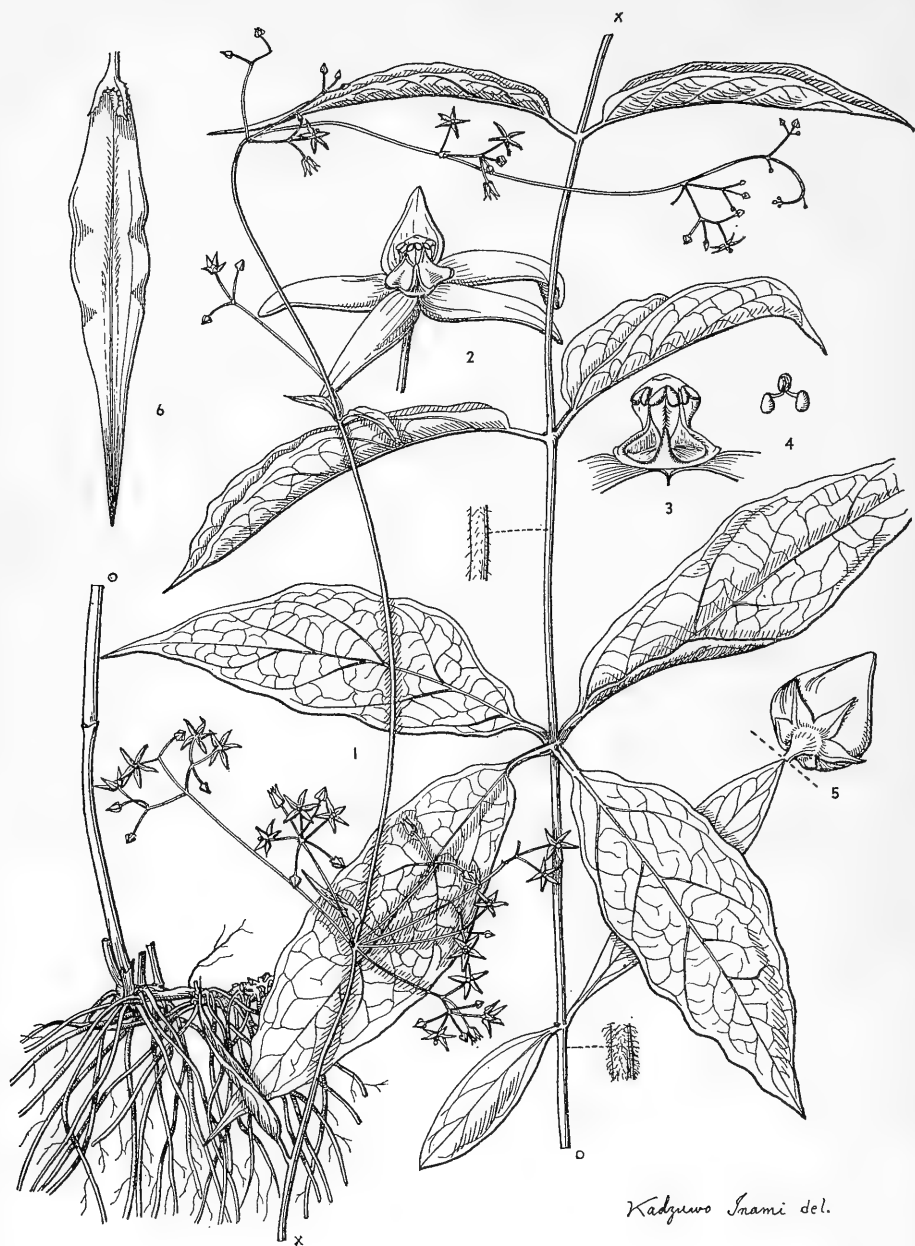

10. *Cynanchum atratum* Bunge. *Vincetoxicum atratum* (Bunge) Morr. & Decne. ex Decne.—FUNABARA-SÔ, ROKUON-SÔ. White-pubescent, especially on the inflorescence, upper part of stems, and lower side of leaves; stems erect, simple, 40–80 cm. long, rather thick; leaves elliptic, broadly ovate or ovate-orbicular, 6–10 (–15) cm. long, 3–7 (–10) cm. wide, acute to abruptly so, or sometimes rounded and mucronate, the petioles 8–12 mm. long; inflorescence umbellate, in the upper axils, densely flowered, sessile or very short-pedunculate, the pedicels shorter than the flowers; calyx-segments lanceolate, slightly shorter than the corolla-tube; corolla 5-lobed, thinly puberulent outside, dark purple and glabrous inside, the lobes ovate-oblong, 6–8 mm. long, obtuse; corona-lobes elliptic, rounded, nearly as long as the gynostegium; follicles broadly lanceolate, densely puberulent, 7–8 cm. long, about 1.5 cm. wide.—May–June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and China.—*Forma viridescens* Hara. AO-FUNABARA-SÔ. Flowers green.

Cynanchum × *sakaianum* Honda. MIYAMA-FUNABARA-SÔ. Hybrid of *C. ascyrifolium* × *C. atratum*.

11. *Cynanchum japonicum* Morr. & Decne. *Vincetoxicum japonicum* Morr. & Decne., ex Decne.; *Vincetoxicum japonicum* var. *verum* Maxim.; *V. japonicum* var. *grayanum* Maxim.; *C. grayanum* (Maxim.) Koidz.—IYO-KAZURA, SUZUME-NO-OGOKU. White crisped-hairy on the stems, the nerves of both leaf surfaces, and the inflorescence; stems simple or sparingly branched, often somewhat scandent, 30–80 cm. long; leaves elliptic, elliptic-ovate, or obovate, 3–10 cm. long, 2–7 cm. wide, rounded to obtuse and often mucronate, rounded at base, the petioles 3–10 mm. long; inflorescence umbellate, sometimes sparingly branched, pedunculate or subsessile, rather densely flowered, the pedicels 5–10 mm. long; calyx-segments broadly lanceolate; corolla about 8 mm. across, deeply 5-lobed, creamy, the tube shorter than the calyx, the lobes narrowly ovate, 4–5 mm. long, glabrous on both sides; corona-lobes obovoid-orbicular, nearly as long as the gynostegium; follicles broadly lanceolate, 5–6 cm. long, about 1.5 cm. across, glabrous; seeds broadly ovate, 8–10 mm. long, narrowly winged.—May–July. Thickets and grassy slopes near seashores; Honshu, Shikoku, Kyushu; rather common.—Korea and China.

Var. *albiflorum* (Fr. & Sav.) Hara. *Vincetoxicum purpurascens* var. *albiflorum* (Fr. & Sav.) Hara; *C. purpurascens* var. *albiflorum* (Fr. & Sav.) Matsum.; *C. albiflorum* (Fr. & Sav.) Koidz.—SHIROBANA-KUSA-TACHIBANA, BIRÔDO-IYO-KAZURA. Leaves thinner, abruptly acute, obtuse to rounded at base.—Occurs with the typical phase.—*Forma puncticulatum* (Koidz.) Ohwi. *C. puncticulatum* Koidz.; *C. japonicum* var. *puncticulatum* (Koidz.) Hara; *Vincetoxicum rubellum* Fr. & Sav.; *C. rubellum* (Fr. & Sav.) Matsum.—KUROBANA-IYO-KAZURA. Flowers purple.

Cynanchum purpurascens Morr. & Decne. *Vincetoxicum japonicum* var. *purpurascens* (Morr. & Decne.) Maxim., partim.—MURASAKI-SUZUME-NO-OGOKU. Leaves narrower, acuminate to cuspidate; flowers on rather long pedicels; calyx loosely pilose.—Described from a cultivated plant. Allied to *C. japonicum*.

Kadzuwo Inami del.

FIG. 13.—*Cynanchum katoi* Ohwi. 1, Habit; 2, flower; 3, gynostegium; 4, pollinia; 5, flower-bud; 6, follicle.

12. *Cynanchum acyrifolium* (Fr. & Sav.) Matsum. *Vincetoxicum acuminatum* Decne.; *V. acyrifolium* Fr. & Sav.; *C. acuminatifolium* Hemsl.; *C. acuminatum* (Decne.) Matsum., non Thunb.—KUSA-TACHIBANA. Sparsely crisped-hairy on the inflorescence and nerves of leaves beneath; stems erect, 30–60 cm. long, with several pairs of leaves; leaves membranous to firmly so, green above, paler beneath, oblong, elliptic, or ovate, 8–15 cm. long, 4–8 cm. wide, acuminate to short-acuminate, the petioles 1–2 cm. long; inflorescence terminal and in upper axils, pedunculate, few-branched, the pedicels 1–3 cm. long; calyx-segments broadly lanceolate; corolla white, about 15 mm. across, the lobes narrowly ovate, 8–10 mm. long, glabrous on both surfaces; corona-lobes ovate-deltoid, slightly shorter than the gynostegium; follicles broadly lanceolate, glabrous, 4–6 cm. long, about 8 mm. wide; seeds broadly ovate, about 7 mm. long, entire, scarcely winged.—June. Honshu (Kantō Distr. and westw.), Shikoku.—Korea and Manchuria.

13. *Cynanchum inamoenum* (Maxim.) Loes. *Vincetoxicum inamoenum* Maxim.—EZO-NO-KUSA-TACHIBANA. Short-pubescent; stems erect, 30–50 cm. long; leaves membranous, of few pairs, elliptic or narrowly so, to ovate, 6–10 cm. long, 3–6 cm. wide, short-acuminate or acute, rounded to broadly cuneate and obtuse at base, the petioles 7–10 mm. long; inflorescence few-flowered, umbellate, sessile or very short-pedunculate; flowers small, yellowish, about 7 mm. across; corolla deeply 5-lobed, glabrous; corona-lobes nearly as long as the gynostegium, broadly deltoid; follicles obliquely spreading, lanceolate, glabrous, 4–5 cm. long, about 5 mm. wide; seeds broadly ovate, winged, about 5 mm. long.—July. Hokkaido.—Sakhalin, Korea, Manchuria, and n. China.

14. *Cynanchum nipponicum* Matsum. Ô-ÂO-KAMOMEZURU. Somewhat crisped-hairy; stems slender, erect on lower half, much elongate and scandent, 40–100 cm. long; leaves of the lower erect portion larger, membranous, broadly lanceolate to narrowly oblong-ovate, 5–12 cm. long, 1–2(–3) cm. wide, gradually acuminate, rounded to shallowly cordate-truncate at base, the petioles 2–4 mm. long; inflorescence in upper axils; flowers yellow, 7–8 mm. across, few, in umbels, the peduncles nearly absent, the pedicels 3–4 mm. long, usually shorter than the flowers; corolla-lobes narrowly ovate, glabrous on both surfaces, obtuse; corona-lobes depressed-deltoid, about half as long as the gynostegium; follicles broadly lanceolate, glabrous, 4–5 cm. long, 5–7 mm. wide; seeds ovate-elliptic, about 5 mm. long, winged.—July–Sept. Mountains; Honshu (centr. and n. distr.).—Korea.—Forma *abukumense* (Koidz.) Hara. *C. abukumense* Koidz.—NAGABA-KURO-KAMOMEZURU. Flowers purple.

Var. *glabrum* (Nakai) Hara. *C. glabrum* Nakai—TACHI-KAMOMEZURU, KUROBANA-KAMOMEZURU. Leaves thicker; corona-lobes ovate-deltoid, slightly shorter than the gynostegium.—Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Korea.

15. *Cynanchum doianum* Koidz. SATSUMA-BYAKUZEN. Crisped-hairy perennial; stems scandent, loosely leaved; leaves membranous, narrowly oblong to oblong-lanceolate, to 10 cm. long, 4.5 cm. wide, puberulent on both surfaces, the petioles to 5 mm. long; inflorescence pedunculate, umbellate; flowers about 11 mm. across, yellowish; corolla-lobes lanceolate, puberulent on both sides especially on the inner surface, obtuse; corona-lobes as long as the gynostegium.—June–Aug. Kyushu (s. distr.).

16. *Cynanchum ambiguum* (Maxim.) Matsum. *Vincetoxicum ambiguum* Maxim.—ÂO-KAMOMEZURU. Sparsely crisped-puberulent perennial herb; stems long-scandent and branched; leaves rather thick-membranous, broadly to linear-lanceolate, 3–10 cm. long, 5–10 mm. wide, acuminate, rounded to truncate at base, the petioles 3–8 mm. long; inflorescence umbellike, rather few-flowered, on axillary peduncles about 1 cm. long, the pedicels 5–10 mm. long; flowers yellow-green, 7–8 mm. across; corolla-lobes deltoid-lanceolate, 3–4 mm. long, obtuse, glabrous outside, short white-puberulent inside; corona-lobes deltoid, yellowish, obtuse, nearly as long as the gynostegium; follicles narrowly lanceolate, glabrous, 4–5 cm. long, 5–6 mm. wide.—Aug.–Oct. Honshu (Yamato Prov.), Shikoku, Kyushu.

17. *Cynanchum austrokusianum* Koidz. NANGOKU-KAMOMEZURU. Perennial with short crisped hairs, especially on the leaves beneath; stems scandent, branched, slender; leaves membranous, narrowly ovate-deltoid or broadly ovate, 5–9 cm. long, 2–4 cm. wide, gradually acuminate, shallowly cordate at base, the petioles 1–3 cm. long; inflorescence umbellike, the peduncles 0–2 cm. long, the pedicels slender, 1–1.5 cm. long; flowers white, 10–15 mm. across; corolla-lobes lanceolate, gradually narrowed to the tip, obtuse, 7–8 mm. long; corona-lobes broadly ovate, obtuse, yellowish, as long as the gynostegium; follicles broadly lanceolate, 5–6 cm. long, 7–8 mm. wide, glabrous; seeds broadly ovate, 6–7 mm. long, narrowly winged, with dark brown spots.—Aug.–Sept. Kyushu (s. distr.).

18. *Cynanchum sublancoelatum* (Miq.) Matsum. var. *sublancoelatum*. *Tylophora sublancoelata* Miq.; *C. sublancoelatum* (Miq.) Matsum.; *Vincetoxicum sublancoelatum* var. *dickinsii* Fr. & Sav.; *C. macranthum* var. *dickinsii* (Fr. & Sav.) Ohwi; *C. dickinsii* (Fr. & Sav.) Nakai.—KÔBA-NO-KAMOMEZURU. Perennial with more or less curved hairs; stems slender, elongate and branched, scandent, loosely leafy; lower leaves lanceolate to broadly lanceolate, 4–5 cm. long, 1–2 cm. wide, gradually acuminate, shallowly cordate to sometimes rounded at base, the petioles 7–15 mm. long; upper leaves 1–5 cm. long, 5–15 mm. wide, usually rounded at base, the petioles 3–10 mm. long; inflorescence umbellike, simple or sometimes few-branched, nearly sessile or short-pedunculate, the pedicels 7–10 mm. long; flowers 6–8 mm. across, dark purple; corolla-lobes lanceolate, gradually narrowed and obtuse, minutely puberulent inside at base; corona-lobes about half as long as the gynostegium, ovate-deltoid; follicles usually solitary, lanceolate, 5–7 cm. long, 6–7 mm. wide; seeds broadly ovate, very narrowly winged, about 6 mm. long.—July–Sept. Thickets in hills and low mountains; Honshu (Kantô Distr. westw. to Kinki).

Var. *albiflora* (Fr. & Sav.) Hara. *Tylophora japonica* var. *albiflora* Fr. & Sav.; *Vincetoxicum sublancoelatum* var. *albida* Fr. & Sav.; *C. sublancoelatum* var. *albidum* (Fr. & Sav.) Matsum.; *C. albidum* (Fr. & Sav.) Koidz.—AZUMA-KAMOMEZURU. Flowers white.—Occurs with the typical phase.

Var. *macranthum* (Maxim.) Matsum. *Vincetoxicum sublancoelatum* var. *macranthum* Maxim.; *C. franchetii* Nakai; *Tylophora macrantha* (Maxim.) Makino; *C. matsudanum* Koidz.—SHIROBANA-KAMOMEZURU, ÔBANA-KAMOMEZURU. Slightly larger in every respect; flowers 10–20 mm. across, light yellow.—Occurs with the typical phase.

Var. *auriculatum* (Fr. & Sav.) Matsum. *Vincetoxicum sublaucolatum* var. *auriculatum* Fr. & Sav.; *C. harunamontanum* Honda; *C. retropilum* Nakai—JŌSHŪ-KAMOMEZURU.

Petioles in lower leaves 8–15 mm. long; flowers dark purple; corona-lobes rather depressed.—Aug. Honshu (centr. distr. and Kantō).

3. TYLOPHORA R. Br. Ô-KAMOMEZURU ZOKU

Herbs, sometimes subshrubs, usually scandent, rarely suberect; leaves opposite, entire; cymes branched or rarely umbellike, sometimes racemelike; flowers small; calyx deeply 5-lobed or parted, the lobes acute; corolla rotate, deeply 5-lobed, the lobes contorted or nearly valvate in bud; corona-lobes 5, fleshy, forming a connate annulus at base, adnate to the stamens; stamens inserted on the corolla-tube or on the throat, the filaments short, connate, the anthers erect, short, with an incurved membrane at apex, the pollinia solitary in each locule, discoid, globose to ovoid, erect or laterally attached to a slender horizontally spreading caudicle; follicles lanceolate, acuminate, smooth; seeds comose.—Many species in se. and e. Asia, the Pacific Islands, and Australia, few in Africa. In habit scarcely distinguishable in our area from *Cynanchum* except by the more strongly scandent branches and generally looser inflorescence.

1A. Leaves membranous, more or less cordate at base.

2A. Corona-lobes much shorter than the gynostegium, erect. 1. *T. nikoensis*

2B. Corona-lobes at least half as long as the gynostegium, radially spreading.

3A. Leaves rather small, 3–7 cm. long, acute; inflorescence diffuse and much branched; corolla-lobes glabrous inside. ... 2. *T. floribunda*

3B. Leaves rather larger, 7–12 cm. long, acuminate; inflorescence small, often umbellike; corolla-lobes puberulent inside, at least on upper part. 3. *T. aristolochioides*

1B. Leaves coriaceous or subcoriaceous, obtuse or rounded at base.

4A. Leaves elliptic or ovate-elliptic, prominently short-pubescent beneath; inflorescence rather umbellike, slightly branched.

4. *T. tanakae*

4B. Leaves lanceolate, glabrous except on midrib above; inflorescence much branched. 5. *T. japonica*

1. *Tylophora nikoensis* (Fr. & Sav.) Matsum. *Vincetoxicum nikoense* Fr. & Sav.—KŌ-KAMOMEZURU. Scandent nearly glabrous or thinly puberulent perennial herb; stems slender, elongate, branched; lower leaves membranous, narrowly deltoid-ovate or narrowly ovate, 4–7 cm. long, 1.2–2.5 cm. wide, smaller in the upper ones, acuminate, shallowly cordate with an open sinus at base, glabrate to thinly puberulent, the petioles 5–15 mm. long; inflorescence branched, loosely many-flowered, longer than to nearly as long as the leaves, nearly glabrous, the pedicels 5–10 mm. long; calyx-lobes small, ovate-deltoid; corolla dark purple, 4–5 mm. across, the lobes spreading, narrowly ovate; corona-lobes shorter than the gynostegium; follicles lanceolate, glabrous, 4–5 cm. long, 4–5 mm. wide; seeds ovate, 4–5 mm. long.—July–Aug. Thickets in lowlands and mountains; Honshu, Shikoku, Kyushu.

2. *Tylophora floribunda* Miq. *Vincetoxicum floribundum* (Miq.) Fr. & Sav.; *T. shikokiana* Matsum.—TŌSA-KAMOMEZURU. Scandent herb with short rhizomes, glabrous or nearly so, crisped-hairy on nerves of the upper leaf surface; stems slender, elongate, much branched; lower leaves narrowly oblong-ovate to broadly lanceolate, 3–7 cm. long, 1–3 cm. wide, abruptly acuminate, cordate at base, puberulent on upper side, the petioles 1–2 cm. long; inflorescence diffuse and much branched, slender, loosely many-flowered, usually longer than the leaves, glabrous, the pedicels 4–7 mm. long; calyx-segments ovate-deltoid, small; corolla dark purplish, 3–4 mm. across, the lobes glabrous, narrowly ovate; corona-lobes depressed-globose, spreading, about half as long as the gynostegium; follicles horizontally spreading, narrowly lanceolate, about 5 cm. long, glabrous.—Aug. Honshu (Chūgoku Distr.), Shikoku, Kyushu.—Korea and China.

3. *Tylophora aristolochioides* Miq. *Vincetoxicum aristolochioides* (Miq.) Fr. & Sav.; *T. yoshinagae* Makino—Ô-KAMOMEZURU. Much-branched, slender, scandent perennial, nearly glabrous except for fine crispate hairs on nerves of upper leaf surface while young; larger leaves membranous,

deltoid-ovate to broadly deltoid-lanceolate, 7–12 cm. long, 2–5 cm. wide, long-acuminate, shallowly cordate at base, often obscurely auriculate, puberulent on upper side, the petioles 1.5–3 cm. long; upper leaves smaller; inflorescence small, slightly branched, umbellike, usually shorter to slightly longer than the petiole, glabrous, the pedicels 3–10 mm. long; calyx-segments deltoid, small; corolla dark purplish, 5–7 mm. across, the lobes narrowly ovate, obtuse, white-pubescent inside; corona-lobes radially spreading, obovate, obtuse, shorter than the gynostegium; follicles horizontally spreading, narrowly lanceolate, 4–6 cm. long, 4–5 mm. wide, glabrous; seeds narrowly ovate, narrowly margined, about 6 mm. long.—July. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.

4. *Tylophora tanakae* Maxim. *Vincetoxicum tanakae* (Maxim.) Fr. & Sav.—TSURU-MŌRINKA. Scandent much-branched slender perennial herb, rather densely yellowish short-crispate and soft pubescent on stems and lower leaf surfaces; leaves subcoriaceous, broadly ovate-elliptic, elliptic, or ovate, 4–7 cm. long, 2–4.5 cm. wide, rounded to obtuse, rounded at base, glabrate and lustrous above, paler beneath, the petioles 5–12 mm. long; inflorescence pedunculate or sessile, many-flowered, rather umbellike, slightly branched, nearly as long as the leaves, the pedicels slender, nearly glabrous, 7–10 mm. long; calyx-segments small, ovate; corolla 6–7 mm. across, the lobes narrowly deltoid-ovate, glabrous; corona-lobes erect, ovate-deltoid, about half as long as the gynostegium; follicles horizontally spreading, lanceolate, often loosely pubescent, sometimes glabrous, 5–6 cm. long, 8–10 mm. wide; seeds broadly ovate, narrowly winged, about 6 mm. long.—Aug. Honshu (Izu Prov.), Kyushu.—Ryukyus.

5. *Tylophora japonica* Miq. *Vincetoxicum sieboldii* Fr. & Sav.; *T. liukiuensis* Matsum.; *Henrya augustiniiana* forma *liukiuensis* (Matsum.) Makino; *H. liukiuensis* (Matsum.) Koidz.; *Cynanchum sieboldii* (Fr. & Sav.) Ohwi—TOKIWA-KAMOMEZURU. Nearly glabrous scandent herb with firm slender striate branches; leaves thick and rather firm,

lanceolate to broadly so, 5-8 cm. long, 1-2(-2.5) cm. wide, gradually acuminate, rarely acute, sometimes obtuse at base, glabrous except on midrib above, deep green and slightly lustrous above, pale green beneath, the petioles 5-12 mm. long; inflorescence much branched, as long as to slightly longer than

the leaves, the pedicels 3-5 mm. long; calyx-segments ovate, slightly pilose; corolla 7-8 mm. across, purplish, the lobes ovate; corona-lobes orbicular, about half as long as the gyno-stegium; follicles narrowly lanceolate, about 9 cm. long.—June-July. Warmer regions; Shikoku, Kyushu.—Ryukyus.

4. HOYA R. Br. SAKURA-RAN ZOKU

Scandent herbs or subshrubs, often creeping on rocks or tree-trunks; leaves opposite, fleshy, coriaceous; inflorescence in umbellate cymes, sessile or pedunculate, axillary; flowers relatively large, rarely small; calyx small, deeply 5-lobed; corolla rotate, deeply 5-lobed, the lobes spreading or reflexed, valvate in bud; corona-lobes 5, fleshy, adnate to the stamen-tube, radially spreading; stamens inserted at the base of the corolla, the filaments short, connate, the anthers adhering around the stigma, with an erect or incurved membrane at apex, pollinia solitary in each locule, pyriform, erect; fruit a follicle.—About 100 species, in the warmer regions of e. and s. Asia, Malaysia, and Australia.

1. *Hoya carnosa* (L. f.) R. Br. *Asclepias carnosa* L. f.; *H. roundifolia* Sieb.; *H. motoskei* Teijsm. & Binn.; *H. carnosa* var. *japonica* Sieb. ex Maxim.—SAKURA-RAN. Branches rather thick, creeping, glabrous; leaves subcoriaceous, elliptic, 5-10 cm. long, 3-5 cm. wide, rounded to obtuse, mucronate, obtuse at base, fleshy, lustrous, pilose beneath, petiolate; inflorescence umbellate, densely flowered, the peduncles axillary,

thick, short; flowers 12-15 mm. across, pale rose, on rather slender elongate pedicels; corolla-lobes deltoid-ovate, obtuse, densely short-papillose, hairy on inside; corona-lobes short, narrowly deltoid, horizontally spreading, shining; follicles linear, 10-14 cm. long, 6-7 mm. across; seeds oblanccolate, 4-5 mm. long, slightly contracted at apex, comose.—June-Oct. Kyushu.—Ryukyus, Formosa, and tropical Asia.

5. MARSDENIA R. Br. KIYO-RAN ZOKU

Shrubs or subshrubs, usually scandent, rarely suberect; leaves opposite; cymes umbellike or somewhat branched, terminal and axillary, pedunculate; calyx 5-parted, the lobes obtuse; corolla campanulate or infundibuliform, rarely rotate, 5-lobed, the throat constricted, sometimes hairy inside, the lobes contorted in bud, obtuse; corona-lobes 5, erect; anthers with a small membrane at apex, the pollinia erect, pyriform; follicles often fleshy; seeds comose.—About 70 species, tropical and subtropical.

1. *Marsdenia tomentosa* Morr. & Decne. *M. acuta* T. Tanaka, excl. syn.—KIYO-RAN. Woody evergreen climber with rather thick elongate branches; leaves petiolate, orbicular, 7-12 cm. in diameter, abruptly acute, truncate-rounded or shallowly cordate at base; inflorescence axillary, short-peduncu-

late, shorter or as long as the petioles, 3-6 cm. long, densely pilose; flowers white, about 5 mm. across; corolla campanulate, hairy on the throat; follicles 13-15 cm. long, rather thick.—Aug.-Sept. Warmer regions; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus and s. Korea.

6. STEPHANOTIS Thouars SHITAKI-SŌ ZOKU

Glabrous scandent shrubs; leaves opposite, coriaceous; cymes umbellike, axillary, short-pedunculate; flowers rather large, white; calyx 5-parted, the segments somewhat foliaceous, lanceolate; corolla salverform or subinfundibuliform, the tube long, the lobes contorted in bud; corona-lobes 5, erect, sometimes obsolete, inserted at the back of the stamens; anthers erect, with a small membrane at apex, the pollinia solitary in each locule, erect on short caudicles; follicles rather thick; seeds comose.—About 15 species, in e. Asia, Malaysia, and Madagascar.

1. *Stephanotis lutchuensis* Koidz. var. *japonica* (Makino) Hatus. *S. japonica* Makino—SHITAKI-SŌ. Much-elongate woody climber with yellowish pubescent young branches; leaves thick-membranous, oblong to broadly ovate, 6-12 cm. long, 3-6 cm. wide, acute to abruptly acuminate, rounded to shallowly cordate at base, with sparse persistent crispate hairs on nerves on both surfaces, the petioles 1.5-2.5 (-3) cm. long; peduncles axillary, shorter than to as long as the petioles, 2- or 3-flowered at the top, the pedicels longer than the peduncle, shorter than the flowers; flowers white, fragrant; calyx-segments 1/2-3/4 as long as the corolla-tube, rounded to subacute; corolla-tube 12-14 mm. long, hairy inside,

the lobes lanceolate, obliquely spreading, subobtusate, about 20 mm. long.—June. Honshu (Awa Prov. and westw.), Shikoku, Kyushu.

Var. *lutchuensis*. *S. lutchuensis* Koidz. OKINAWA-SHITAKI-ZURU. Resembles the preceding but smaller; leaves oblong or ovate, 6-10 cm. long, 3-6 cm. wide, usually rounded at base, the petioles 1.5-2 cm. long; peduncles axillary, shorter than the petioles, the pedicels 2-5, about 1.5 cm. long, nearly as long as the flowers; flowers white, fragrant; corolla-tube 7-8 mm. long, hairy inside, to twice as long as the calyx, the lobes broadly lanceolate, slightly reflexed, subobtusate, about 10 mm. long.—June-July. Kyushu (s. distr.).—Ryukyus.

Fam. 171. CONVULVULACEAE HIRUGAO KA Morning-glory Family

Herbs or often scandent woody plants, often with milky juice; leaves simple, alternate, exstipulate; flowers bisexual, actinomorphic, the bracts often involucrelike; calyx-segments usually free, imbricate in bud, persistent; corolla usually infundibuliform, the lobes contorted in bud; stamens inserted on the lower part of the corolla and alternate with the lobes, the anthers 2-locular, longitudinally dehiscent; ovary often surrounded by a disc at base, 1- to 4-locular; ovules 1 or 2 in each locule, erect; style erect, terminal; fruit dehiscent and capsular or indehiscent and fleshy; seeds often hairy, with scanty endosperm; cotyledons infolded or wrinkled.—About 50 genera, with more than 1,200 species, chiefly tropical and subtropical, abundant in Asia and America.

1A. Plants green, with chlorophyll, nonparasitic; stamens without scales at base; leaves well developed.

2A. Ovary 2-lobed; styles 2; small creeping herbs; corolla broadly campanulate; flowers solitary in axils, small. 1. *Dichondra*

2B. Ovary unlobed; style 1, sometimes very short.

3A. Scandent herbs, sometimes slightly woody at base; leaves orbicular to ovate-cordate; flowers 2 cm. or more long; style elongate; fruit a capsule.

4A. Bracts small, not covering the calyx; ovary 2- to 4-locular. 2. *Ipomoea*

4B. Bracts large, covering the calyx; ovary 1-locular. 3. *Calystegia*

3B. Scandent evergreen shrubs; leaves elliptic to oblong; flowers 10 mm. long; style nearly absent; fruit a 1-seeded berry. 4. *Erycibe*

1B. Plants not green, without chlorophyll, parasitic; stamens with small scales at base; leaves reduced to scales. 5. *Cuscuta*

1. DICHONDRA Forst. AOIGOKE ZOKU

Delicate creeping herbs; leaves cordate-orbicular or reniform, small; flowers axillary, solitary, small; calyx-segments nearly equal, often spatulate; corolla broadly campanulate, deeply 5-lobed, the lobes induplicate in bud; filaments filiform, the anthers small; ovary 2-lobed, the lobes usually 2-locular and 2-ovuled; styles 2, filiform, the stigma capitate; capsules membranous, usually densely pubescent, 2-parted, erect, each lobe 1(-2)-seeded; seeds subglobose, smooth; cotyledons oblong-linear.—Few species in Centr. and S. America, one widely distributed in tropical and subtropical regions.

1. *Dichondra repens* Forst. *Sibthorpia evolvulacea* L. f.; *Dichondra micrantha* Urb.; *Dicrondra evolvulacea* (L. f.) Britt.—AOIGOKE. Thinly yellowish pubescent or nearly glabrous; stems very slender, creeping, matted; leaves loosely arranged, reniform- to orbicular-cordate, 5-10 mm. long, 8-20 mm. wide, rounded to retuse, deeply cordate, the petioles slender, 1-4 cm. long; flowers sessile or on short delicate peduncles

shorter than the petioles, yellow, about 3 mm. across; calyx-segments or sepals obovate-oblong; corolla-lobes oblong, slightly longer than the calyx; lobes of capsules globose, about as long as the calyx, loosely long-hairy.—Apr.-Aug. Around dwellings and along roadsides in lowlands; Honshu (warmer parts of w. distr.), Shikoku, Kyushu.—s. Korea, Ryukyus, Formosa, and the Tropics generally.

2. IPOMOEA L. SATSUMA-IMO ZOKU

Herbs, rarely shrubs, usually twining; leaves alternate, entire or palmately lobed; inflorescence cymose, often capitate, sometimes in terminal panicles, the bracts persistent or caducous, the peduncles axillary, 1- to many-flowered; flowers purple, red, or white, rarely yellow; calyx-segments sometimes unequal; corolla infundibuliform or campanulate, the limb 5-plicate in bud, entire, rarely deeply 5-lobed; stamens not exerted, the filaments filiform or dilated below, sometimes hairy; ovary 2- or 4-locular and 4-ovuled, or 3-locular and 6-ovuled; style filiform, the stigma globose or 2-lobed; capsules globose; seeds glabrous or pilose; cotyledons broad, often bifid.—About 400 species, in warmer areas of the world.

1A. Calyx-segments elliptic to oblong, obtuse, mucronate; ovary 2-locular, 4-ovuled; leaves orbicular, obovate-orbicular to elliptic, retuse to bilobed, glabrous. 1. *I. pes-caprae*

1B. Calyx-segments lanceolate, gradually narrowed to tip; ovary 3-locular, 6-ovuled; leaves cordate, abruptly acuminate, scattered-pilose. 2. *I. indica*

1. *Ipomoea pes-caprae* (L.) Sweet. *Convolvulus pes-caprae* L.; *I. biloba* Forsk.; *I. pes-caprae* subsp. *brasiliensis* (L.) Oostst.; *C. brasiliensis* L.—GUMBAI-HIRUGAO. Glabrous creeping perennial, the branches terete; leaves rather thick, long-petiolate, orbicular, obovate-orbicular to elliptic, sometimes orbicular-cuneate, 3-8 cm. long, 4-10 cm. wide, retuse to shallowly 2-lobed, cuneate to truncate-rounded at base, the mid-rib rather strong, the lateral nerves nearly parallel, ascending; peduncles longer than the petioles; inflorescence cymose, 1-2 (-6)-flowered, the pedicels 1-4 cm. long, flattened in fruit, the bracts small, caducous; calyx-segments membranous, broadly elliptic to oblong, 6-8 mm. long, rounded to very obtuse, mucronate; corolla rose-purple, infundibuliform, 5-6 cm. across; ovary 2-locular, 4-ovuled; capsules about 2 cm. across, depressed-globose; seeds semiglobose, brown-villous, about 7 mm. across.—Aug.-Nov. Sandy places along seashores; Shikoku, Kyushu.—Pantropic.

2. *Ipomoea indica* (Burm.) Merr. *Convolvulus indicus* Burm.; *I. congesta* R. Br.; *Pharbitis congesta* (R. Br.) Hara; *P. insularis* Choisy; *I. insularis* (Choisy) Steud.; *P. indica* Hagiwara, excl. syn.—No-ASAGAO. More or less pilose scandent annual; stems slender, branched; leaves membranous, cordate, 5-10 cm. long, 4-8 cm. wide, entire, abruptly acuminate, long-petiolate; peduncles 2-5 cm. long, shorter than the petioles, 1- to 3-flowered, the pedicels shorter than the calyx, the bracts linear-lanceolate; calyx-segments lanceolate, gradually narrowed to tip, green, about 2 cm. long; corolla blue-purple, 7-8 cm. long, 6-7 cm. across; ovary 3-locular and 6-ovuled; style about half as long as the corolla.—June-Dec. Thickets in lowlands and hills; Honshu (Izu Isls., Kii), Shikoku, Kyushu.—se. Asia and Australia.

3. CALYSTEGIA R. Br. HIRUGAO ZOKU

Creeping or scandent herbs, glabrous or nearly so; leaves alternate, entire or palmately lobed; peduncles axillary, 1-flowered; bracts 2, large, persistent, covering the calyx; flowers rather large, rose, white, or purplish; calyx-segments mostly equal or the inner ones shorter; corolla campanulate or infundibuliform, the limb 5-plicate, entire or 5-angled, sometimes slightly 5-lobed; stamens not exerted, the disc annular; ovary 1-locular or partially 2-locular, 4-ovuled; style filiform, the stigmas 2, flat, ovate or oblong; capsules globose; seeds glabrous; cotyledons broad, often 2-lobed.—Few species, in tropical and temperate regions.

- 1A. Leaves reniform-cordate, shorter than broad, rounded; flowers about 5 cm. across. 1. *C. soldanella*
 1B. Leaves sagittate, acute to obtuse.
 2A. Auricles or lateral lobes of leaves spreading, usually acute; flowers 3-3.5 cm. long; peduncles with narrow flexuous wings on upper part. 2. *C. hederacea*
 2B. Auricles or lateral lobes of leaves spreading to deflexed; flowers 5-6 cm. long; peduncles not winged.
 3A. Main portion of leaves narrowly ovate to oblong, obtuse, mucronate; bracts obtuse to retuse. 3. *C. japonica*
 3B. Main portion of leaves deltoid-ovate, usually acute; bracts obtuse to subacute. 4. *C. sepium*

1. *Calystegia soldanella* (L.) Roem. & Schult. *Convolvulus soldanella* L.—HAMA-HIRUGAO. Glabrous, rhizomatous perennial; stems creeping and branched; leaves long-petiolate, reniform-cordate, 2-3 cm. long, 3-5 cm. wide, retuse to rounded, sometimes undulate on margin; peduncles usually longer than the leaves, terete; bracts broadly ovate or broadly ovate-deltoid, 1-1.3 cm. long, obtuse, mucronate; corolla pale rose, the limb obsoletely 5-angled, 4-5 cm. across.—May-June. Sandy seashores; Hokkaido, Honshu, Shikoku, Kyushu; common.—Seashores of Eurasia and the Pacific Islands.

2. *Calystegia hederacea* Wall. *Convolvulus japonicus* Thunb.; *Calystegia japonica* (Thunb.) Miq. non Choisy; *C. sepium* var. *japonica* (Thunb.) Makino.—KOTO-HIRUGAO. Nearly glabrous twining perennial herb with slender rhizomes; stems slender; leaves long-petiolate, sagittate, the lateral lobes (auricles) spreading or slightly deflexed, usually acute and bilobed, the main (central) lobe lanceolate-deltoid, 4-6 cm. long, 3-6 cm. wide, gradually narrowed to tip, obtuse; flowers solitary, axillary, rose, the bracts deltoid-ovate, acute, rounded at base, 1-2 cm. long, longer than the calyx.—June-Aug. Sunny grassy places and thickets in lowlands and hills; Honshu, Shikoku, Kyushu; common.—se. Asia.

3. *Calystegia japonica* Choisy. *C. sepium* var. *japonica*

Makino, pro parte; *C. subvolvibilis* sensu auct. Japon., non Don.—HIRUGAO. Slightly pubescent twining perennial with slender creeping rhizomes; stems elongate; leaves petiolate, sagittate or hastate, the lateral lobes (auricles) deflexed, small, ovate, obtuse, rarely with a tooth on inner margin, the main lobe broadly lanceolate to narrowly ovate-deltoid, obtuse to subacute, 5-10 cm. long, 2-7 cm. wide, including the lateral lobes; flowers solitary, long-pedunculate, rose, shorter than the leaves, the bracts ovate, slightly cordate, 2-2.5 cm. long.—July-Aug. Thickets and sunny grassy slopes in lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—Korea and China.

4. *Calystegia sepium* (L.) R. Br. var. *americanum* (Sims) Matsuda. *Convolvulus sepium* var. *americanus* Sims; *Calystegia sepium* var. *communis* (Tryon) Hara; *C. sepium* sensu auct. Japon., non R. Br.—HIRO-HA-HIRUGAO. Rhizomes creeping; stems twining; leaves long-petiolate, subhastate, deltoid-ovate to deltoid, 4-8 cm. long, 3-7 cm. wide, with an obtusely angled lateral lobe on each side near base, acute to abruptly acuminate, mucronate, cordate; flowers solitary, long-pedunculate, the bracts ovate, shallowly cordate, 2-3 cm. long; corolla rose-colored.—Hokkaido, Honshu. Temperate regions of the N. Hemisphere.

4. ERYCIBE Roxb. HORUTO-KAZURA ZOKU

Scandent evergreen shrubs; leaves coriaceous; inflorescence cymose, often racemelike or paniclelike, often brown-pubescent; flowers small, yellow; calyx-segments orbicular, nearly equal; corolla campanulate, short-tubular, the lobes 2-fid, induplicate in bud; stamens included, the filaments short, the anthers acuminate; ovary globose, 1-locular, 4-ovuled; stigmas nearly sessile, large, subglobose; berry fleshy, ovoid, 1-seeded; cotyledons often 2-parted.—More than 50 species, in India and se. Asia.

1. *Erycibe henryi* Prain. *E. obtusifolia* sensu auct. Japon., non Benth.; *E. acutifolia* Hayata.—HORUTO-KAZURA. Subscandent evergreen shrub; branches gray-yellow, glabrous; leaves elliptic to oblong, 5-10(-15) cm. long, 3-5(-7) cm. wide, glabrous, coriaceous, penninerved, with rather prominent veinlets beneath, abruptly acute with an obtuse tip, acute at

base, the petioles 1.5-2 cm. long; inflorescence paniculate, many-flowered, axillary, with short gray-yellow hairs, the pedicels nearly as long as the calyx; calyx globose, the segments about 3 mm. long, yellow-villous; corolla about 10 mm. long, 5-lobed, densely yellow-pubescent along the ribs on back.—Kyushu (s. distr.).—Ryukyus, Formosa, and China.

5. CUSCUTA L. NE-NASHI-KAZURA ZOKU

Plants without chlorophyll, parasitic, twining; leaves reduced to scales; flowers in axillary racemes, small, white or rose, sessile or pedicelled, ebracteate; calyx-segments (4-)5, equal, free or connate at base; corolla campanulate, ovoid or globose, the lobes 4-5, short, imbricate in bud; scales on inner side of corolla lobed or laciniate, as many as the lobes and alternate with the stamens; stamens slightly exserted, inserted on the tube or throat, the filaments short-filiform or almost absent; ovary completely or incompletely 2-locular, 4-ovuled; styles 2, often united; capsules globose or ovoid, dry or slightly fleshy, irregularly or transversely dehiscent; seeds glabrous; cotyledons inconspicuous.—More than 100 species, in temperate and warmer regions.

- 1A. Styles connate; capsules ellipsoid-ovoid, circumscissile; valves dry and herbaceous; flowers spicate. 1. *C. japonica*
 1B. Styles free, slender; fruit depressed-globose, irregularly rupturing or circumscissile; valves thinly membranous; flowers mostly fasciculate.
 2A. Stigma oblong, about as thick as the style. 2. *C. europaea*
 2B. Stigma capitate.
 3A. Corolla shorter than the capsule and covering the lower half, with 2-lobed small scales within. 3. *C. australis*
 3B. Corolla much longer than the capsule and completely covering it, with rather prominent laciniate scales. 4. *C. chinensis*

1. *Cuscuta japonica* Choisy. *C. systyla* Maxim.; *C. japonica* var. *thyrsoidea* Engelm.—NE-NASHI-KAZURA. Rather fleshy, glabrous annual; stems terete, much-branched, pale

yellow with red striations and spots; leaves scalelike, deltoid, about 2 mm. long; flowers sessile or very short-pedicelled, many to rather numerous, in short dense axillary spikes, pale

yellow; calyx-segments orbicular to elliptic, rounded at apex, about 1 mm. long, erect; corolla campanulate, rather fleshy, 3.5–4 mm. long, 5-lobed, the lobes oblong; anthers narrowly oblong; capsules ellipsoid-ovoid, about 4 mm. long, enveloped by the persistent corolla at first, naked when ripe, circumscissile; styles connate, about 0.5 mm. long, the stigmas 2, short, oblong; seeds 2.5–3 mm. across.—Aug.–Oct. Lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, China, Korea, Manchuria, and Amur.

2. *Cuscuta europaea* L. *C. major* Gilib.—KUSHIRO-NE-NASHI-KAZURA. Glabrous; scalelike leaves membranous, deltoid; flowers sessile, rather numerous or few, densely fascicled; calyx-segments membranous, elliptic, 1–1.5 mm. long, rounded at apex; corolla membranous, broadly campanulate, about twice as long as the calyx, 5-lobed, the tube broad, the scales inconspicuous, the lobes deltoid, obtuse; capsules membranous, depressed-globose, about 3 mm. across, enveloped by the persistent corolla at first, often naked when ripe, circumscissile; styles slender, the stigma oblong, as thick as the style.—July–Sept. Hokkaido.—Sakhalin, Siberia, Europe, and Africa.

3. *Cuscuta australis* R. Br. *C. milletii* Hook & Arn.; *C. obtusifolia* var. *australis* (R. Br.) Engelm.; *C. sojagena* Makino; *C. hygrophilae* Pears.; *C. hawakamii* Hayata.—MAME-DAOSHI. Very slender glabrous annual; leaves scalelike,

ovate, thinly membranous; flowers few, densely fascicled, sessile; calyx-segments thinly membranous, depressed-deltoid, obtuse, 1/3 to 1/2 as long as the corolla; corolla about 2 mm. long, thinly membranous, the tube with minute bifid scales nearly as long as the broadly ovate, obtuse lobes; stamens as long as the corolla-lobes, the anthers minute, ovate-deltoid; capsules about 3 mm. across, thinly membranous, irregularly dehiscent; styles slender, about 1 mm. long, the stigma punctate; seeds about 0.3 mm. across.—July–Oct. Hokkaido, Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, se. Asia, and Australia.

4. *Cuscuta chinensis* Lam. *Grammica aphylla* Lour.; *C. mariima* Makino.—HAMA-NE-NASHI-KAZURA. Very slender, glabrous; scalelike leaves deltoid-ovate, membranous; flowers few, rather densely fascicled, short-pedicelled; calyx-segments deltoid, about 2 mm. long, united at base; corolla about 2.5 mm. long, 5-lobed to the middle, the lobes ovate, subacute, thinly membranous, the scales of the tube inside lacinate; stamens about half as long as the lobes, the anthers broadly ovate; capsules depressed-globose, about 2 mm. across, about half as long as and enveloped by the corolla; styles slender, about 1 mm. long, the stigma capitate; seeds about 1.5 mm. across.—June–Oct. Honshu (near seashores of centr. and w. distr.), Shikoku, Kyushu.—Ryukyus, Formosa, Korea, China, Malaysia to Australia, and Africa.

Fam. 172. POLEMONIACEAE HANA-SHINOBU KA Polemonium Family

Herbs or rarely shrubs; leaves alternate, sometimes opposite, entire or pinnate; inflorescence in terminal and axillary corymbs or panicles; flowers bisexual, actinomorphic, rarely bilabiate; calyx-segments 5; corolla gamopetalous, the lobes 5, contorted in bud; stamens 5, inserted on the tube and alternate with the lobes, the anthers 2-locular, longitudinally split; ovary superior, inserted on the disc, (2–)3-locular, sessile; ovules 1 or more, on inner angles of the locule; style solitary, the stigmas (2–)3; fruit a loculicidally dehiscent or rarely indehiscent capsule; seeds usually with copious endosperm.—About 12 genera, with about 300 species, chiefly in N. and S. America, few in the temperate regions of the Old World.

1. POLEMONIUM L. HANA-SHINOBU ZOKU

Perennials, sometimes glandular pilose; leaves alternate, pinnatisect; calyx campanulate, often more or less accrescent after anthesis; corolla infundibuliform, broadly campanulate or subrotate, 5-lobed; filaments elongate, declined, hairy at base; ovary ovoid, 3-locular; ovules 2–12 in each locule; capsules ovoid, 3-valved; seeds sometimes narrowly winged, often viscid.—About 20 species, chiefly in N. America, few in Eurasia.

1A. Flowers densely arranged, 11–15 mm. long, short-pedicelled; seeds about 2 mm. long. 1. *P. kiushianum*

1B. Flowers usually loosely arranged, 18–25 mm. long, long-pedicelled; seeds 3–4 mm. long.

2A. Disc 5-lobed; flowers 2–2.5 cm. long; corolla-lobes emarginate. 2. *P. yezoense*

2B. Disc entire, undulate on margin; flowers 18–20 mm. long; corolla-lobes rounded to acute. 3. *P. acutiflorum*

1. *Polemonium kiushianum* Kitam. *P. caeruleum* sensu auct. Japon., saltem pro parte, non L.—HANA-SHINOBU. Rhizomes short-creeping; stems 70–100 cm. long, erect, striate; lower leaves 17–25 cm. long, petiolate, pinnatisect, the leaflets 10 to 12 pairs, broadly lanceolate, sessile, 2–3 cm. long, acuminate; upper leaves gradually smaller, sessile, the segments fewer, glabrous; inflorescence glandular-pilose; flowers short-pedicelled, blue; calyx 5–7 mm. long, the segments as long as to slightly longer than the tube, acuminate; corolla-lobes obtuse, short-pilose on back and margin; capsules globose, 4–5 mm. long; seeds nearly fusiform, angled, nearly wingless.—June–Aug. Mountains; Kyushu.

2. *Polemonium yezoense* (Miyabe & Kudo) Kitam. *P. caeruleum* subsp. *vulgare* var. *yezoense* Miyabe & Kudo.—EZO-NO-HANA-SHINOBU. Stems 35–80 cm. long, obsoletely ribbed; lower leaves 12–16 cm. long, petiolate, pinnatisect, the

leaflets 9 to 12 pairs, lanceolate, sessile, acuminate to acute, glabrous; upper leaves gradually smaller and sessile, with fewer segments; inflorescence a loose corymb, glandular-pilose; flowers rather long-pedicelled, 22–25 mm. long; calyx deeply 5-lobed, 10–12 mm. long, the lobes narrowly lanceolate, acute; corolla blue, the lobes elliptic, emarginate, loosely ciliate.—May–Aug. Hokkaido.

3. *Polemonium acutiflorum* Willd., var. *nipponicum* (Kitam.) Ohwi. *P. caeruleum* sensu auct. Japon., non L.; *P. nipponicum* Kitam.—MIYAMA-HANA-SHINOBU. Stems 40–80 cm. long, ridged; lower leaves petiolate, 10–12 cm. long, pinnatisect, the leaflets 8 to 9 pairs, broadly lanceolate, 2–2.5 cm. long, gradually acute; upper leaves gradually smaller and sessile, with fewer leaflets; inflorescence loosely corymbose, glandular-pilose; flowers rather long-pedicelled, about 2 cm. long, blue; calyx 10–12 mm. long, deeply 5-lobed, the lobes

lanceolate, acute; corolla-lobes subacute or obtuse, sparingly ciliate; capsules globose, about 5.5 mm. long; seeds 3-4 mm. long.—July–Aug. Alpine slopes; Honshu (centr. distr.); rare.

Var. *laxiflorum* (Regel) Ohwi. *P. caeruleum* var. *vulgare* lus. *laxiflorum* Regel; *P. caeruleum* subsp. *vulgare* var. *laxi-*

florum (Regel) Miyabe & Kudo; *P. caeruleum* subsp. *vulgare* var. *racemosum* Miyabe & Kudo; *P. laxiflorum* (Regel) Kitam. —KARAFUTO-HANA-SHINOBU. Calyx 7.5–9.5 mm. long, rather deeply 5-lobed, the lobes subobtusely to acute.—June–July. Hokkaido.—The typical phase occurs in Sakhalin, Kuriles, and the cold regions of the N. Hemisphere.

Fam. 173. BORAGINACEAE MURASAKI KA Borage Family

Usually strigose-hirsute herbs, shrubs, or trees; leaves alternate, very rarely opposite, simple, exstipulate; flowers in scorpioid cymes, actinomorphic, rarely oblique, usually bisexual; calyx-segments imbricate or rarely valvate in bud; corolla-lobes contorted or imbricate in bud; stamens inserted on the corolla-tube, as many as the lobes and alternate with them; anthers 2-locular, longitudinally split; disc sometimes absent; ovary superior, 2-locular, becoming falsely 4-locular at maturity; style terminal or gynobasic; ovules 4, 2 in each locule, erect or spreading; fruit a drupe or composed of 4 nutlets; seeds with or without endosperm. —About 90 genera, with about 1,500 species, nearly cosmopolitan.

- 1A. Fruit a drupe, undivided, with 1-4 nutlets; style terminal.
 - 2A. Trees or large shrubs; style without annulus near apex. 1. *Ehretia*
 - 2B. Herbs or shrubs; style with an annulus below the bifid stigma. 2. *Messerschmidia*
- 1B. Fruit of 4 nutlets; style gynobasic.
 - 3A. Nutlets attached near apex.
 - 4A. Nutlets flat or gently convex on back. 3. *Cynoglossum*
 - 4B. Nutlets excavated on back. 4. *Omphalodes*
 - 3B. Nutlets attached near center or base.
 - 5A. Nutlets prickly or spinulose.
 - 6A. Perennials; inflorescence bractless or bracteate at base; nutlets with a small attachment at the gynobase, sometimes without prickles; rosulate radical leaves present in anthesis. 5. *Eritrichium*
 - 6B. Annuals or biennials; inflorescence bractless; rosulate radical leaves not present in anthesis.
 - 7A. Pedicels and mature calyx erect or ascending; nutlets as long as the gynobase, attached nearly the whole length along the keeled ventral side. 6. *Lappula*
 - 7B. Pedicels and mature calyx reflexed; nutlets twice as long as the gynobase, attached on the upper half of ventral face. 7. *Hackelia*
 - 5B. Nutlets neither prickly nor spinulose, smooth, wrinkled or short-tubercled.
 - 8A. Nutlets short-tubercled, attached on ventral side to the convex gynobase, the attachment with a ringlike raised margin. 8. *Bothriospermum*
 - 8B. Nutlets smooth or wrinkled, attached at the base to the flat gynobase.
 - 9A. Corolla-lobes imbricate in bud.
 - 10A. Corolla infundibuliform-campanulate or tubular-campanulate, the tube prominent.
 - 11A. Nutlets bony and lustrous, not compressed.
 - 12A. Nutlets ovoid, not hooked at apex.
 - 13A. Corolla-throat decorated inside with 5 well-developed vertical lines of hairs. 9. *Buglossoides*
 - 13B. Corolla-throat lacking very well developed vertical lines of hairs. 10. *Lithospermum*
 - 12B. Nutlets elongate and hooked at apex. 11. *Ancistrocarya*
 - 11B. Nutlets sometimes fleshy, usually flattened dorsally. 12. *Mertensia*
 - 10B. Corolla rotate, 5-scaled on the throat; nutlets tetrahedral or slightly flattened dorsally. 13. *Trigonotis*
 - 9B. Corolla-lobes contorted in bud; nutlets slightly flattened. 14. *Myosotis*

1. EHRETIA L. CHISHA-NO-KI ZOKU

Smooth or scabrous shrubs or trees; leaves alternate, entire or toothed; flowers small, usually white, in cymes, corymbs or panicles; calyx small, 5-parted, the segments linear or broader, imbricate or not overlapping in bud; corolla rotate or tubular, the lobes 5, imbricate in bud, spreading; stamens 5, inserted on the tube, the anthers usually exserted; ovary 2-locular, with an imperfect septum in each locule or 4-locular; style solitary, terminal, the stigma bifid; drupe small, 2- or 4-stoned.—About 50 species, chiefly in the warmer regions of the Old World.

- 1A. Young branches and upper side of leaves scabrous; leaves 5-12 cm. wide; inflorescence corymbose-paniculate, rather flat-topped; corolla 8-10 mm. long; fruit 1-1.5 cm. across. 1. *E. dicksonii* var. *japonica*
- 1B. Young branches and leaves glabrous; leaves 3-7 cm. wide; inflorescence paniculate, pyramidal; corolla 4-5 mm. long; fruit 4-5 mm. across. 2. *E. ovalifolia*

1. *Ehretia dicksonii* Hance var. *japonica* Nakai. *E. macrophylla* sensu auct. Japon., non Wall.; *E. dicksonii* var. *liukiuensis* Nakai; *E. dicksonii* var. *velutina* Nakai.—MARUBA-CHISHA-NO-KI. Deciduous tree with rather thick scabrous branches while young; leaves broadly elliptic to broadly obovate, 5-17 cm. long, 5-12 cm. wide, sometimes nearly orbicular,

prominently scabrous and appressed-strigose on upper side, densely short-hairy beneath, irregularly deltoid-serrate, the petioles 3-4 mm. long; panicles terminal, short-pilose, nearly flat-topped; calyx about 4 mm. long, deeply 5-fid, the lobes broadly lanceolate or narrowly oblong, obtuse to subacute, short-pilose; corolla 8-10 mm. long, white; fruit globose, 1-1.5

cm. across, yellow when mature.—May–June. Warmer parts; Honshu (Awa Prov. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

2. *Ehretia ovalifolia* Hassk. *E. serrata* var. *obovata* Lindl.; *E. acuminata* var. *obovata* (Lindl.) Johnston; *Cordia thyrsoiflora* Sieb. & Zucc.; *E. thyrsoiflora* (Sieb. & Zucc.) Nakai; *E. acuminata* sensu auct. Japon., non R. Br.—CHISHA-NO-KI. Smooth, nearly glabrous deciduous tree with rather slender branches; leaves obovate to obovate-oblong, 5–12 (–18) cm.

long, 3–7 (–10) cm. wide, abruptly acute, with short appressed teeth, the petioles 1.5–2.5 cm. long; inflorescence a large densely many-flowered pyramidal panicle, glabrous to slightly short-pilose; calyx about 2 mm. long, deeply 5-lobed, the lobes broadly elliptic, rounded at apex, rarely ciliate; corolla small, 4–5 mm. long, white; fruit 4–5 mm. across.—June. Honshu (Chūgoku Distr.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and Korea (Quelpaert Isl.).

2. MESSERSCHMIDIA L. SUNABIKI-SŌ ZOKU

Herbs or shrubs; leaves alternate, entire; flowers small, usually in branched terminal cymes; calyx 5-parted; corolla-tube cylindric, unappended in the throat, the lobes 5, induplicate in bud; stamens 5, included and inserted on the dilated portion of the corolla-tube; ovary 4-locular, undivided; style terminal, simple, with an annulus below the stigma; stigma usually bifid; ovules pendulous; fruit a drupe, the exocarp corky, stones 4, free.—Three species, in Europe, Asia, Australia, and S. America.

- 1A. Rhizomatous perennial herb; inflorescence corymbose; flowers pedicelled; fruit hairy, 5–7 mm. wide; leaves 7–30 mm. wide, appressed grayish strigose on both sides. 1. *M. sibirica*
- 1B. Large shrub 1–5 m. high; inflorescence branches scorpioid; flowers sessile; fruit glabrous, about 4 mm. across; leaves 3–6 cm. wide, densely whitish silky on both surfaces. 2. *M. argentea*

1. *Messerschmidia sibirica* L. *Tournefortia sibirica* L.; *M. arguzia* L.; *Heliotropium japonicum* A. Gray; *M. sibirica* var. *latifolia* (DC.) Hara; *Tournefortia arguzia* var. *latifolia* DC.—SUNABIKI-SŌ. Perennial herb, long appressed-strigose, with creeping rhizomes; stems 30–50 cm. long, rather fleshy, sometimes branched; leaves oblanceolate or oblong-lanceolate, 4–10 cm. long, 7–30 mm. wide, obtuse, sessile; inflorescence corymbose, few-flowered, terminal or often appearing lateral, pedunculate; flowers white, short-pedicellate; calyx-segments lanceolate, 3–5 mm. long; corolla-tube slender, 6–7 mm. long, longer than the limb, densely appressed-pubescent, the limb shallowly 5-lobed, with a yellow center; fruit broadly ellipsoidal, 8–10 mm. long, 5–7 mm. wide, obtusely 4-angled, pubescent, depressed at apex, with a short style.—May–Aug. Sand-dunes along the sea; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea, s. Siberia, and w. Europe.

2. *Messerschmidia argentea* (L. f.) Johnston. *Tournefortia argentea* L. f.—MONPA-NO-KI, HAMA-MURASAKI-NO-KI. Densely leafy shrub, 1–5 m. high, with thick, terete branches; leaves fleshy, narrowly obovate to obovate-spathulate, 10–20 cm. long, 3–6 (–9) cm. wide, rounded to obtuse or retuse, appressed whitish silky-hairy, the lateral nerves strongly arcuate, ascending; inflorescence terminal, rather large, pedunculate, branched in upper part, silvery gray hairy, the branches scorpioid, many flowered; flowers small, white, sessile; calyx-segments as long as the corolla-tube; corolla-tube 1.5–2 mm. long, the limb about 4 mm. across, deeply 5-lobed, the lobes elliptic, slightly appressed-pilose on back near base; anthers semi-exserted; fruit globose, about 4 mm. across, glabrous.—Aug.–Nov. Seashores; Kyushu (Tanegashima); very rare.—Ryukyus, Formosa, se. Asia to Australia, and Madagascar.

3. CYNOGLOSSUM L. ŌRURI-SŌ ZOKU

Usually tall biennial or perennial herbs, coarsely gray-white strigose; radical leaves often long-petiolate; racemes usually elongate, sometimes in a loose panicle, secund, bractless or rarely bracteate, often dichotomously forked; flowers pedicelled or nearly sessile, blue to white; calyx 5-parted; corolla small, the tube short, with obtuse or reniform appendages on throat, the lobes 5, imbricate in bud; stamens not exserted; ovules horizontal; nutlets 4, prickly, depressed, apically attached to the gynobase, flat, gently convex on back.—About 70 species, in temperate regions and mountains of the subtropics.

- 1A. Lower part of stems with coarse spreading hairs about 2 mm. long; leaves coarsely hispid; racemes rather loosely flowered, the branches ascending; nutlets about 3 mm. long excluding the prickles. 1. *C. asperillum*
- 1B. Stems with hairs less than 1 mm. long; leaves with short coarse or appressed hairs; racemes rather densely flowered, the branches obliquely spreading; nutlets 2–2.5 mm. long excluding the prickles. 2. *C. lanceolatum*
- 2A. Leaves 4–7 cm. long, relatively thick; hairs on leaves and stems longer. 2. *C. lanceolatum*
- 2B. Leaves 10–15 cm. long, relatively thin; hairs shorter. 3. *C. zeylanicum*

1. *Cynoglossum asperillum* Nakai. *Paracynoglossum asperillum* (Nakai) Popov; *C. furcatum* sensu auct. Japon., non Wall.—ŌNIRURI-SŌ. Coarsely strigose biennial; stems 40–80 cm. long, much branched in upper part, rather stout, hairs of lower half spreading, about 2 mm. long; lower leaves petiolate, the median ones sessile, oblong-lanceolate, 10–20 cm. long, 2–3 cm. wide, acuminate at both ends, coarsely strigose on upper side and on nerves beneath; leaves on branches 3–10 cm. long, 7–20 mm. wide; racemes 15–20 cm. long, loosely flowered; flowers pale blue, about 3 mm. across; calyx-segments reflexed in fruit.—June–Aug. Riverbanks and valleys, some-

times in clearings in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—s. Kuriles and Korea.

Var. *tosaense* (Nakai) Hara. *C. tosaense* Nakai—TOSA-RURI-SŌ. Leaves less densely hairy on upper side.—Occurs with the typical phase.

Var. *yesoense* Nakai. EZO-RURI-SŌ. Inflorescence more prominently hairy.—Occurs with the typical phase.

2. *Cynoglossum lanceolatum* Forsk. *C. formosanum* Nakai; *C. micranthum* sensu auct. Japon., non Desf.—TAIWAN-RURI-SŌ, SHIMA-RURI-SŌ. Biennial, scabrous, densely short grayish strigose, the hairs retrorse on lower part of stems,

spreading on the lower leaves beneath to ascending or upwardly appressed; stems 30–50 cm. long, branched in upper part; lower leaves petiolate, the median sessile or short-petiolate, narrowly oblong to oblong-lanceolate, 4–7 cm. long, 1–2 cm. wide, acute, acuminate at base, upper leaves 1.5–3 cm. long; racemes densely flowered, 10–20 cm. long; flowers about 3 mm. across, white or bluish; calyx-segments obliquely spreading in fruit.—July–Aug. Kyushu.—Ryukyus, Formosa, and widely spread in all warmer regions.

3. *Cynoglossum zeylanicum* (Vahl) Thunb. *C. furcatum* sensu auct. Japon., non Wall.; *Anchusa zeylanica* Vahl.—USUBA-RURI-SŌ. Biennial; hairs on lower part of stems and leaves beneath retrorse, otherwise the hairs short and

upwardly appressed; stems 40–70 cm. long, branched; lower leaves long-petiolate, the median ones sessile or short-petiolate, narrowly oblong or broadly lanceolate, 10–15 cm. long, 2–4 cm. wide, acute to acuminate, gradually narrowed at base, rather densely appressed-pilose above, sparsely long-pubescent beneath especially on nerves, the upper leaves sessile, 3–10 cm. long, obtuse at base; racemes 10–20 cm. long, rather densely flowered; flowers bluish, sometimes white, about 4 mm. across, the pedicels short; calyx-segments spreading in fruit. July–Aug. Kyushu.—s. Korea, Ryukyus, Formosa, and s. Asia.

Var. *villosulum* (Nakai) Ohwi. *C. villosulum* Nakai—Ō-RURI-SŌ. Hairs obliquely spreading to retrorse.—Honshu and (?) Shikoku.

4. OMPHALODES Moench RURI-SŌ ZOKU

Annuals or perennials, glabrous or hirsute; radical leaves petiolate or narrowed to a petiolelike base; cauline leaves few, alternate; inflorescence a simple or forked raceme sometimes bracteate at base, loosely flowered; flowers white or blue, pedicelled; calyx 5-parted or lobed, slightly accrescent in fruit; corolla rotate, gibbous or scaly on the throat, the lobes 5, imbricate in bud; stamens included; nutlets 4, depressed, excavated on back, attached to a flat or convex gynobase with a broad attachment on upper portion of ventral face, the dorsal margin extended to form a smooth ringlike or glochidiate crown; seeds nearly horizontal.—About 20 species, in Europe, N. Africa, and Asia.

1A. Stems 1(–3), erect; inflorescence usually leafless, dichotomously forked. 1. *O. krameri*
1B. Stems few, ascending from a short-decumbent base; inflorescence with few leaflike bracts at base, simple, not forked.

2A. Leaves with long and short hairs; rhizomes rather stout, short. 2. *O. japonica*
2B. Leaves with long hairs of one sort; rhizomes slender and proliferating from the axil of the lowest bract. 3. *O. prolifera*

1. *Omphalodes krameri* Fr. & Sav. RURI-SŌ. Perennial with coarse spreading white hairs; rhizomes short, rather thick; stems solitary or few, erect, simple, 25–40 cm. long; leaves broadly oblanceolate, 7–15 cm. long, 1.5–3.5 cm. wide, acute, the radical leaves long-petiolate, the cauline sessile or narrowed to a short petiolelike base; inflorescence pedunculate, dichotomously forked, usually leafless, loosely flowered, erect; flowers blue, 1–1.5 cm. across, the pedicels 1–1.5 cm. long; calyx-segments accrescent after anthesis, narrowly ovate, 5–8 mm. long; nutlets orbicular, about 3.5 mm. across, slightly depressed, excavated on the dorsal face, glochidiate on the margin of the erect crown.—Apr.–June. Woods in mountains; Hokkaido, Honshu.—Forma *alba* (T. Ito) Hara. *Omphalodes krameri* var. *alba* T. Ito.—SHIROBANA-RURI-SŌ. Flowers white.

Var. *laevisperma* (Nakai) Ohwi. *O. laevisperma* Nakai—ECHIGO-RURI-SŌ. Nutlets smooth, not spiny.—Honshu (Echigo Prov.).

2. *Omphalodes japonica* (Thunb.) Maxim. *Cynoglossum japonicum* Maxim.—YAMA-RURI-SŌ. Coarsely spreading-hirsute perennial with short, stout rhizomes; stems scapiform, few, ascending from a decumbent base, 12–20 cm. long, sometimes branched near the base; radical leaves oblanceolate or broadly so, 7–15 cm. long, 1–2.5 cm. wide, acute, gradually narrowed to a petiolelike base, with short and long hairs on

both sides, the cauline leaves few, smaller, sessile, 1–6 cm. long, becoming bracteate in the uppermost; racemes simple, not branched, loosely several-flowered, with few bracts at base, the pedicels deflexed after anthesis, 8–15 mm. long; calyx-segments narrowly ovate, accrescent after anthesis, 5–8 mm. long; corolla about 1 cm. across, blue; nutlets smooth, about 3 mm. long.—Apr.–May. Woods in mountains; Honshu (Iwashiro Prov. and southw.), Shikoku, Kyushu.—Forma *albiflora* S. Okamoto. SHIROBANA-YAMA-RURI-SŌ. Flowers white.

Var. *echinosperma* Kitam. TOGE-YAMA-RURI-SŌ. Nutlets short-glochidiate on margin of the crown.—Shikoku; rare.

3. *Omphalodes prolifera* Ohwi. HAI-RURI-SŌ. FIG. 14. Perennial herb uniformly hirsute with long spreading hairs; rhizomes slender; radical leaves 4 or 5, oblanceolate, 12–25 cm. long, 2.5–4 cm. wide, abruptly acuminate, gradually attenuate at base; scapes 1 to 3, decumbent after anthesis; cauline leaves 2 or 3, remote, sessile, oblong-lanceolate, the upper rounded at base, 4–8 cm. long; racemes terminal, simple, loosely 4- to 8-flowered, the bracts 1 to 3, similar to the cauline leaves, the lowest bract always proliferous in the axil in fruit; corolla rose-colored, the limb nearly 1 cm. across, 5-parted, the lobes orbicular; nutlets smooth, about 2 mm. long.—May. Honshu (Owari Prov.); rare.

5. ERITRICHIMUM Schrad. MIYAMA-MURASAKI ZOKU

Tufted hispid or silky perennials; leaves alternate, usually narrow; racemes simple or branched, bractless or rarely bracteate at base, the flowers very rarely axillary; calyx deeply 5-fid, the segments accrescent after anthesis; corolla blue or white, small, the tube short, the throat usually 5-scaled, the lobes 5, imbricate in bud, spreading, obtuse; stamens 5, inserted on the tube, included, the filaments short, the anthers obtuse; gynobase convex to columnar; nutlets usually 4, erect, areolate on the inner face, smooth, rugose, or tubercled, rarely glochidiate on the margin; seeds straight, rarely curved.—About 10 species, in Eurasia.

Kadynwo Inami. del.

FIG. 14.—*Omphalodes prolifera* Ohwi. 1, Habit; 2, plant in fruit; 3, flower; 4, the same, side view; 5, calyx; 6, the same, expanded with the pistil showing; 7, corolla cut open; 8, stamen and appendage on throat of corolla; 9, fruit; 10, fruitlet.

1. *Eritrichium nipponicum* Makino. *Hackelia nipponica* (Makino) Brand; *E. yessoense* Nakai—MIYAMA-MURASAKI. Dwarf grayish strigose perennial with a thick pendicular caudex; stems 10–20 cm. long, tufted, ascending from a decumbent base; radical leaves rosulate, closely imbricate, rather many, linear-lanceolate, 3–6 cm. long, 4–6 mm. wide, obtuse or subacute, sessile; cauline leaves about 10, lanceolate, 1.2–5 (–3.5) cm. long, 3–5 mm. wide; racemes few,

terminal, several-flowered, bracteate in the lower flowers, the bracts broadly linear, 3–7 mm. long, the pedicels erect, 7–12 mm. long; calyx-segments narrowly oblong; corolla blue, about 8 mm. across, the tube shorter than the calyx; nutlets ascending, about 1.5 mm. long, puberulent on the back, with a series of marginal glochidiate bristles.—July–Aug. Gravelly or sandy alpine slopes; Hokkaido, Honshu (centr. distr.); rare. —Sakhalin.

6. LAPPULA Moench NO-MURASAKI ZOKU

Coarsely hirsute annuals or biennials; leaves alternate, narrow; inflorescence a bracteate raceme; flowers small, blue or white, on short erect pedicels; calyx-segments 5, erect; corolla short tubular, 5-angled on the throat; gynobase long and narrow; nutlets tetrahedral or flattened, with a narrow areole occupying nearly the whole length of the prominently keeled ventral face, usually glochidiate on the margin; style usually longer than the nutlets.—About 15 species, in temperate regions.

1. *Lappula echinata* Gilib. *Myosotis lappula* L.; *Echinosperrmum lappula* (L.) Lehm.—NO-MURASAKI. Coarsely hirsute annual; stems erect, 20–30 (–50) cm. long; leaves oblanceolate to broadly linear, 3–5 cm. long, 3–5 mm. wide; racemes few or more than 10, suberect, about 10 cm. long, loosely

flowered, the pedicels 2–3 mm. long, shorter than the bracts, erect; flowers about 3 mm. across, pale blue; nutlets tetrahedral, with callose bumps or tubercles on back, glochidiate on margin.—July. Naturalized in our area.—Europe to Manchuria, n. China and Korea, naturalized in N. America.

7. HACKELIA Opiz OKA-MURASAKI ZOKU

Annuals, biennials, or perennials, grayish pilose or subglabrous; stems often tall and much branched; leaves alternate, narrow; flowers small, pedicelled, bracteate or bractless, the pedicels reflexed after anthesis; calyx deeply 5-fid, the segments ovate or narrowly so; corolla-tube short, with 5 scales on the throat, the lobes 5, imbricate in bud, spreading; stamens 5, inserted on the tube, included, the filaments very short, the anthers obtuse; gynobase broadly conical; nutlets erect with a large ovate or deltoid areole near the center of the ventral side, keeled only on the upper half of the ventral side, glochidiate on the margin; style not exceeding the nutlets.—About 40 species, in temperate regions of Eurasia and N. America.

- 1A. Calyx-segments 1–3 mm. long, reflexed after anthesis; nutlets only glochidiate. 1. *H. deflexa*
 1B. Calyx-segments 1.3–1.5 mm. long, spreading; nutlets glochidiate and tuberculate. 2. *H. matsudairae*

1. *Hackelia deflexa* (Wahlenb.) Opiz. *Myosotis deflexa* Wahlenb.; *Echinosperrmum deflexum* (Wahlenb.) Lehm.; *Lappula deflexa* (Wahlenb.) Garcke—OKA-MURASAKI. Annual or biennial; stems 20–60 cm. long, much branched; leaves linear-lanceolate, 2.5 (–9) cm. long, 3–10 (–20) mm. wide, obtuse or acute, petiolate only in the lower ones, loosely pilose on both surfaces; racemes 10–15 cm. long, the pedicels bracteate, 2–5 mm. long, as long as the bracts, deflexed after anthesis; calyx-segments lanceolate, 1–3 mm. long, reflexed after anthesis; corolla 3 (–5) mm. across, pale blue to white, yellow on the throat; nutlets tetrahedral, smooth, glochidiate.—June–Aug. Reported to be spontaneous in Hokkaido (Ishikari Prov.).—Sakhalin and Korea to Europe; naturalized in N. America.

2. *Hackelia matsudairae* (Makino) Ohwi. *Echi-*

nosperrmum matsudairae Makino; *Lappula matsudairae* (Makino) Druce—IWA-MURASAKI. About 70 cm. high, slender, erect, branched and appressed-hairy in upper part, with spreading hairs at base; leaves linear to oblong, coarsely hirsute, the lower ones petiolate; racemes 3–10 cm. long, bracteate, loosely flowered, appressed-hirsute, the pedicels 4–5 mm. long, spreading or deflexed, as long as or in the upper ones shorter than the lanceolate bract; calyx-segments spreading, oblong, 1.3–1.5 mm. long, spreading, shorter than the nutlets; corolla small; nutlets about 2 mm. long, ovate-deltoid on back, with small callose tubercles, glochidiate; style short.—July–Aug. Reported from Honshu (Mount Togakushi in Shinano); very rare.

8. BOTHRIOSPERMUM Bunge HANA-IBANA ZOKU

Decumbent to erect, rather small, hirsute or strigose annuals or biennials; leaves alternate, lanceolate to ovate; flowers small, bluish or white, axillary or in loose bracteate racemes; calyx deeply 5-fid, the lobes lanceolate, slightly accrescent after anthesis; corolla-tube short, 5-angled on the throat, the lobes 5, imbricate, spreading; stamens 5, inserted on the tube, the anthers obtuse; gynobase short, oblong; nutlets erect, rounded on back, granular-tuberculate, with an ovate or oblong subdepressed areole with entire or dentate margin on the ventral side.—Few species in Asia.

1. *Bothriospermum tenellum* (Hornem.) Fisch. & Mey. *Anchusa tenella* Hornem.; *Cynoglossum diffusum* Roxb.; *B. asperugoides* Sieb. & Zucc.; *B. tenellum* var. *asperugoides* (Sieb. & Zucc.) Maxim.; *B. perenne* Miq.—HANA-IBANA. Short-strigose, ascending to decumbent annual or biennial; stems 5–30 cm. long, tufted; leaves oblong or elliptic, 2–3 cm. long, 1–2 cm. wide, rounded and mucronate or obtuse, petiolate; bracteal leaves 5–15 (–25) mm. long; pedicels supra-axillary,

much shorter than the bracteal leaves and deflexed after anthesis; flowers pale blue, 2–3 mm. across; nutlets ellipsoidal, about 1.5 mm. long, about 1 mm. across, densely callose-tuberculate, the areole smooth-margined.—Mar.–Dec. Sunny places in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, China, Korea, Manchuria, and se. Asia.

9. BUGLOSSOIDES Moench INU-MURASAKI ZOKU

Annuals or perennials; leaves alternate; racemes one-sided, simple to twice or thrice branched, usually elongate, prominently bracteate; calyx 5-fid, the lobes narrow; corolla blue or white, infundibuliform or salverform, sometimes incurved, plaited, usually appressed-hairy outside, with 5 longitudinal lines of hairs inside, the lobes spreading to ascending, imbricate in bud; stamens included; gynobase flat or depressed-pyramidal; nutlets 1-4, erect to strongly divergent, smooth or rough, rounded or angulate, the attachment basal or oblique.—About 10 species, in Europe, n. Africa, and Asia.

- 1A. Flowers 15-18 mm. across, blue or rarely white; nutlets smooth; leaves oblong, 1-2 cm. wide; perennial with innovation shoots at base. 1. *B. zollingeri*
 1B. Flowers 4-5 mm. across, white; nutlets rugose; leaves lanceolate to broadly linear, 1-3(-7) mm. wide; biennial without innovation shoots at base. 2. *B. arvensis*

1. *Buglossoides zollingeri* (DC.) Johnston. *Lithospermum zollingeri* DC.; *L. japonicum* A. Gray; *L. confertiflorum* Miq.; *Plagiobotrys zollingeri* (DC.) Johnston—HOTARU-KAZURA. Perennial; stems slender, erect, with elongate innovation shoots at the base; leaves oblong to narrowly so, rarely broadly oblanceolate, 2.5-6 cm. long, 1-2 cm. wide, acute, sessile, with callose-based strigose hairs on upper surface, the midrib distinct; flowers in upper axils, 15-18 mm. across; calyx-segments linear-lanceolate, acuminate; corolla blue or rarely white; nutlets smooth, white, 2.5-3 mm. long.—Apr.-May. Sunny grassy slopes; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, China, and Formosa.

2. *Buglossoides arvensis* (L.) Johnston. *Lithospermum arvense* L.—INU-MURASAKI. Rather grayish appressed-strigose biennial; stems erect, 20-40 cm. long, nearly simple or branched; leaves cauline, rather thick, narrowly lanceolate to broadly linear, 1-3 cm. long, 1-3(-7) mm. wide, obtuse, ascending, 1-nerved, the margin often slightly recurved; flowers white, 4-5 mm. across, 6-7 mm. long; nutlets gray, ovoid, obtuse, rugose.—Apr.-June. Sunny grassy places in lowlands and low mountains; Honshu, Shikoku, Kyushu.—The temperate regions of Europe and Asia.

10. LITHOSPERMUM L. MURASAKI ZOKU

Usually perennials from a strong, frequently dye-stained taproot; stems simple or somewhat branched, hispid, villous, or strigose, erect, or spreading; leaves cauline, usually many; racemes scorpioid, simple or paired, few to many-flowered, the bracts usually many; calyx 5-fid, the lobes linear-cuneate to lanceolate; corolla yellow, orange, or white, or rarely bluish, salverform, infundibuliform, or tubular, the lobes imbricate in bud, often with 5 appendages on the throat; gynobase flat to broadly pyramidal; nutlets erect, usually ovoid or ellipsoidal, convex on back, smooth or rarely rugose, the areole large, basal, flat, convex, or excavated.—About 44 species, in Eurasia, Asia, and America.

1. *Lithospermum erythrorhizon* Sieb. & Zucc. *L. murasaki* Sieb., nom. seminud.; *L. officinale* sensu auct. Japon., non L.; *L. officinale* var. *japonica* Miq.; *L. officinale* var. *erythrorhizon* (Sieb. & Zucc.) Maxim.—MURASAKI. Erect perennial with coarse hirsute stems; roots thick, purple-stained when dried; stems few, erect, 40-70 cm. long, many-leaved; leaves ascending, lanceolate to oblong-lanceolate, gradually narrowed to an obtuse tip, sessile, with few parallel nerves;

inflorescence spikelike, with leaflike bracts; calyx-segments broadly linear, obtuse, longer than the corolla-tube; corolla white, 6-7 mm. long, about 4 mm. across, with shallow transverse appendages on the throat; nutlets gray-white, shining, smooth, about 3 mm. long, ovoid.—June-July. Grassy slopes in mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, China, and Amur.

11. ANCISTROCARYA Maxim. SAWA-RURI-SŌ ZOKU

Tall perennial herb with short erect strigose hairs; leaves alternate, oblong, fasciculate near the middle; racemes several or in pairs, loosely flowered, bractless or bracteate only in lower part; calyx deeply 5-fid, the lobes linear; corolla with a rather short tube, ascending-puberulent, scaleless on the throat, the lobes 5, imbricate in bud, spreading; stamens 5, included, the anthers obtuse; style filiform, the stigma capitate; nutlets 1-2, bony, lustrous, subulate, with a hooked beak, the gynobase pyramidal, with a large, basal flabelliform areole.—One species, in Japan.

1. *Ancistrocarya japonica* Maxim. SAWA-RURI-SŌ. Rhizomes short; stems 50-80 cm. long, short appressed-strigose, with about 10 leaves near the middle; leaves chartaceous, oblong to obovate-oblong, 10-20 cm. long, 3-7 cm. wide, short-acuminate, gradually narrowed to the base, sessile, deep green and scabrous above with spotted callosities, pale green and appressed-puberulent beneath, lateral nerves 3-5 pairs, fused to the upper ones at tip; racemes 6-12 cm. long, short appressed-strigose, the bracts linear, absent or present only in a few lower

flowers; flowers erect, blue-purple, on very short pedicels; calyx-segments linear-lanceolate to linear; corolla 10-13 mm. long, tubular-campanulate, the lobes semirounded; nutlets gray-white, gradually narrowed from the rounded broad base to a subulate hooked beak, 8-10 mm. long.—May-June. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Forma *albiflora* (Honda, pro var.) Hara. SHIROBANA-SAWA-RURI-SŌ. Flowers white.

12. MERTENSIA Roth HAMA-BENKEI-SŌ ZOKU

Smooth or strigose, sometimes rather fleshy perennials; leaves alternate, often spotted; racemes terminal, sometimes loosely flowered and cymelike or in a compound panicle; flowers blue to purplish, rarely white, pedicelled, bractless or bracteate only in the lower ones; calyx 5-lobed, corolla infundibuliform, with a broad, naked, plaited, or scaled throat, the limb shallowly 5-lobed; stamens slightly exserted; gynobase convex or pyramidal; nutlets 4, erect, sometimes fleshy, smooth or rugose, keeled on the ventral face, sometimes with a winged margin, the areole elliptic and slightly excavated on inner angle of ventral face.—About 20 species, in cooler regions of the N. Hemisphere.

- 1A. Seashore species; stems procumbent; inflorescence glabrous; nutlets fleshy, not wing-margined. 1. *M. asiatica*
 1B. Alpine species; stems erect; inflorescence short appressed-strigose; nutlets not fleshy, broadly wing-margined.

2. *M. pterocarpa* var. *yezoensis*

1. *Mertensia asiatica* (Takeda) Macbr. *M. maritima* subsp. *asiatica* Takeda; *M. maritima* sensu auct. Japon., non S. F. Gray—HAMA-BENKEI-SŌ. Stems tufted, fleshy, procumbent, to 1 m. long, many-leaved; radical and lower leaves long-petiolate, oblong, elliptic, obovate to broadly so, 3–8 cm. long, 2–6 cm. wide, slightly fleshy, glabrous on both sides or loosely short callose-based hairy, without distinct nerves, the upper leaves subsessile; inflorescence glabrous; flowers pedicelled, bracteate, blue, 8–12 mm. long; calyx-segments glabrous, acute, as long as the corolla-tube; nutlets fleshy.—Sandy seashores; Hokkaido, Honshu (n. distr.).—Sakhalin, Kuriles, Korea, and Aleutians.

2. *Mertensia pterocarpa* (Turcz.) Tatew. & Ohwi var.

yezoensis Tatew. & Ohwi. *M. rivularis* var. *japonica* Takeda, pro parte; *M. yezoensis* Tatew. & Ohwi, in syn.—Ezo-RURI-SŌ. Rhizomatous perennial; stems erect, 20–40 cm. long, simple or short-branched in upper part; radical leaves ovate-cordate, long-petiolate, the cauline leaves ovate, 3–5 cm. long, 2–3 cm. wide, shortly acuminate, abruptly narrowed to rounded and sessile or subpetiolate at base, 7- to 9-nerved, with appressed callose-based hairs above, glabrescent beneath; inflorescence pedunculate, short appressed-strigose; flowers 10–12 mm. long, blue; calyx lanceolate, pilose, acute, slightly shorter than the corolla-tube; nutlets flat, broadly wing-margined.—Aug. Alpine; Hokkaido; rare. The typical phase occurs in the s. Kuriles.

13. TRIGONOTIS Stev. TABIRAKO ZOKU

Annuals, biennials, or often slender or sometimes delicate perennials, pilose to nearly glabrous; leaves alternate, entire, simple; racemes simple or branched, bractless or bracteate at base, rarely with the flowers axillary in the leaflike bracts; flowers pedicelled or subsessile, blue, rose, or white; calyx deeply 5-lobed, slightly accrescent after anthesis; corolla rotate, 5-angled on the throat, the lobes 5, imbricate in bud; stamens included; gynobase flat; nutlets 4, erect, smooth, sometimes puberulent, tetrahedral and slightly flattened dorsally.—About 30 species, in s. and e. Asia, Malaysia, and e. Siberia.

- 1A. Pedicels longer than the calyx, ascending, spreading, or reflexed after anthesis.

2A. Flowers 6–10 mm. across; perennial with 5- to 15-flowered racemes.

3A. Flowers supra-axillary on the leaflike bracts.

4A. Plant appressed-strigose. 1. *T. nakaii*

4B. Plant spreading-strigose on lower part of stems, petioles, and underside of leaves. 2. *T. radicans*

3B. Flowers bractless or bracteate only in the lower ones.

5A. Flowering stems suberect; stolons absent; inflorescence 8- to 15-flowered, commonly branched or sometimes simple.

3. *T. guilielmii*

5B. Flowering stems decumbent; stolons well developed; inflorescence 3- to 10-flowered, simple and unbranched. 4. *T. icumae*

2B. Flowers about 2 mm. across; biennial with many-flowered racemes. 5. *T. peduncularis*

1B. Pedicels shorter than the calyx, never reflexed, appressed to the axis; flowers about 3 mm. across. 6. *T. brevipetala*

1. *Trigonotis nakaii* Hara. *T. radicans* sensu auct. Japon., non Maxim.—CHŌSEN-KAMEBA-SŌ. Somewhat tufted perennial, 10–15 cm. high, loosely appressed-strigose; stems erect in flower, decumbent in fruit; leaves ovate, 1.5–4 cm. long, acute, rounded to shallowly cordate at base, the radical ones long-petiolate, the upper short-petiolate; flowers supra-axillary on the leaflike bracts, the pedicels 1–2 cm. long, ascending in anthesis, nodding or pendulous in fruit, calyx-segments accrescent after anthesis, 2.5–7 mm. long, lanceolate, acute; corolla 7–10 mm. across, nearly white, the tube about 2 mm. long, short-pilose at base inside, the lobes orbicular, 4–5 mm. across; stamens inserted above the middle of the tube, the anthers about 0.8 mm. long, obtuse; nutlets puberulent, dark-brown, about 2 mm. long on back.—Mountains; Kyushu (Higo Prov.); rare.—Korea and Manchuria.

2. *Trigonotis radicans* (Turcz.) Stev. *Myosotis radicans* Turcz.; *Omphalodes aquatica* Brand; *O. sericea* Maxim.; *T. sericea* Ohwi—KE-RURI-SŌ. Somewhat tufted perennial,

spreading-strigose on lower part of stems, petioles, and underside of leaves, appressed-hairy on other parts; stems much elongate and decumbent; leaves ovate, 2.5–5 cm. long, 1–3 cm. wide, rounded and mucronate or subacute, rounded to shallowly cordate at base, the petiole long in the radical ones, much shorter in those above; flowers supra-axillary, the pedicels 1–2 cm. long; calyx-segments 2–5 mm. long, narrowly oblong; corolla 8–10 mm. across; stamens inserted on the middle of the tube, the anthers obtuse, about 0.8 mm. long.—Mountains; Kyushu (Higo Prov.); rare.—Korea and e. Siberia.

3. *Trigonotis guilielmii* A. Gray, ex Guericke. *Eritrichium guilielmii* A. Gray—TACHI-KAMEBA-SŌ. Loosely appressed-strigose perennial herb with creeping rhizomes; stems erect, 20–40 cm. long, simple; leaves ovate or broadly so, 3–7 cm. long, acute, the radical ones long-petiolate, shallowly cordate, the cauline short-petiolate, truncate to broadly cuneate at base; racemes 2- to 4-branched or sometimes solitary, 8- to 15-flowered, bractless, the pedicels ascending, 1–1.5 cm. long;

corolla white or pale blue, 7–10 mm. across, the tube 1.5 mm. long, smooth, glabrous; stamens inserted above the middle of the tube, the anthers about 0.5 mm. long; nutlets dark brown, very short-stipitate, puberulent, about 2 mm. long on the back.—May–June. Wet places in mountains; Hokkaido, Honshu.

4. *Trigonotis icumae* (Maxim.) Makino. *Omphalodes icumae* Maxim.—TSURU-KAMEBA-SŌ. Perennial, short appressed-strigillose, stoloniferous; stems 7–20 cm. long, soon decumbent; leaves ovate, 3–5 cm. long, 1.5–2.5 cm. wide, acute, truncate to shallowly cordate or rounded at base, the lower ones long-petiolate; inflorescence soon becoming lateral, unbranched, loosely 3- to 10-flowered, bractless, the pedicels 1–1.5 cm. long, ascending; corolla about 10 mm. across, pale blue, the tube about 2 mm. long; stamens inserted above the middle of the tube, the anthers about 0.5 mm. long.—May–June. Honshu (centr. and n. distr.); rare.

5. *Trigonotis peduncularis* (Trevir.) Benth. *Myosotis peduncularis* Trevir.; *Eritrichium japonicum* Miq.—TABIRAKO, KIURIGUSA. Appressed-pilulose biennial; stems branched at base, somewhat tufted, 10–30 cm. long, erect, slender; leaves oblong or ovate, 1–3 cm. long, 6–20 mm. wide, obtuse, mucronate, subuncinate at base, the lower ones petiolate, the upper ones sessile; racemes rather loosely many-flowered, 5–25 cm. long, often leafy at the base, the pedicels ascending, 3–9 mm. long, spreading in fruit, clavately thickened at tip; flowers pale blue, about 2 mm. across; stamens inserted on the

middle of the corolla-tube, the anthers about 0.3 mm. long; nutlets short-stipitate, glabrous or puberulent, about 1 mm. long on the back.—Apr.–May. Grassy places and cultivated fields in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Ryukyus, Korea, and widely distributed in the temperate regions of Asia.

6. *Trigonotis brevipes* (Maxim.) Maxim. *Eritrichium brevipes* Maxim.—MIZU-TABIRAKO. Rhizomatous and stoloniferous, appressed-pilose perennial; stems somewhat tufted, 10–40 cm. long, erect, simple or slightly branched; leaves oblong or ovate, 1.5–3 cm. long, 1–2 cm. wide, obtuse and mucronate, or rounded at both ends, petiolate; racemes 1–5, sessile, 5–10 cm. long, densely many-flowered, the pedicels 1–2 mm. long or subsessile, erect, appressed to the axis; calyx-segments 0.5–1 mm. long; corolla pale blue, 2.5–3 mm. across, the tube less than 1 mm. long; stamens inserted on the middle of the tube, the anthers about 0.3 mm. long; nutlets dark-brown, smooth, lustrous, tetrahedral, without appendages, about 1 mm. long on back.—Wet places along streams and ravines in mountains; Honshu, Shikoku, Kyushu; rather common.—? China.

Var. *coronata* (Ohwi) Ohwi. *Trigonotis coronata* Ohwi —KOSHII-TABIRAKO. Nutlets appendaged.—May–July. Wet places along streams in mountains; Honshu (especially on Japan Sea side from Kinki to Hokuriku Distr.).

14. MYOSOTIS L.

WASURENAGUSA ZOKU

Usually slender annuals or perennials, nearly glabrous to densely pilose; leaves alternate, narrow; racemes simple or sometimes branched, bractless or rarely with few bracts at base; flowers pedicelled or subsessile, blue, rose, or white, rarely yellowish; calyx shallowly 5-lobed, the lobes slightly accrescent after anthesis; corolla-tube short, 5-scaled or tubercled on the throat, the lobes 5, spreading, contorted in bud; stamens included; nutlets tetrahedral, ovoid, erect, lustrous, smooth, usually black.—About 40 species, in the temperate regions of the N. Hemisphere.

- 1A. Hairs on calyx short, straight, closely appressed. 1. *M. scorpioides*
 1B. Hairs on calyx hooked, at least some of them.
 2A. Corolla blue, rarely white; fruiting pedicels longer than the calyx.
 3A. Limb of corolla flat, 6–8 mm. across. 2. *M. sylvatica*
 3B. Limb of corolla spreading-ascending, about 3 mm. across. 3. *M. arvensis*
 2B. Corolla yellow, changing to blue before withering, 2–3 mm. across; calyx longer than the pedicel. 4. *M. discolor*

1. *Myosotis scorpioides* L. *M. palustris* Hill.—WASURENAGUSA. Resembles *M. sylvatica*, but with creeping or decumbent stems; calyx shallowly lobed, loosely appressed-pilose.—Wet places in Honshu (Shinano Prov.) and Hokkaido (Nemuro Prov.).—Introduced from Europe and naturalized.

2. *Myosotis sylvatica* (Ehrh.) Hoffm. *M. scorpioides* var. *sylvatica* Ehrh.; *M. intermedia* sensu auct. Japon., non Link.—EZO-MURASAKI, MIYAMA-WASURENAGUSA. Perennial with coarse spreading hairs; rhizomes short-creeping; stems 20–40 cm. long, slender, loosely branched in upper part; radical leaves spatulate, rounded at apex; cauline leaves oblanceolate, 2–6 cm. long, 7–12 mm. wide, obtuse, the middle and upper ones sessile and semiclasping; racemes 10–25 cm. long, bractless or bracteate only at base; calyx shorter than the pedicels,

with spreading hooked hairs; corolla blue, 6–8 mm. across; nutlets ovoid, dark brown, smooth, lustrous, 1.5 mm. long, slightly flattened, with a ridge on the ventral side.—May–July. Woods in mountains; Hokkaido, Honshu (centr. distr.); rare.—Eurasia and Africa.

3. *Myosotis arvensis* (L.) Hill. NOHARA-MURASAKI. Resembles *M. sylvatica*, but with smaller flowers about 3 mm. across.—Honshu (Shirakawa in Iwaki Prov.).—Introduced from Europe and naturalized.

4. *Myosotis discolor* Pers. *M. versicolor* (Pers.) J. E. Smith.—HAMA-WASURENAGUSA. Small annual or biennial with flowers 2–3 mm. across, yellow at the beginning, changing to blue.—Sandy places; Honshu (Echigo and elsewhere).—Introduced from Europe and now naturalized.

Fam. 174. VERBENACEAE

KUMA-TSUZURA KA

Verbena Family

Herbs, shrubs, or trees, commonly with 4-striate or angled branches; leaves opposite or sometimes verticillate, simple or compound; stipules absent; flowers bisexual, zygomorphic; calyx 4- to 5-lobed or toothed, persistent; corolla gamopetalous, tubular, 4- to 5-lobed, the lobes imbricate in bud; stamens 4, rarely 2 or 5, inserted on the corolla, the anthers 2-locular, the locules often divergent, longitudinally split; ovary superior, 2- to 8-locular; style simple, terminal; ovules 1 or 2 in each locule, erect or rarely pendulous; fruit a drupe or berry; seeds with a straight embryo, the endosperm scanty.—About 90 genera, with about 2,600 species, mostly in warmer regions.

- 1A. Inflorescence a spike or raceme.
 2A. Calyx tubular, 5-toothed; nutlets 4. 1. *Verbena*
 2B. Calyx short, bilabiate or 2- to 4-lobed; nuts 2. 2. *Lippia*
 1B. Inflorescence a loose or dense cyme.
 3A. Fruit a drupe; woody (in ours).
 4A. Flowers nearly actinomorphic; stamens equal; leaves usually with sessile discoid glands. 3. *Callicarpa*
 4B. Flowers zygomorphic; stamens didymous, more or less unequal.
 5A. Drupe with a single 4-locular stone; corolla-tube short.
 6A. Corolla 4-lobed, the lower lip slightly larger than the upper; fruit fleshy. 4. *Premna*
 6B. Corolla 5-lobed, the lower lip much larger than the upper; fruit dry. 5. *Vitex*
 5B. Drupe with 4, 1-locular stones; corolla-tube much elongate. 6. *Clerodendrum*
 3B. Fruit a capsule; herbaceous (in ours). 7. *Caryopteris*

1. VERBENA L. KUMA-TSUZURA ZOKU

Herbs or subshrubs, glabrous or with simple hairs; leaves opposite, rarely alternate or verticillate, usually toothed or divided; spikes terminal; flowers small, sessile, solitary in the axils of bracts; calyx tubular, 5-ribbed, 5-toothed; corolla-tube sometimes dilated in upper part, the limb spreading, subbilabiate, the lobes 5, nearly equal, the 2 posterior lobes outermost in bud, the anterior and median innermost; stamens 4, didymous, included; ovary 4-parted, the ovules 4; style short, unequally 2-fid; fruit enclosed in the calyx, dry, with 4 nutlets.—About 120 species, chiefly in the New World, few in the Old World.

- 1A. Leaves ovate, pinnately lobed to cleft, petiolate; spikes linear, much elongate after anthesis, to 30 cm. long, becoming loose in fruit. 1. *V. officinalis*
 1B. Leaves lanceolate, merely toothed on margin, sessile; spikes ellipsoidal to oblong-cylindric, 1–2 cm. long, densely flowered. 2. *V. bonariensis*

1. *Verbena officinalis* L. *V. spuria* L.—KUMA-TSUZURA. Loosely short-hirsute perennial; stems 4-angled, usually branched, 30–80 cm. long; leaves cauline, ovate, 3–10 cm. long, 2–5 cm. wide, pinnately lobed to cleft, the lobes again incised, abruptly narrowed to a winged petiole; spikes much elongate after anthesis, to 30 cm. long; flowers pale purple, about 4 mm. across, the bracts lanceolate, nearly as long as the calyx; calyx about 2 mm. long; nutlets about 1.5 mm. long, with few longitudinal ribs on back.—June–Nov. Weed in waste grounds and along roadsides in lowlands; Honshu, Shikoku, Kyushu.—A nearly cosmopolitan weed.

2. *Verbena bonariensis* L. SANJAKU-BĀBENA. Stems to more than 1 m. high, much branched, 4-angled; leaves lanceolate, 7–12 cm. long, 1–3 cm. wide, rounded and clasping at base, scarious; spikes many, in terminal corymbs, densely many-flowered; flowers small, blue-purple, about 1 cm. long, exerted from the bracts.—Sometimes cultivated and naturalized in the western part of Honshu and Kyushu.—Introduced from S. America.

Verbena × *hybrida* Voss. BIJOZAKURA. Flower heads 1.5–2 cm. across; calyx slender-tubular, about 12 mm. long, glandular-pilose.—Of garden origin and often cultivated.

2. LIPPIA L. IWADARE-SŌ ZOKU

Shrubs or herbs, glabrous or with simple hairs; leaves opposite, sometimes verticillate, toothed or entire; inflorescence spicate; flowers small, sessile, solitary in axils of bracts; calyx small, sometimes bilabiate or 2-winged, 2- or 4-lobed; corolla tubular, the limb ascending and spreading, 5-lobed; stamens 4, anther-locules parallel; ovary 2-locular; ovules solitary in each locule; stigma rather thick; nutlets 2.—About 100 species, chiefly in the New World.

1. *Lippia nodiflora* (L.) L. C. Rich. *Verbena nodiflora* L.; *Phyla chinensis* Lour.; *P. nodiflora* (L.) Greene; *L. nodiflora* var. *sermentosa* Schauer.—IWADARE-SŌ. Perennial; stems long-creeping or decumbent, much branched; leaves rather fleshy, obovate, 2–4 cm. long, 8–18 mm. wide, rounded to obtuse, long-cuneate at base, coarsely toothed toward tip, subsessile, 1-nerved; spikes axillary, unbranched, long-pedunculate, ellipsoidal to short-cylindric, 8–20 mm. long, 6–8 mm.

across, very densely many-flowered, the bracts flabellate, about 2.5 mm. long, cuspidate; calyx short, flattened, with 2 narrow wings; corolla about 2 mm. across, slightly exerted between the bracts, subbilabiate, rose-purple; fruit broadly obovate, about 2 mm. long; nutlets slightly corky.—July–Oct. Sandy seashores; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common.—Ryukyus, Formosa, China, and widely distributed in the warmer regions of the world.

3. CALLICARPA L. MURASAKI-SHIKIBU ZOKU

Shrubs or trees, villous, stellate-pubescent, or glabrate; leaves opposite, toothed, usually with sessile discoid glands; cymes axillary, many-flowered, sessile or pedunculate; flowers nearly regular, small, white, rose, or purplish; calyx short-campanulate, truncate or 4-lobed; corolla tubular, the limb 4-lobed, the lobes nearly equal, imbricate in bud; stamens 4, equal, the anther-locules parallel; ovary incompletely 2-locular, with 2 ovules in each locule; stigma 2-fid, broad and short; drupe globose, juicy, 4- or few-stoned.—About 40 species, in the warmer parts of the N. Hemisphere, except S. America and Africa, abundant in se. Asia.

1A. Plants glabrous or thinly pubescent; calyx glabrous, with very short teeth.

- 2A. Leaves caudate, glandular-dotted on both sides. 1. *C. shikokiana*
 2B. Leaves acuminate to acute glandular-dotted on underside only.

- 3A. Cymes supra-axillary; anthers broadly ellipsoidal. 2. *C. dichotoma*
 3B. Cymes axillary.
 4A. Corolla 1 mm. long, not glandular-dotted; branches slightly 4-angled; leaves with 12 to 14 pairs of nerves. 3. *C. takakumensis*
 4B. Corolla 3-5 mm. long, glandular-dotted; branches terete; leaves with 5 to 9 pairs of nerves. 4. *C. japonica*
 1B. Plants densely soft-pubescent to villous; calyx pubescent, 4-fid.
 5A. Leaves 5-10 cm. long, rounded to obtuse at base; branches and leaves with whitish stellate hairs less than 1 mm. long; calyx-lobes lanceolate; flowers 4-5 mm. long, about 10 in a cyme; anthers 1.5-2 mm. long. 5. *C. mollis*
 5B. Leaves 15-30 cm. long, gradually narrowed at base; branches and petioles with pinnately branched hairs 1.5-3 mm. long; calyx-lobes linear; flowers about 1.5 mm. long, very many in a cyme; anthers about 0.7 mm. long. 6. *C. kochiana*

1. **Callicarpa shikokiana** Makino. *C. yakusimensis* Koidz.—TOSA-MURASAKI, YAKUSHIMA-KO-MURASAKI. Deciduous shrub, scattered short-pilose; branches slender, terete; leaves membranous, 5-12 cm. long, 1.5-3 cm. wide, caudate, cuneate at base, coarsely and obtuse toothed, glandular-dotted on both sides, loosely pilose, especially on nerves on both sides; petioles 5-10 mm. long; cymes axillary, short-pedunculate, rather many-flowered; corolla puberulent, scarcely glandular, about 3 mm. long, 4-lobed to the middle; anthers broadly ellipsoidal, about 0.6 mm. long; fruit purple, about 2 mm. across.—July-Sept. Warmer districts; Shikoku, Kyushu.

2. **Callicarpa dichotoma** (Lour.) K. Koch. *Porphyræ dichotoma* Lour.; *C. purpurea* Juss.; *C. gracilis* Sieb. & Zucc.; *C. japonica* var. *dichotoma* (Lour.) Bakhuijzen—KO-MURASAKI, KO-SHIKIBU. Deciduous shrub with slender purplish branches, minutely stellate-hairy while young; leaves rather thick, obovate-oblong or obovate, 3-6 cm. long, 1.5-3 cm. wide, abruptly acuminate, cuneate to acute at base, loosely puberulent above and on nerves beneath, coarsely serrate near tip, the petioles 1-4 mm. long; cymes supra-axillary, 10- to 20-flowered, the peduncles 1-1.5 cm. long; corolla pale purple, glabrous, about 3 mm. long; anthers broadly ellipsoidal, about 0.6 mm. long; fruit about 3 mm. across, purple.—July-Aug. Honshu (Rikuchu Prov. and westw.), Shikoku, Kyushu.—Korea, Ryukyus, Formosa, and China.

3. **Callicarpa takakumensis** Hatus. TAKAKUMA-MURASAKI. Shrub with slightly 4-angled glabrous branches; leaves membranous, oblong-lanceolate, 10-18 cm. long, 2.5-3.7 cm. wide, acuminate at both ends, obsoletely serrulate, grayish puberulent on nerves above, densely discoid-glandular beneath, the lateral nerves 12-14 pairs, the petioles about 1 cm. long; cymes axillary, densely many-flowered, about 3 cm. across, the peduncles about 1.3 cm. long; calyx glabrous; corolla about 1 mm. long, puberulent outside; stamens about twice as long as the corolla; fruit about 2 mm. across.—Aug. Kyushu (Mount Takakuma in Osumi); rare.

4. **Callicarpa japonica** Thunb. *C. murasaki* Sieb.; *C. japonica* forma *angustifolia* Miq.—MURASAKI-SHIKIBU. Deciduous shrub; branches terete, minutely stellate-puberulent while young, glabrescent; leaves membranous to thinly chartaceous, obovate, ovate or oblong, 6-12 cm. long, 2.5-4.5 cm. wide, acuminate to acute at both ends, serrulate, nearly glabrous to loosely puberulent on both surfaces, yellowish glandular-dotted below, the lateral nerves 5-9 pairs, the petioles 2-10 mm. long; cymes rather many-flowered, axillary, short-pe-

dunculate, scattered stellate-puberulent; corolla pale purple, 3-5 mm. long, usually puberulent and glandular-dotted; anthers oblong, about 2 mm. long; fruit purple, about 3 mm. across.—June-Aug. Hokkaido (s. distr.), Honshu, Shikoku, Kyushu; common and variable.—Ryukyus, Formosa, China, and Manchuria.

Var. *luxurians* Rehd. *C. australis* Koidz.; *C. japonica* subsp. *luxurians* (Rehd.) Masam. & Yanagih.; *Premna staminea* Maxim.—Ô-MURASAKI-SHIKIBU. Leaves thicker, larger, rather lustrous above, 10-15(-20) cm. long, 4-6(-7) cm. wide, serrulate; cymes larger with thicker branches.—July-Aug. Lowlands near the sea; Honshu, Shikoku, Kyushu; rather common.

5. **Callicarpa mollis** Sieb. & Zucc. *C. zollingeriana* Schauer—YABU-MURASAKI. Deciduous shrub, stellate-hairy on young branches; leaves thinly membranous, ovate to broadly so or ovate-elliptic, 5-10(-12) cm. long, 2.5-5 cm. wide, acuminate, rounded to obtuse at base, serrate, densely pubescent above with soft simple hairs, densely stellate-pubescent beneath, minutely glandular-dotted on both surfaces, the petioles 3-5 mm. long; cymes often more than 10-flowered or less, densely stellate-pubescent; calyx 5-parted, the lobes lanceolate, densely stellate-pubescent or with variously branched grayish hairs; corolla 4-5 mm. long, the tube nearly as long as the calyx; fruit purple, 3-4 mm. across.—June-July. Honshu (Rikuchu Prov. and southw.), Shikoku, Kyushu.—Korea.

Callicarpa × **shirasawana** Makino. INU-MURASAKI-SHIKIBU. Hybrid of *C. japonica* × *C. mollis*.—Honshu.

6. **Callicarpa kochiana** Makino. *C. tomentosa* sensu auct. Japon., non Willd.; *C. longiloba* Merr.—BIRÔDO-MURASAKI, ONI-YABU-MURASAKI. Deciduous shrub with pinnately branched yellow-brown hairs; branches thick, terete, villous; leaves chartaceous, narrowly oblong, broadly lanceolate, or ovate-oblong, 15-30 cm. long, 4-8 cm. wide, long-acuminate, gradually narrowed at base, serrulate, with gray-yellow stellate and pinnately branched hairs beneath, obsoletely glandular-dotted, the lateral nerves 8-12 pairs, the petioles 2-3.5 cm. long; cymes densely many-flowered, short-pedunculate; calyx 5-parted, the lobes broadly linear; corolla about 1.5 mm. long; anthers oblong, about 0.5 mm. long; fruit about 2 mm. across, enclosed by the calyx, white.—Aug. Honshu (s. Kinki Distr.), Shikoku, Kyushu (s. distr.).—Formosa, China, and Indochina.

4. PREMNA L. HAMA-KUSAGI ZOKU

Shrubs or trees; leaves opposite, entire or toothed; cymes axillary, in terminal corymbs, panicles, or racemes; flowers small, zygomorphic, white, yellowish, or purplish, often polygamous; calyx small, campanulate, truncate or toothed; corolla-tube rather short, often hairy inside the throat, the limb 4-lobed, the lobes somewhat unequal, the dorsal ones larger, retuse or lip-like; stamens didymous, rarely exserted; ovary 2-locular, with 2 ovules in each locule; style bifid; fruit a small globose fleshy drupe, with a persistent calyx at base, the stone solitary, 4-locular, sometimes 2- or 3-locular.—About 40 species, chiefly in warmer regions.

1. *Premna japonica* Miq. *P. microphylla* sensu auct. Japon., non Turcz.; (?) *P. glabra* A. Gray ex Maxim.; *P. luxurians* Nakai; *P. japonica* var. *luxurians* (Nakai) Sugimoto.—HAMA-KUSAGI. Deciduous much-branched small tree or large shrub, furfuraceous while very young; branches gray-brown, terete, the nodes with thickened pulvinellike scars; leaves membranous, ovate to broadly so, or elliptic, 5–12 cm. long, 2.5–7 cm. wide, acuminate, obtuse at the tip, coarsely few-toothed on

upper half or entire, the petioles 1–3 cm. long; panicles pedunculate, 6–10 cm. long, loosely branched, few-flowered, the bracts linear, truncate; flowers pale greenish yellow, 8–10 mm. long, tubular-campanulate; calyx irregularly toothed; corolla glandular outside, the lobes short; fruit obovoid-globose, dark purple, 3–3.5 mm. across.—May–June. Near seashores; Honshu (s. Kinki, Chûgoku Distr.), Shikoku, Kyushu.—Ryukyus and Formosa.

5. VITEX L. HAMAGÔ ZOKU

Glabrous or hairy shrubs or trees; leaves opposite, simple or usually palmately compound, entire or toothed; cymes axillary or terminal; flowers zygomorphic, white, purplish, or yellowish, the bracts small; calyx (3–)5-toothed; corolla-limb subbilabiate, 5-lobed, the 2 inner lobes often the smallest, the outermost ones largest, sometimes retuse; stamens 4, usually exserted, didymous; ovary imperfectly 2-locular, later becoming 4-locular, with 2 ovules in each locule; drupe globose, dry or slightly juicy, surrounded usually by the accrescent calyx, the stone bony, 4-locular.—About 100 species, chiefly in the Tropics, few in temperate regions of Europe and e. Asia.

1. *Vitex rotundifolia* L. f. *V. ovata* Thunb.; *V. trifolia* var. *simplicifolia* Cham.; *V. trifolia* var. *unifoliolata* Schauer; *V. trifolia* var. *ovata* (Thunb.) Makino.—HAMAGÔ. Procrumbent or ascending shrub densely gray-white puberulent; branches 4-angled; leaves herbaceous, broadly ovate to broadly elliptic, 2–5 cm. long, 1.5–3 cm. wide, obtuse to rounded, abruptly acute at base, entire, green and thinly puberulent above,

densely grayish puberulent beneath; panicles terminal, densely flowered, 4–7 cm. long, with very short branches; corolla purplish, about 13 mm. long; style about 15 mm. long; fruit globose, 5–7 mm. across, enclosed on lower half by the persistent calyx.—July–Sept. Sandy places by the sea; Honshu, Shikoku, Kyushu.—Korea, Bonins, Ryukyus, Formosa to se. Asia, Pacific Islands, and Australia.

6. CLERODENDRUM L. KUSAGI ZOKU

Shrubs or trees; leaves opposite, rarely ternate, entire, sometimes obsolete toothed or shallowly lobed, cymes in upper axils, sometimes forming a terminal corymb or panicle; flowers zygomorphic, rather large, white, blue, or red; calyx campanulate, infundibuliform or tubular, 5-lobed, often accrescent after anthesis, green or variously colored; corolla-tube much-elongate, the limb 4-lobed, spreading or reflexed, the lobes nearly equal; stamens 4, long-exserted, involute in bud; ovary incompletely 4-locular, the ovules 1 in each locule; style elongate, bifid; drupe surrounded at base by the persistent calyx; stones 4.—About 100 species, in the Tropics and subtropics.

- 1A. Leaves narrowly deltoid to deltoid-ovate, 8–15 cm. long, 3-nerved from the base; corymbs rather many-flowered, much-branched, terminal; calyx acutely angled, deeply 5-lobed, about 15 mm. long, about half as long as the corolla-tube. 1. *C. trichotomum*
1B. Leaves elliptic, ovate to broadly so, 3–7 cm. long, obscurely penninerved; corymbs usually 3-flowered, axillary; calyx not angled, with 5 depressed teeth, 3–4 mm. long, shorter than the corolla-tube. 2. *C. nerifolium*

1. *Clerodendrum trichotomum* Thunb. *Siphonanthus trichotomum* (Thunb.) Nakai; *C. serotinum* Carr.—KUSAGI. Large shrub or small tree with rather thick terete branches; leaves membranous, deltoid-ovate, narrowly deltoid, or broadly ovate, 8–15 cm. long, 5–10 cm. wide, gradually acuminate, somewhat rounded at base, obsolete toothed or subentire, 3-nerved from the base, sometimes thinly pubescent above, pubescent beneath especially on nerves, obsolete glandular-dotted, long-petiolate; cymes in large terminal corymbs; calyx deeply 5-lobed, about 15 mm. long, reddish, the lobes ovate, acuminate, spreading in fruit; corolla-tube 2–2.5 cm. long, the limb 2.5–3 cm. across, white; fruit globose, dark blue, lustrous, 6–7 mm. across, subtended by the persistent spreading calyx.—Aug.–Sept. Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, China, Ryukyus, Formosa, and Philippines.—Forma *ferrugineum* (Nakai) Ohwi. *C. trichotomum* var. *ferrugineum* Nakai.—BIRÔO-KUSAGI. Plant densely pubescent.—Occurs with the typical phase.

Var. *esulentum* Makino. SHÎRÔ-KUSAGI. Leaves cordate, long-acuminate; inflorescence shorter; calyx-lobes narrower.—Occurs with the typical phase.

Var. *yakusimensis* (Nakai) Ohwi. *Siphonanthus yakusimensis* Nakai; *C. yakusimensis* (Nakai) Nakai.—AMA-KUSAGI. Plant less pubescent and with fewer flowers and thicker lustrous leaves.—Occurs with the typical phase.

2. *Clerodendrum nerifolium* Wall. ex Schaur. *Volkameria nerifolia* Roxb.; *C. inerme* sensu auct. Japon., non Gaertn.—BOTA-KUSAGI, GASHANGI. Slightly scandent shrub; branches grayish brown, gray-white puberulent while young; leaves chartaceous, elliptic, ovate to broadly so, 3–7 cm. long, 1.5–3.5 cm. wide, acute at both ends, sometimes obtuse at apex, entire, lustrous, puberulent while very young, the petioles 5–10 mm. long; cymes long-pedunculate, axillary, 3-flowered; calyx 3–4 mm. long at anthesis, becoming obconical, 8–10 mm. long in fruit; corolla-tube 2–2.5 cm. long, the limb about 15 mm. across, pinkish; fruit obovoid, 6–8 mm. across, covered on lower half by the persistent calyx.—Wet banks along rivers; Kyushu (Tangashima); rare.—Ryukyus, Formosa, China, Burma, Malaysia to Australia.

Clerodendrum japonicum (Thunb.) Sweet. *Volkameria japonica* Thunb.; *C. squamatum* Vahl.—HIGIRI. Malayan shrub often cultivated in the warmer parts of our area as an ornamental.

7. CARYOPTERIS Bunge KARIGANE-SŌ ZOKU

Herbs or shrubs, often puberulent; leaves opposite, dentate or entire; cymes many-flowered, axillary, sometimes in a narrow terminal compound panicle; flowers zygomorphic, blue, rose, or rarely white; calyx campanulate, 5-lobed, more or less accrescent in fruit; corolla tubular, the limb 5-lobed, the anterior one longer, placed innermost in the bud, concave, sometimes fimbriate, the others equal, oblong or obovate, flat; stamens 4, didymous, involute in bud, exerted at anthesis; ovary imperfectly 4-locular, with 1 ovule in each locule; style long, bifid; fruit dry, shorter than the persistent calyx, separating into 4 nutlets.—About 10 species, in e. Asia from Mongolia to the Himalayas.

- 1A. Plant green, 40–100 cm. high; leaves 8–15 cm. long; corolla-lobes entire. 1. *C. divaricata*
 1B. Plant cinereous, 30–60 cm. high; leaves 3–6 cm. long; anterior lobe of corolla larger, fimbriate. 2. *C. incana*

1. *Caryopteris divaricata* Maxim. *Clerodendron divaricatum* Sieb. & Zucc., non Jack.—KARIGANE-SŌ. Ill-scented thinly-pubescent perennial herb, 40–100 cm. high; stems 4-angled, green, branched; leaves membranous, ovate to broadly so, 8–15 cm. long, 4–8 cm. wide, green, obtusely toothed, short-acuminate, shallowly cordate to rounded at base, long-petiole; panicles long-pedunculate, loosely few-flowered, the peduncles and pedicels often scattered glandular-pilose; calyx obconical, 2–3 mm. long in anthesis, 5–6 mm. long in fruit, the teeth deltoid; corolla blue-purple, the tube 8–10 mm. long, the limb oblique, the largest lobe reflexed, slightly longer than the tube; stamens 3–3.5 cm. long; style 3–3.5 cm. long; nutlets obovoid, 4–4.5 mm. long, net-veined, glandular-dotted.—Aug.–Sept. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea and China.

2. *Caryopteris incana* (Thunb.) Miq. *Nepeta incana*

Thunb.; *Barbula sinensis* Lour.; *N. japonica* Willd.; *C. mastacanthus* Schauer; *C. ovata* Miq.—DANGIKU. Perennial herb, 30–60 cm. high, woody at the base, cinereous, incurved short-pubescent; stems nearly terete, erect, simple or branched; leaves ovate, 3–6 cm. long, 1.5–3 cm. wide, subacute, broadly cuneate to rounded at base, with few coarse teeth on each side, densely short grayish pubescent beneath, the petioles 5–15 mm. long; cymes short-pedunculate, densely many-flowered; calyx 2–3 mm. long at anthesis, 5–6 mm. long in fruit, deeply lobed; corolla about 7 mm. long, blue-purple, the anterior lobe larger, fimbriate; mature carpels winged, about 2 mm. long, deciduous with the seeds.—Sept.–Oct. Kyushu (w. distr. including Tsushima).—Korea, China, and Formosa.—Forma *candida* (C. K. Schn.) Hara. *C. incana* var. *candida* C. K. Schn.—SHIROBANA-DANGIKU. A white-flowered phase, often cultivated.

Fam. 175. LABIATAE SHISO KA Mint Family

Herbs, rarely shrubs, usually aromatic; stems and branches commonly 4-angled; leaves opposite or verticillate, simple; stipules absent; inflorescence composed of dichasial or circinate cymes forming a simulated whorl (verticillaster); flowers bisexual, usually bilabiate; calyx 5-toothed, regular or bilabiate; corolla tubular, the limb 4- to 5-lobed, often bilabiate; stamens 4 or 2, inserted on the tube, the anthers 2-locular, often with divergent locules, usually longitudinally split; ovary superior, deeply 4-lobed; style solitary, gynobasic, usually bifid; ovules 4, erect; fruit of 4 achenelike nutlets, the endosperm scanty or absent.—About 160 genera, with about 3,000 species, cosmopolitan, especially abundant in the Mediterranean basin and w. Asia.

- 1A. Ovary shallowly 4-lobed; nutlets with a large areole on inner face near base.
 2A. Stamens 2; corolla nearly actinomorphic, 4-lobed, the lower (outer) lobe rather larger than the others. 1. *Ametystea*
 2B. Stamens 4; corolla zygomorphic, the upper (inner) lobe very small.
 3A. Upper lip entire or shallowly 2-lobed, the midlobe of lower lip bifid or emarginate. 2. *Ajuga*
 3B. Upper lip deeply 2-fid, the midlobe of the lower lip much larger than the others, sometimes bifid. 3. *Teucrium*
 1B. Ovary deeply 4-lobed; nutlets with a small areole at base.
 4A. Calyx gibbous on upper (inner) side; upper lip of the corolla incurved, the tube often geniculate and gibbous at base. 4. *Scutellaria*
 4B. Calyx not gibbous.
 5A. Upper lip of corolla galeate or much concave on back.
 6A. Calyx 13- to 15-nerved; upper (inner) pair of stamens longer than the others.
 7A. Anthers not approximate, separate or distant, anther-locules nearly parallel.
 8A. Flowers in dense spikes; stamens exerted. 5. *Agastache*
 8B. Flowers axillary or in a loose raceme; stamens not exerted. 6. *Meehania*
 7B. Anthers approximate, anther-locules strongly divergent.
 9A. Calyx-teeth oblique at the throat, with subequal narrow teeth.
 10A. Stems erect; cymes dense, interrupted, in terminal spikes; anther-locules divergent. 7. *Nepeta*
 10B. Stems procumbent or creeping; flowers in the leaf axils; anther-locules rectangular, each pair crossing. 8. *Glechoma*
 9B. Calyx-teeth equal, the upper teeth much broader than the others. 9. *Dracopis*
 6B. Calyx 5- to 10-nerved; upper (inner) pair of stamens shorter than the others.
 11A. Calyx distinctly bilabiate, 10-nerved, closed in fruit, the upper lip flat, erect, toothed, the lower 2 teeth incurved at tip. 10. *Prunella*
 11B. Calyx not distinctly bilabiate, open in fruit, with nearly equal teeth.
 12A. Calyx much inflated in fruit, membranous-papery, campanulate; corolla gradually inflated in upper part, with a concave upper lip; nutlets flattened dorsally, winged on upper margin. 11. *Chelonopsis*
 12B. Calyx scarcely accrescent after anthesis, not inflated; nutlets wingless.
 13A. Nutlets obovate, rounded at apex, obtusely 2-angled, unequally lenticular.
 14A. Anther-locules transversely split, ciliate on the inner side of the locule. 12. *Galeopsis*
 14B. Anther-locules longitudinally split, not ciliate. 13. *Stachys*

- 13B. Nutlets cuneate or obovate-cuneate at the base, truncate or obliquely truncate at apex, acutely 3-angled.
- 15A. Anther-locules parallel; upper lip of corolla suberect, densely villous on back; anthers glabrous. 14. *Leonurus*
- 15B. Anther-locules divergent; upper lip of corolla arcuately incurved, galeate, glabrous or soft-pubescent on back; anthers barbate or glabrous. 15. *Lamium*
- 5B. Upper lip of corolla not concave on back.
- 16A. Fertile stamens 2.
- 17A. Anthers of fertile stamens 1-locular or apparently 2-locular; connective elongate at base and jointed with the filament; corolla clearly bilabiate. 16. *Salvia*
- 17B. Anthers of fertile stamens 2-locular, the locules approximate or confluent at tip; connective not elongate at base; corolla nearly actinomorphic.
- 18A. Nutlets subglobose, without angles or ridges, rounded at apex. 17. *Mosla*
- 18B. Nutlets broadly cuneate, triangular, obliquely truncate and obsoletely undulate-toothed at apex. 18. *Lycopus*
- 16B. Fertile stamens 4.
- 19A. Stamens erect, spreading, or ascending under the upper lip of corolla; corolla actinomorphic or bilabiate, the upper lip 2-lobed, the lower lip 3-lobed.
- 20A. Stamens, at least the lower pair, ascending or arcuate beneath the upper lip of corolla, not exerted; anthers approximate; nutlets globose. 19. *Clinopodium*
- 20B. Stamens erect or spreading, not ascending beneath the upper lip.
- 21A. Calyx bilabiate; nutlets globose, obtuse.
- 22A. Small shrubs with small leaves; corolla distinctly bilabiate; nutlets rounded, rather flattened, smooth. 20. *Thymus*
- 22B. Herbs; corolla indistinctly bilabiate.
- 23A. Annuals; spikes densely many-flowered; nutlets reticulate-veined. 21. *Perilla*
- 23B. Perennials; spikes loosely flowered; nutlets veinless. 22. *Perillula*
- 21B. Calyx actinomorphic; nutlets not globose.
- 24A. Inflorescence not one-sided.
- 25A. Anther-locules distinct; flowers or some of them in spaced verticils. 23. *Mentha*
- 25B. Anther-locules confluent at tip, becoming 1-locular; flowers in dense terminal spikes; stamens long-exserted.
- 26A. Corolla bilabiate, the tube longer than the calyx; bracts caducous; filaments glabrous. 24. *Leucosceptrum*
- 26B. Corolla nearly actinomorphic, the tube usually shorter than the calyx; bracts persistent; filaments often long-pilose. 25. *Dysophylla*
- 24B. Inflorescence a one-sided spike.
- 27A. Calyx deeply 5-fid, the lobes lanceolate. 26. *Keiskea*
- 27B. Calyx 5-toothed, the teeth deltoid. 27. *Elsholtzia*
- 19B. Stamens declined along inner side of the lower navicular lip of corolla; corolla bilabiate, the upper lip 4-lobed, the lower lip undivided. 28. *Plectranthus*

1. AMETHYSTEAE L. RURI-HAKKA ZOKU

Erect nearly glabrous annual; leaves 3- to 5-parted and incised, the floral leaves gradually reduced; verticils loosely arranged, rather many-flowered, pedunculate, forming a narrow terminal panicle; flowers small, blue, pedicelled; calyx globose-campanulate, 10-nerved, the teeth 5, equal; corolla-tube shorter than the calyx, without a ring inside, the limb 4-lobed, the anterior lobes slightly larger; fertile stamens 2, placed in front, ascending, exerted between the upper corolla-lobes; anthers 2-locular, the locules spreading, slightly confluent; nutlets obovoid, the areole on ventral side.—One species.

1. Amethystea caerulea L. RURI-HAKKA. Stems erect, branched, 40–80 cm. long; leaves ovate to narrowly so, 3–6 cm. long, 2–4 cm. wide, 3(–5)-parted, broadly cuneate at base, the median segment lanceolate, incised, acuminate with an obtuse tip, the lateral segments smaller, the petioles 1–2 cm. long; upper leaves smaller and petiolate, the lateral lobes often re-

duced; calyx 2.5–3 mm. long, slightly accrescent after anthesis, 5-lobed, the lobes linear-lanceolate; corolla slightly longer than the calyx; nutlets rounded at apex, 1.5 mm. long, net-veined, the areole obovate, covering lower 2/3 of the body on ventral side.—Sept.–Oct. Honshu, Kyushu.—Korea, Manchuria, China to Turkey.

2. AJUGA L. KIRAN-SŌ ZOKU

Mostly perennials, sometimes stoloniferous; leaves coarsely toothed or incised, rarely entire; verticils 2- to many-flowered, dense, often forming a terminal spike; flowers subsessile; calyx ovate or globose-campanulate, 10- to many-nerved, equally 5-toothed or 4-lobed; corolla tubular, widened at the tip, the limb bilabiate with the upper lip short, entire or sometimes bifid, the midlobe of the lower lip larger, emarginate or bilobed, the lateral lobes smaller; stamens 4; nutlets obovate, with raised reticulations, the areole on ventral face.—About 50 species, in temperate regions and high mountains in the Tropics.

1A. Corolla-tube about 2 cm. long; leaves cordate or partially truncate or rounded at base, prominently incised.

2A. Stems 30–50 cm. long; stolons absent; leaves acutely incised, 6–10 cm. long. 1. *A. incisa*

2B. Stems 10–20 cm. long; stolons present; leaves with few obtuse incisions, 2–5 cm. long. 2. *A. japonica*

1B. Corolla-tube 6–12 mm. long; leaves cuneate to gradually narrowed toward base.

3A. Verticils forming a distinct terminal spike.

4A. Leaves 5–8 cm. long, 3–6 cm. wide; stems 30–40 cm. long. 3. *A. ciliata* var. *villosior*

4B. Leaves 2–4(–6) cm. long, 7–25 mm. wide; stems 10–25 cm. long.

5A. Plant gray-green, prominently white-pubescent perennial herb without stolons; upper leaves abruptly reduced to bracts.

4. *A. nipponensis*

5B. Plant vivid-green, hirsute perennial herb with long stolons; upper leaves gradually reduced to bracts. 5. *A. shikotanensis*

3B. Verticils not forming a distinct terminal spike.

6A. Stems erect; lower leaves reduced to scales.

7A. Corolla white with purple striations, 10–11 mm. long at back; stems erect. 6. *A. yezoensis*

7B. Corolla purple, 13–16 mm. long at back; stems ascending. 7. *A. makinoi*

6B. Stems decumbent; lower leaves not scalelike.

8A. Stems decumbent, tufted, 5–10 (–15) cm. long, stolons absent. 8. *A. decumbens*

8B. Plant stoloniferous, 1–5 cm. long. 9. *A. pygmaea*

1. *Ajuga incisa* Maxim. HIIRAGI-SŌ. Thinly pubescent or nearly glabrous short-rhizomatous perennial; stems erect, rather stout, 30–50 cm. long; leaves membranous, ovate to broadly so, 6–10 cm. long, 4–6 cm. wide, acute, rounded to shallowly cordate at base, acutely incised and toothed, the petioles 3–5 cm. long; verticils often loosely arranged in the lower ones, becoming capitate and spicate above, the bracts broadly lanceolate, slightly longer than the calyx; calyx 5-fid, glabrescent, the lobes lanceolate; corolla dark blue-purple, the tube about 20 mm. long, amplate above, the limb rather small, the upper lip short, broad, 2-lobed; nutlets obovate-oblong, 2.5 mm. long.—May–June. Damp woods along streams; Honshu (Kantō and centr. distr.).

2. *Ajuga japonica* Miq. *A. japonica* var. *grossedentata* Fr. & Sav.; *A. grossedentata* Fr. & Sav.—ŌGI-KAZURA. Plant loosely pubescent, with long multicellular crisped hairs; stolons from lower nodes after anthesis; rhizomes short; flowering stems 8–20 cm. long, erect, few-leaved, with few scalelike leaves at base, obtusely angled; leaves spreading, broadly ovate to ovate-cordate, 2–5 cm. long, 1.5–3.5 cm. wide, obtuse, sometimes acute, usually with 2 or 3 short incisions on each side, the petioles 2–5 cm. long; leaves on stolons rather small, loosely arranged, the petioles 1–2 cm. long; verticils few-flowered, the lower loosely arranged, the upper few pairs forming a short headlike spike, the bracts prominent, rather leaflike; corolla pale purple, the tube about 2 cm. long, amplate above, the upper lip about 4 mm. long, shallowly 2-lobed, the lobes broadly elliptic, rounded at apex; nutlets about 2 mm. long.—Apr.–May. Damp woods in mountains; Honshu, Shikoku, Kyushu; rare.

3. *Ajuga ciliata* Bunge var. *villosior* A. Gray ex Nakai. *A. ciliata* sensu auct. Japon., non Bunge—KAI-JINDŌ. Prominently pubescent with multicellular long whitish hairs; rhizomes short-creeping; stems erect, often slightly purplish red, 30–40 cm. long, sometimes slightly branched, rather stout, 4-angled; lower leaves spatulate or scalelike, small, deciduous, the middle one ovate to broadly so, 3–8 cm. long, 2–4.5 cm. wide, subacute, broadly cuneate at base, with few irregular coarse teeth, the petioles 5–10 mm. long, winged in upper part; bracts narrowly ovate, obtuse, often purplish red, longer than the calyx; verticils dense, forming a terminal cylindrical spike; flowers blue-purple, the tube 10–12 mm. long, the upper lip 1–1.5 mm. long, 2-lobed; nutlets about 2 mm. long.—May–June. Hokkaido, Honshu, Kyushu.

4. *Ajuga nipponensis* Makino. *A. decumbens* var. *typica* Fr. & Sav.; *A. genevensis* var. *pallidescens* Maxim., pro parte—JŪNI-HITOE. Grayish soft pubescent; rhizomes short; stems suberect, 10–25 cm. long, with few pairs of scalelike leaves at base; leaves 2 to 4 pairs, the median ones obovate-spatulate, broadly oblanceolate, or oblong, 3–5 cm. long, 1.5–2 (–3) cm. wide, obtuse to rounded, with few coarsely undulate teeth, the winged petiole 1.5–3 cm. long; spikes terminal, solitary, 4–8 cm. long, the lowest verticil usually distant, the bracts

broadly oblanceolate; flowers pale blue, many, the upper lip ovate, about 1.5 mm. long, shortly 2-fid, about 2/5 as long as the lower lip, the lower lip nearly as long as the tube, retuse and mucronate; nutlets about 1.5 mm. long.—Apr.–May. Low mountains; Honshu, Shikoku.

5. *Ajuga shikotanensis* Miyabe & Tatew. *A. genevensis* var. *pallidescens* Maxim.; *A. reptans* var. *japonica* Makino; *A. glabrescens* Makino, excl. syn.; *A. pallidescens* (Maxim.) Nakai, non Price & Metcalf—TSURU-KAKO-SŌ. Plant stoloniferous; rhizomes short; stems usually solitary, simple, erect, 10–25 cm. long, rather prominently long-hirsute; basal leaves rosulate; cauline leaves few, narrowly obovate to spatulate-oblong, 2–4 cm. long, 1–2 cm. wide, obtuse, cuneate at base, sessile or subsessile, loosely hirsute, with few undulate teeth, the upper leaves gradually reduced to bracts; leaves of stolons spatulate, petiolate; spikes with 5–10 rather loose verticils; flowers pale purple; corolla-tube 6–7 mm. long, the upper lip scarcely 1 mm. long, bilobed, the lower lip erect, scarcely shorter than the tube, spreading, the midlobe cuneate-obovate, notched at the apex; nutlets about 1.5 mm. long.—May–June. Sunny hills; Honshu; rather rare.—s. Kuriles.

6. *Ajuga yezoensis* Maxim. NISHIKIGOROMO, KIMMON-SŌ. Sparingly crisped-pilose; rhizomes short; stems erect, 8–15 cm. long, rather slender, with 2 or 3 pairs of scales at the base; leaves 3 or 4 pairs; the median ones oblong to broadly ovate, 2–4 cm. long, 1–2 cm. wide, obtuse, cuneate to abruptly narrowed at base, coarsely and obtusely few-toothed, green and often purplish along the nerves above, pale purplish beneath, the petioles winged, 1–2 cm. long, the upper leaves rather small and short-petiolate; verticils rather loose, few-flowered; upper lip of corolla erect, 2.5–3 mm. long, deeply 2-lobed, the lower lip 1/3–1/2 as long as the tube, the lateral lobes broadly lanceolate, slightly narrower than the median; nutlets 1.2–1.5 mm. long.—Apr.–May. Hokkaido, Honshu, Shikoku; rather common.

Var. *tsukubana* Nakai. TSUKUBA-KIMMON-SŌ. Upper lip semirounded, subentire, much shorter than the lower lip, about 1 mm. long.—Honshu, Kyushu.

7. *Ajuga makinoi* Nakai. TACHI-KIRAN-SŌ. Perennial herb, long-pubescent on stems and leaves; stems several together, 5–20 cm. long, ascending, decumbent in fruit, with several pairs of scalelike oblanceolate leaves 1–2 cm. long at base; cauline leaves oblong or oblong-spatulate, acute and long-decurrent on the petiole at base, 3–5 cm. long, 1–1.5 cm. wide in anthesis, 8–10 cm. long, 2–3.5 cm. wide in summer leaves, with few obtuse lobes on margin; flowers several in leaf-axils, subsessile; closely related to *A. yezoensis* but larger; flowers blue-purple, the upper lip erect, 2–3 mm. long, deeply 2-lobed.—Apr.–June. Honshu (Tōkaidō, W. Musashi Prov. and s. Shinano Prov.).

8. *Ajuga decumbens* Thunb. *A. decumbens* var. *sinuata* Fr. & Sav.; *A. decumbens* var. *glabrescens* Fr. & Sav.; *A. devesitata* Lév. & Van't.—KIRANE-SŌ, JIGOKU-NO-KAMA-NO-FUTA.

Prominently whitish crisped-pubescent; rhizomes short; stems 5–10 (–15) cm. long, decumbent or ascending, purplish, with few pairs of leaves; rosulate leaves few, broadly oblanceolate, obtuse, 4–6 cm. long, 1–2 cm. wide, dark green, coarsely undulate-toothed, often purplish; cauline leaves oblong to ovate, narrowed to a short petiolike base; cymes axillary, few-flowered; flowers blue-purple, with darker striations; corolla-tube about 8 mm. long, the upper lip semicircular, about 2 mm. long, retuse or shallowly bilobed; nutlets about 2 mm. long.—Mar.–May. Thin woods and hedges in hills and low mountains; Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and China.

Hybrids: *Ajuga* × *bastarda* Makino. KIRAN-NISHIKI-

GOROMO. (*A. decumbens* × *A. yesoensis*); *Ajuga* × *mixta* Makino. JÜNI-KIRAN-SÖ. (*A. decumbens* × *A. nipponensis*).

9. *Ajuga pygmaea* A. Gray. HIME-KIRAN-SÖ. Plant stoloniferous, loosely white crisped-pubescent; stems 1–5 cm. long; radical leaves rosulate, broadly oblanceolate to narrowly obovate, 2–4 cm. long, 8–10 mm. wide, obtuse, with few coarsely sinuate teeth, petiolate; flowering stems 2–5 cm. long, radical or from the tip of the stolons, the cauline leaves few, small; verticils few, usually shorter than the leaves, approximate; corolla-tube slender, 7–8 mm. long, the upper lip about 3 mm. long, deeply 2-lobed; nutlets about 1.5 mm. long.—Mar.–Apr. Kyushu.—Ryukyus and Formosa.

3. TEUCRIUM L. NIGA-KUSA ZOKU

Annuals or biennials, sometimes perennials or shrubs; leaves entire to pinnatifid; verticils 2- or rarely many-flowered, often forming a terminal spike, the bracts foliaceous or bractlike; calyx tubular or campanulate, 10-nerved, 5-toothed, the teeth equal or the inner ones broader; corolla-tube without an annulus inside, the limb 2-lipped, the upper lip minute, deeply 2-fid, the segments connate to the lateral lobes of the lower lip, the lower lip 3-lobed, the lateral lobes small, erect, the median lobe much larger than the others, sometimes bifid, concave on back; stamens 4, didymous, exerted from the fissure between the lobes of the upper lip, the anterior pair longer; anther-locules divergent and confluent at tip; nutlets obovoid, with raised reticulations, the areole large, oblique or lateral, often occupying more than half the length of the body.—About 100 species, mostly in warmer regions of the N. Hemisphere.

- 1A. Calyx uniformly glandular-hairy; bracts broadly lanceolate; flowers in dense spikes; leaves broadly cuneate at base; upper portion of stems and axis of spikes usually with recurved hairs. 1. *T. viscidum* var. *miquelianum*
- 1B. Calyx glabrescent or minutely glandular-puberulent on upper half, or uniformly long-pilose throughout, rarely sparsely glandular-puberulent.
- 2A. Stems 10–25 cm. long, with long spreading hairs at least on the upper nodes; bracts broadly lanceolate; calyx glandular-hairy.
- 3A. Calyx-teeth incurved in fruit, the upper 3 teeth obtuse in fruit; plants usually densely spreading-pilose; leaves ovate to broadly so, 2.5–4 cm. long. 2. *T. veronicoides*
- 3B. Calyx-teeth erect or only slightly incurved above, acute to acuminate in fruit; plants glabrous except the long hairs on petioles and nodes; leaves narrowly ovate, 3–5 cm. long. 3. *T. teinense*
- 2B. Stems 30–70 cm. long, usually recurved-puberulent; bracts broadly linear; calyx nearly glabrous or loosely puberulent on upper part, not glandular-puberulent, the teeth erect or slightly recurved, acute to acuminate; leaves 5–10 cm. long. 4. *T. japonicum*

1. *Teucrium viscidum* Bl. var. *miquelianum* (Maxim.) Hara. *T. stoloniferum* var. *miquelianum* Maxim.; *T. viscidum* sensu auct. Japon., non Bl.; *T. stoloniferum* sensu auct. Japon., pro parte, non Roxb.; *T. miquelianum* (Maxim.) Kudo—TSURU-NIGA-KUSA. Perennial, 25–40 cm. high, the stems, inflorescence, petioles, and underside of leaves recurved-puberulent; leaves thin, narrowly to broadly ovate, 4–8 (–10) cm. long, 2–4 cm. wide, very acute, usually broadly cuneate at base, irregularly toothed, sometimes thinly puberulent above, the petioles 1.5–3 cm. long; spikes 3–5 cm. long, one-sided, the bracts broadly lanceolate, nearly as long as the calyx; flowers 8–10 mm. long, short-pedicellate; calyx broadly ovoid in fruit, 3–3.5 mm. across, uniformly glandular-puberulent, the upper calyx teeth deltoid, obtuse, the lower 2 narrowly deltoid, acute; nutlets nearly orbicular, inflated-lenticular, 1.2 mm. in diameter, the scar orbicular.—July–Sept. Wet places in lowlands and hills; Honshu, Shikoku, Kyushu. The typical phase occurs in the Ryukyus and Formosa, and Malaysia to India.

2. *Teucrium veronicoides* Maxim. EZO-NIGA-KUSA, HIME-NIGA-KUSA. Perennial stoloniferous herb densely spreading-pilose; stems 20–30 cm. long, erect, sometimes branched; leaves ovate or broadly so, 2.5–4 cm. long, 1.5–2.5 cm. wide, subacute, broadly cuneate to shallowly cordate at base, toothed, the petioles 1–2 cm. long; spikes 4–8 cm. long, one-sided, rather loosely flowered, the bracts rather shorter than the calyx, broadly lanceolate, 1-toothed; flowers about

8 mm. long, pedicellate; calyx descending in fruit, often brownish and lustrous, 3–3.5 mm. long, with loose long glandular hairs on upper part, the upper 3 teeth deltoid, obtuse, the lower 2 narrowly deltoid, very acute; corolla glabrous, the lobes rather narrow; nutlets orbicular, about 1.5 mm. in diameter, with obsolete reticulations.—Aug. Woods in mountains; Hokkaido, Honshu; rather rare.—Korea.

Var. *brachytrichum* Ohwi. INU-NIGA-KUSA. Plant with short spreading hairs and the leaves coarsely toothed.—Honshu (Uzen Prov.).

3. *Teucrium teinense* Kudo. TEINE-NIGA-KUSA. Stoloniferous perennial, nearly glabrous, long-hairy on the nodes; stems 20–30 cm. long, erect; leaves narrowly ovate to ovate-oblong, 3–5 cm. long, 1.5–2.5 cm. wide, acuminate to very acute, broadly cuneate to rounded at base, irregularly toothed, long-hirsute on both sides or only on the upper side, the petioles 1–1.5 cm. long; spikes short; bracts broadly lanceolate; calyx in fruit membranous, about 4 mm. long, very sparsely glandular-puberulent, the teeth narrowly deltoid, acute to acuminate, the innermost tooth sometimes deltoid and obtuse; nutlets about 1.5 mm. long.—Aug. Hokkaido, Honshu (Mount Gassan in Uzen).

4. *Teucrium japonicum* Houtt. *T. nepetoides* Lév.; *T. brevispicum* Nakai—NIGA-KUSA. Glabrescent perennial herb; stems erect, 30–70 cm. long, branched, rather stout, 4-angled, often loosely recurved-puberulent; leaves narrowly ovate-oblong or broadly lanceolate, 5–10 cm. long, 2–3.5 cm.

wide, very acute, rounded to subtruncate at base, irregularly toothed, usually loosely short-pilose on the nerves beneath; spikes 3–10 cm. long, sometimes branched at base, rather densely flowered; bracts broadly linear; calyx in fruit 4–5 mm. long, nearly glabrous or loosely puberulent on upper

part, usually not glandular-pilose, the teeth narrowly deltoid, or the 2 anterior ones lanceolate, acuminate to acute; nutlets about 1.5 mm. long.—July. Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

4. SCUTELLARIA L. TATSU-NAMI-SŌ ZOKU

Perennials or annuals, rarely subshrubs, erect or decumbent; leaves often toothed; flowers paired in the verticils, blue or rose-colored, sometimes yellow; calyx campanulate, bilabiate, the lips entire, short, broad, closed in fruit; corolla-tube long, often geniculate and gibbous, erect, the limb bilabiate, the upper lip erect, galeate, sometimes retuse, the lower lip spreading, the lateral lobes connate to the upper lip or to the midlobe of the lower lip; anthers approximate in pairs, the lower ones more or less reduced and 1-locular, the upper ones 2-locular; nutlets orbicular, often slightly compressed, usually short-tubercled.—About 20 species, widely distributed in temperate regions and mountains of the Tropics.

1A. Flowers 6–8 mm. long; corolla-tube erect from the base or slightly geniculate.

2A. Flowers axillary, solitary, not forming a spike.

3A. Nearly glabrous to minutely puberulent; leaves narrowly deltoid-ovate or broadly deltoid-lanceolate; petioles 1–3 mm. long.

1. *S. dependens*

2. *S. guilelmii*

3B. Spreading-hairy on leaves and calyx; leaves cordate; petioles 1–2 cm. long. 3. *S. shikokiana*

2B. Flowers in a terminal spike; leaves broadly ovate-deltoid, with a few deep teeth on each side. 3. *S. shikokiana*

1B. Flowers 1.5–3 cm. long; corolla-tube erect from the prominently geniculate base (except gently curved upward in *S. pekinensis*).

4A. Flowers in terminal spikes.

5A. Flowers 15–22 mm. long.

6A. Stems with upwardly curved hairs or subglabrous.

7A. Lower lip of corolla about twice as long as the upper lip, straight. 4. *S. pekinensis*

7B. Lower lip of corolla about as long as the upper lip.

8A. Leaves 8–20 mm. wide, ovate to ovate-cordate; spikes few-flowered. 5. *S. amabilis*

8B. Leaves 10–15 mm. wide, ovate-deltoid; spikes many-flowered. 6. *S. laeteviolacea*

6B. Stems with spreading or downwardly curved hairs.

9A. Stems densely spreading-pubescent.

10A. Internodes shorter than the larger leaves. 7. *S. abbreviata*

10B. Internodes longer than the leaves.

11A. Leaves flat, thinly long-hairy. 8. *S. kurokawae*

11B. Leaves minutely uneven on the surface, densely short-hairy. 9. *S. indica*

9B. Stems with downwardly curved hairs.

12A. Stems and leaves puberulent; leaves rounded to broadly cuneate at base. 10. *S. muramatsui*

12B. Stems and leaves long-pubescent; leaves cordate at base.

13A. Leaves tending to be approximate on upper part of stem; spikes short, 0.5–3 cm. long. 11. *S. brachyspica*

13B. Leaves tending to be approximate on lower part of stem; spikes often elongate, 2–8 cm. long. 12. *S. maekawae*

5B. Flowers 27–32 mm. long. 13. *S. iyoensis*

4B. Flowers in axils of cauline leaves. 14. *S. strigillosa*

1. *Scutellaria dependens* Maxim. *S. oldhamii* Miq.—HIME-NAMIKI. Nearly glabrous to minutely puberulent, green, slender, perennial; stems erect, sometimes branched, 10–30 cm. long, acutely 4-angled, puberulent on the angles; leaves narrowly ovate-deltoid or deltoid-lanceolate, 1–2 cm. long, 6–10 mm. wide, obtuse, rounded to shallowly cordate at base, slightly scabrous on margin and on nerves above, with 1 or 2 teeth near base, entire on upper half, the petioles 1–3 mm. long; calyx 1.5 mm. long in anthesis, 2.5–3 mm. long in fruit; corolla white, the lower lip twice as long as the upper, about 1.5 mm. long; nutlets about 0.7 mm. long, densely granular-mammillate. June–Aug.—Hokkaido, Honshu, Shikoku (?), Kyushu.—Korea, Manchuria, and e. Siberia.

2. *Scutellaria guilelmii* A. Gray. *S. hederacea* sensu auct. Japon., non Kunth & Bouché; *S. tanaka* Fr. & Sav.; *S. suzukiana* Honda.—KO-NAMIKI. Slender, green, perennial; stems erect, branched, 20–40 cm. long, angled, glabrous or loosely spreading-pubescent; cauline leaves reniform-cordate or cordate, 1–2 cm. wide, rounded at apex, few-toothed, pubescent on both sides, petiolate; floral leaves ovate or narrowly so, 1–2 cm. long, 5–15 mm. wide, obtuse, rarely sessile; calyx 2.5 mm. long in anthesis, 5–6 mm. long in fruit, spreading-pubescent; corolla white, 7–8 mm. long, the upper lip about half as

long as the erect lower lip; nutlets wing-margined, about 2 mm. across inclusive of the wing, toothed, the lower surface with long linear-filiform white tubercles, the upper surface loosely papillose.—May. Honshu (Awa Prov. and westw.), Shikoku, Kyushu.—Ryukyus.

3. *Scutellaria shikokiana* Makino. MIYAMA-NAMIKI. Green, glabrescent perennial with slender branched rhizomes; stems 5–15 cm. long, angled, glabrous to spreading glandular-hairy often on the upper part; leaves membranous, ovate-deltoid, 2–3 cm. long, 1.5–2.5 cm. wide, subobtusely truncate or very broadly cuneate at base, often scattered hairy, few-toothed, the petioles 1.5–2.5 cm. long; spikes loosely flowered, 1–5 cm. long, nearly glabrous; calyx 2 mm. long in anthesis, 4 mm. long in fruit, with long spreading hairs; corolla white, greenish yellow when dried, 7–8 mm. long, the lower lip descending, 2.5 mm. long, about twice as long as the suberect upper lip; nutlets about 0.5 mm. long, densely mammillate.—July–Aug. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Forma *pubicaulis* Ohwi. KE-MIYAMA-NAMIKI. Plant rather prominently puberulent on upper part of stems.—Kyushu.

4. *Scutellaria pekinensis* Maxim. var. *ussuriensis* (Regel) Hand.-Mazz. *S. japonica* var. *ussuriensis* Regel; *S.*

indica var. *ussuriensis* (Regel) Komar.; *S. dentata* Lév.; *S. ussuriensis* (Regel) Kudo; *S. transita* var. *ussuriensis* (Regel) Hara.—Ezo-TATSU-NAMI-SŌ.

Nearly glabrous perennial; stems erect, slender, slightly branched, few-leaved, often with upwardly curved white hairs on the nodes; leaves thinly membranous, broadly deltoid-ovate, 2–4 cm. long, 1.5–2.5 cm. wide, subobtusely, shallowly cordate, toothed; spikes 3–6 cm. long, loosely flowered; calyx 2–2.5 mm. long in anthesis, about 5 mm. long in fruit; corolla-tube gently curved upward from the base, 15–16 mm. long, pale purple, the lower lip about twice as long as the upper lip, straight, ascending; nutlets about 0.7 mm. long, densely mammillate, gray-fulvous.—July–Aug. Woods in mountains; Hokkaido, Honshu.—Korea, Manchuria, and e. Siberia.

Var. *transita* (Makino) Hara. *S. transita* Makino; *S. ussuriensis* var. *transita* (Makino) Nakai; *S. ussuriensis* var. *tomentosa* Koidz.—YAMA-TATSU-NAMI-SŌ. Plant with upwardly curved white hairs throughout.—Hokkaido, Honshu, Shikoku, Kyushu.—Korea. The typical phase occurs in n. China and Manchuria.

5. *Scutellaria amabilis* Hara. YAMAJI-NO-TATSU-NAMI-SŌ. Rhizomes slender, creeping; stems 15–25 cm. long, ascending-puberulent especially on the angles; leaves broadly ovate to ovate-cordate, 1–2 cm. long, 8–20 mm. wide, truncate to shallowly cordate at base, coarsely obtuse-toothed, puberulent on both sides, the petioles to 2 cm. long; spikes short, few-flowered; calyx 2.5–3 mm. long, glandular-pilose; corolla 2–2.5 cm. long, blue-purple, the upper lip about 4 mm. long, galeate, the lower lip spreading, as long as the upper.—May–June. Honshu.

6. *Scutellaria laeteviolacea* Koidz. *S. indica* var. *japonica* forma *humilis* Makino—SHISŌBA-TATSU-NAMI-SŌ. Rhizomes short; stems erect, 5–15 cm. long, ascending-puberulent; leaves few, ovate-deltoid, 1–2 cm. long, 1–1.5(–2) cm. wide, obtuse, truncate at base, coarsely obtuse-toothed, with ascending hairs on both sides, purplish beneath; spikes usually short, 1–3 cm. long, many-flowered, ascending-puberulent; calyx 2.5 mm. long in flower, about 5 mm. long in fruit; corolla 17–20 mm. long, purplish, the lower lip spreading, the upper lip arcuate, galeate, as long as the lower; nutlets about 1 mm. long, densely mammillate.—May–June. Honshu, Shikoku, Kyushu.

Var. *discolor* (Hara) Hara. *S. kiusiana* Hara, incl. var. *discolor* Hara—TSUKUSHI-TATSU-NAMI-SŌ. Plants taller, 20–30 cm. high; leaves larger, 2–4 cm. long; spikes more or less elongate.—Honshu. (w. distr.), Kyushu.

Var. *yakusimensis* (Masam.) Hara. *S. indica* var. *yakusimensis* Masam.—YAKUSHIMA-NAMIKI. Plant smaller, often without decumbent stems and rather numerous leaves.—Kyushu (Yakushima).

7. *Scutellaria abbreviata* Hara. *S. japonica* var. *ussuriensis* forma *humilis* Matsum. & Kudo.—TŌGOKU-SHISŌBA-TATSU-NAMI-SŌ. Resembles the preceding; stems 5–30 cm. long, with spreading white hairs; leaves reniform to ovate-cordate, 2–3(–5) cm. long and as wide; spikes 2–5 cm. long, spreading-hairy; calyx 3 mm. long in anthesis, 6 mm. long in fruit; corolla purple, 20–22 mm. long, puberulent.—June–July. Honshu.

8. *Scutellaria kurokawae* Hara. IGA-TATSU-NAMI-SŌ. Stems 10–30 cm. long, prominently spreading-hairy; leaves ovate to broadly so, or ovate-cordate, 1.2–2.5 cm. long, 1.2–2 cm. wide, obtuse, truncate to shallowly cordate at base, obtuse-

toothed, thinly long-hairy, often purplish beneath, the petioles 1–2.5 cm. long, spreading-hairy; spikes loosely flowered; calyx 3 mm. long, often with glandular hairs; corolla pale purple, about 2 cm. long.—June. Honshu (centr. distr.).

9. *Scutellaria indica* L. TATSU-NAMI-SŌ. Rhizomes slender, creeping; stems erect, 20–40 cm. long, prominently white-pilose; leaves loosely few-paired, deltoid-cordate to broadly ovate, obtuse, cordate at base, obtusely toothed, spreading-hairy, often prominently pubescent on both sides, the petioles 5–20 mm. long, the upper leaves sometimes orbicular, 1–2.5 cm. in diameter; spikes 3–8 cm. long, with prominent spreading hairs; calyx about 3 mm. long in anthesis, 6–7 mm. long in fruit; corolla 18–22 mm. long, geniculate at the base, becoming erect above, pale purple; nutlets about 1 mm. long, densely mammillate.—May–June. Sunny hills; Honshu, Shikoku, Kyushu; common.—Korea, China, Indochina, Formosa, and Ryukyu.

Var. *parvifolia* (Makino) Makino. *S. indica* var. *japonica* forma *parvifolia* Makino; *S. parvifolia* (Makino) Koidz.—KŌBA-NO-TATSU-NAMI, BIRŌDO-TATSU-NAMI. Stems shorter, 5–20 cm. long, long-decumbent at base; leaves small, usually about 1 cm. long and as wide, more sparsely toothed.—Apr.–June. Honshu (centr. and w. distr.), Shikoku, Kyushu.

Var. *tsusimensis* (Hara) Ohwi. *S. tsusimensis* Hara—ATSUBA-TATSU-NAMI-SŌ. Plant rather large, 10–30 cm. high; leaves 2–4 cm. long and as wide, shallowly cordate to truncate at base, with impressed nerves above.—Honshu (w. distr.), Kyushu.—Korea.

10. *Scutellaria muramatsui* Hara. DEWA-NO-TATSU-NAMI-SŌ. Stems ascending, 10–30 cm. long, very short recurved-puberulent; leaves deltoid-ovate to ovate, sometimes ovate-cordate in the lower ones, 2–3.5 cm. long, 1–2.5 cm. wide, obtuse, rounded to broadly cuneate at base, scattered undulate-toothed, loosely pilose above, puberulent on the nerves beneath; spikes 3–5 cm. long, the axis with simple spreading and glandular hairs; calyx 1.5–2 mm. long; corolla 15–18 mm. long, purple.—May–June. Honshu (n. and Hokuriku Distr.).

11. *Scutellaria brachyspica* Nakai & Hara. *S. indica* var. *brachyspica* Nakai ex Hara, in syn.—OKA-TATSU-NAMI-SŌ. Stems erect, 10–50 cm. long, loosely leafy, densely recurved-hairy; leaves deltoid-ovate to ovate, 1.5–5 cm. long, 1–4 cm. wide, obtuse, truncate to subcordate at base, coarsely obtuse-toothed, spreading-pilose on both sides, the petioles to 2 cm. long, densely recurved to spreading-hairy; spikes short, 0.5–3(–5) cm. long, densely flowered, the axis with spreading and glandular hairs; corolla 15–25 mm. long; nutlets about 1.5 mm. across, densely mammillate.—May–June. Honshu, Shikoku; rather common.

12. *Scutellaria maekawae* Hara. *S. indica* var. *intermedia* Nakai ex Hara, in syn.—HONAGA-TATSU-NAMI-SŌ. Stems 7–20 cm. long, recurved-hairy on the angles; leaves ovate to ovate-cordate, 1–3 cm. long, 1.5–2.5 cm. wide, very obtuse, obtuse-toothed, purplish beneath, pilose toward margin above and on nerves beneath; spikes 2–8 cm. long, the axis recurved-hairy; calyx 2.5 mm. long in anthesis, about 5 mm. long in fruit; corolla 2–2.2 cm. long, purple; nutlets 1.5 mm. long, densely papillose.—June. Honshu (centr. and w. distr.).

Var. *pubescens* Hara. SHIMAJI-TATSU-NAMI-SŌ. Plant more densely hairy.—Occurs with the typical phase.

13. *Scutellaria iyoensis* Nakai. HANA-TATSU-NAMI-SŌ. Stems erect, 10–40 cm. long, 4-angled, ascending-puberulent; leaves broadly lanceolate to narrowly ovate, 3–6 cm. long, 1–2.5 cm. wide, acute, cuneate to subtruncate at base, usually glandular-dotted on both sides, coarsely deltoid-toothed, ciliate, the petioles 1–5 mm. long; spikes 2–5 cm. long, loosely flowered, the pedicels appressed-pilose; calyx 3–3.5 mm. long; corolla 27–32 mm. long, blue-purple.—May–June. Honshu (Chūgoku Distr.), Shikoku.

14. *Scutellaria strigillosa* Hemsl. *S. cordifolia* var. *pubescens* Miq.; *S. scordifolia* var. *hirta* F. Schmidt; *S. galericulata* forma *hirta* (F. Schmidt) Koidz.; *S. scordifolia* var. *sachalinensis* Matsum. & Kudo; *S. scordifolia* var. *nipponica* Matsum. & Kudo; *S. schmidtii* Kudo—NAMIKI-SŌ. Rhizomes slender, long-creeping; stems 10–40 cm. long, 4-angled, pubescent; leaves elliptic to oblong, 1.5–3.5 cm. long, 1–1.5 cm.

wide, truncate to rounded at base, more or less pubescent on both sides, sometimes densely so, the petioles 1–4 mm. long, with few minute teeth on both sides; flowers solitary in axils of upper cauline leaves; calyx about 3 mm. long in anthesis, about 5 mm. long in fruit; corolla 2–2.2 cm. long, erect from the arcuate base, blue-purple; nutlets about 1.8 mm. long, semirounded, densely mammillate.—July–Aug. Sandy places along seashores; Hokkaido, Honshu, Shikoku, Kyushu (Tsushima); very variable.—Sakhalin, Kuriles, Korea, and Manchuria.

Var. *yezoensis* (Kudo) Kitam. *S. yezoensis* Kudo—EZO-NAMIKI-SŌ, Ō-NAMIKI-SŌ. Stems softer, glabrescent, upwardly puberulent only on the angles; leaves ovate or narrowly ovate, obtuse to subacute at apex.—Wet places; Hokkaido, Honshu (n. distr.).—Kuriles, Sakhalin, and Korea.

5. AGASTACHE Clayt. ex Gronov. KAWA-MIDORI ZOKU

Erect herbs; leaves toothed; verticils many-flowered, often forming a dense terminal spike, the bracteoles linear; flowers blue or purple; calyx tubular, 5-toothed, 15-nerved, oblique at the mouth, the upper teeth rather longer than the others; corolla-tube as long as to slightly longer than the calyx, broadened at tip, the limb bilabiate, the upper lip suberect, emarginate to bifid, the lower lip somewhat spreading, 3-lobed, the midlobe broader, undulately toothed; stamens 4, slightly exserted, the anthers 2-locular, the locules parallel; style bifid; nutlets ovoid, smooth.—Few species, in e. Asia and N. America.

1. *Agastache rugosa* (Fisch. & Mey.) O. Kuntze. *Lophanthus rugosus* Fisch. & Mey.; *Cedronella japonica* Hassk.; *L. formosanus* Hayata—KAWA-MIDORI. Perennial herb; stems erect, 40–100 cm. long, 4-angled, branched in upper part, white-puberulent; leaves thinly membranous, ovate-cordate or ovate, 5–10 cm. long, 3–7 cm. wide, acuminate, cordate to rounded at base, toothed, nearly glabrous above, often whitish beneath, the petioles 1–4 cm. long; spikes 5–15 cm. long, about 2 cm. across, densely many-flowered, often interrupted below,

bracteate; calyx 5–6 mm. long, the teeth narrowly deltoid, acute, about 1/3 as long as the calyx; corolla purple, 8–10 mm. long, the limb short; stamens long-exserted; nutlets obovate-elliptic, compressed-trigonal, 1.8 mm. long, rounded and without a ridge at apex, puberulent above.—Aug.–Oct. Grassy places in mountains especially along streams and valleys; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, e. Siberia, China, and Formosa.

6. MEEHANIA Britt. RASHŌMON-KAZURA ZOKU

Soft green sometimes stoloniferous perennials; leaves opposite, petiolate, toothed; verticils few, few-flowered, distant, the bracts leaflike or small, the bracteoles small, subulate; calyx campanulate or tubular-campanulate, 15-nerved, bilabiate, the upper lip bifid, the lower ones 3-fid, the teeth narrowly deltoid, acute; corolla-tube gradually broadened to the tip, the limb bilabiate, the upper lip bifid, concave on back, the lower lip 3-lobed; stamens 4, parallel, not exserted; style 2-fid at apex; nutlets ovate, smooth.—Few species, in e. Asia and N. America.

- 1A. Stolons elongate, leafy; verticils forming a terminal spike; plant with long-spreading whitish hairs. 1. *M. urticifolia*
 1B. Stolons absent; verticils not forming a distinct spike; plant without long-spreading hairs. 2. *M. montis-koyae*

1. *Meehania urticifolia* (Miq.) Makino. *Dracocephalum urticifolium* Miq.; *Cedronella urticifolia* (Miq.) Maxim.; *Glechoma urticifolia* (Miq.) Makino—RASHŌMON-KAZURA. More or less long-pubescent stoloniferous green herb; flowering stems erect, 15–30 cm. long, with few pairs of leaves; cauline leaves thinly membranous, deltoid-cordate to ovate-cordate, 2–5 cm. long, 2–3.5 cm. wide, acute, coarsely obtuse-toothed, the petioles 2–5 cm. long; leaves of the stolons to 10 cm. long; flowers 3–12, in loose terminal one-sided spikes, the bracts broadly ovate, 7–15 mm. long, the pedicels and sometimes also the floral axis minutely puberulent; calyx about 1 cm. long; corolla purple-blue, 4–5 cm. long, the upper lip suberect, 8–10 mm. long, the lower lip with a larger, obcordate, retuse median lobe and with spreading, dark-spotted lateral lobes; nutlets narrowly obovate, about 3 mm. long, loosely

puberulent.—Apr.–May. Damp woods in mountains; Honshu, Shikoku, Kyushu.—Manchuria and Korea.

2. *Meehania montis-koyae* Ohwi. *M. urticifolia* var. *montis-koyae* (Ohwi) Ohwi—ŌCHI-FUJI. Perennial herb without stolons; stems 20–25 cm. long, slender, minutely puberulent, erect or ascending, loosely few-leaved; leaves thinly membranous, deltoid-cordate, 2–4 cm. long and as wide, obtuse, sparingly pilose, undulate-toothed, the petioles spreading, 1.5–3 times as long as the blades; flowers few, solitary in axils, short-pedicelled; calyx tubular-campanulate, about 1 cm. long, glandular-puberulent; corolla about 4 cm. long, sparingly pubescent externally, the tube gradually broadened in upper part, the limb bilabiate, the upper lip bifid, the lower lip 3-fid, the median lobe larger.—May. Woods in mountains; Honshu (Kii Prov. and Chūgoku Distr.); rare.

7. NEPETA L. INU-HAKKA ZOKU

Erect herbs; leaves toothed; verticils dense, forming a terminal spike; calyx tubular, straight or slightly curved, 15-nerved, oblique at the mouth and with 5 equal teeth; corolla-tube broadened in upper part, narrowed at base, the limb bilabiate, the upper lip erect, slightly concave on back, bifid, the lower lip 3-lobed, the midlobe large, bilobed, spreading; stamens 4, the upper pair ascending, the lower pair suberect, the anther-locules divergent; style bifid, the lobes equal; nutlets elliptic, smooth. —About 150 species, in the temperate regions of the Old World.

- 1A. Leaves ovate to broadly lanceolate, usually 6–12 cm. long, sessile or the petioles 3–5 mm. long; flowers purple, 22–30 mm. long; calyx 8–10 mm. long, the teeth acuminate with an obtuse tip. 1. *N. subsessilis*
 1B. Leaves deltoid-ovate, 3–6 cm. long, shallowly cordate, broadest above the base, the petioles 1–3 cm. long; flowers pale purple, 8–10 mm. long; calyx 5–7 mm. long, the teeth spine-tipped. 2. *N. cataria*

1. *Nepeta subsessilis* Maxim. *Glechoma subsessilis* (Maxim.) O. Kuntze; *N. fauriei* Lévl.—MISOGAWA-SŌ. Tall perennial herb; stems rather stout, erect, often branched, 50–100 cm. long, puberulent; leaves submembranous, broadly ovate to broadly lanceolate, usually narrowly ovate, 6–12 cm. long, 2.5–8 cm. wide, acuminate, rounded at base, obtusely toothed, puberulent on both sides, more densely so on nerves beneath, subsessile or the petioles 3–5 mm. long; cymes many-flowered, sometimes short-pedunculate; calyx 8–10 mm. long, with raised nerves, 5-fid, the teeth linear-lanceolate, acuminate, the 2 dorsal teeth connate on lower 1/3; corolla purple, 22–30 mm. long; nutlets obovate-oblong, compressed-trigonus, about 3 mm. long, loosely white-pilose on upper side, rounded at apex.—July–Aug. Wet shaded slopes in mountains; Honshu, Shikoku.

Var. *yesoensis* Fr. & Sav. EZO-MISOGAWA-SŌ. Petioles

about 1 cm. long; corolla about 30 mm. long, rarely white. —Hokkaido and Honshu (centr. and n. distr.).—Forma *albiflora* Tatew. SHIROBANA-EZO-MISOGAWA-SŌ. Flowers white.

2. *Nepeta cataria* L. *N. minor* Mill.—INU-HAKKA, CHIKUMA-HAKKA. Prominently white-puberulent perennial herb 50–100 cm. high; stems branched; leaves deltoid-ovate, 3–6 cm. long, 2–3.5 cm. wide, acute, shallowly cordate at base, coarsely toothed or incised, the petioles 1–3 cm. long; spikes often paniculately branched, dense, 2–4 cm. long; calyx 5–7 mm. long, spreading-puberulent, distinctly ribbed, the teeth spine-tipped; corolla pale purple, 8–10 mm. long; nutlets elliptic, 1.5 mm. long, slightly compressed, black-brown, smooth, slightly inflated on ventral face, the areole transversely broadened, white.—July–Aug. Naturalized in Honshu (Shinano Prov. and northw.).—Korea, China, to w. Asia and Europe.

8. GLECHOMA L. KAKIDŌSHI ZOKU

Creeping or ascending perennial herbs; leaves toothed; verticils few-flowered, distant; flowers blue or purple, pedicelled; calyx tubular or campanulate, 15-nerved, slightly oblique at mouth, bilabiate, the upper lip 3-lobed, connate at base, the lower lip bifid with narrow lobes; corolla-tube ampliate in upper part, the limb bilabiate, the upper lip rather flat, erect, retuse, the lower lip spreading, 3-lobed, the midlobe large, retuse; stamens 4, parallel, ascending under the upper lip of corolla; style 2-fid, the lobes equal; nutlets smooth.—Few species, in the N. Hemisphere.

1. *Glechoma hederacea* L. var. *grandis* (A. Gray) Kudō. *G. hederacea* subsp. *grandis* (A. Gray) Hara; *Nepeta glechoma* var. *grandis* A. Gray; *G. grandis* (A. Gray) Kudo, in syn.; *G. hederacea* var. *minor* Honda—KAKIDŌSHI. Perennial creeping herb; stems tufted, erect, 5–20 cm. long; creeping stems 50 cm. or more long, with spreading hairs; leaves reniform to cordate, 1.5–2.5 cm. long, 2–3 cm. wide, coarsely obtuse-toothed, slightly pubescent on both sides, long-petiolate; flowers 1–3 in leaf-axils, the pedicels short, puberulent; calyx

7–9 mm. long, spreading-pilose, the teeth short spine-tipped; corolla rose-purple, 15–25 mm. long, the upper lip retuse, the lower lip obliquely spreading, dark-spotted, twice as long as the upper; nutlets ellipsoidal, 1.8 mm. long, rounded, slightly compressed, keeled on the ventral face, obscurely glandular-dotted, nearly smooth.—Apr.–May. Hedges and thickets in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Temperate regions of e. Asia, Formosa, and Korea.

9. DRACOCEPHALUM L. MUSHARINDŌ ZOKU

Annuals, biennials, or perennials, sometimes subshrubs, with erect or ascending stems; leaves entire or toothed, sometimes palmately pinnatifid; cymes many-flowered, axillary, often in terminal spikes; flowers purple, blue, or rarely white; calyx tubular, 15-nerved, bilabiate, the upper lip 3-lobed, more or less connate at base, the lower lip 2- to 4-lobed; corolla-tube ampliate in upper part, the limb bilabiate, the upper lip erect, entire, concave on back, the lower lip spreading, 3-lobed, the midlobe large, shallowly lobed at apex; stamens 4, didymous, the anther-locules 2 or reduced to 1; nutlets smooth.—About 40 species, in Eurasia.

1. *Dracocephalum argunense* Fisch. ex Link. *D. ruyschiana* var. *speciosum* Ledeb.; *D. ruyschiana* var. *japonicum* A. Gray; *D. ruyschiana* var. *argunense* (Fisch.) Nakai; *D. japonicum* (A. Gray) Kudo—MUSHARINDŌ. Rhizomes short; stems 15–40 cm. long, simple or branched, rather prominently whitish recurved-hairy, usually with a tuft of leaves

from the abbreviated lateral branches in axils; cauline leaves rather thick, linear or narrowly oblong-lanceolate, 2–5 cm. long, 2–5 mm. wide, obtuse, acute at base, entire, recurved on margin, glabrous and lustrous above, loosely ascending-puberulent on the raised midrib beneath, the petioles 1–3(–7) mm. long; spikes 2–5 cm. long, densely flowered, the bracts nar-

rowly ovate, shorter than the calyx except the lower ones; calyx 12–15 mm. long, rather unequally 5-lobed to near the middle, narrow, usually spreading-pubescent, with raised nerves, the lobes short spine-tipped; corolla 3–3.5 cm. long, blue-purple, pubescent externally; anthers bearded; nutlets ovate-orbicular,

compressed-trigonal, black, about 2.5 mm. long, rounded on both ends, the areole transversely oblong, white.—June–July. Sunny dry slopes in mountains; Hokkaido, Honshu (Kinki Distr. and northw.).—Korea, n. China, Manchuria, and e. Siberia.

10. PRUNELLA L. UTSUBOGUSA ZOKU

Perennial herbs with opposite, entire to pinnately lobed leaves; verticils many, few-flowered, in dense terminal spikes; flowers purplish or white; calyx tubulose, about 10-nerved, bilabiate, the upper lip flat, truncate, with 3 short teeth, the lower lip bifid, the lobes lanceolate; corolla-tube with a ring of hairs inside near base, the limb bilabiate, the upper lip galeate, the lower lip 3-lobed, with a larger midlobe concave on back, and reflexed lateral lobes; stamens 4, didymous, the filaments often toothed at top; style bifid, the lobes equal; nutlets oblong, smooth.—Few species, in temperate regions and in mountains of the tropics.

- 1A. Petioles 10–30 mm. long; stems usually ascending or short-decumbent at base; flowers about 2 cm. long, blue-purple; filaments with a tooth on upper part. 1. *P. vulgaris*
 1B. Petioles 0.5–(10) mm. long; stems usually erect from the base; flowers about 3 cm. long, rose-purple; filaments without teeth. 2. *P. prunelliformis*

1. *Prunella vulgaris* L. var. *lilacina* (Nakai) Nakai. *P. vulgaris* forma *lilacina* Nakai; *P. vulgaris* sensu auct. Japon., pro parte, non L.; *P. asiatica* Nakai; *P. vulgaris* subsp. *asiatica* (Nakai) Hara—UTSUBOGUSA. Stoloniferous; stems, leaves and inflorescence coarsely white-pilose; stems ascending or short-decumbent at base, erect, 20–30 cm. long, with few pairs of leaves, sometimes branched; leaves broadly lanceolate to ovate, usually ovate-oblong, 3–6 cm. long, 2–4 cm. wide, sub-obtuse, cuneate to rounded at base, with few mucronate teeth, the petioles 1–3 cm. long, the upper leaves usually sessile; spikes densely many-flowered, 3–8 cm. long, about 2 cm. across, the bracts depressed-cordate, long-ciliate, broadly cuspidate; calyx 7–10 mm. long, the teeth short spine-tipped; flowers blue-purple, about 2 cm. long; corolla toothed on the mid-lobe of lower lip; filaments with a tooth on upper part; nutlets about 1.6 mm. long, yellow-brown, lustrous, obtusely compressed-trigonal, rounded at apex, with few pale longitudinal lines on margin and on both faces, the areole small.—June–Aug. Sunny places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.

Var. *aleutica* Fern. *P. japonica* Makino; *P. vulgaris* var. *japonica* (Makino) Kudo—MIYAMA-UTSUBOGUSA. Stems suberect from the base, estoloniferous, innovation shoots short.

—Hokkaido, Honshu (n. and centr. distr.).—Kuriles, Korea, cooler regions of e. Asia, and the Aleutians. Grades into the typical phase which occurs in Europe.

2. *Prunella prunelliformis* (Maxim.) Makino. *Draccephalum prunelliforme* Maxim.; *Prunellopsis prunelliformis* (Maxim.) Kudo—TATEYAMA-UTSUBOGUSA. Scattered caespitose; rhizomes short; stems usually tufted, erect, 25–50 cm. long, with 5–10 pairs of leaves; leaves narrowly to broadly ovate, 3–8 cm. long, 1.5–4 cm. wide, subacute to obtuse, rounded or sometimes broadly cuneate at base, sessile or short-petiolate; spikes 1–5 cm. long, about 2.5 cm. across, densely many-flowered, the bracts depressed deltoid-ovate, long-ciliate; calyx 1–1.5 cm. long, glabrous inside, the teeth spine-tipped; corolla rose-purple, about 3 cm. long, glabrous to scattered long-pubescent outside, papillose on lower half of the tube inside, with a ring of hairs about 1.5 mm. above the base, midlobe of lower lip prominently toothed on margin; anther-locules pubescent on margin; nutlets lenticular, about 2 mm. long, rounded at apex, yellow-brown, rather lustrous, with few longitudinal striations on both faces and on margin, the areole slightly convex.—Aug. Alpine slopes; Honshu (centr. and n. distr.).

11. CHELONOPSIS Miq. JAKŌ-SŌ ZOKU

Tall erect herbs sometimes slightly woody at base; leaves coarsely toothed; verticils loosely 2- to 10-flowered, distant; flowers relatively large; calyx papery, campanulate, 10-nerved, much inflated in fruit, bilabiate, the upper lip 3-toothed, the lower lip 2-toothed; corolla-tube amplate, the limb subbilabiate, the upper lip retuse, the lower lip 3-lobed, ascending, the midlobe larger than the others; stamens 4, didymous, the anther-locules bearded in front; style with 2 equal lobes; nutlets flattened dorsally, veiny, winged on upper margin.—Few species, in Japan and China.

- 1A. Peduncles 2–12 mm. long, nearly as long as the petiole. 1. *C. moschata*
 1B. Peduncles 3–4 cm. long, much longer than the petiole. 2. *C. longipes*

1. *Chelonopsis moschata* Miq. *C. moschata* var. *subglabra* Miq.; *C. subglabra* (Miq.) Koidz.; *C. yagiharana* var. *jeseensis* Koidz.; *C. yagiharana* Hisauchi & Matsuno; *C. subglabra* var. *jeseensis* (Koidz.) Hara; *C. moschata* var. *jeseensis* (Koidz.) Miyabe & Tatew.; *C. moschata* var. *lasiocalyx* Hayata—JAKŌ-SŌ. Rhizomatous; stems tufted, erect, 60–100 cm. long, declined or ascending in upper part, simple, loosely pilose or nearly glabrous; leaves membranous, narrowly obovate or broadly oblanceolate, 10–20 cm. long, 3–10 cm. wide, long-acuminate, usually auriculate at base, scattered-pilose above,

loosely spreading-pilose on nerves beneath, the petioles 5–12 mm. long; flowers 1–3, in axillary cymes; calyx 1–1.5 cm. long at anthesis, ovoid-globose, to 18 mm. long in fruit, the lower lip at anthesis shorter than the upper; corolla rose-colored, tubular, 4–4.5 cm. long, with a short upper lip; nutlets 7–8 mm. long, elliptic, glabrous, flattened.—Aug.–Sept. Wet places along streams and valleys; Hokkaido, Honshu, Shikoku.

2. *Chelonopsis longipes* Makino. *C. moschata* var. *longipes* Makino—TANI-JAKŌ-SŌ. Stems 50–100 cm. long,

usually purplish in upper part, often loosely spreading-hairy; leaves broadly lanceolate to narrowly obovate-oblong, long-acuminate, auriculate at base, the nerves pilose on both sides, the petioles 5-10 mm. long; peduncles axillary, 3-4 cm. long, puberulent, 1- to 3-flowered, the bracts filiform; calyx ap-

pressed-puberulent, 7-8 mm. long at anthesis, 15-18 mm. long and much inflated in fruit, the lower lip shorter, with short teeth; corolla 3.5-4 cm. long, rose-purple; nutlets about 1 cm. long.—Sept.-Oct. Low mountains; Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu.

12. GALEOPSIS L. CHISHIMA-ODORIKO-SŌ ZOKU

Herbs; leaves opposite, toothed; cymes axillary, sometimes forming a terminal spike, 6- to many-flowered; calyx tubular-campanulate, 10-nerved, the teeth 5, short spine-tipped; corolla-tube erect, broadened on the throat, without or with an imperfect ring of hairs inside at base, the limb bilabiate, the upper lip ovate, arcuate, the lower lip spreading, 3-lobed, the lateral lobes ovate, the midlobe obovate, with 2 conical tubercles near base; stamens 4, exserted, the anther-locules transversely split; nutlets lenticular, obovate, obtusely margined.—About 7 species, in Eurasia, naturalized in N. America.

1. *Galeopsis bifida* Boenn. *G. tetrahit* var. *parviflora* Benth.; *G. tetrahit* var. *bifida* Syme; *G. tetrahit* sensu auct. Japon., non L.; *G. bifida* var. *emarginata* Nakai.—CHISHIMA-ODORIKO-SŌ, ITASHIJI-SŌ. Erect prominently hispid annual; stems branched, 25-50 cm. long; leaves rather thin, ovate or narrowly so, sometimes ovate-oblong, 4-8 cm. long, 2-3.5 cm. wide, acuminate with an obtuse tip, usually broadly cuneate, obtusely to acutely toothed, the petioles 1-2 cm. long; cymes

dense, few, subsessile, the bracteoles linear, spinelike, nearly as long as the calyx or calyx-tube; calyx 7-8 mm. long, long-hispid, loosely glandular-pilose on lower half, the teeth nearly as long as the tube, obliquely spreading, prominently spine-tipped; corolla about 10 mm. long, rather slender; nutlets about 2.5 mm. long, smooth, obovate-orbicular.—July-Aug. Hokkaido, Honshu (Nikko, Kamikochi in Shinano).—Sakhalin, Kuriles, Korea, Siberia, and Europe.

13. STACHYS L. INU-GOMA ZOKU

Annuals, biennials, perennials, or small shrubs; leaves toothed; verticils 2- to many-flowered, or forming a terminal spike; flowers subsessile, rose-purple, white, or yellow; calyx 5- or 10-nerved, 5-toothed; corolla-tube usually with a ring of hairs inside, the limb bilabiate, the upper lip erect, dilated, or galeate, the lower lip spreading, 3-lobed, the middle lobe larger; stamens 4, didymous, the anther locules longitudinally split; nutlets ovate or oblong, truncate at apex.—About 200 species, nearly cosmopolitan, except Australia.

1. *Stachys japonica* Miq. *S. baicalensis* var. *japonica* (Miq.) Komar.; *S. aspera* var. *japonica* (Miq.) Maxim.; *S. aspera* var. *chinensis* forma *glabrata* Nakai; *S. japonica* forma *glabra* Kudo; *S. riederi* var. *japonica* (Miq.) Hara.—KE-NASHI-INU-GOMA, CHŌSEN-INU-GOMA. Stoloniferous, smooth and nearly glabrous except white-hairy on nodes of stems; stems erect, 30-60 cm. long; leaves lanceolate, deltoid-lanceolate or linear-lanceolate, 4-8 cm. long, 1-2.5 cm. wide, subacute, truncate to rounded at base, toothed, smooth, the petioles 5-15 mm. long; floral bracts sessile, 7-15 mm. long; verticils several-flowered, subsessile; flowers pinkish, 12-15 mm. long; calyx 6-8 mm. long, usually loosely puberulent, the teeth spreading, short spine-tipped, narrowly deltoid, slightly shorter than the tube; nutlets suborbicular, 1-7 mm. long, unequally biconvex, ob-

tuse on margin, rounded at apex.—July-Aug. Wet places in lowlands; Hokkaido, Honshu, Kyushu; rather common.—Sakhalin and s. Kuriles.

Var. *intermedia* (Kudo) Ohwi. *S. japonica* forma *intermedia* Kudo.—INU-GOMA. Stems retrorsely scabrous, the leaves with the midrib often scabrous beneath.—Hokkaido, Honshu, Shikoku, Kyushu; common.

Var. *villosa* (Kudo) Ohwi. *S. japonica* forma *villosa* Kudo.—EZO-INU-GOMA. Leaves and stem-angles coarsely hispid.—Hokkaido, Honshu.

S. affinis Bunge. *S. sieboldii* Miq.; *S. tubifera* Naud.—CHOROGI. Cultivated plant of Chinese origin yielding edible tuberlike rhizomes.

14. LEONURUS L. ME-HAJIKI ZOKU

Erect herbs; leaves opposite, coarsely toothed and incised, or in the lower ones palmately parted; verticils many-flowered, loose; calyx obconical or tubular-campanulate, nearly equally 5-toothed, 5-nerved, the teeth ascending, spine-tipped; corolla-tube short, the limb bilabiate, the upper lip nearly erect, oblong, entire, white-villous on back, the lower lip spreading, 3-lobed; stamens 4, didymous, the anthers glabrous; nutlets smooth, compressed-trigonal, truncate.—About 10 species, in Europe and Asia.

1A. Leaves palmately lobed to parted; flowers 12-15 mm. long; calyx 6-7 mm. long, densely white-puberulent, gray-green or whitish green.

1B. Leaves coarsely toothed or incised; flowers 25-32 mm. long; calyx 15-18 mm. long, loosely hirsute, green to yellowish green.

2. *L. macranthus*

1. *Leonurus sibiricus* L. *L. japonicus* Houtt.; *Stachys artemisia* Lour.—ME-HAJIKI. Gray-green biennial with white short-appressed pilose hairs; stems 50-100 cm. long, erect, branched; radical leaves ovate-cordate, obtusely toothed and incised, long-petiolate, withering before anthesis; cauline

leaves 5-10 cm. long, pinnatisect, cuneate at base, long-petioled, the upper leaves gradually smaller, often entire, lanceolate or linear; flowers few, dense, 12-15 mm. long, the bracteoles usually shorter than the calyx, spinelike; calyx-teeth short spine-tipped, ascending in fruit; corolla rose-colored; nutlets

black, subcuneate, acutely 3-angled, slightly compressed, truncate at apex, glabrous.—July–Sept. Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, Korea, and China.

2. *Leonurus macranthus* Maxim. *L. japonicus* Miq., non Houtt.—KISE-WATA. Pubescent perennial; stems stout, firm, erect, simple or slightly branched; leaves chartaceous, ovate or narrowly so, 6–10 cm. long, 3–6 cm. wide, acute to acuminate, broadly cuneate to truncate at base, incised or with large, deep, acute teeth, the petioles 1–5 cm. long, the upper

leaves gradually smaller, broadly lanceolate to narrowly ovate, often entire, the petioles about 1 cm. long; flowers few, in interrupted verticils, subsessile, 25–32 mm. long, pink; calyx-teeth prominently spine-tipped, the lower lip of corolla shorter than the upper; nutlets about 2.5 mm. long, cuneate-obovate, acutely 3-angled, truncate at apex, black.—Aug.–Sept. Grassy places and thickets in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and China.

15. LAMIAM L. ODORIKO-SŌ ZOKU

Annuals or perennials; leaves usually cordate, toothed; verticils densely many-flowered, distant or approximate in upper ones, the bracteoles short, linear or lanceolate, sometimes spinelike; flowers purple, white, rarely yellow, sometimes dimorphic; calyx tubular or obconical-campanulate, 5-nerved, 5-toothed; corolla-tube usually exserted, widened toward the throat, the limb bilabiate, the upper lip erect and concave on back or galeate, the lower lip spreading, 3-lobed, the median lobe larger, retuse, usually narrowed at base; stamens 4, didymous, the anther-locules divergent, barbate or glabrous; nutlets trigonous, smooth or minutely tubercled, usually with acute margin.—About 40 species, in temperate regions of Eurasia and Africa.

1A. Annuals or biennials; flowers less than 2 cm. long, often cleistogamous; corolla-tube usually without a ring of hairs inside.

2A. Floral leaves sessile, rather loosely arranged throughout, green; calyx with incurved or erect teeth. 1. *L. amplexicaule*

2B. Floral leaves short-petiolate, approximate toward top of stems, often somewhat purplish; calyx with obliquely spreading teeth. 2. *L. purpureum*

1B. Perennials; flowers 15–40 mm. long; corolla-tube with a ring of hairs inside.

3A. Flowers 15–22 mm. long; corolla-tube erect; calyx-teeth deltoid-lanceolate, spine-tipped; anther-locules glabrous.

4A. Leaves not approximate at any point, loosely arranged.

5A. Plant 10–25 cm. high, tuberous, stoloniferous; calyx-teeth nearly equal. 3. *L. chinense* var. *tuberiferum*

5B. Plants 40–70 cm. high, rhizomatous; outer 2 calyx-teeth longer and connate at base. 4. *L. ambigua*

4B. Leaves of 2 or 3 pairs, crowded toward the top of short stems. 5. *L. humile*

3B. Flowers 3.5–4 cm. long; corolla-tube slightly curved upward near base; calyx-teeth linear-filiform, not spine-tipped; anther-locules bearded. 6. *L. album* var. *barbatum*

1. *Lamium amplexicaule* L. HOTOKE-NO-ZA. Winter annual; stems 10–30 cm. long, sometimes much-branched near base, reddish, sparsely reflexed-puberulent; leaves mostly basal, cordate or reniform, 1–2 cm. long and as wide, loosely ascending-pilose, sparsely round-toothed, the floral leaves subsorbicular or flabellate, 1–2.5 cm. wide, sessile; flowers 17–20 mm. long, sometimes cleistogamous, in dense sessile verticils, red; calyx about 5 mm. long with incurved or erect teeth; nutlets about 2 mm. long, trigonous, rounded at apex, narrowed below, rounded on back, usually white-spotted.—May–June. Roadsides, cultivated fields, and waste grounds in lowlands; Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, China, Korea to Europe, N. Africa, and widely adventive elsewhere.

2. *Lamium purpureum* L. HIME-ODORIKO-SŌ. Winter annual with decumbent branched base; stems erect, 10–25 cm. long, rather soft and stout, slightly pubescent; leaves long-petiolate, orbicular-cordate, 1.5–3 cm. long and as wide, obtusely round-toothed, long-pubescent, the floral leaves slightly larger, ovate-orbicular or depressed, often tinged purplish, much crowded toward the top of stems, short-petiolate; flowers dense in sessile verticils, about 1 cm. long; calyx-teeth ciliate, obliquely spreading; nutlets broadly obovate, 1.5 mm. long, acutely 3-angled, obliquely truncate at apex, rounded on back.—Apr.–May. Naturalized in our area.—Europe and Asia Minor and widely adventive in N. America.

3. *Lamium chinense* Benth. var. *tuberiferum* (Makino) Murata. *Leonurus tuberiferus* Makino; *Matsumurella tuberifera* (Makino) Makino; *Lamium tuberiferum* (Makino) Ohwi.—HIME-KISE-WATA. Stoloniferous perennial herb with tubers; stems 10–25 cm. long, simple or branched at base, recurved-pubescent in lower part; leaves deltoid to rhombic-

ovate, 1–3.5 cm. long, 1–2.5 cm. wide, obtuse, broadly cuneate to subtruncate at base, coarsely obtuse-toothed, coarsely pubescent on both sides; flowers 1–3 in axils, pale purple, 15–20 mm. long; calyx pubescent, 6–7 mm. long, 5-toothed, the 2 outer lobes slightly broader; lower lip of corolla about 1 cm. long, spreading, the lateral lobes somewhat reflexed.—Apr.–May. Kyushu (s. distr.).—Ryukyus. The typical phase occurs in Formosa and China.

4. *Lamium ambigua* (Makino) Ohwi. *Leonurus ambigua* Makino; *Loxocalyx ambigua* (Makino) Makino.—MANEKIGUSA, YAMA-KISE-WATA. Rhizomes rather slender, creeping; stems erect, 40–70 cm. long, often branched, recurved white-pubescent on the angles; lower leaves cordate, the petioles 2–7 cm. long, the median deltoid-ovate or deltoid-orbicular, 3–6 cm. long and as wide, obtuse to acuminate with an obtuse tip, truncate or very broadly cuneate at base, coarsely obtuse-toothed or incised, shallowly cordate in the lower ones, pubescent on both surfaces especially on nerves beneath; floral bracts leaflike or broadly ovate and smaller, the petioles 1–2 cm. long; flowers 1–3 in axils, dark red-purple, 18–20 mm. long; calyx loosely puberulent, about 8 mm. long in back, 11 mm. long in front, oblique at the mouth, the teeth narrowly deltoid, spine-tipped, ascending; lower lip of corolla 7–8 mm. long, spreading; nutlets obovate-cuneate, 2.5–3 mm. long, 3-angled, rounded at apex.—Sept. Woods in mountains; Honshu (Sagami Prov. and westw.), Shikoku, Kyushu.

5. *Lamium humile* (Miq.) Maxim. *Ajuga humilis* Miq.; *Loxocalyx humilis* (Miq.) Makino; *Ajugoides humilis* (Miq.) Makino.—YAMA-JŌ. Rhizomes slender; stolons filiform, branched and creeping; stems 5–10 cm. long, ascending from the base, rather densely white-pubescent, simple, or with 2 or 3 pairs of approximate leaves toward the top; leaves

obovate to obovate-orbicular or obovate-oblong, rounded at apex, cuneate to acute at base, coarsely toothed, short-ascending pubescent above and on nerves beneath, the petioles 1-5 mm. long; flowers 1-3 in axils, 15-18 mm. long; calyx 7-8 mm. long, 5-toothed, prominently hairy; flowers pinkish; lower lip of corolla 5-6 mm. long, spreading; nutlets about 2 mm. long, acutely angled, glabrous, obliquely truncate at apex.—Aug. Woods in mountains; Honshu (Izu Prov. and westw.), Shikoku, Kyushu.

6. *Lamium album* L. var. *barbatum* (Sieb. & Zucc.) Fr. & Sav. *L. barbatum* Sieb. & Zucc.; *L. petiolatum* sensu auct. Japon., non Royle; *L. album* var. *petiolatum* Nakai, excl. syn.—ODORIKO-SŌ. Stems tufted, rather stout, erect, short-ascending at the base, nearly glabrous or long-pilose on the nodes; leaves triangular to ovate-cordate or broadly ovate,

5-10 cm. long, 3-8 cm. wide, obtuse to short caudate, shallowly cordate to rounded at base, loosely pubescent above and on nerves beneath, petiolate; verticils loose; flowers dense, white to pinkish, 3-4 cm. long; calyx 13-18 mm. long, 5-toothed, the teeth obliquely spreading, linear-filiform, ciliate, gradually broadened at base; corolla-tube slightly curved upward near base, the upper lip of corolla arcuate, white-pubescent externally, the lower lip reflexed, the midlobe large, the lateral ones with a linear appendage; anther locules bearded; nutlets cuneate-obovate, about 3 mm. long, acutely 3-angled, truncate at apex.—Apr.-June. Thickets and thin woods especially along streams in lowlands to high mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—s. Kuriles, Sakhalin, Korea, China, and Manchuria. The typical phase occurs from Eurasia to N. Africa.

16. SALVIA L. AKIGIRI ZOKU

Herbs or shrubs; leaves entire to pinnately parted, verticils 2- to many-flowered, often forming a terminal spike, raceme, or a compound terminal panicle, rarely loosely arranged; flowers sessile or short-pedicelled, red, purple, white, or yellow, the bracteoles usually minute; calyx bilabiate, the upper lip entire or 3-toothed, the lower lip 2-lobed, the throat naked; corolla bilabiate, the tube usually with a ring of hairs inside near base, the upper lip erect, often galeate, the lower lip spreading, 3-lobed, the midlobe larger; stamens 2, the filaments short, the arcuate connective jointed, with a fertile anther-locule at one end and a rudimentary locule opposite; nutlets smooth.—More than 500 species, widespread in temperate and warmer regions.

- 1A. Corolla 5-12 mm. long; calyx 3-7 mm. long.
- 2A. Biennial herb; leaves ovate-oblong or broadly lanceolate, acute at base; spikes usually in a compound panicle; corolla 4-5 mm. long; fertile anther-locules about 0.5 mm. long, not exerted from the upper lip of corolla; nutlets loosely warty. 1. *S. plebeia*
- 2B. Perennial herbs; leaves when simple broadly ovate and rounded to shallowly cordate at base; spikes simple or slightly compound; corolla 7-12 mm. long; fertile anther-locules 1-2 mm. long, often exerted from under the upper lip of corolla; nutlets smooth.
- 3A. Calyx not pilose inside. 2. *S. omerocalyx*
- 3B. Calyx white-pilose inside near middle.
- 4A. Corolla-tube sparsely pilose inside; flowering March to July. 3. *S. ranzaniana*
- 4B. Corolla-tube with a distinct annular-pilose ring inside; flowering July to November.
- 5A. Corolla 11-13 mm. long; corolla-tube much longer than the calyx, with a ring of hairs near the base inside; stamens and styles slightly exerted. 4. *S. japonica*
- 5B. Corolla 6-10 mm. long; corolla-tube slightly longer than the calyx, with a ring of hairs near the middle; stamens and styles much exerted.
- 6A. Corolla 6-8 mm. long; anther-connectives 3-5 mm. long; leaves relatively thick with raised nerves beneath; stems usually white spreading-pilose. 5. *S. iensis*
- 6B. Corolla 8-10 mm. long; anther-connectives 7-8 mm. long; leaves nearly membranous; stems pilose on the nodes. 6. *S. lutescens*
- 1B. Corolla 3-4 cm. long; calyx 7-12 mm. long.
- 7A. Stems and inflorescence not glandular-hairy; leaves hastate.
- 8A. Flowers yellow; corolla with a ring of hairs near the base of the tube inside, the hairs smooth and obtuse at the tip under magnification. 7. *S. nipponica*
- 8B. Flowers purple; corolla uniformly scattered-hairy inside tube, the hairs roughened and acute at the tip under magnification. 8. *S. glabrescens*
- 7B. Stems and inflorescence glandular-hairy; leaves rounded-cordate. 9. *S. koyamae*

1. *Salvia plebeia* R. Br. *Ocimum virgatum* Thunb.; *S. brachiata* Roxb.; *S. minutiflora* Bunge—MIZO-KŪJU, YUKIMI-SŌ. Erect biennial; stems erect, usually branched in upper part, recurved-puberulent on the angles; radical leaves rosulate, long-petiolate, larger than the cauline, withering away before anthesis; cauline leaves ovate-oblong to broadly lanceolate, 3-6 cm. long, 1-2 cm. wide, obtuse, acute to cuneate at base, obtusely toothed, thinly puberulent on both surfaces, the petioles 1-3 cm. long; spikes terminal, 8-10 cm. long, rather prominently spreading-puberulent, simple or more often branched at base; calyx 2.5-3 mm. long at anthesis, to 4 mm. long in fruit, puberulent and glandular-dotted; corolla pale purple, 4-5 mm. long; nutlets loosely warty.—May-June. Wet places, especially around paddy fields; Honshu, Shikoku, Kyushu.—Korea, China, Formosa, India to Malaysia, and Australia.

2. *Salvia omerocalyx* Hayata. TAJIMA-TAMURA-SŌ. Erect perennial herb; stems 20-40 cm. long, leafy toward base; leaves long-petiolate, glabrous; leaflets 3-5, the terminal ones membranous, oblong or ovate-oblong, 3-3.5 cm. long, obtuse, rounded to shallowly cordate at base, crenate-toothed, the petioles 3-5 mm. long, the lateral leaflets much smaller, 1-2 cm. long; spikes 5-15 cm. long, thinly pubescent, the lower verticils loosely arranged, the upper ones dense, 4- to 6-flowered, the floral bracts small; calyx tubular, 8-10 mm. long, bilabiate, sparingly glandular-pilose; corolla 1 cm. long, deep blue, the tube slightly longer than the calyx, the limb spreading; stamens long-exserted.—Honshu (Tajima and Tango Prov.).

Var. *prostrata* Satake. HAI-TAMURA-SŌ. Stems prostrate, sparingly leafy on lower parts.—Honshu (Echizen and Wakasa Prov.).

3. *Salvia ranzaniana* Makino. *S. rosulata* Nakai; *S. japonica* var. *pumila* Fr. & Sav.; *S. chinensis* var. *pumila* (Fr. & Sav.) Makino; *S. vernalis* Kudo—HARU-NO-TAMURA-SŌ. Small perennial, puberulent especially on petioles and spikes; stems erect, simple, 10–20 cm. long, scapelite, with long spreading hairs below the nodes and with small leaves near the middle; radical and lower cauline leaves ovate or narrowly so, 3–6 cm. long, twice or sometimes once pinnate, sparingly pilose, long-petiolate, the terminal leaflets larger, rhombic-orbicular, 1–1.5 cm. long, petioluled, the lateral ones sessile or petioluled, 2 or 3 pairs, ovate or broadly so, 7–12 mm. long, obtuse, few-toothed; spikes 3–6 cm. long, the bracts shorter than the pedicels; calyx 5–8 mm. long; corolla white, about 8 mm. long, glabrescent outside; nutlets elliptic, 1.5 mm. long.—Mar.–July. Honshu (centr. and w. distr.), Shikoku, Kyushu.—Ryukyus (?) and Formosa (var.).

4. *Salvia japonica* Thunb. *S. chinensis* Benth.; *S. diversifolia* Miq.; *S. japonica* var. *integrifolia* Fr. & Sav.; *S. japonica* var. *ternata* Fr. & Sav.; *S. japonica* var. *bipinnata* Fr. & Sav.; *S. fushimiana* Koidz.; *S. tsushimensis* Nakai; *S. japonica* var. *chinensis* (Benth.) Peter-Stibál—AKI-NO-TAMURA-SŌ. Fig. 15. Perennial; stems 20–80 cm. long, sometimes branched, glabrous or puberulent, loosely leafy; leaves simple, or often once- or twice-pinnate, ternate, long-petiolate, the leaflets broadly ovate to rhombic, 2–5 cm. long, glabrous or sparingly pilose above; spikes terminal, often branched at base, prominently puberulent, 10–25 cm. long; corolla pale purple, rarely white (forma *albiflora* Hiyama), 1–1.3 cm. long, sparingly pubescent outside, with a ring of hairs near the base; stamens slightly exserted; nutlets 1.5–2 mm. long.—July–Nov. Woods and thickets in hills and mountains; Honshu, Shikoku, Kyushu.—Formosa, China, and Korea.—*Forma longipes* (Nakai) Murata. *S. longipes* (Nakai) Satake; *Polakiastrum longipes* Nakai—INU-TAMURA-SŌ. An abnormal phase with longer pedicels, green flowers, and sterile stiped ovary.—Honshu; rare.

5. *Salvia isensis* Nakai ex Hara. SHIMAJI-TAMURA-SŌ. Perennial; stems erect, 10–60 cm. long, densely long spreading-hirsute or sometimes nearly glabrate; leaves approximate toward the base, long-petiolate, pinnate, the leaflets rhombic-ovate to oblong, 1.5–2.5 cm. long, obtuse, cuneate to subcordate at base, crenate-toothed, the lateral leaflets of 2 pairs; spikes elongate, the verticils loosely 2- to 8-flowered, the bracts ovate-lanceolate; flowers purplish, 6–8 mm. long; calyx about 6 mm. long; corolla-tube nearly as long as the calyx, with a ring of hairs slightly below the middle inside; stamens long-exserted, the connectives 3–5 mm. long; nutlets elliptic, about 2 mm. long.—July–Nov. Honshu (Ise, Owari, and Mikawa Prov.).

6. *Salvia lutescens* (Koidz.) Koidz. var. *intermedia* (Makino) Murata. *S. japonica* var. *intermedia* Makino; *S. omerocalyx* var. *intermedia* (Makino) F. Maekawa; *S. japonica* sensu auct. Japon., pro parte, non Thunb.; *S. lutescens* forma

lobatocrenata (Makino) G. Nakai; *S. japonica* var. *intermedia* forma *lobatocrenata* Makino—NATSU-NO-TAMURA-SŌ. Perennial; stems 40–80 cm. long, erect, usually with long spreading hairs on nodes; leaves once or twice pinnate or ternate, long-petiolate, the leaflets narrowly ovate to broadly so, the terminal ones slightly larger, 2–7 cm. long, the bipinnate ones 1–2.5 cm. long; spikes terminal, 10–25 cm. long, often branched at base, with long spreading hairs; corolla deep purple, about 1 cm. long, long-pubescent externally; nutlets 1.5–2 mm. long.—July–Aug. Honshu (centr. and w. distr.).

Var. *lutescens*. USUGI-NATSU-NO-TAMURA-SŌ. Flowers pale yellow.—Honshu (Suzuka mts. in c. Kinki Distr.).

Var. *stolonifera* G. Nakai. DANDO-TAMURA-SŌ. Resembles var. *intermedia* but stolons developed after anthesis.—Honshu (Tōkaidō, from Izu Prov. to Mikawa Prov.).

Var. *crenata* (Makino) Murata. *S. japonica* var. *intermedia* forma *crenata* Makino; *S. japonica* var. *crenata* Makino; *S. omerocalyx* var. *crenata* (Makino) F. Maekawa—MIYAMA-TAMURA-SŌ, KE-NATSU-NO-TAMURA-SŌ. Mountain phase with pale purple flowers, and the anther connectives usually glabrous.—Honshu (centr. and n. distr.).

7. *Salvia nipponica* Miq. *S. nipponica* forma *argutidens* Makino; *S. polakoides* Honda; *S. mayebarae* Honda; *S. nipponica* forma *lutea* Makino—KIBANA-AKIGIRI. Perennial, sometimes with thickened narrowly fusiform roots; stems 20–40 cm. long, usually soft-pubescent, decumbent or ascending at base, becoming erect; leaves hastate, 5–10 cm. long, 4–7 cm. wide, abruptly acuminate, cordate at base, pilose, the long petioles pilose; spikes 10–20 cm. long, spreading-pilose, the bracts ovate, longer than the pedicels; calyx with scattered long-spreading hairs; corolla pale yellow, 2.5–3.5 cm. long, bilabiate and bifid almost to the middle; nutlets obovate-orbicular, obtusely 3-angled, slightly flattened, smooth, about 2 mm. long.—Aug.–Oct. Woods and thickets in mountains; Honshu, Shikoku, Kyushu; rather common.

Var. *trisetata* (Matsum.) Honda. *S. trisetata* Matsum.—MITSUBA-KOTOJI-SŌ. Leaves 3-parted.—Shikoku and Kyushu.

8. *Salvia glabrescens* Makino. *S. nipponica* var. *glabrescens* Fr. & Sav.; *S. nipponica* var. *purpurea* Makino; *S. nipponica* subsp. *robusta* Koidz.; *S. robusta* (Koidz.) Makino—AKIGIRI. Closely allied to *S. nipponica*, the stems somewhat taller; leaves less prominently pilose, usually sagittate; rachis usually with minute crispate glandular-tipped hairs; corolla purple, the tube sparingly scaberrulous on inner side.—Honshu (centr. and n. distr.).

9. *Salvia koyamae* Makino. SHINANO-AKIGIRI. Resembles the preceding, the plant slightly taller; leaves 8–15 cm. long, prominently pubescent on both sides; rachis and calyx densely long glandular-pubescent; flowers pale yellow.—Honshu (Matsubara-mura in Shinano Prov.); rare.

17. MOSLA Hamilt. INU-KŌYU ZOKU

Mostly pubescent annuals; leaves lanceolate-linear to ovate-orbicular, toothed; verticils 2-flowered, distant or in terminal spikes, the bracts small or ovate and slightly longer than the calyx; calyx campanulate, accrescent after anthesis, subequally 5-lobed or bilabiate, the lobes linear-lanceolate, the upper lip of 3 more or less connate lobes, the tube in fruit often slightly inflated in front; corolla subbilabiate, the tube with or without a ring of hairs inside, the lower lip 3-lobed; fertile stamens 2, erect, staminodia 2; nutlets subglobose, reticulate or smooth.—About 10 species, in c. Asia and in s. Asia from India to Malaysia.

1A. Bracts lanceolate or linear-lanceolate, shorter than to as long as the pedicels; calyx bilabiate in fruit, the pedicels 2–4 mm. long.

2A. Stems and axis of spikes rather prominently puberulent. 1. *M. punctulata*

2B. Stems and axis of spikes glabrous, the nodes sparsely pubescent, with long whitish hairs. 2. *M. dianthera*

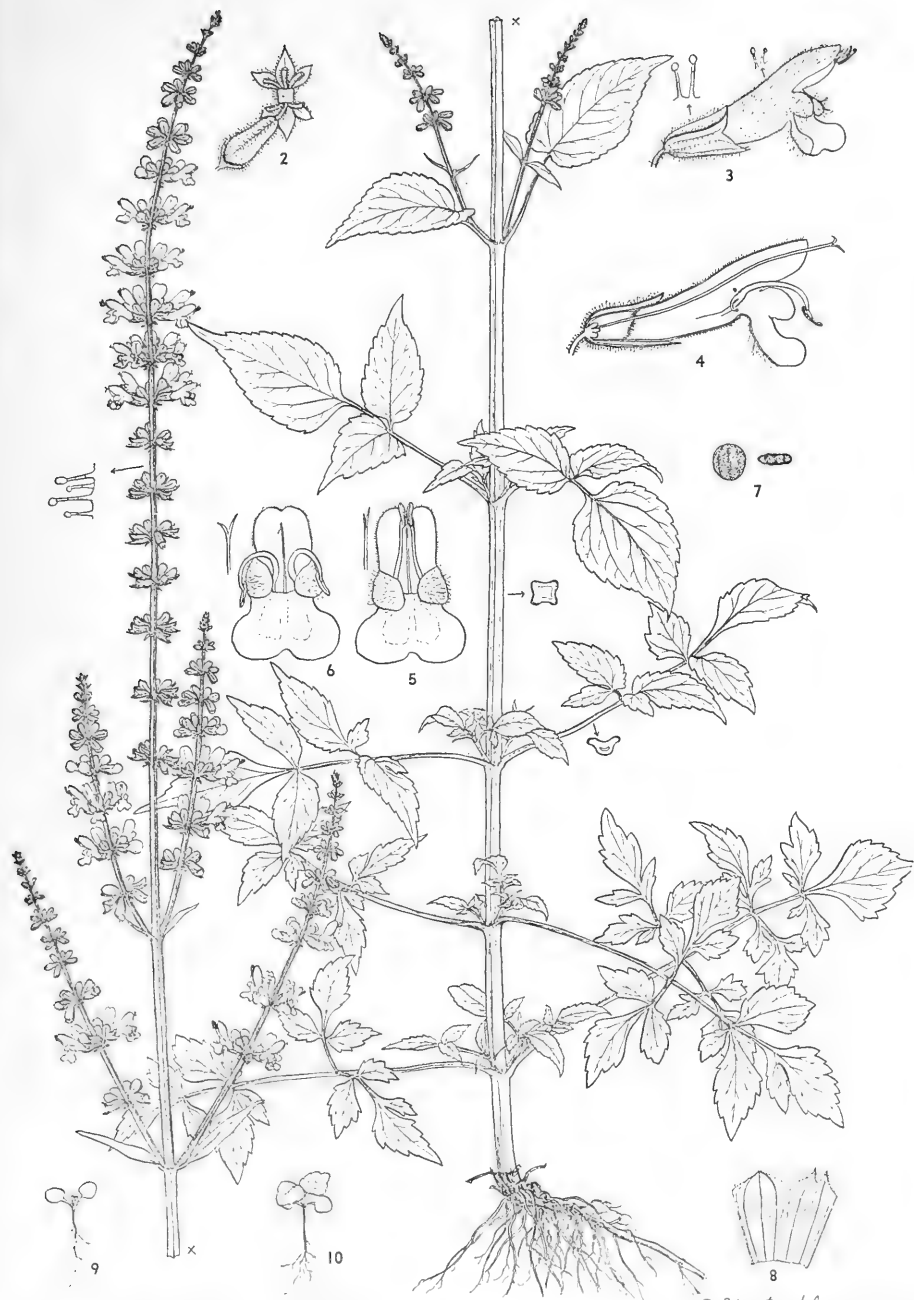

FIG. 15.—*Salvia japonica* Thunb. 1, Habit showing a cross section of stem and petiole; 2, verticill, top view; 3, flower; 4, longitudinal section of a flower; 5, front view of flower late in anthesis; 6, the same, a few days later; 7, pollen; 8, calyx cut open; 9, 10, seedlings.

- 1B. Bracts ovate or broadly so, slightly shorter than to as long as the calyx; calyx subequally 5-lobed, the pedicels 0.5-1 mm. long.
 3A. Leaves broadly linear to lanceolate. 3. *M. chinensis*
 3B. Leaves ovate. 4. *M. japonica*

1. *Mosla punctulata* (J. F. Gmelin) Nakai. *Ocimum punctatum* Thunb., non L. f.; *O. punctulatum* J. F. Gmelin; *O. scabrum* Thunb.; *M. punctata* (Thunb.) Maxim.; *Orthodon scaber* (Thunb.) Hand-Mazz.; *Orthodon punctulatum* (J. F. Gmelin) Ohwi—INU-KÔJU. Erect puberulent annual; stems usually reddish, 20-60 cm. long; leaves ovate, 2-4 cm. long, 1-2.5 cm. wide, acute at apex, abruptly acute, rounded or cuneate at base, toothed, puberulent above, loosely puberulent on nerves beneath, the petioles 1-2 cm. long; spikes elongate, 4-10 cm. long, rather densely flowered, the bracts 2.5-3 mm. long, lanceolate, nearly as long as the pedicels; calyx 2-3 mm. long in anthesis, about 4 mm. long in fruit, the teeth acute; corolla rose-colored, 3-4 mm. long; nutlets obovate, nearly 1 mm. across, slightly compressed, with raised reticulations.—Sept.-Oct. Grassy slopes in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, Korea, and Manchuria.

2. *Mosla dianthera* (Hamilt.) Maxim. *Lycopus dianthera* Hamilt. ex Roxb.; *M. grosseserrata* Maxim.; *Orthodon grosseserratus* (Maxim.) Kudo—HIME-JISO. Branched annual; stems erect, 20-50 cm. long, recurved-puberulent on the angles, white-hairy on the nodes; leaves membranous, ovate to broadly so, or rhombic-ovate, 2-4 cm. long, 1-2.5 cm. wide, acute, coarsely toothed, glabrous or scattered appressed-pilose above, glabrous or scattered long-pubescent beneath near base, the petioles 1-3 cm. long; spikes 3-7 cm. long, rather loosely flowered, the axis white-pubescent on nodes, the pedicels 2-4 mm. long, thinly puberulent, nearly as long as the linear-lanceolate bracts; calyx 2-3 mm. long at anthesis, about 5 mm. long in fruit, teeth of upper lip broad; corolla about 4 mm. long, white or sometimes pinkish; nutlets ovate-orbicular, about 1 mm. long, obscurely reticulate.—Sept.-Oct. Grassy slopes in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea, Manchuria, China, India, Formosa, and Malaysia.

Var. *nana* (Hara) Ohwi. *Orthodon hirtum* Hara; *O. hirtum* forma *nanum* (Hara) Hara; *O. grosseserratus* var. *nanum* Hara; *O. tenuicaule* Koidz.; *O. mayebarum* Honda—HIKAGE-HIME-JISO. Stems thinly long-pubescent on the angles; leaves on both surfaces and axis of spikes loosely long-pubescent.—Sept.-Oct. Honshu, Kyushu.—s. Korea and Formosa.

3. *Mosla chinensis* Maxim. *M. japonica* Maxim. var.

angustifolia Makino; *M. coreana* Lévl.; *M. angustifolia* (Makino) Makino; *Orthodon chinense* (Maxim.) Kudo; *O. japonicum* var. *angustifolium* (Makino) Kudo; *O. angustifolium* (Makino) Masam.; *O. coreanum* (Lévl.) Honda—HOSOBAYAMA-JISO. Annual; stems 10-30 cm. long, often branched, purplish, recurved-puberulent; leaves broadly linear to lanceolate, 1.5-3 cm. long, 2-6 mm. wide, subobtusely, acuminate at base, obscurely short-toothed, puberulent on both sides, the petioles 5-10 mm. long; spikes 1-3 cm. long, densely flowered, the bracts broadly ovate, 5-7 mm. long, cuspidate, appressed to and as long as or slightly shorter than the calyx, much longer than the pedicels; flowers about 4 mm. long; calyx about 3 mm. long at anthesis, 7-8 mm. in fruit, puberulent; nutlets orbicular, about 1.5 mm. across, slightly flattened, with obscure pits.—Sept.-Oct. Honshu, Kyushu.—China.

4. *Mosla japonica* (Benth.) Maxim. *Orthodon japonicum* Benth. ex Oliv.; *Micromeria* (?) *perforata* Miq.; *Mosla perforata* (Miq.) Koidz.; *O. perforatum* (Miq.) Ohwi—YAMA-JISO. Erect annual; stems 10-40 cm. long, purplish red, branched, white-puberulent, especially on the nodes; leaves ovate to narrowly so, 1-3 cm. long, 7-17 mm. wide, subacute, few-toothed, acute to subcuneate at base, glabrescent or very thinly pubescent on both sides, the petioles 3-10 mm. long; spikes densely flowered, 1-4 cm. long, short-pubescent, the bracts ovate to broadly so, cuspidate, shorter than the calyx in fruit except a few of the lower ones; calyx about 3 mm. long in anthesis, 7-8 mm. long in fruit; corolla pink, about 3 mm. long; nutlets nearly orbicular, about 1.3 mm. across, slightly flattened, obsolete reticulate with shallowly impressed areoles.—Sept.-Oct. Hokkaido, Honshu, Shikoku, Kyushu.—s. Korea.

Var. *hadae* (Nakai) Kitam. *Orthodon japonicum* var. *hadae* (Nakai) Ohwi; *M. hadae* Nakai; *O. hadae* (Nakai) Kudo—Ô-YAMA-JISO. Long spreading-pubescent on stems and leaves; corolla white to slightly purplish.—Honshu.

Var. *thymolifera* (Makino) Kitam. *Orthodon japonicum* var. *thymoliferum* (Makino) Ohwi; *M. thymolifera* Makino; *O. thymoliferum* (Makino) Kudo; *M. leucantha* Nakai, non Hayata; *O. leucanthum* (Nakai) Kudo; *O. nakaii* Okuyama—SHIROBANA-YAMA-JISO, AO-YAMA-JISO. Stems green, spreading-pubescent; leaves loosely pubescent above and on nerves beneath.—Honshu (Shimosa Prov.).

18. LYCOPUS L. SHIRO-NE ZOKU

Mostly stoloniferous perennials; leaves acutely toothed to pinnately lobed, sessile or short-petiolate; verticils loose, densely flowered, the bracteoles small or short, subulate; flowers small, subsessile; calyx campanulate, equally 4- or 5-lobed, naked on the throat; corolla campanulate, equally 5-lobed, the tube not longer than the calyx; fertile stamens 2, erect, the anther-locules parallel, the staminodia 2 or none; nutlets smooth, cuneate-obovate, compressed-trigonal with thickened margins, truncate.—About 10 species, in e. Asia and N. America.

- 1A. Calyx-teeth ovate, obtuse or subacute, not spine-tipped; stems puberulent; leaves membranous, ovate; nutlets longer than the calyx, with 4 obsolete obtuse teeth near apex. 1. *L. uniflorus*
 1B. Calyx-teeth lanceolate to linear, spine-tipped; stems glabrous or pubescent on the nodes, rarely uniformly scaberulous; nutlets shorter than the calyx, entire, not toothed.
 2A. Leaves rhombic-ovate to broadly lanceolate, subobtusely, coarsely obtuse-toothed, narrowed below to a winged petiolelike base. 2. *L. ramosissimus*
 2B. Leaves broadly linear to broadly lanceolate, at least the upper ones acuminate or acute and coarsely acute-toothed.

- 3A. Leaves 8–15 cm. long, 1.5–4 cm. wide, at least the upper ones acuminate at base, sessile or subsessile; stems usually rather stout, to 1 m. high. 3. *L. lucidus*
 3B. Leaves 4–8 cm. long, 5–15 mm. wide, slightly narrowed toward the base, somewhat auriculate, very short-petiolate; stems 30–70 cm. long, rather slender. 4. *L. maackianus*

1. *Lycopus uniflorus* Michx. *L. parviflorus* Maxim.; *L. virginicus* var. *parviflorus* (Maxim.) Makino; *L. coreanus* Lévl. —EZO-SHIRO-NE. Perennial; stolons terminated by a fusiform tuber; stems erect, 20–40 cm. long, somewhat branched, soft-puberulent, purplish; leaves membranous, rhombic-ovate or narrowly ovate, obtuse or acute with an obtuse tip, cuneate or acute at base, scattered obtuse-toothed, glabrate or thinly puberulent and glandular-dotted on both sides, short-petiolate; flowers few in each verticil, dense, white, about 2 mm. long; calyx membranous, 1 mm. long at anthesis, to 1.5 mm. long in fruit, 5-fid, the teeth ovate; nutlets broadly cuneate at base, thickened on margin, compressed-trigonal, smooth, truncate, with 4 obsolete undulate teeth on the broad anterior apex. —Aug.–Sept. Wet places; Hokkaido, Honshu, Shikoku, Kyushu. —Sakhalin, Kuriles, Korea, Manchuria, e. Siberia, and N. America.

2. *Lycopus ramosissimus* (Makino) Makino var. *japonicus* (Matsum. & Kudo.) Kitam. *L. coreanus* auct. Japon., non Lévl.; *L. maackianus* auct. Japon., pro parte, non Makino; *L. japonicus* Matsum. & Kudo; *L. coreanus* var. *ramosissimus* (Makino) Nakai; *L. maackianus* var. *ramosissimus* Makino —HIME-SARUDAHIKO, SARUDAHIKO. Stoloniferous perennial; stems mostly erect, 10–80 cm. long, usually branched, often slightly scabrous, white-pilose at the nodes; leaves narrowly rhombic-ovate to broadly lanceolate, 2–4 cm. long, 1–2 cm. wide, subobtusely, narrowed to a winged petiolelike base, coarsely obtuse-toothed; flowers in loose verticils; calyx about 3 mm. long, 5-toothed, the teeth narrowly deltoid, spine-tipped; corolla white, about 3 mm. long; nutlets 1.5 mm. long, broadly cuneate at base, truncate and very slightly undulate at apex. —Aug.–Nov. Wet places; Hokkaido, Honshu, Shikoku, Kyushu. —Korea, Manchuria, and China.

Var. *ramosissimus*. *L. maackianus* var. *ramosissimus* Makino; *L. coreanus* var. *ramosissimus* (Makino) Nakai —HIME-SARUDAHIKO. Stems low, 10–30 cm. long, much-

branched; leaves smaller. —Honshu, Shikoku, Kyushu. —Korea.

3. *Lycopus lucidus* Turcz. SHIRO-NE. Stoloniferous; stems somewhat thickened at the base, erect, simple, to 1 m. long, stout, glabrous or nearly so except for white hairs at nodes; leaves rather broadly lanceolate to narrowly elliptic, 8–15 cm. long, 1.5–4 cm. wide, acuminate at both ends, lustrous above, glabrous on both surfaces or thinly pilose on the nerves beneath, sessile or subsessile, the upper leaves slightly smaller; flowers white, about 5 mm. long; calyx 4–5 mm. long, 5-toothed, the teeth linear-lanceolate, spine-tipped; nutlets about 2 mm. long, entire and rounded-truncate at apex, broadly cuneate at base. —Aug.–Oct. Wet places; Hokkaido, Honshu, Shikoku, Kyushu. —e. Asia and N. America.

Var. *hirtus* Regel. *L. europaeus* var. *parvifolia* Miq.; *L. lucidus* var. *jormosanus* Hayata —KE-SHIRO-NE. Stems and underside of leaves long-pilose. —Hokkaido and Honshu. —Temperate e. Asia.

4. *Lycopus maackianus* (Maxim.) Makino. *L. lucidus* forma *angustifolia* Miq.; *L. lucidus* var. *maackianus* Maxim.; *L. angustus* Makino —HIME-SHIRO-NE. Stoloniferous; stems erect, 30–70 cm. long, rather slender, usually simple, sometimes branched, glabrous except for thin white hairs on the nodes; lower and median leaves rather thick, broadly lanceolate, 4–8 cm. long, 5–15 mm. wide, acuminate, rounded, obtuse, or auriculate rounded at base, deeply acute-toothed, glabrous, the petioles very short, about 1 mm. long, the upper leaves narrowly lanceolate to broadly linear, 1.5–3 cm. long, 1.5–5 mm. wide, sometimes entire; flowers few, about 5 mm. long, white; calyx about 4 mm. long, 4-lobed, the teeth deltoid-lanceolate, spine-tipped; nutlets about 1.5 mm. long, obovate-cuneate, truncate-rounded at apex. —Aug.–Oct. Wet places; Hokkaido, Honshu, Shikoku, Kyushu. —Korea, Manchuria, and e. Siberia.

19. CLINOPODIUM L. TōBANA ZOKU

Perennial herbs; leaves usually toothed, the upper ones reduced to bracts; verticils loose or in a terminal spike, densely or loosely many-flowered, the pedicels bracteolate; calyx tubular, 13-nerved, bilabiate, the upper lip often spreading, 3-toothed, the lower lip bifid, the throat often long-pilose within; corolla erect or slightly curved, often inflated on the throat, the limb bilabiate, the upper lip entire or retuse, the lower lip 3-lobed; fertile stamens 4, didymous, the lower pair longer; nutlets globose, smooth, not angled, small. —About 50 species, in temperate regions.

- 1A. Bracteoles longer than or rarely as long as the pedicels, long spreading-hispid; verticils not forming a terminal spike; leaves and stems long-hispid. 1. *C. macranthum*
 2A. Corolla 15–25 mm. long; bracteoles 3–6 mm. long. 1. *C. macranthum*
 2B. Corolla 8–12 mm. long; bracteoles 5–8 mm. long. 2. *C. chinense*
 1B. Bracteoles 1–3 mm. long, shorter than to as long as the pedicels, usually not long-pilose; verticils forming a terminal spike; leaves and stems glabrous to finely pilose, rarely long-pubescent. 3. *C. micranthum*
 3A. Leaves with distinct sessile discoid glands beneath; calyx with long spreading hairs. 3. *C. micranthum*
 3B. Leaves without distinct sessile glands beneath; calyx glabrous or puberulent. 4. *C. gracile*

1. *Clinopodium macranthum* (Makino) Hara. *C. chinense* var. *macranthum* Makino; *Satureia chinensis* var. *macrantha* (Makino) Matsum. & Kudo; *S. macrantha* (Makino) Kudo, non C. A. Mey. —MIYAMA-KURUMABANA. Rhizomes short-creeping; stems 10–40 cm. long, with recurved hairs especially on the angles, leaves broadly ovate or ovate-obicular,

sometimes narrowly ovate, 3–5 cm. long, 2–3.5 cm. wide, acute to obtuse, rounded to shallowly cordate at base, toothed, long-pilose on both surfaces, the petioles 1.5–(7) mm. long; floral leaves bractlike, the bracteoles 3–6 mm. long, linear, with long spreading hairs; calyx 6–8 mm. long, prominently spreading-hairy and long glandular-pilose; corolla 15–25 mm. long, pale

rose-purple, puberulous externally; nutlets nearly orbicular, slightly flattened, pale brown, smooth.—Aug. High mountains; Honshu (n. and Hokuriku Distr.).

2. *Clinopodium chinense* (Benth.) O. Kuntze var. *parviflorum* (Kudo) Hara. *Satureia chinensis* sensu auct. Japon., non Briq.; *S. chinensis* var. *parviflora* Kudo; *S. chinensis* var. *megalantha* Kudo—KURUMABANA. Stems erect from a decumbent base, 15–40 cm. long, white-pilose, often short-branched in upper part; leaves ovate, 2–4 cm. long, 1–2.5 cm. wide, acute, rounded or often broadly cuneate at base, toothed in the upper ones, more or less whitish pilose on both sides, pinninerved, the petioles 2–20 mm. long; verticils densely many-flowered, the bracteoles linear, 5–8 mm. long, with long spreading hairs; calyx often reddish, 6–8 mm. long, long spreading-pilose; corolla 8–12 mm. long, pale rose-purple, puberulent externally; nutlets orbicular, slightly compressed, about 1 mm. across.—Aug–Sept. Woods and thickets in hills and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and very variable.—s. Kuriles and Korea.

Var. *shibetschense* (Lév.) Koidz. *Calamintha umbrosa* var. *shibetschensis* Lév.; *Clinopodium japonicum* Makino; *Satureia makinoi* Kudo, pro parte—YAMA-KURUMABANA, ŌMIYAMA-KURUMABANA. Plant green, not reddish; flowers white; calyx short glandular-hairy.—Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

Var. *glabrescens* (Nakai) Ohwi. *C. japonicum* Makino, pro parte; *Satureia ussuriensis* var. *glabrescens* Nakai—ŌMIYAMA-TŌBANA, ŌMIYAMA-TŌBANA. Plant green, less pilose; flowers white; bracteoles shorter; calyx shorter, with short-spreading and glandular hairs.—Honshu, Kyushu.—Korea.

Var. *chinense*. *Calamintha chinensis* Benth.; *C. clinopodium* var. *chinensis* (Benth.) Miq.; *Satureia chinensis* (Benth.) Briq.—OKINAWA-KURUMABANA. Much more densely hairy.—Kyushu.—Ryukyus, Formosa, and China.

3. *Clinopodium micranthum* (Regel) Hara. *Hedeoma micranthum* Regel; *Calamintha umbrosa* forma *robustior* Miq.; *C. umbrosa* var. *japonica* Fr. & Sav.; *Clinopodium fauriei* var. *japonicum* (Fr. & Sav.) Hara; *C. omuranum* Honda—INU-TŌBANA. Stems somewhat tufted, 20–50 cm. long, rather slender, green, pilose; leaves thin, ovate to narrowly so, 2–5 cm. long, 1–2.5 cm. wide, subacute, broadly cuneate at base, the petioles 5–20 mm. long, toothed, usually sparsely pilose, with distinct sessile discoid glands beneath; verticils dense, prominently pilose, mostly forming a terminal spike up to 5 cm. long; calyx 4–5 mm. long, green, with long spreading and glandular hairs; corolla white, often pink, 5–6 mm. long; nutlets orbicular, slightly flattened, less than 1 mm. across, smooth.—Aug.

–Oct. Woods in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.

Var. *yakusimense* (Masam.) Hara. *Satureia yakusimensis* Masam.; *S. ussuriensis* var. *yakusimensis* (Masam.) Masam. YAKUSHIMA-TŌBANA. Small plant with decumbent stems; leaves 1–2 cm. long.—Kyushu (Yakushima).

4. *Clinopodium gracile* (Benth.) O. Kuntze. *Calamintha* (?) *gracilis* Benth.; *Clinopodium confine* (Hance) O. Kuntze; *Calamintha confinis* Hance; *Satureia gracilis* (Benth.) Bailey; *S. confinis* (Hance) Kudo—TŌBANA. Stems slender, 10–30 cm. long, tufted, decumbent at base, puberulent; leaves ovate to broadly so, 1–3 cm. long, 0.8–2 cm. wide, sub-obtuse, rounded to broadly cuneate at base, toothed, nearly glabrous on both sides or loosely pilose above and on nerves beneath, the petioles 5–15 mm. long; verticils prominently puberulent, the upper ones forming a loose terminal spike 1–4 cm. long; calyx 3.5–4 mm. long, puberulent on nerves; corolla pale rose, 5–6 mm. long; nutlets obovate-orbicular, less than 1 mm. long.—Apr.–Aug. Woods in lowlands and low mountains; Honshu, Shikoku, Kyushu; common and very variable.—Ryukyus, Formosa, China, s. Korea, Malaysia, and India.

Var. *multicaule* (Maxim.) Ohwi. *Calamintha multicaulis* Maxim.; *Clinopodium multicaule* (Maxim.) O. Kuntze; *Satureia multicaulis* (Maxim.) Matsum. & Kudo—YAMA-TŌBANA. Somewhat taller, usually green, with rather longer hairs on stems and petioles; leaves ovate or broadly so, rather acutely toothed, the petioles 5–10 mm. long; verticils looser, forming a short spike 1–2 cm. long; calyx green, 5–6 (–7) mm. long; corolla white, 7–9 mm. long.—June–Oct. Woods in mountains; Honshu (centr. and w. distr.), Shikoku, Kyushu; common.—Korea.

Var. *minimum* (Hara) Ohwi. *Clinopodium minimum* Hara—KOKE-TŌBANA. Small plant; leaves 4–7 mm. long; calyx 3–4 mm. long; corolla 5–7 mm. long.—Kyushu (Yakushima).

Var. *latifolium* (Hara) Ohwi. *C. multicaule* var. *latifolium* Hara.—HIRO-HA-YAMA-TŌBANA. Stems to 40 cm. long; leaves larger; calyx with longer hairs.—Honshu (Iwajiro Prov., Kantō and centr. distr.).

Var. *sachalinense* (F. Schmidt) Ohwi. *Calamintha umbrosa* var. *sachalinensis* F. Schmidt; *Satureia sachalinensis* (F. Schmidt) Kudo; *Clinopodium sachalinensis* (F. Schmidt) Koidz.; *S. ussuriensis* Kudo, pro parte—MIYAMA-TŌBANA. Stems taller, less densely pilose; leaves larger, to 6 cm. long; spikes 2–7 cm. long; calyx 3.5–4 mm. long, puberulent on lower half; corolla 5–6 mm. long.—Hokkaido, Honshu (n. distr.).—s. Kuriles and Sakhalin.

20. THYMUS L. IBUKI-JAKŌ-SŌ ZOKU

Shrubs or subshrubs; leaves small, entire or nearly so; verticils usually few-flowered, remote, or forming a short spike, the bracts small; calyx 10- to 13-nerved, bilabiate, with a dense tuft of hairs on throat inside, the upper lip broad, 3-lobed, the lower lip with 2 narrow ciliate lobes; corolla prominently bilabiate, without a ring of hairs inside, the limb slightly bilabiate, the upper lip erect, retuse, the lower lip spreading, 3-lobed; stamens 4, of equal length or the lower ones longer, the anthers 2-locular; nutlets somewhat flattened, smooth.—About 35 species, Europe to e. Asia, and Africa.

1. *Thymus quinquecostatus* Celak. *T. serpyllum* sensu auct. Japon., non L.; *T. serpyllum* var. *ibukiensis* Kudo; *T. serpyllum* var. *przewalskii* Komar.; *T. przewalskii* (Komar.) Nakai; *T. przewalskii* var. *laxa* Nakai; *T. quinquecostatus* var. *ibukiensis* (Kudo) Hara; *T. quinquecostatus* var. *japonicus*

Hara—IBUKI-JAKŌ-SŌ. Aromatic dwarf prostrate shrub with ascending, more or less white-pilose branchlets; leaves narrowly to broadly ovate, 5–10 mm. long, 3–8 mm. wide, obtuse, entire, glandular-dotted on both surfaces, long white-ciliate at base, the lateral nerves arcuate, 2 or 3 pairs, rather

abruptly short-petiolate; flowers in a short terminal spike; upper lip of calyx toothed; corolla rose-purple, 7-8 mm. long, about 5 mm. across; nutlets orbicular, slightly flattened, about 1 mm. across.—June-July. Rocky sunny places in high

mountains, or sometimes near the sea; Hokkaido, Honshu, Kyushu.—Korea, n. China, Manchuria, Mongolia, and Siberia.

21. PERILLA L. SHISO ZOKU

Erect annual; leaves opposite, toothed; verticils 2-flowered, in dense or loose terminal spikes; floral leaves bractlike; flowers small; calyx campanulate, 5-toothed, slightly accrescent in fruit, bilabiate, inflated in front at base, the upper lip 3-toothed, the lower lip 2-fid; corolla-tube short, the limb 5-lobed, the lower lobes slightly larger; stamens 4, nearly equal, erect or ascending; nutlets globose, reticulate.—Few species, in e. Asia and India.

1. *Perilla frutescens* (L.) Britt. var. *japonica* (Hassk.) Hara. *P. ocimoides* var. *japonica* Hassk.—E-GOMA. Erect branched annual; stems 20-70 cm. long, long-pubescent; leaves green, broadly ovate, 7-12 cm. long, 5-8 cm. wide, abruptly acute or acuminate, rounded to broadly cuneate at base, toothed, long-pubescent especially on nerves, long-petiolate; spikes 4-8 cm. long, rather one-sided, densely many-flowered, the axis prominently pubescent, the bracts deltoid-ovate, longer than the pedicels; calyx 3-4 mm. long in anthesis, 8-12 mm. long in fruit, long-pubescent; corolla whitish, 4-5 mm. long; nutlets globose, slightly compressed, about 2 mm. across, reticulate.—Aug.-Oct. Widely cultivated for oil-yielding seeds; naturalized in our area.—se. Asia.

Var. *citriodora* (Makino) Ohwi. *P. ocimoides* var. *typica* forma *citriodora* Makino; *P. citriodora* (Makino) Nakai—REMON-E-GOMA. Stems rather densely short soft-pubescent; leaves loosely pubescent beneath; spikes elongate after anthesis, to 10-18 cm. long, rather loosely flowered and the hairs

shorter; calyx 6-8 mm. long in fruit; nutlets 1.2-1.5 mm. across.—Hills and mountains; Honshu, Shikoku, Kyushu.

Var. *hirtella* (Nakai) Makino & Nemoto. *P. hirtella* Nakai—TORA-NO-O-JISO. Spikes slender; calyx smaller, 5-6 mm. long in fruit.—Honshu. May be a hybrid of var. *citriodora* × var. *crispa*.

Var. *crispa* (Thunb.) Deane. *Ocimum crispum* Thunb.; *Dentidia nankinensis* Lour.; *P. ocimoides* var. *crispa* (Thunb.) Benth.; *P. frutescens* var. *nankinensis* (Lour.) Britt.—CHIRIMEN-JISO. Stems soft-pubescent; leaves green or deep purple, long-pubescent beneath especially on nerves, thinly pilose above, the margins wrinkled; spikes 5-15 cm. long, rather long-pubescent; calyx 7-10 mm. long in fruit; nutlets about 1.5 mm. across.—Widely cultivated.—Forma *viridis* (Makino) Makino. *P. ocimoides* vars. *crispa*, *viridis*, *discolor*, and *purpurea* of Makino.—SHISO. Plants with margins of the leaves flat.

22. PERILLULA Maxim. SUZU-KŌJU ZOKU

Stoloniferous perennials; leaves opposite, small, toothed; verticils 2- to 6-flowered, in loose, simple or subcompound racemes; floral leaves small, linear, bractlike; calyx obliquely campanulate-obconical, 10-nerved, bilabiate, accrescent, the upper lip 3-lobed, the lower one 2-lobed; corolla small, campanulate-infundibuliform, the tube short and broad, without a ring of hairs inside, the limb obsoletely bilabiate, the upper lip retuse, the lower one shallowly 3-lobed; stamens 4, slightly didymous, the anthers with parallel locules; nutlets elliptic, small.—A single species, in Japan.

1. *Perillula reptans* Maxim. SUZU-KŌJU. Stems 20-40 cm. long, tuberlike and decumbent at base, then erect, 4-angled, green, with scattered white recurved hairs; leaves membranous, ovate or rhombic-ovate, 2-4 cm. long, 1-2.2 cm. wide, acute at apex, broadly cuneate at base, coarsely toothed, thinly pilose above and on nerves beneath, the petioles 1-2 cm. long; racemes terminal, short-pedunculate, 4-10 cm. long, loosely flowered, recurved white-puberulent, the bracts linear,

1-3(-5) mm. long, the pedicels spreading, 5-7 mm. long; calyx 2.5 mm. long at anthesis, 6-7 mm. long and deflexed in fruit, lobes of lower lip obscurely spine-tipped, longer than the upper lip, the upper lip with 3 short teeth; corolla white, 5-6 mm. long, about 4 mm. across; nutlets narrowly elliptic, slightly compressed, 1.7 mm. long.—Aug.-Dec. Honshu (w. Tōkaidō and Kinki Distr.), Shikoku, Kyushu.—Ryukyus.

23. MENTHA L. HAKKA ZOKU

Aromatic perennial herbs; leaves usually toothed; verticils densely many-flowered, globose, remote or spicate, the bracteoles minute; flowers pedicellate, small, white to rose; calyx campanulate or tubular, 5-toothed, often with long hairs on throat; corolla campanulate, the limb equally 4-lobed; stamens 4, equal, erect, the anther-locules distinct, parallel; nutlets ovate, small, smooth or reticulate.—About 20 species, in temperate and warmer parts of the N. Hemisphere.

1A. Stems, leaves, and calyx pubescent; leaves distinctly toothed; calyx-teeth acuminate; verticils loose, many.

1. *M. arvensis* var. *piperascens*

1B. Stems, leaves, and calyx nearly glabrous, the nodes of stems sometimes pubescent; leaves entire or nearly so; calyx-teeth obtuse; verticils 2-6, forming a short 10- to 20-flowered umbel-like spike. 2. *M. japonica*

1. *Mentha arvensis* L. var. *piperascens* Malinv. *M. arvensis* var. *sachalinensis* Briq.; *M. sachalinensis* (Briq.) Kudo; *M. haplocalyx* sensu auct. Japon., non Briq.; *M. haplocalyx* var. *sachalinensis* (Briq.) Briq. ex Kudo; *M. sachalinensis*

forma *pilosa* Hara—HAKKA. Perennial; stems 20-40 cm. long, scattered-pubescent; leaves ovate to narrowly so, oblong, 2-5 cm. long, 1-2.5 cm. wide, acute at both ends, acutely toothed, glandular-dotted on both sides, the petioles

3-10 mm. long; verticils many flowered; cymes sessile or rarely short-pedunculate, the pedicels slightly shorter than the calyx, glabrous or puberulous; calyx 2.5-3 mm. long, the teeth spreading-ciliate, narrowly deltoid, long-acuminate; corolla white or pale rose, 4-5 mm. long, the tube as long as the calyx; nutlets elliptic, slightly compressed, 0.7 mm. long, very broadly cuneate and 3-angled at base.—Aug.-Oct. Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Sakhalin, and e. Asia. The typical phase occurs in temperate regions of the N. Hemisphere.

2. *Mentha japonica* (Miq.) Makino. *Micromeria japonica* Miq.; *Satureia japonica* (Miq.) Matsum. & Kudo; *Mi-*

cromeria yezoensis Miyabe & Tatew.—HIME-HAKKA. Nearly glabrous perennial; stems 20-40 cm. long, erect, sometimes branched, slender, green, the internodes short, puberulent; leaves many, ovate-oblong, obtuse, acute at base, the lateral nerves few, obscure, the petioles to 1.5 mm. long; verticils 2-6, forming a short spike, the pedicels longer than the calyx; calyx about 2.5 mm. long, glabrous, glandular-dotted, the teeth deltoid-ovate, erect, obtuse; corolla pale purple, 3.5 mm. long, the tube slightly longer than the calyx; nutlets about 0.8 mm. long, elliptic, slightly flattened, very broadly cuneate and mucronate at the base.—Aug.-Oct. Wet places in lowlands to mountains; Hokkaido, Honshu.

24. LEUCOSCEPTRUM Smith TENNIN-SŌ ZOKU

Subshrubs or herbs, woody at base; leaves toothed, broadly lanceolate to broadly elliptic; bracts scalelike, broad, depressed-orbicular, claspig, caducous; spike elongate, terminal; verticils few-flowered, short, the pedicels short; calyx tubular, 5-toothed; corolla bilabiate, the tube longer than the calyx, slightly inflated, the limb slightly bilabiate, the upper lip 2-lobed, the lower 3-lobed; stamens 4, nearly equal, long-exserted, the filaments glabrous or pubescent below; nutlets cuneate, truncate at apex, acutely angled, smooth.—Few species, Japan to the Himalayas.

- 1A. Subshrub; bracts orbicular, short-cuspidate; leaves usually oblong to elliptic. 1. *L. stellipilum*
1B. Herb with a slightly woody base; bracts long-cuspidate; leaves usually lanceolate to narrowly oblong. 2. *L. japonicum*

1. *Leucosceptrum stellipilum* (Miq.) Kitam. & Murata. *Comanthosphace stellipila* (Miq.) S. Moore; *Elsholtzia stellipila* Miq.; *Pogostemon stellipila* (Miq.) Benth. & Hook. f.; *C. tajimensis* Makino—MIKAERI-SŌ, ITOKAKE-SŌ. Subshrub with slightly branched slender woody base; stems 40-100 cm. long, smooth, lustrous, green and prominently stellate-pilose while young, pale yellow-brown the second year; leaves membranous, oblong to broadly elliptic, 10-20 cm. long, 6-12 cm. wide, rounded or short-cuneate at base, toothed, stellate-pubescent above and especially on the nerves beneath, the petioles 1-5 cm. long; spikes erect, densely flowered, 10-18 cm. long, sessile, stellate-puberulent, the bracts densely imbricate, short-cuspidate, 6-8 mm. long, 8-10 mm. wide, caducous; corolla 8-10 mm. long, rose-colored.—Sept.-Oct. Woods in mountains; Honshu (centr. and w. distr.).

Var. *tosaense* (Makino) Kitam. & Murata. *Comanthosphace stellipila* var. *tosaensis* (Makino) Makino—Ō-MARUBA-NO-TENNIN-SŌ. Leaves stellate-pubescent while very young. Reported from Shikoku and Kyushu.

2. *Leucosceptrum japonicum* (Miq.) Kitam. & Murata. *Elsholtzia japonica* Miq.; *E. sublanceolata* Miq.; *E. barbinervis* Miq.; *Comanthosphace japonica* (Miq.) S. Moore; *C. sublanceolata* (Miq.) S. Moore; *C. barbinervis* (Miq.) S. Moore; *C. stellipila* var. *japonica* (Miq.) Matsum. & Kudo; *C. hakoensis* Koidz.; *C. stellipila* var. *barbinervis* (Miq.) Ohwi; *C. stellipila* var. *sublanceolata* (Miq.) Ohwi; *C. stellipila* var. *japonica* forma *sublanceolata* (Miq.) Matsum. & Kudo and forma *barbinervis* (Miq.) Matsum. & Kudo; *C. japonica* var. *barbinervis* (Miq.) Makino—TENNIN-SŌ. Closely allied to the preceding; herb with a short woody base; stems erect, slightly 4-angled, glabrescent, slightly stellate-pilose on upper part; leaves lanceolate to oblong, 3-7 cm. wide, cuneate at base, acuminate, slightly stellate-pilose only while young; spike terminal, erect, the bracts scalelike, closely imbricate, caducous, orbicular, conspicuously cuspidate; corolla pale yellow.—Sept.-Oct. Woods; Hokkaido, Honshu, Shikoku.

25. DYSOPHYLLA Bl. MIZU-TORA-NO-O ZOKU

Perennials or annuals; leaves verticillate or opposite; verticils many-flowered, densely spicate, the bracts persistent; calyx ovate-campanulate, equally 5-toothed, without hairs on throat; corolla nearly actinomorphic, the tube usually shorter than the calyx, the limb spreading, nearly equally 4-lobed, the upper lobe entire or retuse; stamens 4, long-exserted, rather unequal, erect or slightly recurved, the filaments often long-pilose near the middle, the anthers subglobose, the anther-locules connate at tip; nutlets ovate or oblong, smooth.—About 20 species, in se. Asia and Australia.

- 1A. Perennial with slender rhizomes; spikes (excluding filaments) 7-10 mm. across; flowers 7-8 mm. long, inclusive of the stamens; filaments with a dense tuft of long crisped hairs near middle; stems usually simple, sometimes branched at base; leaves usually verticillate in 4's. 1. *D. yatabeana*
1B. Annual without rhizomes; spikes 4-5 mm. across; flowers about 3 mm. long, inclusive of the stamens; filaments loosely short-pilose on lower half; stems usually branched in upper half; leaves verticillate in 3's to 6's. 2. *D. verticillata*

1. *Dysophylla yatabeana* Makino. *D. linearis* var. *yatabeana* (Makino) Kudo—MIZU-TORA-NO-O, MURASAKI-MIZU-TORA-NO-O. Rhizomes slender, creeping; stems erect, 30-50 cm. long, many-leaved, rather soft, glabrous or slightly pubescent on the nodes, usually simple; inflorescence terminal, spicate; leaves usually verticillate in 4's, linear or broadly linear,

3-7 cm. long, 2-5 mm. wide, obtuse, narrowed at both ends, entire, glabrous on both sides or loosely short-pubescent on midrib above, nearly sessile; spikes 2-8 cm. long, densely very many-flowered; flowers nearly sessile, rose-colored, 7-8 mm. long inclusive of the long exserted stamens, the bracts lanceolate, as long as the calyx, pubescent; calyx about 3 mm. long,

pubescent; filaments with a dense tuft of long crisped hairs near middle; nutlets ovate, biconvex, about 0.7 mm. long, obtusely angled, narrowed below and subtruncate at base.—Aug.–Oct. Wet places; Honshu, Shikoku, Kyushu.—Korea.

2. *Dysophylla verticillata* (Roxb.) Benth. *Mentha verticillata* Roxb.; *D. japonica* Miq.—MIZU-NEKO-NO-O. Annual; stems 10–50 cm. long, sometimes short-creeping at base, usually branched in upper half, glabrous or short-pubescent

on the nodes; leaves verticillate in 3's to 6's (–10's), linear, 2–5 cm. long, 2–4 mm. wide, glabrous; spikes 2–5 cm. long, densely very many-flowered; flowers white, about 3 mm. long inclusive of the stamens; calyx about 1.5 mm. long, the teeth obliquely ascending in fruit; filaments loosely short-pilose on lower half; nutlets about 0.7 mm. long, pale brown, ovate, narrowed at base.—Aug.–Oct. Wet places; Honshu, Shikoku, Kyushu.—Korea, Ryukyus, Formosa, China, and se. Asia.

26. KEISKEA Miq. SHIMOBASHIRA ZOKU

Perennials; leaves opposite, toothed; verticils 2-flowered, forming one-sided spikes, the bracts lanceolate, small, persistent; flowers pedicelled; calyx campanulate, deeply 5-fid, with lanceolate lobes, hairy on the throat; corolla-tube broadened in upper part, with a ring of hairs inside, the limb slightly bilabiate, the lower lip 3-lobed, the midlobe slightly larger; stamens 4, didymous, exserted, the upper pair shorter, the filaments glabrous; nutlets ovate or oblong, smooth.—Few species, in e. Asia.

1. *Keiskea japonica* Miq. *K. japonica* var. *lancifolia* Nakai; *K. japonica* var. *hondoensis* Nakai—SHIMOBASHIRA. Perennial herb; stems about 60 cm. long, slightly pilose or glabrous, often branched in upper part; leaves thinly chartaceous, broadly lanceolate to narrowly ovate, 6–15 (–20) cm. long, 2–5.5 cm. wide, long-acuminate, abruptly to long-acuminate, rarely subobtusate at base, acutely toothed except near the base, puberulent on midrib above, glabrous or thinly pilose on the

nerves beneath, the petioles 5–30 mm. long; spikes 5–12 cm. long, short-pilose, one-sided, the bracts broadly linear; calyx 3 mm. long at anthesis, 5–6 mm. long in fruit, nearly as long as the pedicels, exceeding the bracts; corolla white, about 7 mm. long, shallowly lobed; nutlets usually solitary, glabrous, dark brown, 1.5–2 mm. across, with darker reticulations.—Sept.–Oct. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

27. ELSHOLTZIA Willd. NAGINATA-KŌJU ZOKU

Herbs or shrubs; leaves opposite, usually toothed; verticils many-flowered, in dense one-sided spikes; floral bracts persistent, broadly ovate or obovate-orbicular, dense; calyx equally 5-toothed, without long hairs on the throat, inflated and accrescent in fruit; corolla small, the tube nearly as long as the calyx, the limb 4-lobed, subbilabiate, the upper lip erect, retuse, the lower lip spreading; stamens 4, exserted, ascending or spreading, the lower pair longer; nutlets ovate to oblong.—About 20 species, in temperate regions of Eurasia, N. Africa, and Malaysia.

1A. Bracts depressed-orbicular, nearly glabrous on back, short-ciliate, the awns 1–2 mm. long. 1. *E. ciliata*
1B. Bracts narrowly flabellate, short-pubescent on back, long-ciliate, the awns 2–3 mm. long. 2. *E. nipponica*

1. *Elsholtzia ciliata* (Thunb.) Hylander. *Sideritis ciliata* Thunb.; *Mentha patrinii* Lepech.; *E. patrinii* (Lepech.) Garcke; *E. cristata* Willd.; *E. interrupta* Ohwi—NAGINATA-KŌJU. Erect branched annual, 30–60 cm. long; stems obtusely angled, loosely soft-pubescent; leaves thinly membranous, broadly to narrowly ovate, 6–10 cm. long, 2.5–6 cm. wide, short-acuminate with an obtuse tip, cuneate to broadly cuneate at base, toothed, thinly pubescent above and on nerves beneath, the petioles winged in upper part; spikes terminal and axillary, 5–10 cm. long, 7–8 mm. across, densely many-flowered, one-sided, the bracts depressed-orbicular, short-ciliate, rounded at base, nearly glabrous on back, as long as to slightly longer than the calyx, often purplish, the awns 1–2 mm. long; flowers pale rose-colored, about 5 mm. long; calyx 3–3.5 mm. long in fruit, the teeth spine-tipped; nutlets narrowly obovate, about 1 mm. long, slightly flattened, broadly rounded at apex, cuneate at base.—Sept.–Nov. Hokkaido, Honshu, Shikoku,

Kyushu; common.—s. Kuriles, Korea, Formosa, China, temperate Asia to w. Europe.

2. *Elsholtzia nipponica* Ohwi. *E. oldhamii* var. *nipponica* Ohwi; *E. argyi* var. *nipponica* (Ohwi) Murata—FUTOBO-NAGINATA-KŌJU. Resembles the preceding; stems 30–80 cm. long, obtusely angled, short-pubescent; leaves ovate or broadly so, 2.5–6 cm. long, 1.5–4 cm. wide, acuminate or acute, broadly cuneate at base, toothed, glabrous or thinly pubescent on nerves beneath, thinly pilose above, petiolate; spikes 2–5 cm. long, about 10 mm. across, densely many-flowered, one-sided, the bracts long-ciliate, narrowly flabellate, short-pubescent on back, the awns 2–3 mm. long; corolla rose-colored, 4–5 mm. long; nutlets obovate, slightly compressed, about 1 mm. long.—Sept.–Oct. Sunny slopes along streams and valleys in mountains; Honshu (Kantō Distr. and westw.), Kyushu. The typical phase occurs in China.

28. PLECTRANTHUS L'Hérit. YAMA-HAKKA ZOKU

Perennial herbs or sometimes shrubs; leaves toothed; verticils several- to many-flowered, in loose simple or branched racemes; calyx campanulate in anthesis, equally 5-toothed or bilabiate, the upper lip 3-toothed, the lower lip 2-fid, accrescent in fruit; corolla bilabiate, the tube elongate, gibbous, the upper lip 3- or 4-lobed, the lower lip entire, often navicular; stamens 4, didymous, declined; nutlets ovate or oblong, smooth or granular, sometimes short-pilose.—About 150 species, in Asia, Australia, and Africa.

- 1A. Nutlets white-pilous; corolla dark purple. 1. *P. trichocarpus*
 1B. Nutlets glabrous; corolla pale blue, blue-purple or white.
 2A. Corolla 5–12 mm. long, the tube 1–3 times as long as the limb.
 3A. Calyx nearly equally 5-lobed, with fine ascending hairs; corolla 5–10 mm. long, with small dark spots on upper lip inside.
 4A. Flowers 5–7 mm. long, pale blue; stamens or style exerted; leaves 6–15 cm. long. 2. *P. japonicus*
 4B. Flowers 8–10 mm. long, blue-purple; stamens and styles included; leaves 3–4 cm. long. 3. *P. inflexus*
 3B. Calyx bilabiate, with spreading hairs or pilose; corolla 6–12 (–15) mm. long, without dark spots, the lower lip bifid, usually longer than the upper.
 5A. Leaves broadly lanceolate to ovate, acuminate.
 6A. Calyx-teeth acute; bracts ovate to ovate-cordate. 4. *P. umbrosus*
 6B. Calyx-teeth mucronate; bracts broadly lanceolate to ovate. 5. *P. shikokianus*
 5B. Leaves ovate-obcordate to ovate, caudate. 6. *P. kameba*
 2B. Corolla 15–20 mm. long, the tube 4–6 times as long as the limb.
 7A. Cymes short, the pedicels puberulent, less than 1 cm. long; upper calyx-teeth short, obtuse. 7. *P. longitubus*
 7B. Cymes effuse, the pedicels slender, glabrous, usually 1–2.5 cm. long; upper calyx-teeth lanceolate, acute. 8. *P. effusus*

1. **Plectranthus trichocarpus** Maxim. *P. inconspicuus* Maxim., non Miq.; *Isodon trichocarpus* (Maxim.) Kudo; *Amethystanthus trichocarpus* (Maxim.) Nakai—KUROBANAHIKI-OKOSHI. Rhizomatous; stems tufted, 50–150 cm. long, branched in upper part, rarely minutely recurved-puberulent on the angles; leaves broadly deltoid-ovate to broadly lanceolate, 6–15 cm. long, 2.5–7 cm. wide, acuminate, broadly cuneate and gradually decurrent at base to a winged petiole, toothed, usually thinly pilose above, appressed-puberulent on nerves beneath; verticils loose, distant, axillary, on long slender peduncles, those in the upper part forming a loose terminal raceme, the pedicels slender; calyx puberulent, 3–3.5 mm. long in fruit, the teeth deltoid; corolla dark purple, 5–6 mm. long, the tube as long as the lower lip and calyx; nutlets obovoid, scarcely flattened, about 1.5 mm. long, white-pilous.—Aug.–Sept. Along streams and in clearings in mountains; Hokkaido, Honshu (Tango Prov. and eastw.).

2. **Plectranthus japonicus** (Burm.) Koidz. *Scutellaria* (?) *japonica* Burm.; *Ocimum rugosum* Thunb.; *P. maximowiczii* Miq.; *P. buergeri* Miq.; *P. glaucocalyx* var. *japonicus* (Burm.) Maxim.; *Isodon japonicus* (Burm.) Hara; *I. glaucocalyx* var. *japonicus* (Maxim.) Kudo; *Amethystanthus japonicus* (Burm.) Nakai—HIKI-OKOSHI. Stems 50–100 cm. long, with recurved short hairs on the angles; leaves ovate to narrowly so, 6–12 (–15) cm. long, 3.5–7 cm. wide, short-acuminate or acute, truncate to cuneate-truncate at base, paler beneath and pilose at least on nerves; racemes loose, terminal and in upper axils, elongate, the pedicels short; calyx 3–4 mm. long, gray-puberulent, the teeth deltoid; corolla pale purple, 5–7 mm. long, the tube slightly inflated at base on back, about twice as long as the calyx, slightly longer or nearly as long as the lower lip; nutlets ellipsoidal, slightly flattened, obsoletely reticulate, loosely granular above.—Sept.–Oct. Honshu, Shikoku, Kyushu.—Korea.

3. **Plectranthus inflexus** (Thunb.) Vahl ex Benth. *Ocimum inflexum* Thunb.; *Isodon inflexus* (Thunb.) Kudo; *Amethystanthus inflexus* (Thunb.) Nakai; *I. inflexus* var. *macrophyllus* (Maxim.) Kudo; *I. inflexus* var. *transicus* Kudo—YAMA-HAKKA. Stems 40–80 cm. long, branched, with recurved short hairs especially on the angles; leaves broadly deltoid-ovate or broadly ovate, 3–6 cm. long, 2–4 cm. wide, acute to subobtusely, broadly cuneate and decurrent on the winged petiole, coarsely toothed, thinly pilose above and on nerves beneath; racemes loose, terminal and axillary, narrow, elongate, the pedicels and peduncles of the cymes short; calyx 5–6 mm. long in fruit, ascending-puberulent, the teeth narrowly deltoid; corolla blue-purple, rarely white, 8–10 mm. long, the tube rather broad, as long as the lower lip, about

twice as long as the calyx; nutlets slightly compressed, orbicular, 1.2 mm. long, with darker reticulations, smooth.—Sept.–Oct. Thin woods and thickets in hills and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable.

4. **Plectranthus umbrosus** (Maxim.) Makino. *P. inflexus* var. *umbrosus* Maxim.; *Isodon umbrosus* (Maxim.) Hara; *Amethystanthus umbrosus* (Maxim.) Nakai; *I. inflexus* var. *umbrosus* (Maxim.) Kudo—INU-YAMA-HAKKA. Stems 60–80 cm. long, recurved-hairy on the angles; leaves broadly lanceolate or narrowly ovate-oblong, 5–10 cm. long, 1–3.5 cm. wide, long-acuminate, cuneate and long decurrent at base, acutely-toothed, thinly pilose on both surfaces especially on nerves beneath, petiolate; racemes loose, terminal and axillary, 10–25 cm. long, the bracts ovate to ovate-cordate, the pedicels rather long; calyx spreading-puberulent and glandular-dotted, about 4 mm. long in fruit, the teeth narrowly deltoid, acute; corolla blue-purple, 8–10 mm. long, the tube rather broad, gibbous, about twice as long as the calyx and slightly longer than the lower lip; nutlets orbicular, 1.2 mm. long, slightly flattened, obsoletely reticulate, smooth.—Sept.–Oct. Mountains; Honshu (Fuji and Hakone regions).

5. **Plectranthus shikokianus** (Makino) Makino. *Isodon shikokianus* (Makino) Hara; *I. excisus* var. *shikokianus* (Makino) Kudo; *I. lanceus* (Nakai) Kudo; *P. lanceus* Nakai; *P. axillarisiflorus* Honda; *Amethystanthus lanceus* (Nakai) Nakai; *A. manabeanus* Honda; *I. manabeanus* (Honda) Hara—TAKA-KUMA-HIKI-OKOSHI. Stems 50–80 cm. long, with recurved short hairs, especially on the angles; leaves broadly lanceolate or narrowly ovate, 5–10 cm. long, 1.5–2.5 cm. wide, long-acuminate, cuneate at base, acutely toothed, thinly pilose above, loosely puberulent beneath or nearly glabrous on both surfaces, petiolate; racemes 5–15 cm. long, rather narrow; bracts broadly lanceolate to ovate; calyx 3.5–5 mm. long in fruit, loosely puberulent, the teeth narrowly deltoid, mucronate; corolla about 10 mm. long, rather thick, the tube nearly as long as the lower lip, gibbous, 2 or 3 times as long as the calyx; nutlets broadly elliptic, about 1.2 mm. long, rather smooth, slightly flattened.—Sept.–Oct. Woods and thickets in mountains; Honshu (centr. and s. distr.), Shikoku, Kyushu.

6. **Plectranthus kameba** (Okuyama) Ohwi. *Isodon kameba* Okuyama; *Plectranthus excisus* sensu auct. Japon., non Maxim.; *I. excisus* Kudo, excl. basionym; *Amethystanthus excisus* Nakai, excl. basionym—KAMEBA-HIKI-OKOSHI. Tufted perennial; stems 50–100 cm. long, with recurved short hairs on the nodes; leaves ovate-obcordate or ovate, 5–8 cm. long and as wide, truncate to incised at apex, with a long-caudate tip, 2–5 cm. long, cuneate-truncate at the winged-petiolate base, acutely toothed, thinly puberulent on

the nerves of both sides, sparingly pilose above, the upper leaves often without appendage at apex, few-toothed; racemes 5-20 cm. long, rather slender, the pedicels short, spreading-puberulent; calyx about 7 mm. long in fruit, spreading-puberulent, the teeth narrowly deltoid, acute; corolla blue-purple, 8-10 mm. long, the tube rather broad, gibbous, twice as long as the calyx, 1.5 times as long as the lower lip; nutlets orbicular, about 2 mm. long, slightly flattened, smooth.—Aug.-Sept. Woods in mountains; Honshu (Kantō and eastern centr. distr.).

Var. excisiflexus (Nakai) Ohwi. *Amethystanthus excisiflexus* Nakai—TAIRIN-YAMA-HAKKA. Corolla larger, 10-13 mm. long.—Honshu (Hokuriku and n. distr.).

Var. hakusanensis (Kudo) Ohwi. *Isodon excisis* var. *hakusanensis* Kudo; *Amethystanthus excisis* var. *hakusanensis* (Kudo) Nakai—HAKUSAN-KAMEBA-HIKI-OKOSHI. Appendage of leaves broader and toothed or incised.—Honshu (high mountains of w. Hokuriku Distr.).

Var. latifolius (Okuyama) Ohwi. *Isodon umbrosus* var. *latifolia* Okuyama—KOSHIN-YAMA-HAKKA. Leaves larger, 8-15 cm. long, 4-7 cm. wide, without a distinct caudate appendage at apex.—Honshu. (s. centr. distr.).

7. Plectranthus longitubus (Miq.) *Isodon longitubus* (Miq.) Kudo; *Amethystanthus longitubus* (Miq.) Nakai; *P. longitubus* var. *contractus* Maxim.; *I. longitubus* var. *contractus* (Maxim.) Kudo—AKI-CHŌJI. Stems 70-100 cm. long, recurved-puberulent on the angles; leaves narrowly ovate, 7-12 cm. long, 2.5-4 cm. wide, acuminate, cuneate at the base, toothed, puberulent on nerves beneath, petiolate; racemes 10-20 cm. long, one-sided, the pedicels rather long, the cymes sessile or short-pedunculate; calyx puberulent, about 6 mm. long in fruit, the teeth deltoid-ovate, short, very short-mucronate; corolla 15-20 mm. long, blue-purple, the tube rather broad, gibbous, 4-6 times as long as the limb; nutlets orbicular, about 2 mm. across, slightly flattened, smooth.—Aug.-Oct. Mountains; Honshu (w. Tōkaidō Distr. and westw.), Shikoku, Kyushu.

8. Plectranthus effusus (Maxim.) Ohwi. *P. longitubus* var. *effusus* Maxim.; *Isodon longitubus* var. *effusus* (Maxim.) Kudo; *I. effusus* (Maxim.) Hara; *Amethystanthus effusus* (Maxim.) Honda—SEKIYA-NO-AKI-CHŌJI. Closely allied to No. 7; cymes effuse, with slender, elongate, horizontally spreading peduncles; upper calyx-teeth lanceolate, acute.—Woods in mountains; Honshu (e. Tōkaidō and Kantō Distr.).

Fam. 176. SOLANACEAE NASU KA Nightshade Family

Herbs or woody plants with exstipulate, simple, alternate leaves; flowers bisexual, usually actinomorphic; calyx 4- to 6-lobed, persistent, often accrescent after anthesis; corolla gamopetalous, rotate to tubular, usually 5-lobed, induplicate or valvate in bud; stamens inserted on the tube, alternate with the corolla-lobes, the anthers 2-locular, longitudinally dehiscent or opening by pores; ovary 2-locular, the locules often divided by false septa, the ovules many, on axile placentae; style terminal; fruit a capsule or berry; seeds with copious endosperm.—About 75 genera, with about 2,000 species, chiefly in the Tropics.

|---|-------------------------|
| 1A. Shrubs | 1. <i>Lycium</i> |
| 1B. Herbaceous or sometimes woody at the base. | |
| 2A. Fruit a capsule; corolla and calyx campanulate. | 2. <i>Scopolia</i> |
| 2B. Fruit a berry; corolla rotate or campanulate. | |
| 3A. Anthers longitudinally split, distinct. | |
| 4A. Calyx accrescent after anthesis, enclosing the fruit. | |
| 5A. Calyx bladdery, loosely enclosing the fruit. | 3. <i>Physalis</i> |
| 5B. Calyx accrescent and tightly enclosing the fruit. | 4. <i>Physalisstrum</i> |
| 4B. Calyx scarcely accrescent after anthesis, not enclosing the fruit. | 5. <i>Tubocapsicum</i> |
| 3B. Anthers opening by pores, surrounding the style, free or connate. | 6. <i>Solanum</i> |

1. LYCIUM L. Kuko Zoku

Mostly spiny shrubs or small trees; leaves entire, slender and terete or flat, often fasciculate; peduncles usually solitary in axils, rarely fasciculate; flowers white, rose-purple, or yellowish; calyx campanulate, truncate, irregularly 3- to 5-toothed, slightly accrescent after anthesis; corolla tubular, infundibuliform, campanulate or urceolate, 5-lobed, the throat often inflated; stamens often exserted, the anthers short; ovary 2-locular, the ovules often few; berry globose or ovoid.—About 100 species, chiefly in temperate and warmer regions, especially abundant in the S. Hemisphere.

1. *Lycium chinense* Mill. *L. barbatum* var. *chinense* Ait.—KUKO. Glabrous deciduous spiny shrub; leaves elliptic or narrowly oblong, 2-4(-6) cm. long, 1-2(-3) cm. wide, entire, short-petiolate; flowers pale purple or white, 1-1.5 cm. long, with darker striations near base, the pedicels slender,

nearly as long as the flowers; stamens exserted, the filaments densely bearded near base; fruit narrowly ovoid-ellipsoid, about 1.5-2 cm. long, red.—Aug.-Nov. Thickets and riverbanks in lowlands; Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, China, Ryukyus, and Formosa.

2. SCOPOLIA Jacq. HASHIRI-DOKORO ZOKU

Erect, fleshy, glabrous herbs; stems rather stout, slightly branched; leaves membranous, entire; flowers pendulous, brown-purple or greenish, solitary, on slender axillary pedicels; calyx membranous, broadly campanulate, truncate or shallowly 5-lobed at apex, accrescent and covering the fruit; corolla campanulate, 5-angled or shallowly 5-lobed, with 2 or 3 lobes larger in bud and covering the others, the limb plicate; stamens not exserted, the anthers ovoid, longitudinally split; ovary conical, 2-loculed; ovules many; style filiform; capsules circumscissile, enclosed in the calyx, subglobose; seeds nearly reniform, papillose.—Few species, in Japan, Himalayas, and Europe.

1. *Scopolia japonica* Maxim. HASHIRI-DOKORO. Glabrous stout rhizomatous perennial; stems 30–60 cm. long, loosely branched in upper part; leaves petioled, narrowly oblong, 10–20 cm. long, 3–7 cm. wide, abruptly narrowed and acute at both ends, entire or with 1 or 2 teeth in the lower

ones, petiolate; flowers 3–5 cm. long; calyx unequally 5-lobed; corolla about 2 cm. long, purplish yellow, 5-lobed; fruit globose, about 1 cm. across, enclosed in the accrescent calyx; seeds reniform, about 2.5 mm. across, reticulate with depressed dots. —Apr.–May. Mountains; Honshu, Shikoku, Kyushu.

3. *Physalis* L. HÖZUKI ZOKU

Annuals or perennials often slightly woody at base, with simple or stellate hairs; leaves entire or rarely pinnatifid; flowers small, usually solitary in axils, pedicelled, blue-purple, yellowish, or whitish, often purplish toward base; calyx membranous, campanulate or conical, shallowly 5-lobed or cleft, becoming bladdery in fruit, 5-angled or prominently 10-ribbed, the lobes connivent at tip; corolla nearly rotate or very broadly campanulate, the limb plicate in bud, 5-angled or shallowly 5-lobed; style slender, the stigma bifid; ovules many; berry globose, enclosed in the inflated calyx; seeds flat. —About 50 species, chiefly in N. and S. America, few in temperate regions of the Old World.

- 1A. Rhizomes long-creeping; flowers 1.5–2 cm. across. 1. *P. alkekengi* var. *franchetii*
 1B. Rhizomes absent or nearly so. 2. *P. angulata*
 2A. Cultivated; calyx loosely short-hairy, the teeth linear-lanceolate in fruit. 2. *P. angulata*
 2B. Spontaneous; calyx loosely pilose on the prominent winglike ribs, the hairs multicellular, broadened at base, the teeth ovate-deltoid in fruit. 3. *P. chamaesarachoides*

1. *Physalis alkekengi* L. var. *franchetii* (Mast.) Makino. *P. franchetii* Mast.; *P. bunyardii* Hort.; *P. franchetii* var. *bunyardii* Makino—HÖZUKI. Nearly glabrous perennial with long creeping rhizomes; stems 40–80 cm. long; leaves broadly ovate, 5–12 cm. long, 3.5–9 cm. wide, acute to obtuse, rounded to broadly cuneate at base, scattered incised-toothed and short-pilose on margin, petiolate; flowers solitary, the pedicels 3–4 cm. long; calyx short-tubular, 5–6 mm. long at anthesis, subtruncate at the base, deeply 5-lobed, the lobes narrowly deltoid, obtuse, short-ciliate; corolla creamy, subrotate; fruit globose, red, about 1.5 cm. across, enclosed by the finely veined bladdery red calyx about 4–5 cm. long.—June–Aug. Hokkaido, Honshu, Shikoku, Kyushu.—Korea, n. China. The typical phase occurs in Europe and w. Asia.—Forma *monstrosa* Miq. YÖRAKU-HÖZUKI. An abnormal sterile phase; spike pendulous, many-bracteate but without flowers. Cultivated.

2. *Physalis angulata* L. *P. ciliata* Sieb. & Zucc.; *P. minima* sensu auct. Japon., non L.—SENNARI-HÖZUKI. Slightly pubescent annual; stems 30–40 cm. long, the branches obliquely spreading; leaves broadly ovate, 3–7 cm. long, 2–5 cm. wide, short-acute, rounded at base, nearly entire or with

few obscure teeth, petiolate; flowers solitary in axils, pale yellow, the pedicels about 1 cm. long, pubescent; calyx 4–5 mm. long at anthesis, ovoid, about 2.5 cm. long in fruit, short-pubescent especially on the angles, green; corolla about 8 mm. long; fruit globose, about 1 cm. across.—Aug.–Oct. A tropical American plant cultivated in our area and often naturalized.

3. *Physalis chamaesarachoides* Makino. *Physalistrum chamaesarachoides* (Makino) Makino—YAMA-HÖZUKI. Plant sparsely puberulent; stems 30–60 cm. long, branched, soft; leaves thinly membranous, ovate or elliptic-ovate, 6–10 cm. long, 3–5 cm. wide, acuminate or abruptly short-acuminate, rounded to cuneate at base, green, usually with few irregular coarse teeth, the petioles winged in upper part; flowers 1 or 2 in leaf-axils, pendulous, white, 7–8 mm. long, the pedicels glabrous, 1–2 cm. long; calyx 3–4 mm. long at anthesis, ovoid-globose, 12–15 mm. long in fruit, loosely pilose on the prominent winglike ribs; fruit globose, about 1 cm. across, loosely enclosed by the persistent, membranous, 10-ribbed calyx.—Aug.–Oct. Woods; Honshu (Kanto Distr. and westw.), Shikoku, Kyushu.

4. *Physalistrum* Makino IGA-HÖZUKI ZOKU

Perennial branched herbs; leaves ovate, often oblique at base, petiolate; flowers axillary, solitary or fascicled, small, pendulous; calyx short-campanulate, globose or ellipsoidal, 5-lobed, accrescent, tightly enclosing the fruit; corolla campanulate, 5-lobed, the lobes short, induplicate in bud, with a gland on the inside toward the base; style slender, the stigma bilobed; ovules many; berry pendulous, slightly fleshy, globose or ellipsoidal, enclosed by the accrescent calyx; seeds flat, rugose, depressed-punctate.—Few species, in Japan and China.

- 1A. Leaves ovate to broadly so, obtuse or acute, with a long winged petiole; calyx long-pubescent at anthesis, the hairs becoming spiny in fruit; corolla about 10 mm. long and as wide; fruit globose, as long as the calyx; filaments glabrous. 1. *P. japonicum*
 1B. Leaves oblong or ovate-elliptic, acuminate, with a short petiole; calyx short-pubescent at anthesis, rarely with short spinelike hairs; corolla 1.5–2 cm. long and as wide; fruit ellipsoidal, rarely globose, shorter than the calyx; filaments hairy. 2. *P. savatieri*

1. *Physalistrum japonicum* (Fr. & Sav.) Honda. *Chamaesaracha japonica* Fr. & Sav., pro parte; *C. echinata* Yatabe; *P. echinatum* (Yatabe) Makino; *P. japonicum* (Fr. & Sav.) Kitam.—IGA-HÖZUKI. Perennial herb with short rhizomes; stems branched, 50–70 cm. long, often with scattered long-spreading hairs; leaves membranous, ovate to broadly so, 4–8 cm. long, 3–5 cm. wide, obtuse to acute, abruptly narrowed at base to a rather long winged petiole, entire, ciliate; flowers

2 or 3, rarely solitary in the axils, pendulous, small, pale yellowish, the pedicels 2–3 cm. long, sometimes long pubescent, thickened at apex; calyx long-pubescent in flower, the teeth depressed-deltoid, undulate, the hairs becoming soft spiny in fruit; corolla puberulent externally; filaments glabrous; fruit globose, 8–10 mm. across, enclosed in the persistent calyx, white at maturity.—July–Oct. Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and China.

2. *Physalisstrum savatieri* (Makino) Makino. *Chamaesaracha japonica* Makino; *C. savatieri* Makino; *C. watanabei* Yatabe; *P. japonicum* Honda, pro parte.—Ao-HÖZUKI. Perennial herb with short rhizomes; stems branched, soft, thinly soft-pubescent; leaves membranous, oblong, sometimes ovate-elliptic, 6–12 cm. long, 2.5–4.5 cm. wide, acuminate at both ends, loosely short-pubescent, ciliate, short-petiolate; flowers 1 or sometimes 2 in axils, greenish, the pedicels 2–3 cm. long in fruit, thickened at apex; calyx often thinly short-

pubescent, the teeth deltoid, the hairs becoming soft spiny in fruit; corolla puberulent outside, densely pubescent inside at base with branched hairs; filaments soft spreading-pubescent; fruit ellipsoidal, 1–1.3 cm. long, enclosed by the green persistent urceolate calyx longer than the fruit.—June–July. Woods in mountains; Honshu, Shikoku.—Forma *kimurae* (Makino) Ohwi. *P. kimurae* Makino.—TAKAO-HÖZUKI. Fruit globose.—Honshu (Mount Takao in Musashi Prov.).

5. TUBOCAPSICUM Makino HADAKA-HÖZUKI ZOKU

Perennial rhizomatous herbs; stems erect, branched; leaves nearly entire; flowers fasciculate in axils, pendulous, yellowish; calyx short, truncate, nearly entire, slightly accrescent and not enclosing the fruit; corolla broadly campanulate, 5-lobed, valvate in bud; anthers ovate, with parallel locules; style elongate, the stigma dilated and capitate; ovules many; berry juicy, small, globose, red; seeds flat, depressed-punctate.—Few species, in e. Asia and India.

- 1A. Leaves thinly membranous, acuminate; pedicels somewhat thickened at apex; corolla with the lobes deltoid, acute. 1. *T. anomalum*
1B. Leaves rather thick, obtuse; pedicels much thickened at apex; corolla with the lobes oblong, obtuse. 2. *T. obtusum*

1. *Tubocapsicum anomalum* (Fr. & Sav.) Makino. *Capsicum anomalum* Fr. & Sav.; *C. cordiforme* var. *truncata* Miq.; *Solanum anodontum* Lévl. & Van't.—HADAKA-HÖZUKI. Nearly glabrous perennial herb with obliquely spreading branches; leaves oblong or elliptic, 8–18 cm. long, 4–10 cm. wide, acuminate or abruptly acuminate at both ends, entire or obsoletely and remotely undulate-toothed, the petioles short, winged; flowers 2–5 in axils, sometimes solitary, yellowish, the pedicels slender, pendulous, 15–25 mm. long, thickened at the apex in fruit; calyx shallow, truncate, glabrous; corolla about 8 mm. across, 5-lobed, the lobes recurved above, lanceolate-deltoid, acute with a minute obtuse tip; fruit globose, 7–10

mm. across, red, naked.—Aug.–Oct. Woods in hills and mountains; Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, Philippines, and India.

2. *Tubocapsicum obtusum* Kitam. *T. anomalum* var. *obtusum* Makino.—MARUBA-HADAKA-HÖZUKI. Resembles the preceding; leaves thicker, ovate or narrowly so, 8–12 cm. long, 4.5–5.5 cm. wide, obtuse, entire, gradually narrowed to a short petiole; flowers 2–5 in axils, the pedicels 2–2.5 cm. long in fruit, about 7 mm. long in anthesis; calyx truncate, about 5 mm. across; corolla with the lobes oblong, obtuse; fruit globose, 8–12 mm. across, red.—Woods and thickets near seashores; Honshu (Kii Prov.), Shikoku, Kyushu.

6. SOLANUM L. NASU ZOKU

Herbs or woody plants, sometimes scandent; stems sometimes prickly, glabrous or stellate-pubescent, often viscid; leaves alternate, entire or pinnatifid; cymes regularly branched or one-sided, axillary or in terminal panicles or corymbs; flowers yellow, white, or purplish; calyx campanulate or spreading, 5- to 10-toothed, rarely accrescent in fruit; corolla rotate, the limb plicate in bud, angled or shallowly lobed; filaments inserted on the throat, very short, the anthers connivent around the style, longitudinally splitting or opening by pores; ovary 2(–4)-loculed, many-ovuled; berry juicy, sometimes becoming dry, globose to oblong; seeds flat.—About 1,500 species, in the Tropics and warmer regions, especially abundant in S. America.

- 1A. Flowers axillary, fasciculate; calyx 10-cleft, densely yellowish pubescent, the lobes linear. 1. *S. biflorum*
1B. Flowers in supra-axillary or extra-axillary pedunculate cymes; calyx undulately 5-lobed or -toothed.

2A. Flowers in simple umbellate cymes.

3A. Cymes with a short axis; leaves rather thick, broadly ovate, acute or obtuse, deep green; corolla and fruit 6–7 mm. across.

2. *S. nigrum*

3B. Cymes without axis; leaves thinly membranous, ovate, acuminate, vivid green; corolla and fruit narrower. 3. *S. photinocarpum*

2B. Flowers in dichotomous elongate cymes.

4A. Anthers lanceolate, 4–5 mm. long, narrowed at tip; berry ellipsoidal; leaves entire. 4. *S. megacarpum*

4B. Anthers oblong or narrowly so, 2.5–3.5 mm. long, not narrowed at the tip; fruit usually globose.

5A. Plants glabrous or nearly so; calyx-teeth short, distinctly shorter than wide.

6A. Anther-locules obliquely truncate at apex; leaves often incised or deeply 3- to 5-lobed, long-acuminate, rounded at base when entire, cordate when lobed. 5. *S. japonense*

6B. Anther-locules subtruncate at apex; leaves entire, acute to acuminate, rounded to broadly cuneate at base.

6. *S. maximowiczii*

5B. Plant densely glandular-tipped hairy; calyx-teeth depressed-deltoid to broadly ovate; anthers nearly truncate at apex; leaves pinnately cleft, rarely entire. 7. *S. lyratum*

1. *Solanum biflorum* Lour. *Lycianthes biflora* (Lour.) Bitter; *S. decedentatum* Roxb.—MEJURO-HÖZUKI. Perennial erect herb, 60–100 cm. high, ligneous at base, the branches pubescent while young, becoming glabrous and gray-yellow; leaves oblong, ovate, or narrowly so, 6–13 cm. long, 3–7 cm. wide, acute, rounded or abruptly narrowed at base, entire or

slightly undulate-toothed, pubescent above and on nerves beneath or on both surfaces, the petiole winged in upper part; flowers 1 or 2 in axils, the pedicels 5–10 mm. long, prominently yellow-brown spreading-pubescent; calyx 10-cleft, 6–10 mm. across at anthesis, 1–2 cm. across in fruit, densely yellowish pubescent, the teeth broadly linear; corolla about 1.5 cm.

across, 5-cleft, the teeth narrowly ovate-deltoid; anthers 3-4 mm. long, narrowed at tip, the locules opening by an oblique apical pore; berries globose, red.—May-Oct. Warm regions; Honshu (s. centr. distr.), Shikoku, Kyushu.—Ryukyus, Formosa, China, India to Malaysia, and Hawaii.

2. *Solanum nigrum* L. INU-HÖZUKI. Nearly glabrous or scattered short-pubescent erect annual; stems 30-60 cm. long, angled, branched; leaves rather thick, broadly ovate, 6-10 cm. long, 4-6 cm. wide, acute or obtuse, rounded to broadly cuneate at base, entire or undulate-toothed, deep green, the petioles short, winged in upper part; cymes umbellate, supra-axillary, the axis 3-8 mm. long, the peduncles 1-3 cm. long, the pedicels 7-12 mm. long; flowers 6-7 mm. across, white; calyx-teeth depressed-deltoid or ovate-rounded; anthers narrowly oblong; berries globose, black, 6-7 mm. across.—Aug-Oct. Waste grounds and roadsides; Hokkaido, Honshu, Shikoku, Kyushu; common.—Cosmopolitan.

3. *Solanum photeinocarpum* Nakamura & Odashima. *S. nigrum* var. *pauciflorum* Liou.—TERIMI-NO-INU-HÖZUKI. Closely resembles the preceding; leaves thinner, acuminate, vivid green; inflorescence umbellate, without an axis; flowers fewer, smaller; corolla and fruit narrower; seeds smaller.—Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, and s. China.

4. *Solanum megacarpum* Koidz. *S. dulcamara* var. *macrocarpum* Maxim.; *S. macrocarpum* (Maxim.) Kudo; *S. nipponense* var. *macrocarpum* (Maxim.) Makino & Nemoto.—Ö-MARUBA-NO-HOROSHI, MARUBA-NO-HOROSHI. Somewhat scandent, nearly glabrous perennial; leaves thinly membranous, ovate to narrowly so, 5-8 cm. long, the pedicels slender, ovate, rounded to shallowly cordate at base, entire, short-ciliate, petiolate; cymes supra-axillary, loosely rather many-flowered, the peduncles 2-4 cm. long, the pedicels slender; calyx-teeth depressed; corolla pale purple, 1-1.2 cm. long, 5-cleft, the teeth reflexed, lanceolate; anthers lanceolate, 4-5 mm. long, opening by small pores; berries ellipsoidal, 12-15 mm. long, red.—July-Sept. Hokkaido, Honshu (centr. and n. distr.).—Sakhalin and s. Kuriles.

5. *Solanum japonense* Nakai. *S. dulcamara* var. *heterophyllum* Makino; *S. heterophyllum* (Makino) Nakai; *S. nipponense* Makino; *S. gracilescens* Nakai, 1930, non Nakai ex Makino, 1926.—YAMA-HOROSHI, HOSOKA-NO-HOROSHI. Nearly glabrous scandent perennial herb with slender, elongate branches; leaves thinly membranous, deltoid-lanceolate to

narrowly deltoid-ovate, 4-8 cm. long, 1-3.5 cm. wide, gradually long-acuminate, rounded at base, entire or undulate-toothed, sometimes incised to deeply 3- to 5-lobed and cordate, often thinly pilose on margin and on nerves above; peduncles 1-3 cm. long, loosely few-flowered; corolla 6-7 mm. long, pale purple, 5-cleft, the lobes lanceolate, reflexed; anthers narrowly oblong, 2.5-3 mm. long, the locules obliquely truncate at apex; berries globose, red, 6-7 mm. across.—July-Oct. Woods and thickets in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

—Korea, Manchuria, and China.—Forma *xanthocarpum* (Makino) Hara. *S. nipponense* forma *xanthocarpum* Makino.—KIMI-NO-YAMA-HOROSHI. Fruit yellow.

Var. *takaoyamense* (Makino) Hara. *S. takaoyamense* Makino; *S. nipponense* var. *takaoyamense* (Makino) Makino.—TAKAO-HOROSHI. Leaves toothed; fruit ellipsoidal.—Honshu.

6. *Solanum maximowiczii* Koidz. *S. dulcamara* var. *ovatum* sensu auct. Japon., non Dunal; *S. gracilescens* Nakai ex Makino.—MARUBA-NO-HOROSHI. Nearly glabrous scandent perennial herb with elongate, slender branches; leaves narrowly oblong or narrowly ovate, 5-10 cm. long, 1.5-4 cm. wide, acute to acuminate, rounded to broadly cuneate at base, entire, ciliate, the petiole winged; cymes rather large, loosely flowered, the peduncles 2-4 cm. long; corolla pale purple, 5-6 mm. across, 5-cleft, the lobes lanceolate, reflexed; anthers 2-2.5 mm. long, narrowly oblong, subtruncate at apex; berries globose, red, 7-10 mm. across.—Aug-Oct. Honshu, Shikoku, Kyushu.—Ryukyus.

7. *Solanum lyratum* Thunb. *S. dulcamara* var. *pubescens* Bl.; *S. dulcamara* var. *lyratum* (Thunb.) Sieb. & Zucc.—HIYODORI-JÖGO. Scandent, densely glandular-pubescent perennial herb; leaves ovate, 3-8 cm. long, 2-4 cm. wide, acuminate or acute, sometimes obtuse, cordate at base, usually with 1 or 2 pairs of lobes near base, rarely entire; cymes loosely flowered, the peduncles 1-4 cm. long; calyx-teeth depressed-deltoid to broadly ovate; corolla white, 7-8 mm. long, 5-cleft, the lobes lanceolate, reflexed; anthers narrowly oblong, about 3 mm. long, nearly truncate at apex; fruit red, about 8 mm. across.—Aug-Oct. Thickets in hills and low mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, China, Ryukyus, Formosa, and Indochina.—Forma *xanthocarpum* (Makino) Hara. *S. lyratum* var. *xanthocarpum* Makino.—KIMI-NO-HIYODORI-JÖGO. Fruit yellow. Rare.

Fam. 177. SCROPHULARIACEAE

GOMA-NO-HA-GUSA KA

Figwort Family

Herbs or shrubs, rarely trees; leaves alternate or opposite, sometimes verticillate; stipules absent; flowers bisexual, usually zygomorphic; calyx-lobes imbricate or valvate in bud; corolla gamopetalous, the limb 4- to 5(-8)-lobed, usually more or less bilabiate, the lobes imbricate in bud; stamens usually 4, didymous, or 2, inserted on the tube and alternate with the lobes, the 5th one absent or present as a staminode, rarely fertile; ovary superior, sessile, entire, usually completely 2-locular; style terminal; ovules many, on axile placentae; fruit a capsule; seeds many, with fleshy endosperm.—About 180 genera, with about 3,000 species, essentially cosmopolitan, especially abundant in temperate regions.

1A. Upper lip of corolla (the inner lobes) covering the others in bud.

2A. Corolla spurred; capsules opening by pores; inflorescence a raceme or spike or the flowers solitary in axils. 1. *Linaria*

2B. Corolla not spurred; capsules commonly dehiscent by valves.

3A. Inflorescence compound.

4A. Tree; leaves 20-40 cm. wide. 2. *Paslowia*

4B. Herbs or subshrubs; leaves smaller.

5A. Staminodes absent or scalelike; calyx 5-lobed. 3. *Scrophularia*

5B. Staminodes filiform or spatulate; calyx 5-cleft. 4. *Pentstemon*

3B. Inflorescence simple.

6A. Anterior pair of stamens inserted on the corolla-tube, sometimes absent.

- 7A. Fertile stamens 4.
 8A. Corolla nearly actinomorphic, rotate; anther-locules confluent; acaulescent. 5. *Limosella*
 8B. Corolla bilabiate, with a distinct tube; caulescent.
 9A. Flowers solitary in axils.
 10A. Calyx tubular, prominently ridged or winged, the teeth very short. 6. *Mimulus*
 10B. Calyx-tube not winged or prominently ribbed, the lobes lanceolate to ovate or linear. 7. *Limnophila*
 9B. Flowers in short racemes; calyx-tube short but distinct. 8. *Mazus*
- 7B. Fertile stamens 2.
 11A. Calyx tubular, 5-lobed, 5-angled; corolla nearly rotate. 9. *Microcarpaea*
 11B. Calyx 5-cleft to -parted; corolla bilabiate, with a distinct tube.
 12A. Leaves chiefly cauline, uniformly flat or linear.
 13A. Calyx subtended by two bracteoles, the teeth imbricate in bud; anthers glabrous. 10. *Gratiola*
 13B. Calyx not bracteolate, the teeth valvate in bud; anthers pilose. 11. *Deinostema*
 12B. Leaves of two forms, the radical subelongate, the cauline scalelike. 12. *Dopatrium*
- 6B. Anterior pair of stamens inserted on the corolla-throat.
 14A. Leaves palmately veined, entire or obscurely toothed; anther-locules emarginate at base; seeds smooth. 13. *Lindernia*
 14B. Leaves pinnately veined, toothed; anther-locules not emarginate at base; seeds with several rows of small pits.
 15A. Flowers small, usually 4–10 mm. long; calyx wingless; capsules usually longer than the calyx. 14. *Vandellia*
 15B. Flowers larger, 1.5–3 cm. long; calyx broadly 5-winged; capsules not exceeding the calyx. 15. *Torenia*
- 1B. Outer (anterior) or lateral lobes of corolla enveloping the others in bud.
 16A. Corolla not bilabiate, the lobes flat.
 17A. Stamens 4 or 5.
 18A. Stems long-creeping below ground; leaves radical, alternate, long-petiolate, pinnately cleft; flowers radical; pedicels spirally coiled after anthesis. 16. *Ellisiophyllum*
 18B. Stems erect; leaves cauline, opposite, or alternate in the upper portion, sessile, entire or toothed; flowers cauline, nearly sessile, the upper ones forming a terminal spike. 17. *Centranthera*
- 17B. Stamens 2.
 19A. Stems leafy; stamens inserted on corolla-tube, long-exserted; fruit a dehiscent capsule.
 20A. Corolla with lobes longer than the tube; capsules obtuse to retuse at apex; leaves opposite. 18. *Veronica*
 20B. Corolla with lobes much shorter than the tube; capsules acute at apex; leaves alternate or verticillate. 19. *Veronicastrum*
 19B. Stems scape-like, with few pairs of small leaves; stamens inserted on the corolla-throat, not exserted; fruit consisting of 2 nutlets. 20. *Lagotis*
- 16B. Corolla clearly bilabiate, with a galeate or erect upper lip and spreading lower lip.
 21A. Calyx 2-bracteolate.
 22A. Stems with many imbricate scalelike leaves on lower part; capsules dehiscent only on one side; calyx 4-lobed. 21. *Monochasma*
 22B. Stems without scalelike leaves; capsules dehiscent into 2 valves; calyx 5-lobed. 22. *Siphonostegia*
- 21B. Calyx without bracteoles.
 23A. Ovules 2 in each locule; capsules 1- to 4-seeded. 23. *Melampyrum*
 23B. Ovules several to many in each locule; capsules several to many-seeded.
 24A. Annuals or biennials; upper lip of corolla recurved on margin.
 25A. Leaves toothed or lobed; flowers white or yellowish; capsules symmetrical; seeds longitudinally striate. 24. *Euphrasia*
 25B. Leaves pinnately dissected; flowers usually reddish; capsules somewhat asymmetrical; seeds reticulate.
 25. *Phtheirospermum*
- 24B. Perennials or rarely biennials; upper lip of corolla not recurved; leaves usually pinnately lobed to dissected; flowers white, yellowish, or reddish; capsules oblique, usually dehiscent on one side. 26. *Pedicularis*

1. LINARIA Mill. UN-RAN ZOKU

Herbs, rarely subshrubs; lower leaves usually opposite or verticillate in 3's or 4's, the upper or sometimes all leaves alternate, entire, toothed, or lobed; flowers solitary in axils or the upper sometimes forming a spike or raceme, white, yellow, or rose-purple, the pedicels without bracteoles; calyx 5-cleft, the lobes imbricate in bud; corolla-tube spurred, the upper lip erect, bifid, the lower lip spreading, 3-lobed, with protuberances or teeth closing the throat; stamens didymous, the anther-locules parallel, not connate; capsules ovoid-globose, usually opening by pores near the top; seeds sometimes winged.—About 100 species, in temperate regions of the N. Hemisphere, chiefly in the Old World.

1. *Linaria japonica* Miq. *L. geminiflora* F. Schmidt;
L. japonica var. *geminiflora* (F. Schmidt) Nakai.—UN-RAN.
 Glaucous, glabrous perennial; stems terete, erect, more or less branched, 15–40 cm. long, from an ascending base; leaves opposite or verticillate in 3's or 4's, alternate in the upper ones, elliptic to elliptic-lanceolate, 1.5–3 cm. long, 5–15 mm. wide,

obtuse to subacute, sessile, obscurely 3-nerved; racemes short, the pedicels short; flowers pale yellow, 15–18 mm. long, the spur 5–10 mm. long; capsules 6–8 mm. long; seeds winged, about 3 mm. long.—Aug.–Oct. Sandy places along seashores; Hokkaido, Honshu, Shikoku; common.—Kuriles, Sakhalin, Korea, Ussuri, and Manchuria.

2. PAULOWNIA Sieb. & Zucc. KIRI ZOKU

Trees; leaves opposite, large, petiolate, broadly ovate or angled-cordate, 20–40 cm. wide, soft-pubescent; panicles terminal, many-flowered, with opposite branches; flowers purplish, large; calyx 5-parted, the segments obtuse; corolla-tube elongate, inflated in upper part, the lobes 5, obliquely spreading, rounded, nearly equal; stamens 4, didymous, not exserted, the anther-locules divergent, not connate; staminodia absent; ovules many; capsules coriaceous, rather large, broadly ovoid, acuminate; seeds small, numerous, with membranous wings.—Few species, in warmer regions of e. Asia, one long cultivated in our area.

1. *Paulownia tomentosa* (Thunb.) Steud. *Bignonia tomentosa* Thunb.; *P. imperialis* Sieb. & Zucc.—KIRI. Deciduous tree with glandular-pubescent branches and leaves; leaves large, long-petiolate, entire or shallowly 3- to 5-lobed;

flowers before the leaves; calyx yellow-brown villous; corolla 5-6 cm. long, pale purple, yellow-striate inside; capsules 3-4 cm. long.—May-June. Much cultivated in our area and reportedly wild in Kyushu.—(?) Korea (Utsuryo Island).

3. SCROPHULARIA L. GOMA-NO-HA-GUSA ZOKU

Usually foetid herbs or subshrubs; leaves opposite, or alternate in the upper ones, toothed or entire, sometimes pinnatifid; cymes often forming a terminal panicle; flowers small, green-purple, yellow-green, or sometimes brown; calyx 5-cleft, the lobes obtuse, rounded; corolla-tube ellipsoidal, gibbous, the lobes 5, small, flat, the 2 posterior lobes often longer than the others, the anterior one spreading; stamens didymous, the anther-locules parallel, connate; capsules ovoid, septicidal; seeds ovoid, rugose, wingless.—More than 200 species, chiefly in the N. Hemisphere, abundant in the Mediterranean region.

- 1A. Stems winged; leaves slightly fleshy; petioles winged, semiclasping; capsules 7-10 mm. long, 5-7 mm. wide. 1. *S. grayana*
- 1B. Stems 4-angled, wingless; leaves membranous or chartaceous.
- 2A. Roots more or less thickened; rhizomes not prominent; capsules ovoid-conical; leaves chartaceous.
- 3A. Calyx-lobes broadly ovate; panicles terminal, very narrow and spikelike, densely flowered; flowers yellow-green, 6-7 mm. long; capsules about 5 mm. long, about 3 mm. across. 2. *S. buergeriana*
- 3B. Calyx-lobes narrowly ovate to lanceolate; panicles broader and looser; flowers dark purple, slightly larger; capsules 5-8 mm. long, 4-6 mm. across.
- 4A. Calyx-lobes narrowly ovate, acute to subobtusate; leaves serrulate. 3. *S. kakudensis*
- 4B. Calyx-lobes lanceolate, acuminate; leaves minutely serrulate. 4. *S. toyamae*
- 2B. Roots slender, fibrous; rhizomes short, thick and prominent; capsules ovoid-globose to globose; leaves membranous.
- 5A. Cymes axillary, 1- to 3-flowered, shorter than the leaves, not forming a terminal panicle; flowers 9-11 mm. long; capsules ovoid-globose. 5. *S. musashiensis*
- 5B. Cymes forming a loose terminal panicle; flowers 7-9 mm. long; capsules globose, abruptly acute. 6. *S. duplicatoserrata*

1. *Scrophularia grayana* Maxim. ex Komar. *S. alata* A. Gray, non Gilib.—EZO-HINA-NO-USU-TSUBO. Stems rather stout, 4-winged, usually pubescent on the nodes and upper parts; leaves slightly fleshy, narrowly ovate to deltoid-ovate, 8-15 cm. long, 4-8(-10) cm. wide, acute, rounded to broadly cuneate at base, regularly toothed, nearly glabrous on both sides, the petioles narrowly winged, semiclasping; cymes rather many-flowered, pedunculate, forming a terminal panicle, longer than the bracts, the branches usually loosely glandular-pilose; pedicels 1-2 cm. long; calyx-lobes ovate-orbicular, rounded at apex; corolla 12-15 mm. long, yellow-green, tinged pale brownish purple; capsules 7-10 mm. long, 5-7 mm. wide, ovoid-conical; seeds narrowly ovate, dark brown, with few obsolete longitudinal grooves.—May-Aug. Near seashores; Hokkaido, Honshu (Rikuchu and Noto Prov. and northw.).—s. Kuriles and Sakhalin.

2. *Scrophularia buergeriana* Miq. *S. buergeriana* var. *distantiiflora* Miq.; *S. oldhamii* Oliv.; *S. oldhamii* var. *distantiiflora* (Miq.) Fr. & Sav.—GOMA-NO-HA-GUSA. Stems erect, 80-150 cm. high, 4-angled, glabrous, nearly simple; leaves narrowly deltoid or deltoid-oblong, 5-10 cm. long, 2.5-5 cm. wide, acuminate, truncate to broadly cuneate at base, the petioles wingless or very slightly winged; cymes few-flowered, forming a spikelike rather dense panicle, 1-2 cm. long inclusive of the peduncle, minutely glandular-pilose, the bracts small; calyx-lobes broadly ovate, subacute or subobtusate; corolla yellow-green, 6-7 mm. long; capsules ovoid, about 5 mm. long, about 3 mm. across; seeds rather small.—July-Aug. Grassy places along rivers in lowlands; Honshu, Kyushu.—Korea, Manchuria, and China.

3. *Scrophularia kakudensis* Franch. Ô-HINA-NO-USU-TSUBO, HINA-NO-USU-TSUBO. Stems 4-angled, erect, often much branched, thinly pubescent or glabrous at base; leaves narrowly deltoid to deltoid-oblong, acute, truncate to rounded at base, serrulate, thinly pubescent especially beneath, petiolate; cymes several-flowered, pedunculate, forming a terminal rather loose panicle, the pedicels 7-15 mm. long, glandular-pilose;

calyx-lobes narrowly ovate or ovate-deltoid, acute to subobtusate; corolla dark purple, 8-10 mm. long; capsules ovoid.—Aug.-Oct. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

4. *Scrophularia toyamae* Hatus. ex Yamazaki. TSUSHIMA-HINA-NO-USU-TSUBO. Stems erect, simple, glabrous, 4-angled; leaves ovate, 5-7 cm. long, 2.5-4 cm. wide, subacute, shallowly cordate at base, very minutely serrulate, thinly short-pilose on both surfaces; cymes forming a narrow glandular-pilose terminal panicle, the pedicels 5-15 mm. long; calyx-lobes lanceolate, acuminate; corolla purple, about 8 mm. long; capsules ovoid-conical, acute, 5-8 mm. long.—July-Aug. Reported from Kyushu (Tsushima).

5. *Scrophularia musashiensis* Bonati. SATSUKI-HINA-NO-USU-TSUBO. Stems 40-80 cm. long, 4-angled, usually simple, often loosely pubescent; leaves thinly membranous, ovate-oblong or ovate, 7-15 cm. long, 3-8 cm. wide, subacute, rounded or cuneate at base, doubly toothed or incised, the petioles narrowly winged; cymes axillary, 1- to 3-flowered, loose, long-pedunculate, loosely glandular-pilose; flowers 9-11 mm. long, the pedicels slender, 2-3(-4) cm. long; calyx-lobes ovate, obtuse; capsules ovoid-globose, 7-10 mm. long.—(Apr.-)May. Honshu (w. Kantô Distr. and Shinano Prov.).

6. *Scrophularia duplicatoserrata* (Miq.) Makino. *S. alata* var. *duplicatoserrata* Miq.; *S. musashiensis* var. *surugensis* Honda; *S. duplicatoserrata* var. *surugensis* (Honda) Hara.—HINA-NO-USU-TSUBO, YAMA-HINA-NO-USU-TSUBO. Stems 40-60 cm. long, 4-angled, glabrous or thinly pubescent at base; leaves thinly membranous, ovate to oblong-ovate, acute to acuminate, rounded to broadly cuneate at base, glabrous on both sides or rarely thinly pubescent above and on nerves beneath, doubly toothed, petiolate; cymes forming a loose terminal panicle, scattered glandular-pilose, the pedicels slender, 1-2(-3) cm. long; calyx-lobes ovate or broadly so, obtuse to subacute; capsules 6-7 mm. long, globose, abruptly acute.—Honshu (Tôkaidô Distr. and westw.), Shikoku, Kyushu.

4. PENTSTEMON Mitchell IWABUKURO ZOKU

Perennial herbs or subshrubs; leaves opposite, the lower petiolate, the upper reduced to bracts; inflorescence a terminal, often leafy, bracteate panicle, rarely a raceme; flowers showy, rose-purple, purplish, whitish, rarely pale yellow; calyx 5-parted or cleft, the lobes imbricate in bud; corolla-tube usually elongate, sometimes inflated on one side, the limb bilabiate; stamens 4, didymous, not exerted; staminode filiform; capsules septicidal, the valves entire.—About 150 species, in N. America and Mexico, one in e. Asia.

1. *Pentstemon frutescens* Lamb. IWABUKURO. Rhizomes ascending and branched; stems erect, somewhat tufted, 10–20 cm. long, few-leaved, with 2 longitudinal lines of hairs; lower few leaves scalelike, the upper ones rather thick and fleshy, ovate-oblong or broadly lanceolate, 4–7 cm. long, 1.5–3 cm. wide, acute, narrowed or obtuse at base, mucronate-toothed, short-pilose on margin, sessile; flowers few, the pedicels 5–10 mm. long, as long as or slightly longer than the

lanceolate bracts, rather densely glandular-tipped pubescent; calyx 12–15 mm. long, 5-parted, the lobes narrowly lanceolate; corolla about 2.5 cm. long, tubular, pale purple, loosely pubescent externally; capsules narrowly ovoid, as long as the calyx; seeds many, flat, winged, about 2 mm. long.—Aug. Gravelly and sandy alpine slopes; Hokkaido, Honshu (n. distr.).—Kuriles, Sakhalin, e. Siberia, Kamchatka, and Aleutians.

5. LIMOSELLA L. KITAMI-SŌ ZOKU

Dwarf glabrous tufted acaulescent often stoloniferous herbs; leaves tufted, radical, alternate, linear to oblong or ovate; pedicels radical, axillary, bractless; flowers white or rose-colored, minute; calyx campanulate, 5-toothed; corolla rotate, actinomorphic, 5-lobed, the lobes nearly equal, spreading, ovate-rounded, imbricate in bud; stamens 4, inserted on the tube, the anther-locules confluent; ovary 2-locular at base, without the septum at tip; style short, the stigma subcapitate; capsules indehiscent or tardily dehiscent, the valves membranous; seeds many, small, ovate.—Few species, chiefly S. African, 1 or 2 nearly cosmopolitan.

1. *Limosella aquatica* L. KITAMI-SŌ. Delicate glabrous annual; leaves radical, tufted, broadly linear to narrowly oblong, 4–10 mm. long, 1–3 mm. wide, 2–5 cm. long including the petiole; stolons short, nodeless, with a tuft of leaves at the top; pedicels 4–20 mm. long, ascending, appressed to the ground in fruit; flowers white to pinkish, about 2.5 mm.

across; calyx thinly membranous, shorter than the fruit; corolla lobes broadly ovate; capsules 2-lobed, ellipsoidal, about 3 mm. long; seeds elliptic, about 0.3 mm. long, somewhat reticulate.—May–Oct. Muddy or sandy places around springs and along rivers; Hokkaido, Honshu, Kyushu; very rare.—Cooler regions of the N. Hemisphere.

6. MIMULUS L. MIZO-HŌZUKI ZOKU

Erect or decumbent, glabrous to pubescent herbs; leaves opposite, entire or toothed; flowers yellow, rose, or purplish, solitary, in axils or the upper ones sometimes in terminal racemes, the pedicels bractless; calyx tubular, 5-ribbed, 5-toothed, the ribs often winglike; corolla-tube sometimes inflated on one side, the upper lip 2-lobed, the lower lip 3-lobed, with 2 tubercles or ridges inside the throat; stamens 4, didymous; style with 2 lamellate stigmas; capsules ellipsoidal to linear, enclosed in the calyx, loculicidal.—About 60 species, in temperate regions, except Europe and the Mediterranean area, especially abundant in w. N. America, also in S. America.

1A. Calyx-teeth 5, mucrolike; corolla 1.5–2 cm. long; leaves petiolate except the upper ones, abruptly acute at base.

1. *M. nepalensis* var. *japonicus*

1B. Calyx with 5 short deltoid lobes; corolla 2.5–3 cm. long; leaves sessile, rounded at base. 2. *M. sessilifolius*

1. *Mimulus nepalensis* Benth. var. *japonicus* Miq. ex Maxim. *M. nepalensis* forma *japonica* Miq.; (?) *Torenia inflata* Miq.; *M. tenellus* var. *japonicus* (Miq.) Hand-Mazz.—MIZO-HŌZUKI. Glabrous perennial; stems 10–30 cm. long, 4-angled; leaves ovate to broadly so, 1.5–4 cm. long, 1–2.5 cm. wide, subacute or obtuse, abruptly acute to broadly cuneate or sometimes rounded at base, loosely few-toothed, short-petiolate or sessile in the upper ones; pedicels longer or slightly shorter than the leaves, 1.5–3 cm. long; calyx 8–10 mm. long at anthesis, 10–15 mm. in fruit, with 5 narrow wings, the teeth mucrolike, less than 1 mm. long; corolla pale yellow, 1.5–2 cm. long, with 2 lines of hairs inside near tip; capsules oblong, 8–10 mm. long, enclosed in the persistent slightly inflated calyx; seeds minute, smooth.—June–Aug. Wet places and along streams in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea.

2. *Mimulus sessilifolius* Maxim. ŌBA-MIZO-HŌZUKI. Glabrous perennial; stems erect, simple, 4-angled, 20–30 cm. long; basal leaves scalelike; cauline leaves broadly to narrowly ovate, 3–6 cm. long, 1.5–3.5 cm. wide, short-acuminate or acute, rounded at base, sessile, sometimes obtuse in the lower ones, coarsely acute-toothed, short-pilose on margin, the lateral nerves of 2 or 3 pairs arising near the base, the pedicels 1–3 cm. long, usually half as long as the leaves; calyx 8–13 mm. long, 5-angled, the lobes deltoid, acuminate; corolla pale yellow, yellow-brown spotted at base inside, 2.5–3 cm. long, with 2 rows of long papillose hairs; capsules not exerted from the persistent calyx.—July–Aug. Wet grassy places in high mountains; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin and s. Kuriles.

7. LIMNOPHILA R. Br. SHISO-KUSA ZOKU

Glabrous or pubescent soft mostly marsh herbs; aerial leaves opposite or verticillate, dentate or incised, the aquatic leaves sometimes dissected into filiform segments; flowers solitary in axils, pedicelled, the upper ones often forming a terminal raceme; bracteoles small, linear, inserted at the base of calyx; calyx 5-cleft or -lobed, the lobes lanceolate to ovate, or linear, imbricate in bud, equal or the posterior ones larger; corolla with the upper lip entire or 2-lobed, the lower lip spreading, 3-lobed; stamens 4, didymous; stigmas 2, lamellate; capsules broadly ovoid to oblong, usually obtuse, 4-valved, loculicidal or septicidal; seeds many, small, reticulate.—About 30 species, in Asia, Africa, and Australia.

- 1A. Leaves verticillate in 5's to 8's, pinnately dissected or parted; flowers rose-purple, rarely white, sessile or the pedicels shorter than the calyx.
 2A. Stems and lower portion of calyx pubescent; calyx lobes linear-lanceolate, distinctly longer than the capsule; pedicels absent or nearly so.
 2B. Stems, calyx, and pedicels glabrous; calyx lobes narrowly deltoid, as long as to slightly shorter than the capsule, shorter than the calyx-tube; pedicels as long as or shorter than the calyx.
 1B. Leaves opposite, narrowly oblong, obtusely toothed; flowers white, the pedicels longer than to as long as the calyx. 3. *L. aromatica*

1. *Limnophila sessiliflora* Bl. *Hottonia sessiliflora* Vahl; *Ambulia sessiliflora* (Vahl) Baill.—KIKU-MO. Perennial, terrestrial or sometimes aquatic; stems terete, reddish, pubescent, the basal stems creeping and branched, 10–30 cm. long or much longer in the aquatic phase; aerial leaves verticillate in 5's to 8's, spreading, the pinnatifid segments linear or narrowly lanceolate, 1–2 cm. long, 3–7 mm. wide, acute, glabrate; aquatic leaves 2 or 3 times pinnately dissected into filiform segments; flowers solitary in axils, sessile or nearly so; calyx 5–7 mm. long, 5-cleft, loosely pubescent at base, the lobes lanceolate; corolla rose-purple, 6–10 mm. long, tubular; capsules ovoid-globose, about 4 mm. long; seeds oblong, terete, about 0.6 mm. long.—Paddy fields, shallow ponds, and ditches in lowlands; Honshu, Shikoku, Kyushu; common.—Korea, Ryukyus, Formosa, China to India.

2. *Limnophila indica* (L.) Druce. *Hottonia indica* L.; *Gratiola trifida* Willd.; *L. gratioides* R. Br.; *Ambulia trichophylla* Komar.; *A. indica* (L.) W. F. Wight; *A. stipitata* Hayata; *L. stipitata* (Hayata) Makino & Nemoto—KO-KIKU-MO, TAIWAN-KIKU-MO. Resembles the preceding; stems glabrous; leaves sessile, verticillate in 5's or 6's, glabrous, pinnately lobed in the upper half, 1–1.5 cm. long, 3–5 mm. wide, gradually narrowed at base; aquatic leaves finely dissected into linear segments; flowers solitary in axils, the pedicels glabrous,

shorter than or as long as the calyx; calyx greenish, 3–3.5 mm. long, membranous, as long as the capsules, glabrous, 5-lobed, the lobes deltoid, acute or with an obtuse tip; capsules about 3 mm. across, broadly ellipsoidal; seeds broadly ellipsoidal, about 0.3 mm. long, dark brown.—Sept. Honshu; rare.—Manchuria, Korea, Formosa, China, India, Malaysia, and Australia.

3. *Limnophila aromatica* (Lam.) Merr. *Ambulia aromatica* Lam.; *Gratiola aromatica* Pers.; *L. punctata* Bl.; *L. gratissima* Bl.; *A. gratissima* (Bl.) Nakai—SHISO-KUSA. Nearly glabrous annual; stems terete, short-decumbent and branched at base; leaves rarely verticillate in 3's, narrowly oblong to lanceolate, sometimes oblanceolate, 1.5–3 cm. long, 3–7 (–10) mm. wide, acute to obtuse at both ends, obtusely short-toothed, glabrous, glandular-dotted beneath, sessile; pedicels 7–15 mm. long; bracteoles short-linear, much shorter than the calyx; calyx 5–7 mm. long, 5-cleft, the lobes narrowly lanceolate; corolla about 10 mm. long, creamy white; capsules broadly ovoid, slightly shorter than the calyx; seeds reniform, with 2 ridges on the back, about 0.3 mm. long.—Sept.–Oct. Wet places in lowlands; Honshu, Shikoku, Kyushu; common.—S. Korea, Ryukyus, Formosa, China, India, Malaysia, and Australia.

8. MAZUS Lour. SAGIKOKE ZOKU

Small perennial often stoloniferous herbs; lower leaves and those of stolons opposite, the upper leaves alternate, toothed; racemes terminal, the bracts small, the bracteoles absent or on the pedicel; flowers pale purple or white; calyx broadly campanulate, short-tubular, 5-cleft; corolla-tube shorter or slightly exserted from the calyx, the upper lip erect, 2-lobed, the lower lip 3-lobed, spreading or ascending, with 2 elevated papillose lines on the throat; stamens 4, didymous; stigma bifid with lamellate lobes; capsules globose, loculicidal; seeds many, small, ovoid.—About 10 species, in e. Asia, India, Malaysia, and Australia.

- 1A. Stolons much-elongate; flowers pale purple, rarely white, 1.5–2 cm. long.
 1B. Stolons absent.
 2A. Flowers 1.3–2 cm. long; leaves mostly basal.
 2B. Flowers 1–1.2 cm. long; leaves also cauline.

1. *Mazus miquelii* Makino. *Lindernia japonica* Thunb. pro parte; *M. rugosus* var. (?) *stoloniferus* Maxim.; *M. rugosus* var. *macranthus* Fr. & Sav.; *M. rugosus* var. *rotundifolius* Fr. & Sav.; *M. rotundifolius* (Fr. & Sav.) Koidz.; *M. rotundus* Furumi; *M. stoloniferus* (Maxim.) Makino; *M. englerianus* Bonati—MURASAKI-SAGIKOKE. Thinly pubescent stoloniferous perennial; stems 7–15 cm. long, few-leaved at base; leaves obovate, elliptic, or broadly ovate, 4–7 cm. long inclusive of the petiole, 1–1.5 cm. wide, very obtuse, undulately obtuse-

toothed, the petioles winged in upper part; leaves of stolons short-petiolate, sometimes ovate-orbicular, 1.5–2.5 cm. long; racemes loosely few-flowered, puberulent, the pedicels longer than the calyx; calyx 7–10 mm. long, 5-lobed; corolla slightly flattened dorsiventrally, the lobes of the bilobed upper lip narrowly oblong, the lower lip inside with 2 raised lines of yellow-brown clavate tubercles; capsules subglobose, about 4 mm. long.—Apr.–May. Wet places, especially abundant around paddy fields in lowlands; Honshu, Shikoku, Kyushu.—

Forma albiflorus (Makino) Makino. *M. japonicus* var. *albiflorus* Makino—SHIROBANA-SAGIGOKE, SAGIGOKE. White-flowered phase.

Var. *contractus* Makino. JAKAGO-SŌ. Leaves strongly incurved and bullate, very numerous on the stems.—Possibly of garden origin.

2. *Mazus fauriei* Bonati. *M. japonicus* var. *tenuiracemus* Hayata; *M. taihoquensis* Masam.; *M. tenuiracemus* (Hayata) Hatus.—SEITAKA-SAGIGOKE. Somewhat pubescent perennial; leaves opposite, nearly radical, obovate-spathulate, 3–4 cm. long inclusive of the winged petiole, 1–1.5 cm. wide, rounded at apex, obtusely toothed; stems leafy near base, 8–15 cm. long, loosely 5- to 10-flowered, scattered-puberulent, the pedicels longer than the calyx; calyx 5–7 mm. long, 5-lobed; corolla 13–20 mm. long, pale purple, the upper lip divided into 2 narrowly oblong lobes, the lower lip with 2 yellowish raised bands inside; capsules globose, 3–4 mm. across; seeds minute.—Apr. Kyushu (s. distr.).—Ryukyus and Formosa.

3. *Mazus japonicus* (Thunb.) O. Kuntze. *Lindernia japonica* Thunb., pro parte; *M. rugosus* Lour.; *Tittmannia obovata* Bunge—TOKIWA-HAZE. Somewhat pubescent perennial; stems 5–15 cm. long, leafy mostly on lower half or toward the base; basal leaves opposite, obovate, elliptic-cuneate or oblong-spathulate, 2–6 cm. long inclusive of the petiole, 8–15 mm. wide, rounded at apex, coarsely obtuse-toothed; cauline leaves subsessile or short-petiolate; racemes loosely few-flowered, the pedicels longer than the calyx, puberulent; calyx 5–10 mm. long, 5-fid; corolla white to purplish, 1–1.2 cm. long, the upper lip about half as long as the lower, the lower lip with 2 raised yellow clavate-pilose bands inside; fruit globose, 3–4 mm. across.—Apr.–Oct. Waste grounds, cultivated fields, and riverbanks in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Korea, Ryukyus, China, and India.

9. MICROCARPAEA R. Br. SUZUME-NO-HAKOBE ZOKU

Minute, creeping, much-branched annual; leaves opposite, narrow, entire, sessile; flowers solitary in axils, sessile, very minute, without bracteoles; calyx tubular, 5-ribbed, shortly 5-lobed; corolla-tube short, the limb 5-lobed, spreading, imbricate in bud, the 2 posterior (upper) lobes connate at base; stamens 2, inserted on tube, the anther-locules confluent; ovules many; capsules ovoid, 2-grooved, loculicidal; seeds ovoid.—One species, in e. Asia, India, Malaysia, and Australia.

1. *Microcarpaea minima* (Koenig) Merr. *Paederota minima* Koenig; *M. muscosa* R. Br.—SUZUME-NO-HAKOBE. Plant very delicate, glabrous except the calyx-lobes; stems much branched, appressed to the ground, many-leaved; leaves spreading, broadly linear to broadly lanceolate, 3–5 mm. long, 1(–2) mm. wide, obtuse, shorter than the internodes of branches, semiclasping at base, entire, sessile; flowers solitary in axils, sessile; calyx 2.5–3 mm. long, tubular-campanulate, 5-ribbed,

5-lobed, the lobes narrowly deltoid, acute, sparsely ciliate, slightly spreading at tip; corolla minute, pink; capsules oblong, nearly as long as the calyx-tube, enclosed in the calyx; seeds fusiform-ovoid, obtuse, yellow-brown, nearly smooth, about 0.3 mm. long.—July–Oct. Paddy fields and wet riverbanks in lowlands; Honshu, Shikoku, Kyushu.—Korea, Ryukyus, Formosa, China, India, Malaysia, and Australia.

10. GRATIOLA L. Ō-ABU-NO-ME ZOKU

Erect or decumbent, glabrous or pilose herbs; leaves opposite, entire or toothed; pedicels solitary in axils, usually bibracteolate; calyx deeply 5-lobed to parted, slightly unequal; corolla-tube bilabiate, the upper lip entire or shortly 2-lobed, the lower lip 3-lobed, the lobes rounded; stamens 2, the anther-locules distinct, not confluent, the staminodia 2 or absent; capsules ovoid, often acute, 4-valved, loculicidal or septicidal, the valves incurved on margin, free from the placentae; seeds many, small, striate, or reticulate.—About 25 species, chiefly in temperate and warmer regions.

- 1A. Flowers sessile; leaves lanceolate. 1. *G. japonica*
1B. Flowers on pedicels 3–10 mm. long; leaves ovate. 2. *G. virginiana*

1. *Gratiola japonica* Miq. *G. micrantha* Fr. & Sav.—Ō-ABU-NO-ME. Glabrous annual; stems rather fleshy, erect, 10–25 cm. long, usually branched at base; leaves spreading, lanceolate, subobovate, entire, weakly few-nerved from the base, sessile; flowers solitary in axils, sessile, the bracteoles simulating the calyx-lobes; calyx 3–4 mm. long, 5-parted nearly to the base, the segments lanceolate, subobovate; corolla white, about 6 mm. long, the limb rather short, bilabiate; capsules globose, 4–5 mm. across, slightly longer than the calyx; seeds lanceolate, about 0.7 mm. long.—May–July. Wet places especially in paddy fields; Honshu, Kyushu.—Korea, Amur, and Ussuri.

2. *Gratiola virginiana* L. *G. fluitatilis* Koidz.—KA-

MIGAMO-SŌ. Annual, about 15 cm. high; stems somewhat fleshy, puberulent, sparsely branched at base; leaves ovate, 2.5–5.5 cm. long, 1.5–2.8 cm. wide, very obtuse, broadly cuneate at base, 5-nerved, irregularly obtuse-toothed, loosely pilose on margin; flowers solitary, white, about 8 mm. long, in axils, the pedicels pilose, 3–10 mm. long, the bracteoles broadly linear, 2.5 mm. long; calyx 5-parted to the base, the segments linear-lanceolate, pilose, slightly accrescent after anthesis, to 7 mm. long in fruit; corolla bilabiate; stamens 2, the filaments densely pilose, staminodes absent; capsules cordate, about 5 mm. long.—Oct. Found once in Honshu near Kyoto.—N. America.

11. DEINOSTEMA Yamazaki SAWA-TŌGARASHI ZOKU

Annual herbs with fibrous roots; stems erect; leaves opposite, sessile, entire, obscurely veined; chasmogamic flowers long-pedicelled in the axils of upper leaves, solitary; calyx campanulate, 5-parted, ebracteolate; corolla tubulose-campanulate, the limb

dilated, bilabiate; 2 posterior stamens perfect, included, the filaments short, adnate on the corolla-tube; anther locules short-pilose, the 2 anterior anthers reduced to staminodes; ovary glabrous, ovate-globose; capsules ovate-orbicular, shorter than the calyx; seeds many, oblong.—Two species in e. Asia.

- 1A. Leaves ovate or elliptic. 1. *D. adenocaulum*
 2A. Leaves broadly linear to linear-lanceolate. 2. *D. violaceum*

1. *Deinostema adenocaulum* (Maxim.) Yamazaki. *Gratiola adenocaula* Maxim.; *G. violacea* var. *adenocaula* (Maxim.) Makino.—MARUBA-NO-SAWA-TÔGARASHI. Annual, thinly pilose with spreading glandular hairs on upper portion; stems erect, more or less branched at base; leaves ovate or elliptic, 5–8 mm. long, 3–6 mm. wide, acute to subobtusely rounded and weakly few-nerved from the base, entire, sessile; pedicels slender, 1–2 cm. long in chasmogamic flowers, sessile or less than 10 mm. long in the cleistogamic; calyx 3–4 mm. long, 5-parted nearly to the base, the segments linear-lanceolate; corolla pale purple, about twice as long as the calyx; capsules ellipsoidal, 1.5–3 mm. long, shorter than the calyx; seeds oblong-lanceolate, about 0.5 mm. long, finely reticulate.—July–Sept. Wet places and paddy fields; Honshu, Shikoku, Kyushu.—Korea (Quelpaert Isl.).

2. *Deinostema violaceum* (Maxim.) Yamazaki. *Gratiola violacea* Maxim.; *G. axillaris* Nakai; *G. saginoides* var. *violacea* (Maxim.) Matsum.—SAWA-TÔGARASHI. Glabrous, or thinly glandular-pilose on pedicels; stems erect, often branched at base, terete, 3–10 cm. long, sometimes decumbent at base; leaves spreading, linear-lanceolate or broadly linear, 7–10 mm. long, about 2 mm. wide, long-acuminate, entire; pedicels 1–1.5 cm. long or absent in cleistogamic flowers; calyx 4–6 mm. long, 5-parted nearly to the base, the segments linear-lanceolate; corolla purple, bilabiate, about 1½ times as long as the calyx, the limb nearly as long as the tube; cleistogamic flowers often fasciculate in axils; capsules oblong, about 3 mm. long; seeds narrowly ovoid-oblong, about 0.5 mm. long, reticulate.—Aug.–Oct. Wet places; Honshu, Shikoku, Kyushu.—Korea, Manchuria, and Ryukyus.

12. DOPATRIUM Hamilt. ex Benth. ABU-NO-ME ZOKU

Glabrous herbs; leaves opposite, small, approximate toward the base of stems, the cauline leaves scalelike, loosely arranged; bracteoles absent; flowers purplish, solitary in upper axils; calyx small, deeply 5-fid, the segments imbricate in bud; corolla-tube narrow, broadened at the throat, the upper lip short, 2-lobed, the lower lip larger, spreading, 3-lobed; stamens 2, the anther-locules parallel, not confluent, the staminodia inserted on the tube; capsules globose or ovoid, scarcely grooved, loculicidal, the valves entire or 2-fid; seeds small.—Few species, in the Tropics of Africa, Asia, and Australia.

1. *Dopatrium juncum* (Roxb.) Hamilt. *Gratiola juncæ* Roxb.—ABU-NO-ME. Glabrous, fleshy annual; stems erect, 10–30 cm. long, usually tufted, branched at base; basal leaves fleshy, rosulate, lanceolate or linear-oblong, 1.5–2.5 cm. long, 3–5 mm. wide, obtuse, with few obscure parallel nerves, sessile, the cauline leaves gradually smaller, narrowly oblong, 1–3 mm. long, erect or appressed, very obtuse; pedicels axillary

in the upper nodes, solitary, 0–1 cm. long; calyx about 1.5 mm. long, deeply 5-cleft, the lobes obtuse; corolla purple, 5–6 mm. long; capsules globose, much longer than the calyx, 2.5–3 mm. long; seeds ovoid, reticulate, about 0.2 mm. in diameter.—Aug.–Oct. Wet places in lowlands; Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, and India.

13. LINDERNIA Ail. AZENA ZOKU

Herbs; leaves opposite, usually entire, palmately veined; flowers small, solitary in axils, without bracteoles, sessile or pedicelled, sometimes forming a terminal elongate or umbellate raceme; calyx tubular-campanulate, 5-parted or -toothed; corolla tubular or ampelate above, the upper lip erect, 2-lobed or retuse, the lower lip larger, 3-lobed; stamens 4 or 2, the upper 2 fertile, the lower fertile or reduced to staminodia; capsules linear to globose, often longer than the calyx, septically dehiscent.—Many species, in warmer and temperate regions of the world.

- 1A. Leaves entire; style 1–1.5 mm. long; seeds smooth. 1. *L. pyxidaria*
 1B. Leaves toothed; style 2.5–3.5 mm. long; seeds weakly lineolate. 2. *L. dubia*

1. *Lindernia pyxidaria* L. *Vandellia pyxidaria* (L.) Maxim.—AZENA. Glabrous annual; stems branched below, erect or ascending, 7–15 cm. long; leaves oblong to narrowly so, 1.5–3 cm. long, 5–12 mm. wide, obtuse at both ends, entire, with 5(–3) parallel nerves, slightly lustrous above, sessile; flowers solitary in axils, the pedicels 2–2.5 cm. long, mostly longer or as long as the leaves; calyx 3–4 mm. long, the segments slightly shorter than the capsule; corolla rose-purple, about 6 mm. long; capsules ellipsoidal, 3.5–4.5 mm.

long; style 1–1.5 mm. long; seeds smooth.—Aug.–Oct. Wet places in the lowlands; Hokkaido, Honshu, Shikoku, and Kyushu.—Korea, China, Formosa, and the warmer regions of Eurasia.

2. *Lindernia dubia* (L.) Pennell. *Gratiola dubia* L.; *Ilysanthes dubia* (L.) Barnhart.—AMERIKA-AZENA. Leaves toothed, as long as to longer than the pedicels; capsules oblong; style 2.5–3.5 mm. long; seeds weakly lineolate.—Naturalized in Honshu (Kinki Distr.).—N. America.

14. VANDELLIA L. AZE-TÔGARASHI ZOKU

Small annual or short-lived perennial herbs; leaves opposite, often toothed, pinnately veined; flowers small, solitary in axils, sessile or pedicelled, rarely in terminal racemes, ebracteolate; calyx 5-parted to -toothed; corolla-tube tubulose or slightly ampelate

above, the limb bilabiate; stamens 4, all perfect, or the 2 anterior reduced, the posterior fixed to the throat of corolla, anther-locules divaricate; capsules linear to ellipsoidal, usually longer than the calyx, septicidally dehiscent; seeds with several rows of small pits.—Many species, in warmer areas of the world.

1A. Capsules broadly linear, 2 or 3 times as long as the calyx.

2A. Calyx stamens 2; leaves of upper portion of racemes abruptly smaller, bractlike; margin of calyx-segments narrowly scarious; corolla rose-purple. 1. *V. anagallis* var. *verbenaeifolia*

2B. Fertile stamens 4; leaves of upper portion of racemes well developed; calyx-segments not scarious; corolla creamy-white. 2. *V. angustifolia*

1B. Capsules ellipsoidal or globose, scarcely longer than the calyx.

3A. Calyx shallowly 5-lobed, the lobes narrowly deltoid; corolla purple; capsules oblong. 3. *V. crustacea*

3B. Calyx 5-lobed nearly to the base, the lobes linear; corolla white; capsules narrowly fusiform-ovoid. 4. *V. setulosa*

1. *Vandellia anagallis* (Burm.) Yamazaki var. *verbenaeifolia* (Colsm.) Yamazaki. *Lindernia verbenaeifolia* (Colsm.) Pennell; *Gratiola verbenaeifolia* Colsm.; *Ruellia serrata* Thunb.; *V. pachypoda* Fr. & Sav.; *Bonnaya veronicaefolia* var. *verbenaeifolia* (Colsm.) Hook. f.; *L. pachypoda* (Fr. & Sav.) Matsum.; *L. anagallis* var. *verbenaeifolia* (Colsm.) Hara; *Ilysanthes serrata* (Thunb.) Makino.—SUZUME-NO-TÖGARASHI. Glabrous annual; stems branched at base, 8–20 cm. long; leaves oblanceolate to broadly so, 2–4 cm. long, 5–10 mm. wide, obtuse or subacute, gradually narrowed to the base, sessile, obtusely toothed; racemes loose, terminal, leafy at base, abruptly linear-bracteate in upper part, the pedicels thick and spreading, nearly as long as the capsules; calyx 5–6 mm. long, the segments linear, scarious on margin; corolla rose-purple, about 1 cm. long; fertile stamens 2, the anthers without appendages; capsules linear, 2–2.5 times as long as the calyx.—Aug.–Oct. Wet places in lowlands; Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, India and Malaysia.

2. *Vandellia angustifolia* Benth. *Lindernia angustifolia* (Benth.) Wettst.; *V. cymulosa* Miq.; *L. cymulosa* (Miq.) Matsum.—AZE-TÖGARASHI. Glabrous annual; stems branched at base, 8–20 cm. long; leaves lanceolate or oblong-lanceolate, sometimes narrowly lanceolate, 1–3(–4) cm. long, 3–5(–8) mm. wide, acute or subobtusely, narrowed at base, obtusely short-toothed, obsoletely penninerved; flowers solitary in upper axils, the pedicels spreading, nearly as long as the capsules; calyx 4–5 mm. long, the segments linear; corolla creamy white, about 1 cm. long; lower anther-locule of the fertile stamens short spine-tipped; capsules linear, 3 or 4 times as long as the calyx.—Aug.–Oct. Wet places in lowlands; Honshu, Shikoku, Kyushu.—Korea, China, India, and Malaysia.

3. *Vandellia crustacea* (L.) Benth. *Lindernia crustacea* (L.) F. Muell.; *Capraria crustacea* L.; *Torenia crustacea* (L.) Cham. & Schltdl.—URI-KUSA. Thinly puberulent annual; stems 7–15 cm. long, ascending from a branched base; leaves ovate or narrowly deltoid-ovate, sometimes oblong, 1–2 cm. long, 6–12 mm. wide, subobtusely to obtuse, rounded at base, obtusely few-toothed, short-petiolate; flowers solitary in axils, the uppermost flowers forming a terminal cyme, the pedicels slender, ascending, 1–2.5 cm. long; calyx 4–5 mm. long, with 5 narrowly deltoid-acute shallow lobes; corolla purple, about 1 cm. long; capsules oblong, slightly shorter than the calyx; seeds elliptic, obsoletely impressed-punctate.—Aug.–Oct. Wet cultivated fields and riverbanks in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—s. Korea, Ryukyus, Formosa, China, India, and Malaysia.

4. *Vandellia setulosa* (Maxim.) Yamazaki. *Torenia setulosa* Maxim.; *Lindernia setulosa* (Maxim.) Tuyama.—SHISOBA-URI-KUSA. Thinly pilosulous annual; stems ascending, branched, 10–20 cm. long, glabrous or thinly coarse-hairy on upper portion; leaves broadly ovate, 1–1.5 cm. long, 8–12 mm. wide, obtuse, rounded and short-petiolate at base, obtusely toothed, thinly pilosulous especially on upperside; pedicels 1–1.5 cm. long, longer than the leaves; calyx 5–7 mm. long, the segments linear, cleft nearly to the base, incurved and appressed to the fruit, sparsely coarse-pilosulous; corolla white, 7–8 mm. long; capsules narrowly fusiform-ovoid, acute, 4–5 mm. in diameter; seeds minute, slightly angled.—Aug.–Oct. Honshu (Kii and Ise Prov.), Shikoku, Kyushu.—Ryukyus (Shichito).

15. TORENIA L.

TSURU-URI-KUSA ZOKU

Glabrous or pilose herbs; leaves opposite, entire or toothed; racemes short or elongate, few-flowered, the pedicels not bracteolate; calyx tubular, usually with 5 winglike ribs, 3- to 5-toothed or bilabiate; corolla tubular, sometimes amplate in upper part, the upper lip erect, retuse or 2-lobed, the lower lip larger, 3-lobed; stamens 4, toothed or with a filiform appendage at base, the lower pair inserted on the throat; capsules oblong, enclosed in the calyx, septicidal; seeds many, rugose, impressed-areolate.—About 30 species, in the Tropics and warmer regions of Asia and Africa.

1. *Torenia glabra* Osb. *T. kiusiana* Ohwi.—KOBANATSURU-URI-KUSA. Short-pubescent perennial; stems decumbent, 15–20 cm. long, branched, slender; leaves ovate to deltoid-ovate, 2–2.5 cm. long, 1–1.5 cm. wide, acute, rounded to truncate at base, appressed-toothed, the petioles 5–10 mm. long;

flowers solitary in axils, pedicelled; calyx 13–17 mm. long, 5-toothed, 5-winged; corolla about 15 mm. long; capsules about 13 mm. long, short-cylindric.—Kyushu (s. distr.).—Ryukyus (Amami-oshima), China.

16. ELLISOPHYLLUM Maxim.

KIKUGARA-KUSA ZOKU

Delicate perennial herb; rhizomes long-creeping, loosely leaved; leaves alternate, long-petiolate, pinnately parted, the segments coarsely obtuse-dentate; pedicels axillary, radical, elongate, 1-flowered, bracteolate, coiled after anthesis; flowers small, white; calyx 5-cleft, the lobes 3-nerved; corolla infundibuliform, 5-lobed; stamens 4, inserted on the throat, equal, slightly exerted, the

anther-locules distinct; style elongate, the stigma bifid; ovary 2-locular, each locule few-ovuled; capsules 2-locular, globose; seeds orbicular, convex on back, attached at the center on ventral face, puberulent, viscid when moistened.—One species, in c. Asia and India.

1. *Ellisiophyllum pinnatum* (Wall.) Makino. *Ourisia pinnata* Wall. ex Benth.; *Hornemannia pinnata* (Wall.) Benth.; *E. reptans* Maxim.; *Moseleya pinnata* (Wall.) Hemsley —KIKUGARA-KUSA, HOROGIKU. Plant pubescent; stems slender; leaves thin, soft, membranous, distant, broadly ovate-deltoid to broadly ovate, 2.5–6 cm. long, 2–5 cm. wide, long-petiolate, deeply pinnatiparted with few coarse rounded and

toothed segments; flowers solitary in axils, 8–10 mm. across, white, the pedicels radical, 3–6 cm. long; calyx 5–7 mm. long, 5-lobed; fruit globose, 4–5 mm. across; seeds few, about 1.5 mm. across.—May–June. Woods in mountains; Honshu (s. Kinki and Chūgoku Distr.), Shikoku.—Formosa, China, and India.

17. CENTRANTHERA R. Br. GOMA-KUSA ZOKU

Rather firm usually strigose and scabrous erect herbs; leaves opposite or alternate in upper ones, obtuse, entire or few-toothed; flowers rose or yellowish, solitary in axils, the upper ones forming a terminal spike, the pedicels very short, 2-bracteolate; calyx spathe-like, split on one side, acute, entire or with 3–5 short lobes; corolla-lobes 5, subequal, spreading, the tube elongate, ampliate above, the limb obsoletely bilabiate; stamens 4, didymous, not exserted, in pairs; capsules loculicidal; seeds minute, very many.—Several species, in Asia, Malaysia, and Australia.

1. *Centranthera cochinchinensis* (Lour.) Merr. var. *lutea* (Hara) Hara. *C. hispida* sensu auct. Japon., non R. Br.; *C. brunoniana* sensu auct. Japon., non Wall.; *Razumovia cochinchinensis* var. *lutea* Hara—GOMA-KUSA. Strigose and scabrous erect annual; stems often branched, terete, 20–40 cm. long; leaves opposite, the upper ones alternate, broadly linear to linear-lanceolate, 2–5 cm. long, 3–7 mm. wide, nearly entire, sessile; flowers nearly sessile, yellowish, 15–20 mm.

long, the bracteoles narrowly lanceolate, shorter than and appressed to the calyx; calyx shallowly split in front, acute, 7–10 mm. long at anthesis, 10–15 mm. long in fruit, longer than the capsule; seeds truncate at apex, cuneate at base, obliquely linear-lanceolate.—Aug.–Oct. Wet grassy places in lowlands; Honshu, Shikoku, Kyushu. The typical phase occurs in Korea, Ryukyus, Formosa, China, and Indochina.

18. VERONICA L. KUWAGATA-SŌ ZOKU

Herbs or shrubs; leaves at least sometimes opposite or verticillate, simple; flowers solitary in axils or in terminal or axillary racemes, without bracteoles; calyx 4- or 5-parted, the outer 2 segments sometimes connate; corolla rotate, the limb spreading, 4- or 5-lobed; stamens 2, inserted on the tube, exserted; style entire; ovules many or rarely 2 in each locule; capsules flat or inflated, 2-grooved, loculicidal or septical; seeds few to many, ovate or orbicular, attached at the ventral face, convex on back, smooth or rugose.—About 300 species, chiefly in the temperate regions of the N. Hemisphere, Australia, and New Zealand.

1A. Flowers in terminal spikes or racemes, or solitary and axillary.

2A. Perennials; flowers in terminal spikes or racemes; plants of woods or grassy places.

3A. Herbs 30–150 cm. high, rather many-leaved; inflorescence a dense spike (racemose in No. 3).

4A. Calyx and leaves beneath white-tomentose.

4B. Calyx green, glabrous to pubescent; leaves usually green on both surfaces.

5A. Leaves narrowed at base.

6A. Leaves slightly dilated and clasping at base; inflorescence and young branches with long-spreading multicellular hairs.

6B. Leaves not dilated and clasping at base; inflorescence and stems puberulent or with upwardly directed hairs.

7A. Lowest lateral nerves of leaves $\frac{1}{3}$ – $\frac{2}{3}$ the length of the blades.

7B. Lowest lateral nerves shorter.

5B. Leaves rounded to truncate-cordate at base.

8A. Leaves sessile, or with petioles 3–5 mm. long, ovate, rounded at base.

8B. Leaves, at least the median ones, with petioles 1–3 cm. long.

9A. Leaves with scattered multicellular hairs on both sides, slightly scabrous above.

9B. Leaves short-pubescent or thinly tomentose on both sides or sometimes glabrous, not scabrous.

10A. Leaves with many prominent acute teeth.

10B. Leaves with rather loose appressed teeth.

3B. Herbs less than 30 cm. high, with few pairs of leaves; inflorescence racemose, loosely few- to rather many-flowered.

11A. Leaves distinctly petiolate, ovate to broadly lanceolate, pinnately incised to parted.

11B. Leaves sessile or subsessile, ovate or elliptic, toothed or subentire.

12A. Plants short rhizomatous; leaves distinctly toothed, ovate; inflorescence few-flowered, about 1 cm. long.

13A. Flowers 7–8 mm. across; styles 3–6 mm. long; plant rather prominently pubescent; leaves 1.5–2.5 cm. long.

13B. Flowers 4–5 mm. across; styles 1–2 mm. long; plant sparingly pubescent; leaves 1–2 (2.5) cm. long.

12B. Plants from a long creeping base; leaves subentire, elliptic, sometimes ovate; inflorescence rather many-flowered, 3–15 cm. long.

14A. Inflorescence curved-puberulent; leaves 5–10 mm. long.

14B. Inflorescence subglandular-puberulent; leaves 7–15 mm. long.

1. *V. ornata*

2. *V. sieboldiana*

3. *V. linariaefolia*

4. *V. rotunda* var. *subintegra*

5. *V. subsessilis*

6. *V. kiusiana*

7. *V. subcinanovelutina*

8. *V. denkitchiana*

9. *V. schmidtiana*

10. *V. stelleri* var. *longistyla*

11. *V. nipponica*

12. *V. serpyllifolia*

13. *V. tenella*

- 2B. Annuals or biennials; flowers solitary in leaf-axils or forming a large bracteate spike; plants of waste grounds and cultivated fields or of riverbanks.
- 15A. Pedicels absent or very short, much shorter than the calyx; seeds flat, less than 1 mm. across.
- 16A. Glabrous or glandular-puberulent herb; leaves linear to lanceolate, subentire or with few short teeth; indigenous plant of wet places and riverbanks. 14. *V. peregrina*
- 16B. Short-pubescent herb; leaves ovate to ovate-obicular, distinctly toothed; introduced plant of waste grounds and cultivated fields. 15. *V. arvensis*
- 15B. Pedicels elongate, much longer than the calyx; seeds convex, rugose on back, deeply depressed on ventral face, 1.3–3 mm. across.
- 17A. Corolla 7–10 mm. across; leaves longer than wide; pedicels (1–)1.5–4 cm. long; seeds about 10. 16. *V. persica*
- 17B. Corolla 2–4 mm. across; leaves of equal proportions or shorter than wide; pedicels about 1 cm. long.
- 18A. Flowers blue-purple; leaves shallowly 5(3–7)-lobed, the terminal lobe much broader and entire; calyx membranous, prominently ciliate; capsules prominently inflated, about 4-seeded. 17. *V. hederaefolia*
- 18B. Flowers rose-purple; leaves 5- to 7-lobed, the terminal lobe only slightly broader than the others; calyx herbaceous, sparsely ciliate; capsules inflated, about 16-seeded. 18. *V. didyma* var. *lilacina*
- 1B. Flowers in axillary spikes or racemes.
- 19A. Plants pubescent, the pedicels erect or suberect; woods or grassy places.
- 20A. Capsules obovate, distinctly longer than wide; longer than the calyx; stems long-creeping; inflorescence from leaf-axils; leaves broadly elliptic or broadly ovate-elliptic, serrulate. 19. *V. onoc*
- 20B. Capsules obovate, depressed-deltoid, or reniform, wider than long, as long as or shorter than the calyx; stems erect or creeping; inflorescence terminal or mainly toward the upper part of the stems; leaves ovate to deltoid-ovate, coarsely acute-toothed.
- 21A. Capsules depressed-deltoid, angled on both sides, 7–10 mm. wide; racemes 3- to 10-flowered. 20. *V. cana*
- 21B. Capsules obovate to reniform, with rounded margins, 3–5 mm. wide; racemes 10- to 30-flowered.
- 22A. Perennial herb with short rhizomes; corolla 6–8 mm. across; cauline leaves about 10 pairs. 21. *V. laxa*
- 22B. Biennial herb without rhizomes; corolla 2–2.5 mm. across; cauline leaves few-paired. 22. *V. javanica*
- 19B. Plants usually glabrous, rarely minutely glandular-pubescent; pedicels spreading; wet places.
- 23A. Leaves sessile, at least the upper ones more or less clasping. 23. *V. undulata*
- 23B. Leaves at least the lower ones short-petiolate. 24. *V. americana*

1. *Veronica ornata* Monjus. *V. incana* sensu auct. Japon., non L.—TÔTEI-RAN. Erect rhizomatous perennial, white-tomentose on stems, lower side of leaves, and inflorescence; stems terete, 40–60 cm. long, usually simple; leaves opposite, lanceolate or oblanceolate, 5–10 cm. long, 1.5–2 cm. wide, subobtusely to acute, short-toothed toward the tip, the midrib raised beneath; spikes usually simple, solitary, erect, 8–12 cm. long, densely many-flowered, the pedicels 2–3 mm. long; calyx 3–4 mm. long, 4-cleft; corolla blue-purple, 7–8 mm. across; style 6–7 mm. long.—Aug.–Oct. Pine woods near seashores; Honshu (n. Kinki Distr. on Japan Sea side); rare.

2. *Veronica sieboldiana* Miq. *V. sieboldiana* var. *integrifolia* Maxim. ex Matsum.—HAMA-TORA-NO-O. Perennial with short rhizomes; stems erect, 20–30 cm. long, long spreading-pubescent while young; leaves on innovation shoots long-petiolate, ovate, broadly cuneate at base, toothed, short-pubescent, the cauline leaves rather coriaceous, oblong, 3–5 cm. long, 1.5–2.5 cm. wide, lustrous above, obtuse, slightly dilated and clasping at base, obscurely short-toothed, lustrous above, the margins slightly recurved; racemes usually solitary, 7–12 cm. long, erect, densely many-flowered, long-pubescent, the pedicels 4–7 mm. long, longer than to as long as the linear bracts; calyx narrowly ovate, ciliate; corolla blue-purple, 6–8 mm. across; capsules deltoid-obcordate, 4–5 mm. long, longer than the calyx; style 5–6 mm. long.—Sept.–Oct. Seashores; Kyushu (Is. of western coast).—Ryukyus (Kerama Isl.).

3. *Veronica linariaefolia* Pall. ex Link. *V. paniculata* var. *angustifolia* Benth.; *V. spuria* var. *angustifolia* Benth. ex Makino.—HOSOBATA-HIME-TORA-NO-O. Rhizomes short; stems erect, 40–70 cm. long, often branched in upper part; leaves rather thick, oblanceolate to linear-oblanceolate, 4–8 cm. long, 5–8 mm. wide, acute, loosely few-toothed near tip, with ascending hairs especially on midrib beneath; spikes erect, terminal, densely many-flowered, 10–30 cm. long; calyx about 2 mm. long, 4-cleft, the lobes obtuse, ciliate; corolla about 6 mm. across, blue-purple; capsules slightly longer than the calyx, depressed-obicular, inflated, retuse; style 6–7 mm. long; seeds

minute.—Aug.–Oct. Honshu (s. Kinki Distr. and westw.), Shikoku, Kyushu.—Korea, Formosa, and temperate e. Asia.

Var. *dilatata* (Nakai & Kitag.) Nakai & Kitag. *V. angustifolia* var. *dilatata* Nakai & Kitag.—ÔHOSOBATA-TORA-NO-O. Leaves broadly lanceolate to obovate-oblong.—Occurs with the typical phase.

4. *Veronica rotunda* Nakai var. *subintegra* (Nakai) Yamazaki. *V. spuria* var. *subintegra* Nakai; *V. komarovii* Monjus; *V. spuria* var. *paniculata* sensu auct. Japon., non Maxim.—HIME-TORA-NO-O, YAMA-TORA-NO-O. Rhizomes short; stems erect, 40–80 cm. long, terete, with scattered upwardly curved short soft hairs; leaves opposite, narrowly ovate to broadly lanceolate, 5–10 cm. long, 1.5–2.5 cm. wide, acuminate, acute to acuminate at base, irregularly acute-toothed, nearly glabrous, the nerves beneath ascending-puberulent, sessile or short-petioled; spikes 1 or few, erect, 10–20 cm. long, short-pubescent; calyx 4-cleft, the lobes acute with an obtuse tip; corolla blue-purple, about 8 mm. across; capsules depressed-obicular or broadly obovate, longer than the calyx.—Aug.–Oct. Mountains; Honshu, Shikoku, Kyushu; rare.—Korea, Manchuria, and e. Siberia.

5. *Veronica subsessilis* (Miq.) Carr. *V. longifolia* var. *subsessilis* Miq.—RURI-TORA-NO-O. Stems 40–80 cm. long, with scattered, ascending, soft, short hairs; leaves narrowly ovate or deltoid-ovate, 5–10 cm. long, 2.5–5 cm. wide, acute to very acute, rounded at base, finely toothed, soft-pubescent especially on nerves beneath, sessile or the petioles 3–5 mm. long; spikes 1–4, 10–20 cm. long, pubescent; calyx about 3 mm. long, 4-cleft, the lobes narrowly ovate, prominently ciliate, acute; corolla 8–10 mm. across.—July–Aug. Honshu (Mount Ibuki in Oomi); also planted in gardens.

6. *Veronica kiusiana* Furumi. HIRO-HA-TORA-NO-O. Stems erect, 50–70 cm. long, soft-hairy while young; leaves deltoid-ovate or narrowly deltoid, 5–8 cm. long, 3–6 cm. wide, subacute, truncate to shallowly cordate at base, mucronate-toothed, scabrous above, the petioles 1–2.5 cm. long; spikes 10–25 cm. long, simple, erect, densely many-flowered, short-pubes-

cent, the pedicels 3-4 mm. long, longer than the calyx and bracts; calyx about 3 mm. long, 4-cleft, the lobes ovate, acute, ciliate; corolla blue-purple, 6-9 mm. across; style 7-10 mm. long.—Aug.-Sept. Mountains; Honshu (centr. distr.), Kyushu.—Korea.

7. *Veronica subincanovelutina* Koidz. *V. longifolia* var. *grayi* F. Schmidt; *V. grayi* Miyabe & Kudo, non Armstr.; *V. longifolia* var. *villosa* Furumi; *V. miyabei* Nakai.—BIRŌO-TORA-NO-O, EZO-RURI-TORA-NO-O. Rhizomes short; stems erect, 50-80 cm. long, terete, densely white-pubescent in the upper portion; leaves deltoid-lanceolate to deltoid-ovate, 6-12 cm. long, 1.5-4 cm. wide, acuminate to acute, truncate-cordate to truncate at base, serrulate, loosely white-pubescent or glabrous above, densely white-pubescent beneath, the petioles 1-2 cm. long; spikes few, many-flowered, sometimes solitary, 6-12 cm. long, densely white-pubescent; calyx 3-4 mm. long, 4-cleft, the lobes broadly lanceolate, subacute, with minute capitate hairs on margin, usually loosely pubescent on back; corolla about 7 mm. across, blue-purple; capsules obovate, about 4 mm. long; seeds elliptic, flat, about 1 mm. long.—July-Sept. Hills and mountains on Japan Sea side; Hokkaido, Honshu (centr. and n. distr.).—Korea.

Var. *glabrescens* (Hara) Yamazaki. *V. miyabei* var. *glabrescens* Hara; *V. miyabei* var. *hondoensis* Hara—YAMA-RURI-TORA-NO-O. Leaves nearly glabrous, the nerves beneath with recurved hairs.—Occurs with the typical phase.

8. *Veronica denkichiana* Honda. *V. holophylla* var. *maritima* Nakai.—ECHIGO-TORA-NO-O. Stems erect, terete, 40-80 cm. long, scattered short-pilose or glabrous; leaves herbaceous, broadly lanceolate to deltoid-lanceolate or sometimes deltoid-ovate, 5-10 cm. long, 1.5-3.5 cm. wide, acute or acuminate, rounded to shallowly cordate or cuneate at base, short-toothed, glabrous, the midrib beneath loosely incurved-puberulent, the petioles 1-3 cm. long; spikes few, sometimes solitary, 8-12 cm. long, densely many-flowered, incurved-puberulent, the pedicels shorter to nearly as long as the calyx; calyx about 3 mm. long, 4-cleft, the lobes obtuse, ciliate with incurved short hairs; corolla blue-purple, about 8 mm. across; capsules broadly obovate, 4-5 mm. long; seeds elliptic, flat, about 1 mm. long.—Aug.-Oct. Near seashores; Honshu (Hokuriku and n. distr., along the Japan Sea).

9. *Veronica schmidtiana* Regel. *V. yezoalpina* (Koidz.) Takeda; *V. senanensis* var. *yezoalpina* Koidz.—KIKUBA-KUWAGATA. Rhizomes rather short; stems 10-25 cm. long, simple, leafy, short-pubescent; rosulate and lower leaves slightly fleshy, long-petiolate, broadly lanceolate to ovate, sometimes ovate-deltoid, 2-4 cm. long, 1-2 cm. wide, obtuse, truncate to broadly cuneate at base, glabrous to thinly pubescent, pinnately incised or parted, the lobes obtuse, 2- to 4-toothed; racemes loosely 10- to 30-flowered, 5-10 cm. long, soft-pubescent; calyx 4-6 mm. long, 4-parted; corolla pale blue-purple, with deeper striations, 10-12 mm. across; capsules obovate, glabrous, retuse, slightly longer to as long as the calyx.—June-Aug. Alpine slopes; Hokkaido.—Sakhalin and s. Kuriles.

Var. *bandaiana* Makino. *V. bandaiana* (Makino) Takeda; *V. schmidtiana* var. *daisenensis* (Makino) Ohwi; *V. senanensis* Maxim.; *V. senanensis* var. *daisenensis* (Makino) Hara; *V. daisenensis* Makino; *V. schmidtiana* var. *senanensis* (Maxim.) Ohwi.—BANDAI-KUWAGATA, MIYAMA-KUWAGATA, DAISEN-KUWAGATA. Leaf-lobes shallow, subacute.—Alpine regions; Honshu (n. and centr. distr. and Mount Daisen in Hoki Prov.).

10. *Veronica stelleri* Pall. var. *longistyla* Kitag. *V. yezoensis* Nakai.—EZO-HIME-KUWAGATA. Rhizomes short-creeping; stems somewhat tufted, slender, erect, 7-15 cm. long, white-pubescent, with 5-8 pairs of leaves; leaves ovate to broadly so, 1.5-2.5 cm. long, 8-15 mm. wide, subobtusely rounded at base, few-toothed, slightly pubescent, sessile; racemes loosely few-flowered, long-pubescent, the upper bracts small, oblanceolate, shorter than the pedicels, the lower bracts leaflike; calyx 4-parted, 4-6 mm. long, the segments oblanceolate, obtuse; corolla pale blue-purple, 7-8 mm. across; style slender, 3-6 mm. long, longer than the calyx.—July-Aug. Alpine slopes; Hokkaido.—Sakhalin, s. Kuriles, and n. Korea. The typical phase occurs in Kamchatka, Kuriles, Aleutians, and Alaska.

11. *Veronica nipponica* Makino. *V. stelleri* sensu auct. Japon., non Pall.—HIME-KUWAGATA. Rhizomes slender, short, branched; stems 7-12 cm. long, simple, with 4-6 pairs of leaves, short-pubescent; leaves ovate or narrowly so, sometimes oblong, 1-2(-2.5) cm. long, 6-10 mm. wide, obtuse, rounded to obtuse at base, slightly pubescent, short-toothed, sessile or nearly so; racemes few-flowered, usually short-pubescent, the lower bracts leaflike; calyx 4-parted, 4-6 mm. long, the segments oblanceolate, obtuse; corolla pale blue-purple, 4-5 mm. across; style 1(-2) mm. long, shorter than the calyx; capsules flat, broadly obovate, retuse, loosely short-pilose; seeds elliptic, flat, about 1 mm. long.—July-Aug. Alpine slopes in mountains of Japan Sea side; Honshu (centr. and n. distr.).

Var. *shinanoalpina* Hara. *V. stelleri* sensu auct. Japon., pro parte, non Pall.—SHINANO-HIME-KUWAGATA. Capsules entire, obtuse, not retuse.—Alpine slopes in mountains; Pacific side of Honshu (centr. and n. distr.).

12. *Veronica serpyllifolia* L. KO-TENGU-KUWAGATA. Delicate creeping perennial herb; stems to 10 cm. long, puberulent; leaves elliptic, 5-10 mm. long, 4-7 mm. wide, obtuse to rounded, obscurely few-toothed, nearly glabrous, sessile or very short-petiolate; racemes terminal, 2-5 cm. long, loosely many-flowered, the bracts lanceolate, longer than the pedicels; calyx about 3 mm. long, as long as the pedicels, the lobes oblong, obtuse, nearly as long as the capsules; corolla about 3 mm. long, about 4 mm. across; style about 2 mm. long, slender; seeds elliptic, flat, about 1 mm. long.—July. Naturalized in Honshu (mountains of Kozuke Prov.).—Europe.

13. *Veronica tenella* All. *V. humifusa* Dicks.; *V. serpyllifolia* var. *humifusa* (Dicks.) Vahl; *V. serpyllifolia* sensu auct. Japon., non L.—TENGU-KUWAGATA. Resembles the preceding but slightly larger and the stems longer creeping, loosely puberulent, 10-20 cm. long; leaves ovate to broadly so, 7-15 mm. long, 6-13 mm. wide, obtuse, rounded to very obtuse at base, nearly glabrous, obscurely toothed, sessile or very short-petiolate; racemes terminal, 5-10 cm. long, loosely 10- to 20-flowered, often glandular-puberulent, the bracts lanceolate, shorter than the ascending pedicels; calyx lobes 4, about 3 mm. long, oblong, obtuse, nearly as long as the capsules; corolla pale blue, 5-7 mm. across; capsules 4-5 mm. across; style about 3 mm. long.—June-Aug. Woods and grassy places in coniferous woods; Hokkaido, Honshu (centr. and n. distr.).—Korea, Sakhalin, Kuriles, Siberia, Europe, and N. America.

14. *Veronica peregrina* L. MUSHI-KUSA. Glabrous to glandular-puberulent slightly fleshy biennial herb; stems tufted, branched from base, 5-20 cm. long; leaves linear to

lanceolate, 1.5–2 cm. long, 3–5 mm. wide, obtuse to subacute, few-toothed or subentire, sessile; racemes loosely flowered, leafy bracteate, the pedicels about 1 mm. long; calyx 3.5–4.5 mm. long, the segments narrowly lanceolate, subobtusely; corolla pale rose, 2–3 mm. across; style about 0.3 mm. long; capsules depressed-obcircular, retuse, shorter than to as long as the calyx; seeds minute.—Apr.–May. Wet places especially common along riverbanks in lowlands.—Honshu, Shikoku, Kyushu.—Eurasia and N. America.

Var. *xalapensis* (H.B.K.) St. John & Warren. *V. peregrina* var. *pubescens* Honda; *V. xalapensis* H.B.K.—KEMUSHI-KUSA. Stems and capsules puberulent.—Occurs with the typical phase.

15. *Veronica arvensis* L. TACHI-INU-NO-FUGURI. Annual or biennial short-pubescent herb; stems terete, slender, erect, 10–30 cm. long, often branched at base; leaves opposite, ovate to broadly so, or ovate-orbicular, 1–2 cm. long, 7–15 mm. wide, obtuse, rounded and sessile at base, with few obtuse teeth, nerved from the base; floral leaves alternate, gradually smaller above, broadly lanceolate, obtuse, longer or sometimes in the upper ones slightly shorter than the calyx, the pedicels less than 1 mm. long; calyx segments 4, broadly lanceolate, 4–6 mm. long, longer than to as long as the capsules; corolla blue, about 4 mm. across; capsules obcordate, deeply notched at apex, about 4 mm. across.—Apr.–Oct. Naturalized in our area.—Europe, Africa, and Asia.

16. *Veronica persica* Poir. *V. tournefortii* Gmel., non Vill.; *V. buxbaumii* Tenore, non F. W. Schmidt.—O-INU-NO-FUGURI. Soft-pubescent annual or biennial; stems 10–30 cm. long, loosely leafy, from a creeping or ascending branched base; leaves opposite, deltoid or broadly ovate-deltoid, 1–2 cm. long and as wide, rounded at the base, coarsely toothed, short-petiolate; upper leaves alternate, broadly ovate, subsessile; flowers solitary in axils, the pedicels 1.5–4 cm. long, slender, longer than the leaves; calyx 6–10 mm. long, the segments narrowly ovate, obtuse, slightly longer than and appressed to the capsule; corolla 7–10 mm. across, blue, with darker striations; capsules depressed-obcordate, 5 mm. long, about 1 cm. across, shallowly and broadly 2-lobed, with prominent raised reticulations; style about 3 mm. long; seeds elliptic, about 1.5 mm. long, finely rugose, rather thick, concave on the ventral face.—Apr.–May. Widely naturalized in our area.—Eurasia and Africa.

17. *Veronica hederifolia* L. FURASABA-SŌ. Pubescent annual or biennial; stems 5–15 cm. long, ascending to erect from a decumbent branched base; lower leaves opposite, petiolate, the upper ones alternate, subsessile, depressed-cordate or depressed-obcircular, 7–10 mm. long, 8–12 mm. wide, shallowly 5 (3 or 7)-lobed, the lobes entire, the terminal lobe larger; pedicels longer than to as long as the leaves; calyx 4–5 mm. long, the segments membranous, ovate or ovate-deltoid, prominently ciliate; corolla 2–2.5 mm. across, pale blue; capsules depressed-globose, with 4 shallow grooves, glabrous; style nearly 1 mm. long; seeds elliptic, 2.5 mm. long, black-brown, rather thick, convex and transversely rugose on the back, deeply concave on the ventral face.—Mar.–May. Sparingly naturalized in our area.—Eurasia and Africa.

18. *Veronica didyma* Tenore var. *ilicinea* Yamazaki. *V. caninotesticulata* Makino; *V. agrestis* auct. Japon., non L.; *V. polita* auct. Japon., non Fries.—INU-NO-FUGURI. Rather short pubescent annual or biennial; stems 5–15 cm. long, erect from a short-decumbent or ascending branched base; leaves opposite in lower ones, alternate in the inflorescence, ovate-orbicular or

depressed-cordate, 6–10 mm. long and as wide, rounded at the base, 5- to 7-lobed, short-petiolate or sessile in the upper ones, the pedicels nearly as long as the leaves; calyx herbaceous, 3–6 mm. long, the segments ovate, few-nerved, obtuse; corolla 3–4 mm. across, rose-purple; capsules reniform, inflated, about 6 mm. across, prominently puberulent; style about 1 mm. long; seeds ovate, about 1.2 mm. long, obsoletely rugose.—Mar.–May. Sunny places and waste grounds in lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, and Korea.

19. *Veronica onoei* Fr. & Sav. MARUBA-KUWAGATA, GUMBAIZURU. Stems rather slender, long-creeping, leafy with long spreading hairs; leaves broadly elliptic, broadly ovate-orbicular, or broadly ovate, 1.5–3 cm. long, 1–2.5 cm. wide, rounded to obtuse, rounded at base, serrulate, glabrous, sparingly ciliate, the petioles 2–5 mm. long; racemes rather densely many-flowered, from leaf-axils, minutely glandular-hairy, the peduncles 3–6 cm. long; calyx 3–4 mm. long, the segments oblanceolate, obtuse; corolla blue, about 8 mm. across; capsules obovate, flat, retuse, loosely glandular-pilose, 5–6 mm. long.—July. Mountains; Honshu (ne. Shinano and Kozuke Prov.).

20. *Veronica cana* Wall. var. *miqueliana* (Nakai) Ohwi. *V. miqueliana* Nakai; *V. cana* sensu auct. Japon., non Wall. ex Benth.—KUWAGATA-SŌ. Short-pubescent perennial; stems 15–30 cm. long, decumbent at the base; leaves narrowly to broadly ovate, 3–6(–8) cm. long, 2–3.5 cm. wide, acute, toothed, rounded, sometimes shallowly cordate or broadly cuneate at base, the petioles 5–15 mm. long; racemes 3–8 cm. long, pedunculate or subsessile, loosely 3- to 10-flowered, terminal and lateral, short-pubescent, the pedicels suberect, nearly as long as the calyx and the broadly linear bract; calyx 4–6 mm. long, the segments oblanceolate, usually ciliate, acute; corolla pale rose, deeply striate, 8–13 mm. across; capsules depressed-deltoid, flat, loosely ciliate, nearly as long as the calyx, 5–6 mm. long, 7–10 mm. wide, with a shallow notch at apex; style 3–4 mm. long.—May–June. Woods in mountains; Honshu, Shikoku, Kyushu.

Var. *takedana* Makino. *V. miqueliana* var. *takedana* (Makino) Nemoto; *V. takedana* (Makino) Nakai.—KO-KUWAGATA. Plant dwarf, 5–15 cm. high; leaves 1–2.5 cm. long; racemes 1- to 3-flowered, not exceeding the leaves.—Honshu (centr. and w. distr.), Shikoku, Kyushu.—Formosa.

Var. *decumbens* Makino. *V. japonensis* Makino.—YAMA-KUWAGATA, TSURU-KUWAGATA. Stems 5–15 cm. long, from a long-creeping rooting base, pubescent; leaves usually broadly ovate, sometimes ovate, short-toothed; calyx-segments not ciliate; capsules subrhombic-deltoid.—July. Woods in high mountains; Honshu (centr. distr.).

Var. *occidentalis* (Murata) Ohwi. *V. japonensis* var. *occidentalis* Murata. NISHINO-YAMA-KUWAGATA. Similar to the preceding variety; stems appressed-pubescent; calyx-segments acuminate.—Honshu (w. distr.).—The typical phase occurs in the Himalayas and sw. China.

21. *Veronica laxa* Benth. *V. melissaeifolia* auct. Japon., non Poir.; *V. thunbergii* A. Gray.—HIYOKU-SŌ. Perennial, rhizomatous, creeping herb, prominently white-pubescent; stems erect, 30–50 cm. long, simple; leaves about 10 pairs, sessile, membranous, ovate, 2.5–4 cm. long, 1.5–3 cm. wide, obtuse, toothed, rounded at base; racemes in the upper leaf axils loosely 10- to 30-flowered, 10–20(–30) cm. long, short-pedunculate, the pedicels as long as to slightly shorter than the calyx and the linear-oblanceolate bract; calyx 3–5 mm. long,

the segments broadly oblanceolate, obtuse, longer than the capsule; corolla about 6-8 mm. across, pale rose-purple; capsules depressed-obcordate, 4-5 mm. long, 5-6 mm. wide, flat, broadly and shallowly emarginate, ciliate; style 2.5-3 mm. long.—May-July. Grassy places in mountain valleys; Hokkaido, Honshu, Shikoku, Kyushu.—China and Himalayas.

22. *Veronica javanica* Bl. *V. murorum* Maxim.; *V. cana* var. *glabrior* Miq.; *V. murorum* var. *glabrior* (Miq.) Maxim.; *V. glabrior* (Miq.) Koizd.—HAMA-KUWAGATA. Annual or biennial; stems erect, 15-35 cm. long, branched in lower part, with a line of short hairs; leaves membranous, opposite, deltoid-ovate or deltoid-cordate, 2-3 cm. long, 1-2.5 cm. wide, subobtusely, shallowly cordate at base, obtusely toothed, loosely pubescent on both sides, the petioles 5-10 mm. long; racemes on the upper part of stems, 3-6 cm. long, loosely few-flowered, incurved-puberulent, the pedicels 1-2 mm. long, suberect, the bracts broadly linear, as long as to slightly longer than the calyx; calyx 3-5 mm. long, the segments oblanceolate, obtuse, longer than the capsule; corolla 2-2.5 mm. across; capsules depressed-cordate, 3 mm. long, 4 mm. across, retuse, loosely ciliate; seeds about 0.5 mm. long.—Apr.-May. Lowlands near the sea; Honshu (Miyake Isl. in Izu Prov.), Shikoku, Kyushu.—Ryukyus, Formosa, China, Malaysia to India and Africa, and S. America.

23. *Veronica undulata* Wall. ex Roxb.—KAWAJISA. Glabrous slightly fleshy annual or biennial; stems terete, erect,

30-60 cm. long; leaves lanceolate or oblong-lanceolate, 4-7 cm. long, 8-15 mm. wide, subacute, rounded to shallowly cordate at base, undulately serrulate, sessile and semiclasping; racemes rather loosely many-flowered, 5-12 cm. long, on short axillary peduncles, the pedicels spreading, 4-6 mm. long, the bracts broadly linear, nearly as long as the pedicels; calyx segments 4, narrowly oblong, 3-4 mm. long, obtuse, slightly longer than to as long as the capsule; corolla about 4 mm. across, pale blue-purple; capsules nearly orbicular, about 3 mm. across; style about 1.5 mm. long; seeds about 0.3 mm. long.—May-June. Wet places in lowlands; Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, Korea to Europe, and N. America.

24. *Veronica americana* (Raf.) Schwein. *V. beccabunga* var. *americana* Raf.—EZO-NO-KAWAJISA. Glabrous, slightly fleshy creeping perennial; stems terete, 30-50 cm. long; leaves opposite, broadly lanceolate or narrowly ovate, 4-6 cm. long, 1-2.5 cm. wide, rounded at base, short-toothed, the petioles 2-4 mm. long; racemes 5-10 cm. long, axillary, pedunculate, loosely 10- to 20-flowered, the pedicels spreading, 7-12 mm. long, the bracts shorter than the pedicels; calyx 3-4 mm. long, the segments acute; corolla blue-purple, about 6 mm. across; capsules inflated, orbicular, as long as to slightly shorter than the calyx, 3-4 mm. in diameter.—July-Aug. Wet places; Hokkaido.—Sakhalin, Kuriles, e. Siberia, and N. America.

19. VERONICASTRUM Heister ex Fabricius KUGAI-SŌ ZOKU

Frequently declined, rarely erect perennials or subshrubs; leaves alternate or verticillate, simple, toothed; flowers in dense elongate spikes, bracteolate, subsessile; calyx 5-parted, the segments acuminate; corolla tubular, blue-purple, the lobes 4, nearly equal, or the upper lobe slightly larger; stamens 2, inserted on the tube, exserted; style slender; ovules many; capsules ovoid-conical, loculicidal or septical; seeds many, small.—About 10 species in the temperate regions of the northern hemisphere, especially abundant in the Himalayas, China, Formosa, Philippines, and Japan; one in e. United States.

- | | |
|--|-------------------------|
| 1A. Leaves alternate; stems declined; spikes axillary, 1-3 cm. long. | |
| 2A. Leaves and stems rather densely pale-brown pubescent; spikes 1-1.5 cm. long. | 1. <i>V. villosulum</i> |
| 2B. Leaves and stems glabrous or very sparsely puberulent; spikes 2-3 cm. long. | |
| 3A. Stems, petioles, and leaves scattered-puberulent. | 2. <i>V. tagawae</i> |
| 3B. Plant glabrous throughout. | 3. <i>V. axillare</i> |
| 1B. Leaves verticillate; stems erect; spikes terminal, 20-35 cm. long. | 4. <i>V. sibiricum</i> |

1. *Veronicastrum villosulum* (Miq.) Yamazaki. *Botryopleuron villosulum* (Miq.) Makino; *Calorhabdos villosula* (Miq.) Makino; *Paederota villosula* Miq.; *C. axillaris* var. *villosula* (Miq.) Benth. & Hook. f. ex Makino in syn.—SUZUKAKE-SŌ. Plant densely pubescent; rhizomes short; stems terete, leafy, much elongate, declined in upper part, slender; leaves rather thick, ovate, 5-13 cm. long, 3-5 cm. wide, long-acuminate, broadly cuneate at base, with obliquely deltoid acute teeth, short-petiolate; spikes nearly globose, 1-1.5 cm. long, densely many-flowered, sessile, the bracts lanceolate, about 6 mm. long, acuminate; calyx-segments linear-lanceolate, 2.5-4 mm. long; corolla deep violet-purple, the tube 6-7 mm. long, spreading-pilose inside except at base, the limb about 5 mm. across, the lobes acute; anthers about 1.5 mm. long; ovary broadly ovoid; style more than 10 mm. long.—Aug.-Oct. Thickets; Honshu (Mino Prov.); very rare.

2. *Veronicastrum tagawae* (Ohwi) Yamazaki. *Botryopleuron tagawae* Ohwi; *Calorhabdos tagawae* (Ohwi) Masam.—KINOKUNI-SUZUKAKE. Perennial herb 1-2 m. high; stems terete, arcuate and declined, loosely recurved-puberulent; leaves ovate or oblong, 8-15 cm. long, 3-5 cm.

wide, acuminate, broadly cuneate at base, loosely recurved-puberulent beneath and on nerves, with appressed short teeth on margin, short-petiolate; spikes nearly sessile, 2-3 cm. long, densely many-flowered, the bracts lanceolate, acuminate, about 2 mm. long, glabrous; calyx-segments slightly unequal, linear-lanceolate, as long as the bracts, acuminate; corolla blue-purple, about 6 mm. long, the tube pilose inside, the lobes 4, deltoid, acute; anthers about 1 mm. long; style persistent, about 8 mm. long; capsules broadly ovoid, about 2.5 mm. in diameter.—Aug.-Sept. Honshu (Kii Prov.); rare.

3. *Veronicastrum axillare* (Sieb. & Zucc.) Yamazaki. *Botryopleuron axillare* (Sieb. & Zucc.) Hemsl.; *Calorhabdos axillaris* (Sieb. & Zucc.) Benth. & Hook. f. ex S. Moore; *Paederota axillaris* Sieb. & Zucc.; *P. bracteata* Sieb. & Zucc.—TORA-NO-O-SUZUKAKE. Glabrous perennial 1-2 m. high; stems terete, slender, often declined in upper part; leaves herbaceous, oblong or ovate, 5-10 cm. long, 2.5-5 cm. wide, acuminate, rounded to broadly cuneate at base, with obliquely deltoid teeth, short-petiolate; spikes axillary, 1.5-3 cm. long, densely many-flowered; flowers blue-purple, nearly sessile, the bracts linear-lanceolate, acuminate, slightly longer than the

calyx, smooth or sparingly ciliate; calyx-segments 5, linear-lanceolate, 3-4 mm. long, long-acuminate, glabrous; corolla about 5 mm. long, the tube about 3 mm. long, the lobes acuminate; anthers about 0.8 mm. long; style about 5 mm. long; capsules ovoid-globose, slightly flattened.—Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.—China.

4. *Veronicastrum sibiricum* (L.) Pennell. *Veronica sibirica* L.; *Leptandra sibirica* (L.) Nutt.; *Veronica virginica* (L.) var. *sibirica* (L.) Nakai; *Veronica virginica* (L.) var. *japonica* (Raf.) Nakai; *Eustachys japonica* Raf.; *Veronica japonica* (Raf.) Steud.; *Veronica virginica* (L.) var. *zuccarini* Koidz.; *Veronicastrum sibiricum* (L.) var. *yessoense* Hara—KUGAI-SŌ, KUKAI-SŌ. Short-pubescent to nearly glabrous perenn-

nial with short rhizomes; stems terete, erect, 80-150 cm. long, simple or sparingly branched in upper part; inflorescence terminal; spikes erect, 20-35 cm. long, very densely many-flowered; leaves verticillate, in 4's to 6's, broadly lanceolate to oblong, 10-15 cm. long, 2-5 cm. wide, acuminate, acute at base, acutely toothed; calyx deeply 5-lobed, the lobes broadly lanceolate, slightly unequal; corolla blue-purple; style and stamens exserted; capsules ovate-conical, 4-5 mm. long, acute, with a groove on each side; seeds about 4 mm. long, oblong.—July-Sept. Grassy places in mountains and lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, n. China, Manchuria, Sakhalin, and Siberia.

20. LAGOTIS Gaertn. URUPPU-SŌ ZOKU

Rather fleshy perennials; radical leaves obovate to oblong, entire, incised or undulate-toothed; stems scapellike, erect or decumbent at base, few-leaved; spikes terminal, densely many-flowered, globose to cylindric; flowers in spikes, blue-purple, sessile, solitary in axils of bracts; calyx membranous, split in front, sometimes 2- or 3-lobed or -toothed; corolla-tube narrow, broadened on the throat, the limb bilabiate, spreading, the upper lip entire or 2-lobed, the lower lip 3-lobed; stamens 2, inserted on the throat, shorter than the lobes; ovary 2-locular, 2-ovuled; fruit consisting of 2 nutlets, enclosed in the calyx.—About 10 species, in the cooler regions of N. Asia, alpine regions of central Asia, and N. America.

- 1A. Filaments shorter than to as long as the anthers; stamens about half as long as the upper lip of corolla. 1. *L. glauca*
1B. Filaments longer than the anthers, inserted at the base on each side of upper lip of corolla, nearly as long as to slightly shorter than the upper lip; stigma entire. 2. *L. stelleri* var. *yessoensis*

1. *Lagotis glauca* Gaertn. *Gymnandra gmelinii* Cham. & Schldt.—URUPPU-SŌ. Glabrous fleshy short-rhizomatous perennial; radical leaves long-petiolate, deltoid-orbicular to broadly ovate, 4-10 cm. long and as wide, obtuse to rounded, shallowly cordate to rounded at base, deep green, undulately obtuse-toothed, lustrous above, nerveless, long-petiolate; stems scapellike, 10-25 cm. long, rather stout, with few small orbicular-ovate or broadly cuneate leaves 1.5-3 cm. long, arising from a tuft of radical leaves; spikes solitary, terminal, 3-10 cm. long, very densely many-flowered, erect; flowers pale blue-purple, sessile, the bracts narrowly elliptic, longer than the calyx, obtuse, with broad hyaline margins; calyx long-pubescent on margin, with 2 broad teeth at apex; corolla 8-10 mm. long.—Aug. Sunny gravelly or sandy places in alpine regions; Hokkaido (Rebun Isl.), Honshu (alpine regions of centr. distr.); rare.—Kuriles, Sakhalin, Kamchatka, Ochotsk Sea.

Var. *takedana* (Miyabe & Tatew.) Kitam. *Lagotis takedana* Miyabe & Tatew.—YUBARI-SŌ. Differs from the typi-

cal phase in the smaller parts; leaves narrower; stems 10-20 cm. long.—Hokkaido (Mount Yubari); rare.

2. *Lagotis stelleri* (Cham. & Schldt.) Rupr. var. *yessoensis* Miyabe & Tatew. *L. yessoensis* Tatew.—HOSOGA-URUPPU-SŌ. Glabrous rhizomatous perennial; stems scapellike, 10-15 cm. long, few-leaved in upper part; radical leaves narrowly ovate or broadly oblong-lanceolate, 4-8 cm. long, 2-4 cm. wide, obtuse, rounded to abruptly narrowed at base, rather fleshy, obtuse-toothed, long-petiolate; cauline leaves ovate or broadly so, 1-2.5 cm. long, obtusely toothed, sessile; spike cylindric, solitary and terminal, 4-6 cm. long, 1.5-2 cm. across, the bracts narrowly ovate, longer than the calyx; flowers dense; calyx membranous, truncate or rounded at apex, pubescent on margin; corolla about 8 mm. long, the lower lip shorter than the upper; stigma entire.—Aug. Alpine regions; Hokkaido (Mount Daisetsu).

Further study may reveal that these two species are conspecific.

21. MONOCHASMA Maxim. KUCHINASHI-GUSA ZOKU

Small herbs; stems tufted, leafy; lower leaves scalelike, the upper ones larger, usually opposite, linear-lanceolate, entire; flowers solitary in axils, short-pedicelled, bracteoles 2, inserted at the base of calyx; calyx tubular, 4-lobed, enclosing the capsule, accrescent in fruit; corolla tubular, the throat slightly amplexate, the upper lip arcuate, galeate, 2-fid, with recurved margins, the lower lip longer than the upper, 3-lobed, the midlobe longer than the lateral ones and 2-grooved on the throat; stamens inclosed, didymous, inserted on the tube, the filaments filiform; ovary imperfectly 2-locular, many-ovuled; capsules ovoid, acuminate, loculicidal, enclosed in the calyx; seeds small, many, flat.—Few species, in e. Asia.

- 1A. Plant white-woolly only at base; stems with elongate internodes; leaves only opposite; corolla about 10 mm. long, shorter than the calyx-lobes. 1. *M. japonicum*
1B. Plant prominently white-woolly throughout except on the inflorescence; stems with short internodes; leaves opposite, ternate, or sometimes nearly alternate; corolla 20-25 mm. long, longer than the calyx-lobes. 2. *M. savatieri*

1. *Monochasma japonicum* (Maxim.) Makino. *M. shearerii* var. *japonicum* Maxim. ex Fr. & Sav.—KUCHINASHI-GUSA, KAGARIBI-SŌ. Biennial herb; stems tufted, 10-30 cm. long, nearly terete, reddish, loosely white-woolly at base, nearly

glabrous or puberulent in upper part; basal leaves broadly subulate, 1-5 mm. long, entire, sessile, the upper leaves linear, to 4 cm. long, 3(-4) mm. wide, acute, entire, sessile; flowers solitary in axils, the pedicels 3-10(-20) mm. long, puberulent, the

bracteoles 7–15 mm. long, nearly leaflike; calyx-tube with 10 raised ribs, the lobes broadly linear, leaflike, 1–2 cm. long, about 2 mm. wide; corolla pale rose-purple, about 10 mm. long; capsules glabrous, narrowly ovoid, acute or short-beaked, about 8 mm. long, enclosed in the calyx; seeds ovoid, many, about 1 mm. long.—May–June. Woods in lowlands and low mountains; Honshu, Shikoku, Kyushu.

2. *Monochasma savatieri* Franch., ex Maxim. *USU-YUKI-KUCHINASHI-GUSA*. White-woolly biennial (?); stems tufted, 15–30 cm. long; basal leaves 3–5 mm. long, scalelike;

upper leaves rather many, ascending to obliquely spreading, narrowly lanceolate, 1–2(–3) cm. long, gradually acute, entire; inflorescence green, glandular-pubescent, the bracts leaflike; flowers several, the pedicels 3–5 mm. long, the bracteoles leaflike, 1–1.5 cm. long; calyx-tube with 10 raised ribs, the lobes nearly as long as the tube; corolla 20–25 mm. long, much longer than the calyx-lobes, the tube gradually amplate, white, with a rosy hue on the upper corolla lobe, the lower lip about half as long as the tube.—Apr.–May. Kyushu (Hondo-mura in Amakusa Isl.).—China.

22. SIPHONOSTEGIA Benth. HIKI-YOMOGI ZOKU

Usually pilose or pubescent annuals or perennials; stems erect, sometimes branched; lower leaves opposite, the upper ones alternate, entire or pinnately parted; inflorescence spicate; flowers solitary in axils of bracts, sessile or nearly so, 2-bracteolate at the base of calyx; calyx tubular, 10-ribbed, 5-lobed, the linear segments nearly as long as the tube; corolla tubular, yellowish or purplish, the limb bilabiate, the upper lip erect, galeate, entire, the lower lip 3-lobed, with 2 longitudinal crests inside toward the base; stamens 4, didymous, inserted on the tube, ascending under the upper lip; capsules narrowly oblong, subacute, loculicidal; seeds very many, minute.—Few species, in the warmer parts of Asia.

1A. Scabrous annual, without glandular hairs; leaf-lobes slightly broadened at base; calyx-lobes equal, $\frac{1}{4}$ – $\frac{1}{2}$ as long as the tube, suberect; corolla clear yellow, the lower lip glabrous inside, the upper lip dark brown on lower margin, acute, with a minute tooth at the tip.

1. *S. chinensis*

1B. Glandular-pubescent annual; leaf-lobes often prominently broadened at base; calyx-lobes unequal, one slightly smaller than the others, $\frac{1}{2}$ – $\frac{2}{3}$ as long as the tube, ascending; corolla grayish yellow, the lower lip villous inside, the upper lip red-brown on upper side, truncate, entire at tip.

2. *S. laeta*

1. *Siphonostegia chinensis* Benth. *HIKI-YOMOGI*. Scabrous annual; stems erect, 30–60 cm. long, simple or branched; leaves deltoid, 2–3.5 cm. long, pinnately parted, the segments linear-lanceolate, acute, with 1–3 teeth, the petioles winged, the upper leaves smaller, 3-parted; flowers solitary in axils of the rather leafy spike, very short-pedicelled; calyx narrowly tubular, 12–15 mm. long, 2.5–4 mm. across, prominently ribbed, the bracteoles short; calyx-lobes lanceolate; corolla about 2.5 cm. long, clear yellow, amplate near the throat, the upper lip loosely long-pubescent on back, the lower lip glabrous inside with 2 raised crests; capsules enclosed in the calyx, as long as the calyx-tube; seeds ovoid, about 0.5 mm. in diameter.—Aug. Meadows and grassy slopes in hills and low mountains; Hokkaido, Honshu, Shikoku, Kyushu.—China, Korea, Manchuria, Formosa, and s. Kuriles.

2. *Siphonostegia laeta* S. Moore. *S. laeta* var. *japonica* Matsum.; *S. japonica* (Matsum.) Matsum. ex Furum.—*HIKI-YOMOGI*. Glandular-pubescent annual; stems 30–60 cm. long, much branched in upper part; leaves deltoid, 2.5–4 cm. long, acuminate, pinnately parted, the segments acutely toothed, the petioles winged, the upper leaves ovate, incised or entire; flowers very short-pedicelled; calyx-tube membranous, 12–17 mm. long, ribbed, the lobes lanceolate, unequal; corolla about 2.5 cm. long, grayish yellow, loosely short-pubescent externally, the upper lip red-brown on upper side, truncate, entire at the tip, the lower lip with 2 raised crests, villous inside; anthers obtuse; capsules broadly lanceolate, glabrous, slightly shorter than the calyx-tube.—Aug.–Sept. Honshu (Kantō Distr. and westw.), Shikoku.—China.

23. MELAMPYRUM L. MAMAKO-NA ZOKU

Glabrous or pubescent annuals; leaves opposite, entire or the upper ones incised; flowers yellowish or rose-purple, subsessile, ebracteolate, solitary in axils, often forming a terminal spike, the bracts usually colored; calyx tubular, 5-toothed, the upper teeth often larger than the others; corolla tubular, the limb bilabiate, the upper lip erect, flat, short, galeate, obtuse and often bidentate, the lower lip 3-lobed; stamens 4, didymous, inserted on underside of the upper lip; ovary 2-locular, with 2 ovules in each locule; capsules flat, ovate, oblique, loculicidal; seeds 4 or fewer, strophiolate.—About 40 species, in temperate regions of the N. Hemisphere.

1A. Corolla white on each side of throat within; bracts acute or acuminate.

2A. Bracts green; leaves oblong-lanceolate or narrowly ovate, short-acute to acuminate.

1. *M. roseum*

2B. Bracts rose-purple; leaves linear-lanceolate to lanceolate, long-acuminate.

2. *M. setaceum*

1B. Corolla orange-yellow on each side of throat within; bracts obtuse.

3. *M. laxum*

1. *Melampyrum roseum* Maxim. *M. henryanum* Soë; *M. jedoense* Miq.; *M. roseum* var. *typicum* Fr. & Sav.—*T'SUSHIMA-MAMAKO-NA*. Stems 4-angled, erect, 30–50 cm. long, with ascending branches, puberulent; median leaves narrowly ovate to oblong-lanceolate, 5–7 cm. long, 1.5–2.5 cm. wide, acuminate, rounded at base, entire, loosely puberulent on

both sides, the petioles 7–10 mm. long; spikes elongate, the bracts green, smaller than the median leaves, with few soft spines on margins; flowers 15–20 mm. long; calyx 3–4 mm. long, glabrous or sparsely puberulent, the lobes acute; corolla red, granular-puberulent externally, hairy inside; capsules ovate, acuminate, about 8 mm. long, densely puberulent to-

ward the top; seeds ellipsoidal, black, about 3 mm. long, strophiolate at base.—Aug.–Oct. Honshu (centr. distr. and westw.), Kyushu.—Korea, Manchuria, and China.

Var. *ovalifolium* Nakai ex Beauverd. *M. ovalifolium* Nakai; *M. roseum* subsp. *ovalifolium* (Nakai) Beauverd; *M. aristatum* (Beauverd) Soó.—MARUBA-MAMAKO-NA. Spikes usually congested, the bracts long-acuminate, with rather numerous spreading soft spines on margin; calyx glabrous or pubescent, the teeth usually acuminate.—Kyushu (Iki and Tsushima).—Korea.

Var. *japonicum* Fr. & Sav. *M. ciliare* Miq.; *M. jedoense* var. *luxurians* Miq.; *M. roseum* var. *ciliare* (Miq.) Nakai; *M. roseum* subsp. *japonicum* Nakai ex Matsum., incl. vars. *genuinum*, *salicifolium*, and *resupinatum* of Nakai; *M. roseum* var. *sendaiense* Beauverd.—MAMAKO-NA. Similar to var. *ovalifolium* but densely long-pubescent on axis of spikes and calyx.—Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea.

2. *Melampyrum setaceum* (Maxim.) Nakai. *M. roseum* var. *setaceum* Maxim. ex Palib.; *M. roseum* var. *alpinum* Kitam.; *M. kawasakianum* Kitam.—HOSOBAMA-MAMAKO-NA. Stems slightly angled, erect, 30–60 cm. long, usually much branched, terete, loosely puberulent; median leaves linear-lanceolate to lanceolate, 2–4 cm. long, 3–4 mm. wide, long-acuminate, thinly short-pubescent, short-petiolate; bracts linear to broadly deltoid-lanceolate, prominently setose on margin, the upper ones rose-purple; calyx 3–4.5 mm. long, puberulent to glabrous, the lobes acuminate, slightly awn-tipped; corolla red, 15–18 mm. long; capsules 8–9 mm. long, puberulent.—Aug.–Oct. Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Korea and Manchuria.

Var. *latifolium* Nakai. *M. nakaianum* var. *latifolium* (Nakai) Tuyama.—OHOSOBAMA-MAMAKO-NA. Broad-leaved phase with leaves 3–4.5 cm. long, 6–8 mm. wide.—Kyushu.

3. *Melampyrum laxum* Miq. var. *nikkoense* Beauverd. *M. australe* forma *edentatum* Tuyama; *M. laxum* forma *nikkoense* (Beauverd) Soó.—MIYAMA-MAMAKO-NA. Stems 20–50 cm. long, puberulent, with ascending branches; median leaves broadly lanceolate to narrowly ovate, acuminate, rounded to abruptly acute at base, petiolate; bracts loose, small, obtuse, entire; calyx puberulent or nearly glabrous, about 3 mm. long, the teeth thick, obtuse, short; corolla red, rarely white, 13–18 mm. long; capsules ovate, acuminate, about 1 cm. long, densely puberulent.—Aug.–Sept. Woods in mountains; Hokkaido, Honshu, Kyushu.

Var. *laxum*. *M. australe* Nakai ex Tuyama; *M. roseum* var. *brevidentis* Kitam.; *M. laxum* var. *brevidentis* (Kitam.) Hara; *M. laxum* forma *australe* Nakai, pro parte.—SHIKOKU-MAMAKO-NA, UBA-MAMAKO-NA. Bracts often hastate, more or less setose-dentate on lower margin; corolla 13–18 mm. long, red.—Honshu (centr. distr. and westw.), Shikoku, Kyushu.

Var. *arcuatum* (Nakai) Soó. *M. arcuatum* Nakai.—TAKANE-MAMAKO-NA. Stems 15–20 cm. long; leaves ovate-elliptic to narrowly ovate, 2–4 cm. long, 7–15 mm. wide; bracts loose, broadly lanceolate, small; calyx-lobes rounded; corolla yellowish, 10–12 mm. long.—July–Aug. Damp woods in high mountains; Honshu (Kai, s. Shinano, and w. Musashi Prov.).

Var. *yakusimense* (Tuyama) Kitam. *M. yakusimense* Tuyama.—YAKUSHIMA-MAMAKO-NA. Resembles var. *arcuatum*, but with broader, ovate or oblong bracts and red corollas.—Kyushu (Yakushima).

24. EUPHRASIA L. KOGOMEGUSA ZOKU

Branched or simple erect annuals or perennials; leaves small, opposite, cuneate, sessile, toothed or incised, or pinnately lobed; flowers sessile or short-pedicelled, in axils of leaflike bracts, white, yellowish, or rarely purplish, ebracteolate; calyx tubular or campanulate, 4-cleft, the lobes obtuse or acute; corolla-tube amplate, the limb bilabiate, the upper lip erect, shallowly 2-lobed or bidentate, the lower lip spreading, 3-lobed, the lobes obtuse or retuse; stamens 4, didymous; capsules oblong or obovate, flattened, loculicidal; seeds longitudinally striate.—About 100 species, in cooler regions of the N. Hemisphere, Australia, S. America, and in mountains of Malaysia.

1A. Leaves narrowly obovate to narrowly oblong, more than twice as long as wide.

2A. Corolla large, 7–10 mm. long on back.

3A. Calyx less than half as long as the corolla. 1. *E. insignis*

3B. Calyx half as long as the corolla or longer.

4A. Bracts with acute teeth. 2. *E. pubigera*

4B. Bracts short awn-toothed. 3. *E. hachijoensis*

2B. Corolla small, 5–6 mm. long on back. 4. *E. microphylla*

B. Leaves orbicular, broadly obovate, or rhombic-elliptic, less than twice as long as wide.

5A. Corolla large, 7–10 mm. long.

6A. Plants 2–10 cm. high, usually simple, rarely sparingly branched.

7A. Hairs not curled or glandular. 5. *E. yabeana*

7B. Hairs curled and glandular on upper part. 6. *E. matsumurae*

6B. Plants 10–30 cm. high, usually much branched.

8A. Leaves scarcely scabrous; corolla 8–10 mm. long; lower lip of corolla much longer than the upper. 7. *E. inunae*

8B. Leaves prominently scabrous; corolla 7–8 mm. long; lower lip of corolla slightly longer than the upper. 8. *E. multifolia*

5B. Corolla small, 4–5(–6) mm. long; lower lip nearly as long as to slightly longer than the upper lip; teeth of leaves and calyx-lobes acuminate, short awn-tipped. 9. *E. maximowiczii*

1. *Euphrasia insignis* Wettst. MIYAMA-KOGOMEGUSA. Stems 7–15 cm. long, simple or branched, white-puberulent; median leaves narrowly obovate, 6–12 mm. long, 3–6(–7) mm. wide, cuneate at base, with 2 or 3 acute or subacute teeth on

each side, sessile; leaves of the inflorescence rhombic-obovate or obovate, scabrous on upper side, with 2 or 3 very acute or mucronate teeth; calyx 4–6 mm. long, 4-lobed, the lobes linear-lanceolate, very acuminate; corolla 8–10 mm. long, the lobes

of lower lip shallowly 2-lobed; capsules obovate, retuse, appressed-pilose on margin; seeds 4-6, about 1.5 mm. long.—Aug.–Sept. High mountains; Honshu (centr. distr.).

Var. *togakusiensis* (Y. Kimura) Y. Kimura. *E. koidzumii* var. *togakusiensis* Y. Kimura.—TOGAKUSHI-KOGOMEGUSA. Teeth of leaves acute, those of bracts awn-tipped; calyx-lobes short awn-tipped.—Honshu (Mount Togakushi in Shinano Prov.).

Var. *japonica* (Wettst.) Ohwi. *E. japonica* Wettst.—HOSOGAKI-KOGOMEGUSA. Calyx-lobes acute or subacute, sometimes very acute, not cuspidate.—Honshu (Hokuriku Distr.).

2. *Euphrasia pubigera* Koidz. MATSURA-KOGOMEGUSA. Stems 6–12 cm. long, white-pilose; median leaves ovate, acute, cuneate toward the base, glabrous, with 2–3 (–4) acute teeth on each side, the bracts leaflike, scabrous on margin; calyx about 4 mm. long, the lobes broadly linear, as long as the tube, scabrous on margin; corolla prominently puberulent externally, about 7.5 mm. long, the lower lip deeply 3-lobed, the lobes retuse, ciliate; style scattered pilose at the tip.—July. Honshu (Mount Odaigahara in Yamato).

3. *Euphrasia hachijoensis* Nakai. HACHIJO-KOGOMEGUSA. Stems 8–15 cm. long, white-puberulent; median leaves narrowly ovate to narrowly obovate, 6–10 mm. long, 3–5 mm. wide, cuneate at base, sparingly scabrous on margin, with 3 (–4) acute teeth on each side, the bracts quite numerous, similar to the median leaves but usually narrowly obovate, smooth, short awn-toothed; calyx about 5 mm. long, nearly smooth, 4-lobed, the lobes linear-lanceolate, long-acuminate and awn-tipped; corolla 7–8 mm. long, the lower lip distinctly longer than the upper, the lobes retuse; capsules narrowly oblong-obovate, slightly shorter than the calyx, about 6-seeded, loosely ciliate.—Aug. Honshu (Mount Hachijofuji on Hachijo Isl.).

4. *Euphrasia microphylla* Koidz. NAYONAYO-KOGOMEGUSA. Stems 5–10 cm. long, very slender, white-puberulent, simple or branched; median leaves narrowly obovate, 4–8 mm. long, 2–3 (–4) mm. wide, obtuse, long-cuneate toward the base, 1- or 2-toothed on each side; bracts obovate, 3–5 mm. long, 2–3 mm. wide, 1- or 2-toothed on each side; calyx deltoid, 2.5–3.5 mm. long, shallowly toothed, the lobes obtuse; corolla 5–6 mm. long, the lower lip slightly longer than the upper, the lobes shallowly retuse; capsules obovate, nearly as long as the calyx, retuse.—Aug. Alpine regions; Shikoku.

5. *Euphrasia yabeana* Nakai. HINA-KOGOMEGUSA. Stems 2–10 cm. long, simple or sparingly branched, white-puberulent, few-leaved; leaves broadly obovate or broadly ovate, 3–7 mm. long, 2–5 mm. wide, obtuse, acute to cuneate at base, nearly glabrous, 1- or 2-toothed on each side, the bracts simulating the leaves but sometimes flabellate; calyx 3–4 mm. long, nearly glabrous, shallowly lobed, the lobes narrowly ovate-deltoid, subacute; capsules obovate, about as long as the calyx, loosely pilose on margin; seeds 4–6.—Aug. Alpine regions; Honshu (sw. part of n. and centr. distr.).

6. *Euphrasia matsumurae* Nakai. KOSA-NO-KOGOMEGUSA. Stems 3–10 cm. long, simple or sparsely branched, white-puberulent at base, glandular crispate-pubescent on the upper portion; leaves of few pairs, nearly glabrous, 1- to 3-toothed on each side, the bracts flabellate or obovate, 5–8 mm. long, 4–6 mm. wide, rounded or obtuse, with 2–4 teeth on each side; calyx 3.5–5 mm. long, shallowly lobed, the lobes deltoid, obtuse; corolla 8–10 mm. long, the lower lip shallowly 2-lobed;

capsules broadly obovate, slightly shorter than the calyx, loosely long-pilose on the margin, about 8-seeded.—Aug. Alpine regions; Honshu (Kantō and centr. distr.).

7. *Euphrasia inumae* Takeda. KOGOMEGUSA. Stems 10–20 cm. long, branched, white-puberulent; median leaves obovate, rhombic or rhombic-elliptic, 7–10 mm. long, 5–7 mm. wide, obtuse, cuneate at base, glabrous, with 2–4 teeth on each side, the bracts simulating leaves but broader and shorter, the teeth obtuse or subobtuse; calyx 4–5 mm. long, shallowly 4-lobed, the lobes broadly lanceolate, acute or subacute; corolla 8–10 mm. long, the lower lip deeply retuse, much longer than the upper; capsules obovate-oblong, slightly shorter than the calyx, loosely long-pilose on margin, 4- to 6-seeded.—Mountains; Honshu (Mount Ibuki in Oomi Prov.).

Var. *makinoi* (Takeda) Ohwi. *E. makinoi* Takeda.—TOSA-NO-KOGOMEGUSA. Leaves broader, the bracts cuspidate or short awn-toothed; calyx-lobes acuminate and sometimes minutely awn-tipped.—Honshu (Suwo Prov.) and Shikoku.

Var. *kusiana* (Y. Kimura) Ohwi. *E. kusiana* Y. Kimura.—KYŪSHŪ-KOGOMEGUSA. Leaves narrower; teeth of the bracts and calyx-lobes awn-tipped.—Mountains of Honshu (Chūgoku Distr.) and Kyushu.

Var. *idzuensis* (Takeda) Ohwi. *E. idzuensis* Takeda.—IZU-KOGOMEGUSA. Bracts with the teeth minutely cuspidate; calyx-lobes usually minutely awn-tipped.—Honshu (Izu Prov.).

8. *Euphrasia multifolia* Wettst. TSUKUSHI-KOGOMEGUSA. Stems 20–30 cm. long, white-puberulent, branched above the middle; leaves rather numerous, the median ones ovate to broadly so, or elliptic, 7–11 mm. long, 4–6 mm. wide, obtuse, obtuse to rounded at base, scabrous on upper surface near margin, with 3 or 4 teeth on each side, the bracts simulating the leaves but somewhat smaller, prominently scabrous on upper surface near margin, sometimes cuspidate-toothed; calyx deltoid-lanceolate, acuminate, prominently scabrous; corolla prominently puberulent, (6–)7–8 mm. long, the lower lip slightly longer than the upper, the lobes retuse; capsules obovate-oblong, ciliate, slightly shorter than the calyx.—Sept.–Oct. Honshu (Shinano Prov. and Chūgoku Distr.), Kyushu.

Var. *kirishimana* Y. Kimura. KUMOI-KOGOMEGUSA. Teeth of the leaves more acute.—s. Kyushu.

9. *Euphrasia maximowiczii* Wettst. ? *E. officinalis* var. *nervosa* Miq.—TACHI-KOGOMEGUSA. Stems erect, 20–40 cm. long, white-puberulent, branched in upper part; median leaves broadly ovate or nearly ovate-orbicular, 6–12 mm. long, 5–10 mm. wide, obtuse, rounded at base, glabrous or thinly pilose on the nerves beneath, scabrous near the margin, the teeth obtuse in the upper leaves, acuminate and often awn-pointed in the lower, the bracts small, simulating the leaves, scabrous, the teeth acuminate, awn-tipped; calyx 3.5–5 mm. long, shallowly lobed, the lobes deltoid-lanceolate, acuminate, usually awn-tipped, scabrous; corolla 4.5–(6) mm. long, the lower lip 3-lobed, slightly longer to as long as the upper lip, the lobes retuse; capsules obovate-oblong, slightly shorter than the calyx, loosely ciliate, about 12-seeded.—Aug.–Oct. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea and Manchuria.

Var. *yezoensis* Hara. *E. yezoensis* Hara; *E. maximowiczii* Wettst. pro parte—EZO-KOGOMEGUSA. Copiously coarse whitish hairy; bracts with acuminate but not awn-tipped teeth.—Hokaido, Honshu. (n. distr.).—s. Kuriles.

25. *PHITHEIOSPERMUM* Bunge KO-SHIOGAMA ZOKU

Glandular-pubescent annuals or biennials; leaves opposite, pinnately dissected; flowers solitary in upper axils, short-pedicelled, bracteolate, usually reddish; calyx campanulate, 5-lobed, the upper lobe smaller; corolla-tube rather broad, amplate, the limb bilabiate, the upper lip erect, short, broadly 2-lobed, the lower lip elongate, spreading, 3-lobed, with 2 raised points inside at base, open on throat; stamens 4, didymous, inserted below the upper lip; style spatulate, shortly 2-fid; capsules flat, beaked, loculicidal, somewhat asymmetrical; seeds many, ovoid, reticulate.—Few species, in Japan, China, and the Himalayas.

1. *Phtheiospermum japonicum* (Thunb.) Kanitz.
Gerardia japonica Thunb.; *P. chinense* Bunge.—KO-SHIOGAMA. Glandular-hairy annual herb; stems simple or usually branched, erect, 30–60 cm. long; leaves deltoid-ovate, 3–5 cm. long, 2–3.5 cm. wide, acute, pinnately divided, serrulate, petiolate, the lateral segments usually obtuse, the upper leaves gradually smaller; calyx obliquely 5-lobed, 5–7 mm. long, slightly accrescent after anthesis, the lobes green, oblong,

toothed; corolla pale rose-purple, about 2 cm. long; capsules narrowly ovate, 8–12 mm. long, 4–6 mm. wide, oblique, much longer than and exserted from the calyx, glandular-pubescent; seeds many, elliptic, about 1 mm. long, with winklelike longitudinal and horizontal markings.—Sept.–Oct. Meadows and thickets in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Formosa, China, Korea, and Manchuria.

26. *PEDICULARIS* L. SHIOGAMA ZOKU

Perennials or rarely biennials; leaves opposite, alternate, or verticillate, toothed or pinnatifid, sometimes pinnately compound; floral bracts small, sessile; inflorescence spicate; flowers solitary in the bracts, white, yellowish, or reddish; calyx tubular or campanulate, often split in front or back, 2- to 5-toothed; corolla-tubular, amplate, the limb bilabiate, the lower lip spreading, 3-lobed or undivided, the upper lip or helmet erect, galeate, entire or with a tooth on each side, or beaked at apex; stamens 4, didymous, inserted inside the upper lip; capsules flat, ovate or lanceolate, oblique, usually beaked, loculicidal; seeds many, often reticulate or longitudinally striate.—About 500 species, in temperate regions of the N. Hemisphere and S. America, especially abundant in sw. China, centr. Asia, and the Himalayas.

1A. Helmet (upper lip of corolla) developed as an incurved beak.

2A. Leaves alternate or opposite; calyx deeply split in front, oblique, subentire or with 2 or 3 minute teeth on back at apex; lower lip of corolla only barely lobed, longer than the helmet.

3A. Leaves opposite, pinnately divided; capsules deltoid-lanceolate, 3 to 4 times as long as the calyx. 1. *P. keiskei*

3B. Leaves alternate, rarely opposite, pinnately incised or doubly toothed; capsules narrowly deltoid-ovate or narrowly ovate, 1.5–2 times as long as the calyx. 2. *P. yezoensis*

4A. Flowers pale yellow; helmet abruptly long and slenderly beaked. 3. *P. resupinata*

4B. Flowers rose-purple, rarely white; helmet gradually somewhat short and stoutly beaked. 4. *P. chamissonis* var. *japonica*

2B. Leaves verticillate in 4's (3's to 6's); calyx not split on one side, toothed at apex; lower lip of corolla with 3 nearly equal lobes, shorter than to as long as the helmet; corolla rose-purple. 5. *P. verticillata*

1B. Helmet obtuse or rounded, entire or with a minute tooth on each side at apex, not forming a beak.

5A. Leaves verticillate in 4's (3's to 6's); flowers rose-purple, rarely white.

6A. Helmet 6–7 mm. long, about $\frac{1}{2}$ as long as the corolla-tube.

7A. Stems 5–15 cm. long; spikes densely flowered, 2–3(–5) cm. long; flowers about 15 mm. long; capsules nearly horizontally spreading. 6. *P. refracta*

7B. Stems 20–40 cm. long; spikes rather loosely flowered, 10–20 cm. long; flowers about 20 mm. long; capsules sometimes slightly deflexed. 7. *P. spicata*

6B. Helmet about 2.5 mm. long, about $\frac{1}{4}$ – $\frac{1}{2}$ as long as the corolla-tube.

5B. Leaves opposite or alternate.

8A. Cauline leaves alternate; stems 5–20 cm. long, rarely to 30 cm. long.

9A. Stems 5–15 cm. long, rarely to 20 cm. long.

10A. Flowers rose-purple or deep red.

11A. Radical leaves bipinnately parted, the segments acute. 8. *P. apodochila*

11B. Radical leaves pinnately parted, the lobes toothed or shallowly incised, obtuse. 9. *P. koidzumiana*

10B. Flowers yellowish, the helmet brown-yellow on upper part. 10. *P. oederi*

9B. Stems 20–40 cm. long; flowers many, yellow. 11. *P. venusta* var. *schmidtii*

8B. Cauline leaves opposite; stems stout, usually 30–60 cm. long.

12A. Stems unbranched; spikes terminal, solitary; flowers pale rose. 12. *P. nipponica*

12B. Stems branched above; spikes (1–) 3–5; flowers red-purple.

13A. Calyx 5-toothed or split on one side, truncate; lower lip of corolla ascending. 13. *P. gloriosa*

13B. Calyx with 2 lateral lobes; lower lip of corolla spreading or slightly recurved. 14. *P. ochiaiana*

1. *Pedicularis keiskei* Fr. & Sav. SERIBA-SHIOGAMA. Nearly glabrous slender perennial; stems slender, 30–50 cm. long, sometimes somewhat branched in upper part; radical leaves absent at anthesis, the median ones short-petioled, thinly membranous, narrowly ovate in outline, 4–7 cm. long, 2–4 cm. wide, pinnately divided, the segments broadly lanceolate and toothed, acute, the upper leaf-segments adnate at base to the

rachis; flowers sparse, the bracts small, simulating the median leaves; calyx membranous, about 4 mm. long, deeply split in front, obtuse, with 2 or 3 minute teeth at apex on back side; corolla pale yellow, about 2 cm. long, the beak nearly as long as the basal part, the lower lip ascending, minutely 3-lobulate; capsules about 12 mm. long, 3 mm. across near base, gradually narrowed to tip, deltoid-lanceolate in outline, acuminate;

seeds fusiform, smooth, longitudinally striate, subtruncate, with a short rounded point at one end.—Aug.-Sept. Damp woods in high mountains; Honshu (southern half of centr. distr.).

2. *Pedicularis yezoensis* Maxim. *P. resupinata* var. *glabricalyx* Miq.; *P. glabricalyx* (Miq.) Koidz.—EZO-SHI OGAMA. Glabrous or nearly glabrous perennial; stems 30–60 cm. long, nearly erect, in small tufts; cauline leaves alternate, broadly deltoid-lanceolate or rarely narrowly ovate, 3–5 cm. long, 1–2 cm. wide, acute, truncate-rounded at base, pinnately double-toothed, short-petiolate; floral bracts leaflike, ovate-deltoid; flowers pale yellow; calyx 4–6 mm. long, glabrous or puberulent, deeply split anteriorly, with 2 or 3 minute teeth at apex; corolla about 2 cm. long, the beak slender, falcate, as long as to slightly longer than basal part, the lower lip ascending, shortly 3-lobulate; capsules oblique, narrowly ovate, about 1 cm. long, abruptly mucronate at apex; seeds fusiform, about 2.5 mm. long, obtuse at both ends, smooth.—Aug.-Sept. High mountains and alpine regions; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin.—Forma *pubescens* (Hara) Ohwi. *P. yezoensis* var. *pubescens* Hara—BIRÖDO-EZO-SHI OGAMA. Short-pubescent throughout, especially on the calyx.—Hokkaido.—Sakhalin.

3. *Pedicularis resupinata* L. *P. levilleana* Bonati; *P. vaniotiana* Bonati—SHI OGAMA-GIKU. Nearly glabrous to short-pubescent perennial; stems ascending at base, becoming erect, 40–100 cm. long, purplish red, loosely leaved; leaves alternate or sometimes subopposite, broadly lanceolate to broadly deltoid-lanceolate, sometimes narrowly oblong-ovate, 5–8 cm. long, 1.5–2.5 (–3) cm. wide, acute, rounded to truncate-rounded at base, penninerved, obtusely incised and serrulate, short-petiolate; floral bracts leaflike, the upper ones often ovate-rhombic; calyx 5–10 mm. long, deeply split in front, rounded-truncate and obtusely 2- or 3-toothed at apex on backside, soft-pubescent or sometimes nearly glabrous; corolla about 2 cm. long, red-purple, with a darker helmet, the helmet gradually curved and short-beaked, the lower lip ascending; capsules subovate, 8–12 mm. long, acute; seeds fusiform, about 2.5 mm. long, obscurely striate, smooth, obtuse at both ends.—Aug.-Oct. Meadows in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Kuriles, Sakhalin, Kamchatka, Korea, e. Siberia, and China.

Var. *caespitosa* Koidz. TOMOE-SHI OGAMA. Flowers in short densely congested spikes, paler in color, the helmet somewhat deeper colored.—Alpine regions; Honshu (centr. distr.).

Var. *microphylla* Honda. MIKAWA-SHI OGAMA. Leaves smaller, narrower, rather densely arranged on usually simple or sparsely branched stems; beak shorter.—Wet boggy places; Honshu (Mikawa Prov.).

4. *Pedicularis chamissonis* Stev. var. *japonica* (Miq.) Maxim. *P. japonica* Miq.; *P. fauriei* Bonati; *P. japonica* var. *maximowiczii* Nakai, pro parte.—YOTSUBA-SHI OGAMA. Stems 20–60 cm. long, in small tufts, erect, with sparse lines of short hairs or nearly glabrous; radical leaves withering before anthesis, the cauline ones in 4's (3's to 6's), narrowly ovate or broadly deltoid-lanceolate, 3–5 cm. long, 1.5–3 cm. wide, acute, pinnately divided, nearly glabrous, short-petiolate, the segments 7 to 12 pairs, lanceolate, pinnately incised and toothed; spikes usually solitary, loosely flowered, 5–25 cm. long, the bracts linear, longer than the calyx, toothed or incised, glabrous or pubescent; calyx 5–7 mm. long, 5-toothed;

corolla reddish, about 1.5 cm. long, the helmet dark red, abruptly long-beaked, the lower lip spreading, deeply 3-lobed; capsules nearly elliptic, 8–10 mm. long, 4–5 mm. wide, mucronate; seeds fusiform, about 2.5 mm. long, longitudinally striate and cross-lined.—July–Sept. Alpine regions; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin and s. Kuriles.—The typical phase occurs in n. Kuriles, Kamchatka, and the Aleutians.

5. *Pedicularis verticillata* L. *P. amoena* sensu auct. Japon., non Adams—TAKANE-SHI OGAMA. Monocarpic densely pubescent herb; stems 5–15 cm. long, simple or somewhat branched at the base; leaves cauline, verticillate in 4's (2's to 6's), narrowly oblong or ovate-oblong, 2–3 cm. long, 5–10 mm. wide, obtuse, petiolate, pinnately parted to divided, the pinnae 5 to 7 pairs, oblong, toothed; spikes terminal, solitary, head-like or very short, densely flowered, 2–5 cm. long, the bracts longer than the calyx, deltoid, pinnately or palmately lobed or cleft, cuneate at base; calyx membranous, 3–5 mm. long at anthesis, to 8 mm. long in fruit, split to the middle in front, with 10 darker colored nerves, the 5 deltoid teeth minute; corolla red, about 1.5 cm. long, the helmet declined, rounded at apex, entire, the lower lip ascending, 3-lobed; capsules oblique to nearly horizontally spreading, about 15 mm. long; seeds about 3 mm. long, reticulate, with elliptic areolae.—July–Aug. Alpine regions; Hokkaido, Honshu (centr. distr.).—n. Kuriles and Korea to Europe, and N. America.

6. *Pedicularis refracta* (Maxim.) Maxim. *P. verticillata* var. *refracta* Maxim.—TSUKUSHI-SHI OGAMA. Plant rather prominently whitish crispate-pubescent; stems erect, tufted or solitary, 20–40 cm. long, simple or branched at base; leaves verticillate in 4's, narrowly oblong to narrowly ovate, the basal ones long-petiolate, the cauline short-petiolate, 3–5 cm. long, 1–1.5 cm. wide, obtuse, pinnately parted or divided, the segments of several pairs, oblong, deeply toothed; spikes 10–20 cm. long in fruit, the bracts as long as the calyx or longer, broadly lanceolate, pinnately lobed; calyx 5–8 mm. long, shallowly split in front, with 10 cross-lined ribs, deltoid-toothed on the back at apex; corolla about 2 cm. long, red; anthers of lower and upper pairs contiguous; capsules horizontally spreading or slightly deflexed, broadly deltoid-lanceolate, about 1.5 cm. long.—May. Meadows in mountains; Kyushu (centr. distr.).

7. *Pedicularis spicata* Pall. HOZAKI-SHI OGAMA. Monocarpic herb, prominently whitish pubescent throughout, especially on the spikes; stems simple or somewhat tufted, often short-branched in upper part; radical leaves withering before anthesis, the median cauline ones short-petiolate, usually verticillate in 4's, lanceolate or deltoid-lanceolate, 3–5 cm. long, about 1 cm. wide, subobtusely, pinnately cleft to parted, the segments serrulate; spikes rather densely flowered, the bracts leaflike, shallowly lobed, shorter than to as long as the flowers, longer than the calyx, the upper bracts broadly ovate, smaller; calyx 3–4 mm. long, undulate-toothed; corolla red, 1–1.5 cm. long, the helmet short, declined, rounded and entire at apex, the lower lip obliquely spreading, 3-lobed; capsules suberect, 6–8 mm. long, obliquely ovate.—July–Sept. Naturalized in Hokkaido (Tokachi Prov.).—Korea, Manchuria, e. Siberia, and n. China.

8. *Pedicularis apodochila* Maxim. *P. rubens* var. *japonica* Maxim.—MIYAMA-SHI OGAMA. Stems 5–15 cm. long, rather stout, leafless or 1- or 2-leaved; basal leaves rather many, rosulate, narrowly ovate to ovate-oblong, 4–8 cm. long,

2-3 cm. wide, abruptly acute, long-petiolate, pinnately divided, the segments ovate-oblong, acute, pinnately parted; cauline leaves simulating the basal, alternate, the uppermost smaller; spikes solitary, terminal, erect, densely 10- to 20-flowered, subcapitate or somewhat elongate in fruit, to 4 cm. long, prominently pubescent, the lower bracts leaflike, usually longer than to as long as the flowers, the upper bracts ternate-pinnate, long-attenuate at base, as long as or slightly longer than the calyx; calyx 8-12 mm. long, tubular, membranous, the teeth oblanccolate, 3-5 mm. long; corolla red, 2-2.5 cm. long, ascending, the helmet rounded at apex, with a minute tooth on each side immediately below the apex, the lower lip spreading, shorter than the helmet, deeply 3-lobed; anthers of upper and lower pairs contiguous; capsules 12-18 mm. long, suberect, acute, mucronate; seeds about 3 mm. long, with longitudinal rows of depressed, minute, 4-angled impressed dots.—July-Aug. Alpine regions; Hokkaido, Honshu (centr. and n. distr.).

9. *Pedicularis koidzumiana* Tatew. & Ohwi. BENI-SHIOGAMA, RISHIRI-SHIOGAMA. Rhizomes thick; stems 5-10 cm. long, stout, simple, few-leaved or leafless; radical leaves many, long-petiolate, oblong-ovate, 1.5-3 cm. long, 1-1.5 cm. wide, subobtusely, pinnately divided, the segments of 7 to 10 pairs, oblong, obtuse, toothed; cauline leaves absent or few, similar to the radical; spikes solitary, densely few-flowered, subcapitate, 1-2 cm. long, unbranched, the lower bracts leaflike, much longer than the calyx, the upper ones shorter than the calyx; calyx short-tubular, about 1 cm. long, the teeth oblong-spathulate, few-toothed, obtuse; corolla red, about 3 cm. long, the helmet rounded at apex, with a shallow minute tooth on each side immediately below the apex, the lower lip spreading, shorter than the helmet, 3-lobed; capsules about 1.5 cm. long, erect, mucronate; seeds 2.5-3 mm. long, reticulate.—Hokkaido (Rishiri Isl.).—Sakhalin.

10. *Pedicularis oederi* Vahl. *P. versicolor* Wahlenb. —KIBANA-SHIOGAMA. Plant long-pubescent, becoming nearly glabrous; rhizomes stout, with few membranous scale-like leaves on the neck; stems 7-15 cm. long, rather stout, few-leaved; radical leaves few, petiolate, oblanceolate or oblong-lanceolate, 3-5 cm. long, 8-15 mm. wide, obtuse, pinnately divided, the segments 10 to 18 pairs, ovate-oblong, obtuse, toothed; cauline leaves similar but sometimes smaller; spikes solitary, 3-5 cm. long, simple, densely 10- to 20-flowered, the lower bracts leaflike, the upper ones reduced to a small pinnately lobed blade, with a dilated petiole; calyx 1-1.5 cm. long, tubular, membranous, usually loosely long-pubescent, the teeth 2-4 mm. long, narrowly deltoid, with a small toothed blade at apex; corolla erect, about 2.5 cm. long, yellowish, rather narrow, the helmet obtuse, brownish on upper half, not toothed, entire, the lower lip much shorter than the helmet, spreading, 3-lobed; capsules about 1.5 cm. long, cuspidate; seeds minutely impressed-punctulate, reticulate.—July-Aug. Alpine regions; Hokkaido.—Kuriles, Sakhalin, and northern regions of the N. Hemisphere.

11. *Pedicularis venusta* Schangin var. *schmidtii* T. Itô. NEMURO-SHIOGAMA. Perennial with stout rhizomes; stems (15-)20-30(-50) cm. long, prominently whitish pubescent, few-leaved, simple; radical leaves pinnately divided, long-petiolate, the cauline leaves alternate, similar to the radical, broadly lanceolate or narrowly ovate-oblong, 7-12 cm. long, 3-4 cm. wide, subacute, short-petiolate, pinnately parted, the segments broadly lanceolate to narrowly ovate, 10 to 15 pairs, pinnately cleft or lobed, white-pubescent beneath, mucronately acute-

toothed; spikes solitary, simple, densely many-flowered, 5-12 cm. long, prominently whitish pubescent, the lower bracts rather leaflike, longer than the flowers, pinnately lobed, the lobes incised, the upper bracts slightly shorter than the calyx, palmately lobed, cuneate at base; calyx 7-8 mm. long, erect, deltoid, toothed; corolla pale yellow, about 2.5 cm. long, the helmet shallowly bilobed, minutely toothed, the lower lip much shorter than the helmet, spreading, 3-lobed; capsules cuspidate, obliquely spreading, 1-1.2 cm. long; seeds reticulate.—July. Rocky slopes near the sea; Hokkaido.—s. Kuriles, Sakhalin, and Ochotsk Sea region.

12. *Pedicularis nipponica* Makino. *P. praecleara* Franch. —ONI-SHIOGAMA. Perennial, prominently white-pubescent on spikes especially while young; stems 30-60 cm. long, rather stout, simple, with few pairs of opposite leaves on lower part; radical and lower cauline leaves ovate to narrowly so, abruptly acute, narrowed toward the base, long-petiolate, pinnately parted or cleft, the segments incised or pinnately lobed, acutely serrulate, the upper leaves gradually smaller, becoming bracteate; spikes rather loose, 5-25 cm. long, the bracts broadly ovate, 1-1.5 cm. long, doubly toothed; calyx 8-12 mm. long, toothed; corolla pale rose, suberect, about 3.5 cm. long, the helmet erect, subobtusely, villous on upper margin, the lower lip ascending, as long as the helmet, shallowly 3-lobed.—Aug.-Oct. Wet places in mountains; Honshu (Hokuriku and n. distr.).

13. *Pedicularis gloriosa* Biss. & Moore. *P. sceptrum-carolinum* forma *japonica* Miq. —HANKAI-SHIOGAMA. Long-pubescent on lower part of stems and leaves, glabrate in upper part; stems 50-80 cm. long, often sparsely branched; radical and lower cauline leaves opposite, ovate or broadly so, 10-30 cm. long, 8-15 cm. wide, acute, long-petiolate, pinnately parted or divided, the segments oblong-ovate, 5 to 8 pairs, acute, pinnately cleft or lobed, incised and mucronate-toothed; spikes few or rarely solitary, 2-5 cm. long, about 10-flowered, glabrous or sparsely long-pubescent, the bracts cordate or cordate-orbicular, short-toothed; calyx 7-8 mm. long, with obscure minute teeth, about 3 mm. long; corolla reddish, about 3 cm. long, obliquely spreading, the helmet obtuse, entire, white-villous on the margin, the lower lip slightly shorter than the helmet, obliquely spreading, shallowly 3-lobed; capsules ovate-orbicular, 12-15 mm. long, abruptly narrowed at apex to a reflexed beak.—Aug.-Oct. Woods in mountains; Honshu (Kantô and e. Tôkaidô Distr.).

Var. *iwatensis* (Ohwi) Ohwi. *P. iwatensis* Ohwi.—IWATE-SHIOGAMA.—Stems angled on lower portion; calyx-lobes oblong with few short teeth; bracts ovate-deltoid, usually long-pubescent on upper margin.—Honshu (n. distr.).

14. *Pedicularis ochiaiana* Makino. *P. gloriosa* var. *ochiaiana* (Makino) Masam.—YAKUSHIMA-SHIOGAMA. Perennial, long-pubescent at base, glabrous in upper part; stems 20-50 cm. long, loosely few-leaved on the lower half; radical leaves long-petiolate, the cauline opposite, broadly deltoid-ovate, 7-15 cm. long, 6-12 cm. wide, acute, petiolate, pinnately divided or parted, the segments 5 to 8 pairs, broadly lanceolate, pinnately cleft or lobed, irregularly toothed, the lower segments often petiolulate; upper leaves abruptly smaller; spikes 1 or few, 3-5 cm. long, glabrous, about 10-flowered, the lower bracts rather leaflike, shorter than the flowers, the upper bracts slightly shorter to slightly longer than the calyx, broadly deltoid-ovate, 3-lobed or pinnately lobed, broadly cuneate at base, with a short, broad dilated petiole; calyx 6-7 mm. long,

with 2 lateral rounded lobes, obsoletely toothed; corolla obliquely spreading, about 3 cm. long, the helmet gently incurved, obtuse, entire, villous on margin, the lower lip spreading from the base, deeply 3-lobed, the lobes subreflexed; cap-

sules oblique, ovate, to 15 mm. long, with a short reflexed beak; seeds about 4 mm. long, reticulate.—Aug.-Sept. Mountains; Kyushu (Yakushima); rare.

Fam. 178. PEDALIACEAE GOMA KA Sesame Family

Annuals or perennials; leaves opposite or the upper alternate, simple, not stipulate; flowers bisexual, zygomorphic; sepals 4 or 5, often connate, sometimes split on one side; corolla often oblique, the limb 5-lobed, the lobes imbricate in bud; fertile stamens 4, rarely 2, alternate with the corolla-lobes, the anthers in pairs, contiguous, longitudinally split; ovary superior or semi-inferior, 1-locular with 2 intruded parietal placentae, or 2- to 4-locular; ovules 1 to many; fruit a capsule or nut, or drupelike; seeds without endosperm.—About 12 genera, with about 60 species in tropical and warmer regions, especially abundant in Africa.

I. TRAPELLA F. W. Oliv. HISHI-MODOKI ZOKU

Aquatic herb with elongate slender stems; leaves opposite, the submersed ones narrowed at base, the floating deltoid-orbicular or reniform-cordate, toothed; flowers solitary in axils, long-pedicellate; calyx-tube adnate to the ovary, with 5 hornlike appendages near the apex, these elongate after anthesis, spreading, antennalike; corolla tubular, ampliate, 5-lobed, the lobes imbricate in bud; stamens inserted on the tube, the upper pair sterile, elongate; ovary semi-inferior, 2-locular, the 1 fertile locule with 2 ovules; stigma dilated, shortly bilobed; fruit indehiscent, narrow, 1-seeded; seeds 4-ridged, narrow.—One species.

1. *Trapella sinensis* F. W. Oliv. *Trapa antennifera* Lév.; *Trapella sinensis* var. *antennifera* (Lév.) Hara; *Trapella antennifera* (Lév.) Glueck; *Trapella sinensis* var. *infundibularis* Glueck.—HISHI-MODOKI. Plant glabrous; stems slender, elongate; submersed leaves lanceolate to broadly so, loosely toothed, the floating 2-3.5 cm. long, 2.5-4 cm. wide, very obtuse or rounded at apex, undulately toothed, cordate at base,

3-nerved, the petioles 1-3 cm. long; flowers pedicellate, 2-2.5 cm. long, 1.5-2 cm. across, pale rose, sometimes cleistogamous; calyx-teeth about 2 mm. long; fruit cylindric, narrowed at base, often winged, 12-20 mm. long, 3-4 mm. across, with 3-5 spreading spines longer than the fruit, these often hooked.—July-Sept. Ponds and shallow lakes in lowlands; Honshu, Kyushu.—Korea and China.

Fam. 179. OROBANCHACEAE HAMA-UTSUBO KA Broom-rape Family

Root parasites without chlorophyll; scapes usually simple, often with scalelike leaves toward the base; flowers bracteate, usually in dense spikes, bisexual, zygomorphic; calyx 4- or 5-toothed or variously lobed; corolla often incurved, the limb oblique or bilabiate, the lobes 5, imbricate in bud, the 2 dorsal (inner) ones innermost in bud; fertile stamens 4, didymous, inserted on lower part of tube, alternate with the lobes, the median or 5th one absent or reduced to a staminode, the anthers in pairs, longitudinally split; ovary superior, 1-locular, the placentation parietal; ovules many; capsules usually enclosed in the calyx, 2-lobed; seeds many, minute, with fleshy endosperm.—About 15 genera, with about 150 species. Cosmopolitan.

- 1A. Flowers on very long bracteolate basal pedicels; calyx spathe-like, split in front nearly to the base, entire; anthers with one well-developed locule. 1. *Aeginetia*
 1B. Flowers sessile or short-pedicellate, in terminal spikes; calyx of separate or variously connate sepals; anthers with 2 well-developed locules.
 2A. Sepals 4 or 5, connate.
 3A. Calyx united, 4- or 5-toothed.
 4A. Calyx cup-shaped, 5-toothed; flowers sessile, without a disc. 2. *Boschniakia*
 4B. Calyx campanulate, 4-toothed; flowers short-pedicellate, with a disc at base of ovary in front. 3. *Lathraea*
 3B. Calyx irregularly 2-fid, the 1- or 2-toothed segments free or connate at base in front. 4. *Orobanche*
 2B. Sepals 2(or 3), free, sometimes much reduced. 5. *Phacellanthus*

I. AEGINETIA L. NAMBAN-GISERU ZOKU

Stems very short, simple, few-scaled, narrow; flowers few, large, without bracteoles, very long-pedicelled; calyx spathe-like, split in front nearly to the base, acute or obtuse, usually entire; corolla-tube broad and elongate, incurved, the limb spreading, slightly bilabiate, the lobes 5, broad, the dorsal (inner) 2 lobes connate at base; stamens not exerted, the anthers with one well-developed locule; placentae 2, free, broad, irregularly lobed; stigma large, peltate; capsules many-seeded; seeds small, impressed-punctulate.—Few species, in s. Asia.

- 1A. Calyx acute, 1.5-3 cm. long, pale rose-purple striate; corolla-lobes entire. 1. *A. indica*
 1B. Calyx obtuse, (2.5-)3-4(-5) cm. long, pale rose-purple; corolla-lobes minutely toothed. 2. *A. sinensis*

1. *Aeginetia indica* L. var. *gracilis* Nakai. *A. indica* sensu auct. Japon., non L.; *A. japonica* Sieb. & Zucc.—NAMBAN-GISERU. Reddish glabrous saprophytic slightly fleshy herb; stems short, branched, scarcely emergent above ground, scales (bracts) few, narrowly deltoid, 5-10 mm. long; flowers horizontal, pale rose-purple, 3-5 cm. long, the pedicels erect,

20-30 cm. long, naked, 1-flowered; calyx spathe-like, 2-3 cm. long, obtusely keeled on the back; corolla tubular, the lobes depressed-rounded, spreading, about 7 mm. long; capsules ovoid-globose, 1-1.5 cm. long.—July-Sept. Grassy places in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus.

Var. *sekimotoana* (Makino) Makino. *A. sekimotoana* Makino.—HIME-NAMBAN-GISERU. Plants 10–20 cm. high; scales narrow, 4–6 mm. long; calyx 15–20 mm. long; corolla 2–3 cm. long.—Mountains; Honshu (Kantō Distr.). The typical phase occurs from India to Malaysia.

2. *Aeginetia sinensis* G. Beck. *A. japonica* sensu auct. Japon., non Sieb. & Zucc.; *A. indica* forma *japonica* Bakhuizen,

excl. syn. Sieb.—Ö-NAMBAN-GISERU. Plant slightly larger than the preceding; stems and pedicels stouter; pedicels 20–40 cm. long; calyx 2.5–4 cm. long, pale rose-purple, obtuse; corolla 4–6 cm. long, the lobes spreading, depressed-rounded, 8–10 mm. long, 1–1.5 cm. wide, obsolete serrulate.—July–Sept. Honshu, Shikoku, Kyushu.—Ryukyus, and China.

2. BOSCHNIAKIA C. A. Mey. ONIKU ZOKU

Stems stout, simple, scaly, tuberouslike, fissured, and naked at base; spikes stout, many-flowered, solitary, simple; flowers sessile, ebracteolate, solitary in axils of bracts; calyx cup-shaped, with 5 unequal teeth; corolla-tube recurved, the limb bilabiate, the upper lip erect, entire or shallowly bilobed, concave, the lower lip with 3 short lobes; stamens subexserted, the anther locules parallel, equal, not spurred or tuberculate; placentae 2, each deeply 2-lobed; stigma dilated, shallowly 2-fid; seeds minute, subglobose, reticulate.—Three or four species, in Asia and N. America.

1. *Boschniakia rossica* (Cham. & Schltdl.) Fedtsch. & Flerov. *Orobanche rossica* Cham. & Schltdl.; *B. glabra* C. A. Mey.—ONIKU. Root parasite on *Alnus maximowiczii*; stems stout, yellow-brown, terete, erect, 15–30 cm. long, densely scaly, especially in lower part; scales rather thick, narrowly deltoid, 7–10 mm. long, erect, obtuse, the upper ones ascending or obliquely spreading, with rather membranous margins, glabrous; spikes about half as long as the whole stem, densely

many-flowered, the bracts deltoid or narrowly so, often pubescent on margin at base; calyx truncate, with 3 teeth in front, undulate on posterior margin; corolla erect, recurved, about 15 mm. long, lip loosely ciliate, the upper rounded, the lower small, 3-lobed.—July–Aug. Alpine areas among bushes; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin, Kuriles, Kamchatka, Korea, e. Siberia, and nw. America.

3. LATHRAEA L. YAMA-UTSUBO ZOKU

Whitish, yellowish, bluish, or sometimes rose-colored root parasites; rhizomes branched, scaly; stems simple, with scalelike leaves; racemes or spikes densely or loosely flowered; flowers short-pedicelled, ebracteolate, with a disc at the base of ovary; calyx campanulate, 4-toothed, the lobes broad, valvate in bud; corolla-tube suberect, the limb bilabiate, the upper lip retuse, sometimes galeate, the lower lip shorter than the upper, truncate or shallowly 3-lobed; stamens shorter than to nearly as long as the upper lip; ovary with 2 bifid placentae; capsules 2-valved; seeds many, small, globose, rugulose.—Few species, in Eurasia.

1. *Lathraea japonica* Miq. *L. nakaharae* Makino—YAMA-UTSUBO. Plants whitish, glabrous or glabrescent, with short branched creeping rhizomes, densely fleshy-scaly; scapes erect, 10–30 cm. long, loosely few-scaled; spikes densely many-flowered, 5–13 cm. long, the bracts membranous, ascending, broadly lanceolate or narrowly ovate, 3–7 mm. long, longer than the pedicel, obtuse; calyx 5–8 mm. long, the teeth deltoid;

corolla tubular, 12–15 mm. long, the upper lip broad, retuse; anthers with a short awn at one end.—Apr.–June. Woods in mountains; Honshu, Shikoku, Kyushu.

Var. *miqueliana* (Fr. & Sav.) Ohwi. *Clandestina japonica* Miq.; *L. miqueliana* Fr. & Sav.—KE-YAMA-UTSUBO. Plant prominently pubescent.

4. OROBANCHE L. HAMA-UTSUBO ZOKU

Various colored parasitic herbs; scapes usually more or less fleshy, scaly, rarely branched; flowers solitary in axils of bracts, sessile or nearly so, bracteolate or ebracteolate, forming a terminal spike; calyx irregularly 2-fid or divided into 2 lateral segments, these 2-lobed or entire, rarely with a well-developed dorsal segment, the lobes membranous, usually acuminate; corolla-tube usually amplate, the limb more or less bilabiate, the upper lip erect, entire or 2-lobed, the lower lip spreading, 3-lobed, sometimes with tubercles or plaits between the lobes; stamens not exserted, the anthers usually mucronate at base; placentae 4; seeds minute, globose.—About 100 species, in the N. Hemisphere, chiefly in the Old World, few in N. America.

- 1A. Corolla pale purple, about 2 cm. long, white-woolly externally. 1. *O. coerulescens*
1B. Corolla pale yellow with purple striations, about 15 mm. long, short glandular-pubescent externally. 2. *O. minor*

1. *Orobanche coerulescens* Steph. ex Willd. *O. nipponica* Makino; *O. japonensis* Makino; *O. akiana* Honda—HAMA-UTSUBO. Plants pale bluish purple, white-pubescent; stems rather stout, 10–30 cm. long inclusive of the spikes, erect, thickened at base; scalelike leaves at base of stem looser, narrower and membranous above, lanceolate or narrowly ovate, 1–1.5 cm. long, loosely white-pubescent; spikes rather densely many flowered, the bracts narrowly deltoid; flowers about 2 cm. long; calyx membranous, about half as long as the corolla; upper lip of corolla broad, retuse, the lower lip spreading, 3-lobed, with undulate margins; capsules narrowly ellipsoidal, about 1 cm. long.—May–July. Parasitic on *Artemisia*, along

rivers and near seashores; Hokkaido, Honshu, Shikoku, Kyushu.—Formosa, Korea, Ryukyus, China, Siberia, and e. Europe.

2. *Orobanche minor* Sutton. YASE-UTSUBO. Stems simple from a thickened base, 10–40 cm. long; leaves scalelike; flowers loosely racemose on upper part of stem, solitary in axils of caudate-lanceolate bracts; calyx deeply bifid, the segments 2-lobed, lobes unequal; corolla bilabiate, pale yellow, purple-striate, about 15 mm. long, the margin of lobes minutely toothed.—Naturalized in Honshu; root parasite on *Trifolium* spp.—Introduced from Europe.

5. PHACELLANTHUS Sieb. & Zucc. KIYOSUMI-UTSUBO ZOKU

Glabrous saprophytes without chlorophyll; stems short, simple; leaves scalelike; flowers solitary in axils of bracts, very short-pedicelled, in short dense spikes; bracteoles absent; calyx of 2 (or 3) separate, sometimes much-reduced sepals; corolla ascending, tubular, slightly amplate, deeply 2-lobed, the upper lip broad, erect, entire, the lower lip short, ascending, 3-lobed, glabrous; stamens usually 4, not exerted, the anther locules parallel, without appendages; ovary 2- to 4-lobed, the placentae 4(-10); stigma thick, densely papillose; capsules ovoid.—A single species, in e. Asia.

1. *Phacellanthus tubiflorus* Sieb. & Zucc. *P. continentalis* Komar.; *Tienmuia triandra* Hu.—KIYOSUMI-UTSUBO. Plant white or pale yellowish, glabrous; stems rather thick, 5-10 cm. long; scales ovate or elliptic, 4-8 mm. long, obtuse or rounded at apex, more or less membranous on margins, erect or suberect, the bracts oblong or narrowly ovate, sometimes spatulate-oblong, 1-1.5(-2) cm. long, membranous or nearly so, fragile; flowers about 10, in a terminal solitary short head-

like spike, white, changing to yellow in age, ascending to erect, very short-pedicellate; sepals usually 2, linear or filiform, 1-2 cm. long, lateral, free, sometimes partly or wholly absent; corolla (2-)2.5-3 cm. long, the tube rather narrow, the upper lip 7-8 mm. long, flabellate-cuneate, sometimes retuse; capsules about 1 cm. long, ellipsoid-ovoid.—Apr.-July. Hokkaido, Honshu, Shikoku, Kyushu.—Korea, China, Manchuria, Ussuri, and Sakhalin.

Fam. 180. GESNERIACEAE IWA-TABAKO KA Gloxinia Family

Herbs sometimes shrubs, rarely trees; leaves radical or opposite, equal or paired and unequal, sometimes one of the pair completely reduced and apparently alternate; flowers bisexual, usually zygomorphic, sometimes nearly actinomorphic, often showy; calyx usually tubular, free or adnate to the ovary, the lobes valvate, rarely imbricate in bud; corolla sometimes more or less bilabiate or nearly regular, the limb usually oblique, the lobes imbricate with the dorsal lobe innermost in bud; stamens 2 or 4, sometimes 5, the anthers usually paired, contiguous or connate, 2-locular, longitudinally split, the disk ringlike or only on one side, sometimes divided; ovary superior or inferior, 1-locular, with 2 parietal or intruded placentae; ovules many; fruit a capsule, rarely a berry; seeds small, many.—About 100 genera, with about 1,500 species, chiefly in the Tropics of both hemispheres.

1A. Fruit a capsule.

2A. Corolla long-tubular, zygomorphic; fertile stamens 2; capsules linear.

3A. Small shrubs with evergreen, ternate leaves; seeds caudate at each end. 1. *Lysionotus*

3B. Herbs with radical leaves (in ours); seeds with a minute obtuse point on each end. 2. *Opithandra*

2B. Corolla rotate, actinomorphic; fertile stamens 5; capsules lanceolate; leaves radical, large. 3. *Conandron*

1B. Fruit berrylike; fertile stamens 4; subshrubs or herbs with silky hairs; flowers small. 4. *Rhynchosyche*

1. LYSIONOTUS D. Don SHISHIN-RAN ZOKU

Shrubs or subshrubs, often epiphytic; leaves coriaceous or membranous, cauline, ternate, evergreen, entire or toothed; cymes terminal and in upper axils, sometimes reduced to a single flower, the bracts small, caducous; calyx 5-parted, the segments narrow, the 2 anterior ones connate; corolla purplish or violet, the tube elongate, straight, amplate, the limb broadly bilabiate, the upper lip 2-lobed, the lower one 3-lobed; fertile stamens 2, anterior, inserted above the middle on the tube, not exerted, the filaments with a tooth at the apex longer than the anthers, the disc annular; style long, the stigmas 2, lamellate, short and broad; placentae connate on the center with the ovules borne on the incurved margins; capsules elongate-linear, 4-valvate; seeds linear, with a capillary appendage at each end.—Few species, in e. Asia and the Himalayas.

1. *Lysionotus pauciflorus* Maxim. SHISHIN-RAN. Small epiphytic glabrous shrub, 5-20 cm. high; stems short, usually simple, 2-3 mm. thick, pale grayish brown; leaves coriaceous, ternate, oblong-lanceolate, 3-6 cm. long, evergreen, 8-15 mm. wide, subobtusely, acute at base, scattered mucronate-toothed, with an impressed midrib above, the lateral nerves obscure, slightly recurved on margin, the petioles 2-3 mm. long; flowers solitary in axils, the pedicels about 1 cm. long,

with a subtending caducous bract; sepals linear-lanceolate, about 3 mm. long; corolla about 3 cm. long, pale rose-colored; capsules pendulous, 4-8 cm. long; seeds minute, fusiform, with a tail nearly as long as the body on each end.—Epiphytic on large trees in mountains; Honshu (Izu, Yamato, Oku Prov. and westw.), Shikoku, Kyushu; rare.—Ryukyus (Amami-oshima).

2. OPITHANDRA B. L. Burtt IWAGIRI-SŌ ZOKU

Acaulescent herb; leaves radical, petiolate, usually toothed; peduncles axillary, scapellike; flowers umbellate, pedicellate; calyx 5-parted; corolla purple-violet, the tube elongate, the limb bilabiate, the upper lip 2-lobed, the lower 3-lobed; fertile stamens 2, extrorse, not exerted, the filaments straight; anther-locules parallel.—One species, in Japan.

1. *Opithandra primuloides* (Miq.) B. L. Burtt. *Chirita primuloides* (Miq.) Ohwi; *Boea primuloides* Miq.; *Didymocarpus primuloides* (Miq.) Maxim.; *Oreocharis primuloides* (Miq.) Benth. & Hook. f. ex C. B. Clarke.—IWAGIRI-SŌ. Densely pubescent perennial; rhizomes short; leaves rather fleshy, radical, ovate, elliptic to orbicular, 4-10 cm. long, 3-7

cm. wide, obtuse, cordate, grayish green, coarsely depressed-deltoid and short mucronate-toothed, long-petiolate; inflorescence umbellate, about 10-flowered, the peduncles elongate, 10-20 cm. long, basal, in axils of the radical leaves, leafless, the bracts broadly linear, 2-4 mm. long, the pedicels 2-3 cm. long, slender; flowers horizontal; calyx 5-parted, 4-5 mm. long, the

segments linear-lanceolate; corolla about 2 cm. long, pale purple-violet, with deeper-colored striations, soft-pubescent externally, the upper lip rather short, the midlobe of the lower lip erect, slightly spreading above, the tube narrow, slightly recurved at base; upper 2 stamens fertile; capsules linear, 2.5-4.5

cm. long, glabrous, the style very short, the stigmas 2, persistent; seeds minute, fusiform, smooth.—May-June. Rocks in mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

3. CONANDRON Sieb. & Zucc. IWA-TABAKO ZOKU

Rhizomes short, creeping, densely dark brown long-hairy; leaves radical, few, large, toothed, rugose while young; scapes with few small bracts; cymes terminal; flowers pedicelled, purple, actinomorphic; calyx 5-toothed, the segments narrow, imbricate in bud; corolla rotate, deeply 5-lobed, the lobes narrowly deltoid, subacute, imbricate in bud; stamens 5, all fertile, inserted at base of corolla; filaments short, the anthers erect, oblong, connate into a tube around the style, the anther-locules parallel; disc absent; placentae 2-lobed, prominently intruded and raised within the ovary; ovary imperfectly 2-locular; ovules marginal on the placentae; style linear, the stigma capitate; capsules lanceolate, rather short, 2-valved; seeds minute, fusiform, smooth.—Two species, in Japan and Indochina.

1. Conandron ramondiioides Sieb. & Zucc. IWA-TABAKO. Soft green perennial; scapes slender, 10-30 cm. long, 10 to 40-flowered, the bracts broadly linear; leaves pendulous, solitary, elliptic-ovate, 10-30 cm. long, 5-15 cm. wide, abruptly short-acuminate, lustrous, irregularly mucronate-toothed; wing-petiolate; calyx-segments 4-6 mm. long; corolla about 1.5 cm. across, purple, rarely white, the lobes narrowly deltoid, obtuse, slightly contracted at base, the pedicels 8-15 mm. long, much longer than the bracts; anthers

shorter than the narrow apical appendages; capsules broadly lanceolate, 1.5-2 times as long as the calyx, acute.—Aug. Wet rocky cliffs in mountains; Honshu, Shikoku, Kyushu; rather common.—Ryukyus and Formosa.—Forma *pilosum* (Makino) Ohwi. *C. ramondiioides* var. *pilosum* Makino —KE-IWA-TABAKO. Rather short-pilose on scapes, cymes, calyx and sometimes also on nerves of leaves beneath.—Honshu (centr. distr.).

4. RHYNCHOTECHUM Bl. YAMA-BIWA-SŌ ZOKU

Long silky-pubescent perennials or subshrubs; stems erect, low, scarcely branched; leaves alternate or opposite; cymes simple or slightly branched, axillary, pedunculate; flowers small, white; calyx 5-toothed, the segments linear; corolla subrotate or rotate-campanulate, deeply 5-lobed, the lobes equal, broad; stamens 4, inserted at base of corolla, short; staminodes small or absent; disc annular; stigma entire, rather thick; ovules evenly distributed over the placentae except on the inner face at the center; fruit berrylike, small, ovoid to subglobose; seeds minute, ovoid.—About 12 species, in India, Philippines, Formosa, Ryukus, Japan, and China.

1. Rhyrchotechum discolor (Maxim.) Burt var. *austrokiushiuense* (Ohwi) Ohwi. *Istanthera discolor* sensu auct. Japon., non Maxim.; *I. discolor* var. *austrokiushiuensis* Ohwi.—TAMAZAKI-YAMA-BIWA-SŌ. Stems 30-40 cm. long, nearly always simple, soft, terete, gray, densely yellowish brown long-woolly; leaves herbaceous, alternate, broadly oblanceolate or obovate-oblong, 10-25 cm. long, 3-8 cm. wide, acute, acuminate at base, mucronate-toothed, rather fleshy, pale green above, paler beneath, with yellowish brown long-woolly hairs beneath while young, these persistent on the

nerves, densely punctulate beneath, with 8-15 pairs of parallel ascending arcuate lateral nerves, the petioles 2-7 cm. long; peduncles 1.5-3 cm. long; cymes solitary, 20- to 30-flowered, dense and in headlike glomerules, the bracts lanceolate; flowers about 7 mm. across, nearly sessile; calyx 6-8 mm. long, the segments broadly linear; corolla-lobes rounded; filaments longer than the anthers; fruit oblong, 6-7 mm. long.—Aug.-Oct. Woods in low mountains; Kyushu (Osumi, Yakushima and Tanegashima).

Fam. 181. LENTIBULARIACEAE TANUKI-MO KA Bladderwort Family

Herbs, often aquatic or in wet places, insectivorous; leaves alternate or basal and rosulate, often reduced to scales or bladders; flowers bisexual, zygomorphic; calyx 2- to 5-parted, the segments not overlapping or slightly imbricate in bud; corolla spurred at base, the limb bilabiate, the lobes 5, imbricate in bud; stamens 2, inserted at the base of corolla, staminodes 2, the anthers 1- or 2-locular, longitudinally split; disc absent; ovary superior, 1-locular; stigma often sessile; ovules many, on basal placentae; fruit a capsule, 4- or 2-valved or irregularly dehiscent; seeds many, without endosperm.—Four or five genera, with more than 250 species, of wide distribution.

- 1A. Calyx 2-lipped; corolla personate, the upper lip erect; anthers parallel, nearly 2-locular; leaves finely dissected, with bladders; aquatic or growing in wet muddy places. 1. *Utricularia*
 1B. Calyx 5-lobed; corolla merely bilabiate with an open throat, the limb spreading; anthers transverse, 1-locular; leaves rosulate, entire; wet rocky cliffs or in bogs. 2. *Pinguicula*

1. UTRICULARIA L. TANUKI-MO ZOKU

Soft delicate herbs, aquatic or in wet muddy places; stems usually elongate, leafy; leaves finely dissected into capillary segments, floating or immersed, with small bladders at intervals, or aerial and simple, spatulate, small; scapes simple or slightly

branched, erect, rarely elongate and scandent, often scaly, 1- to many-flowered; flowers on a terminal raceme, the bracts small, the pedicels solitary, often 2-bracteolate; calyx 2-toothed or -parted, often slightly accrescent after anthesis; corolla often incurved, spurred, the upper lip erect, entire or 2-lobed, the lower lip usually larger, spreading, 2- to 3-lobed or again lobulate; filaments often thickened, incurved; stigma-lobes lamellate, sometimes reduced to a single lobe; capsules irregularly dehiscent or 2-valved; seeds ovoid, compressed above or lenticular, reticulate, striate, or rugulose, sometimes spinulose.—About 250 species, in wet muddy soil, or in ponds and lakes. Cosmopolitan.

- 1A. Plants terrestrial, of wet muddy places; aerial leaves linear or spatulate, simple.
- 2A. Bracts and scalelike leaves on scapes oblanceolate, dorsifixed; calyx minutely mammillate externally; spur incurved; plant becoming blackish when dry. 1. *U. racemosa*
- 2B. Bracts and scalelike leaves on scapes lanceolate or ovate-elliptic, basifixed; calyx smooth; spur outwardly curved; plants not becoming blackish when dry.
- 3A. Scapes 1–3 cm. long; flowers 2–3 mm. across, nearly sessile; capsules about 1 mm. long, nearly as long as the calyx. 2. *U. nipponica*
- 3B. Scapes 5–20 cm. long; flowers 4–5 mm. across, pedicelled; capsules 3–4 mm. long, shorter than the calyx.
- 4A. Flowers pale purple, rarely white; leaves spatulate. 3. *U. yakusimensis*
- 4B. Flowers yellow; leaves linear. 4. *U. bifida*
- 1B. Plants aquatic; leaves all submerged, finely dissected; aerial leaves absent.
- 5A. Leaves of two kinds, the floating ones trichotomously or dichotomously dissected, 5–10(–15) mm. long, the rachis not elongate, the immersed leaves less dissected, bladder-bearing; pedicels not reflexed in fruit; plants growing in mud.
- 6A. Floating leaves capillary, with 3–5 segments, nearly bladeless in the immersed ones, each leaf uniformly with 1–3 bladders. 5. *U. exoleta*
- 6B. Floating leaves dissected into 5–10, flat, linear lobes without bladders, the immersed ones with reduced blades and with well-developed bladders.
- 7A. Floating leaves with rather narrow entire segments. 6. *U. multispinosa*
- 7B. Floating leaves with rather broad segments loosely and minutely toothed on upper half. 7. *U. intermedia*
- 5B. Leaves all alike, 2–5 cm. long, with an elongate rachis, pinnately much-dissected into narrow segments; plants free floating.
- 8A. Leaves always with well-developed bladders; scapes without cleistogamous flowers at base.
- 9A. Pedicels 6–10(–12) mm. long, deflexed and thickened above after anthesis; scapes without scalelike leaves; spur and upper lip of corolla minutely puberulent. 8. *U. pilosa*
- 9B. Pedicels 1.5–2.5 cm. long, arcuate after anthesis, not thickened; scapes usually with few scalelike leaves; corolla glabrous.
- 10A. Floating stems thicker than the scape, with slender leafless respiratory branches; flowers about 15 mm. across, sterile. 9. *U. japonica*
- 10B. Floating stems more slender than the scape, without respiratory branches; flowers about 10 mm. across, fertile; capsules globose.
- 11A. Spur longer than the lower lip, about 8 mm. long; teeth and spinules of leaf-segments often obscure. 10. *U. siakujimensis*
- 11B. Spur shorter than the lower lip; teeth and spinules of leaf-segments distinct. 11. *U. tenuicaulis*
- 8B. Leaves usually bladderless, occasionally with small bladders; scapes with solitary single cleistogamic flowers at base and on adjacent nodes of floating stems. 12. *U. dimorphantha*

1. *Utricularia racemosa* Wall. ex Walp. *U. caerulea* Wight, non L.; *Calpidisca takenakae* Nakai.—HOZAKI-NOMIMIKAKIGUSA. Delicate herb of wet muddy places, dimorphic; subterranean stems capillary, with 1 to few remote aerial leaves, these simple, minute, narrowly oblanceolate to narrowly obovate-spatulate; scapes slender, 10–30 cm. long; scales few, loose, appressed to the scape, oblanceolate, 2–3.5 mm. long, long-acuminate at both ends, dorsifixed; flowers 4–10, rather loose, the bracts simulating the scales, the bracteoles linear, 1–1.5 mm. long, as long as the pedicels; calyx broadly ellipsoidal, about 2.5 mm. long, densely mammillate externally; corolla purple, about 4 mm. across, the spur about twice as long as the lower lip, incurved; capsules globose, 2.5–3 mm. across, enclosed in and as long as the persistent calyx; style about 0.5 mm. long; seeds wingless.—June–Sept. Wet muddy places in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea, China, Formosa, and India.

2. *Utricularia nipponica* Makino. HIME-MIMIKAKIGUSA. Subterranean stems capillary, loosely bladder-bearing; aerial leaves distant, linear, obtuse; scapes 1–3 cm. long, very delicate, erect, 1- to 3-flowered; scalelike leaves 2 or 3, loose, narrowly deltoid, basifixed, acuminate, about 0.5 mm. long, the bracts basifixed, rather membranous, small, the pedicels as

long as to slightly longer than the bracts; calyx smooth, about 1 mm. long, enclosing the capsule in fruit, the lobes not accrescent after anthesis, rounded and nearly all alike; corolla purplish, 2–3 mm. across, the spur curved forward, longer than the lower lip, obtuse; capsules broadly ellipsoidal, about 1 mm. long, as long as the calyx; seeds minute, smooth, ovoid, wingless.—Aug.–Oct. Wet muddy places in lowlands; Honshu (Tōkaidō and Ise Prov.); rare.

3. *Utricularia yakusimensis* Masam. *U. yakusimensis* f. *albida* (Makino) Hara; *U. affinis* sensu auct. Japon., non Wight.—MURASAKI-MIMIKAKIGUSA. Glabrous slender herb; subterranean stems capillary, with bladders; scapes erect, very slender, 7–15 cm. long; aerial leaves small, oblanceolate or narrowly so, very obtuse; scalelike leaves few, ovate to narrowly so, membranous, obtuse or acute, 0.5–0.8 mm. long, basifixed; flowers 1–3(–4), loose, the bracts similar to the scalelike leaves, slightly longer, 1–1.5 mm. long, acute, the bracteoles 2, linear, shorter than the bracts, the pedicels erect or suberect, 2–3 mm. long in anthesis, 3–6 mm. long in fruit, winged; calyx-segments membranous, broadly ovate, obtuse, 2–3 mm. long at anthesis, accrescent and 4–5 mm. long in fruit, erect, entire, enclosing the capsule; corolla 3.5–4 mm. across, pale purple, rarely white, the spur 2–3 mm. long, directed downward, obtuse; capsules broadly ellipsoidal or globose, about 3

mm. long, much shorter than the calyx; seeds with raised oblique striations.—Aug.–Sept. Wet muddy places in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu.

4. *Utricularia bifida* L. MIMIKAKIGUSA. Glabrous very slender herb; subterranean stems capillary, with bladders; aerial leaves small, broadly linear to oblanceolate; scapes very slender, erect, 7–15 cm. long; scalelike leaves membranous, few, loose, ovate or narrowly so, obtuse or acute, about 1 mm. long, basifixed; flowers 2–7(–10), loose, the bracts ovate, acute, the bracteoles 2, linear, about half as long as the bracts, the pedicels 2–3 mm. long, arcuate-spread, 3–7 mm. long in fruit, winged; calyx-segments membranous, broadly ovate, nearly as long as the pedicels, obtuse; corolla 3.5–4 mm. long, yellow, the spur directed downward, about 3 mm. long, acute; capsules globose, about 3.5 mm. long; seeds with raised oblique striations.—Aug.–Oct. Wet muddy places in lowlands and hills; Honshu, Shikoku, Kyushu.—Formosa, China, India, Malaysia, and Australia.

5. *Utricularia exoleta* R. Br. *U. naguræ* Makino—MIKAWA-TANUKI-MO, ITO-TANUKI-MO. Glabrous, very delicate sedentary aquatic herb, in shallow water; stems cinnate; leaves 5–10 mm. long, 1- to 3-times dichotomously forked, the segments capillary, very narrow, minutely toothed; bladders absent or 1–3 on a leaf, very small; scapes 5–8(–12) cm. long; scalelike leaves 1–3, distant, membranous, ovate, basifixed, 0.5–1 mm. long; flowers 1–3, the bracts broadly ovate, retuse, the pedicels slender, slightly curved, 3–6 mm. long in fruit, terete; calyx membranous, about 2 mm. long, the segments orbicular or broadly obovate, rounded at apex, scarcely accrescent after anthesis, enclosing the lower half of capsule; corolla yellow, 5–6 mm. across, the spur obtuse, curved forward, as long as to slightly longer than the lower lip; capsules depressed-globose, about 3 mm. across; seeds elliptic, about 1.2 mm. across inclusive of the wing, lenticular, the winged-margin undulate-toothed.—Aug.–Nov. Shallow water in paddy fields and ponds in lowlands; Honshu (Tōkaidō and Kinki Distr.), Kyushu; rare.—Formosa, India, Africa, and Australia.

6. *Utricularia multispinosa* (Miki) Miki. *U. minor* var. *multispinosa* Miki; *U. minor* sensu auct. Japon., non L.—HIME-TANUKI-MO. Delicate sedentary aquatic herb in shallow water; leaves rather sparse, 3- to 4-times dichotomously forked, 8–13 mm. long, with a very short rachis, the segments linear-filiform, slightly flattened, entire, with a minute apical spine in the summer leaves, with 2 or 3 spines in the autumn leaves; bladders few, loose; branches below ground short leaved, with several bladders; scapes about 10 cm. long, slender; scalelike leaves few, scattered, ovate-deltoid, small; flowers loose, 4–8, the bracts similar to the scalelike leaves, the pedicels 4–5 mm. long, obliquely spreading; calyx-segments erect, broadly ovate, 2–2.5 mm. long, rounded at apex, about twice as long as the capsule; corolla pale yellow, about 8 mm. across, the spur short-conical; capsules globose; seeds winged, orbicular.—Shallow ponds; Hokkaido, Honshu.—Kuriles and Korea (?).

7. *Utricularia intermedia* Heyne. (?) *U. ochroleuca* sensu auct. Japon., non Hartm.—KO-TANUKI-MO. Rather delicate sedentary aquatic herb; leaves rather dense, 4–8 mm. long, 2- to 3-times ternately or dichotomously dissected into linear, flat, acute segments; summer leaves with few spinulose minute teeth on margin and at tip of segments; leaves

absent in subterranean branches, only bladders present; scapes 5–15 cm. long, 2- to 5-flowered; scalelike leaves 1 or 2, small, the bracts ovate, the pedicels 7–10 mm. long, ascending; calyx-segments about 3 mm. long; corolla 12–15 mm. across, pale yellow, the spur cylindric, parallel with the lower lip and as long as the latter.—June–Sept. Shallow ponds especially in high moors; Hokkaido, Honshu.—Kuriles, Korea, and widely spread in the temperate and northern regions of the N. Hemisphere.

8. *Utricularia pilosa* (Makino) Makino. *U. vulgaris* var. *pilosa* Makino—NO-TANUKI-MO. Floating aquatic herb; stems rather thick, elongate; leaves 3–4 cm. long, much dissected into fine capillary loosely toothed or smooth segments, spine-tipped; bladders prominent, 2–2.5 mm. long; scapes thicker than the aquatic stems, 8–20 cm. long, without scalelike leaves; flowers 4–10, loosely arranged, the bracts thinly membranous, ovate, about 2 mm. long, acute, the pedicels deflexed after anthesis, thickened in upper part, 6–10(–12) mm. long; calyx-segments ovate-elliptic, 2.5–3 mm. long, rounded at apex, accrescent after anthesis, to 4–5 mm. long in fruit, spreading; corolla 6–7 mm. across, pale yellow, the spur obliquely descended, obtuse, slightly shorter than the lower lip, loosely puberulent; capsules globose, 4–5 mm. across; style persistent, as long as the capsule, broadened at base; seeds obtusely 5- or 6-angled.—Aug.–Oct. Shallow ponds and ditches in lowlands; Honshu, Shikoku.—s. Korea.

9. *Utricularia japonica* Makino. *U. vulgaris* sensu auct. Japon., non L.—TANUKI-MO. Rather stout floating aquatic herb; respiratory branches filiform, nearly leafless; leaves rather densely arranged, 3–6 cm. long, pinnately divided, the segments loosely spine-toothed; bladders few to rather numerous per leaf; scapes 20–30 cm. long, the scalelike leaves few, thinly membranous, broadly ovate, 2–3 mm. long, obtuse; flowers 4–7, sterile, the bracts simulating the scalelike leaves, the pedicels 1.5–2.5 cm. long, obliquely spreading, arcuate after anthesis; calyx segments 2, equal, elliptic, 3–4 mm. long, rounded at apex; corolla pale yellow, about 15 mm. across, the spur obliquely descending, about 6 mm. long, obtuse, shorter than the lower lip.—July–Sept. Ponds and ditches in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Sakhalin, s. Kuriles, and Manchuria.

10. *Utricularia siakuiensis* Nakajima. SHAKUJIT-TANUKI-MO. Resembles the preceding; plant free-floating; respiratory branches absent; leaves pinnately dissected, the segments slender, obscurely toothed or nearly entire, spines very short; bladders few; scapes 10–20 cm. long, rather thick, the scalelike leaves few, membranous, narrowly ovate, about 2 mm. long, obtuse; flowers 5–10, the bracts broadly ovate, 3–3.5 mm. long, obtuse, clasping at base, the pedicels ascending, about 2 cm. long, slender; upper calyx-segment slightly larger than the lower, ovate, about 3 mm. long, obtuse to rounded at apex; corolla about 10 mm. across, yellow, the spur about 8 mm. long, longer than and descending under the lower lip, straight, obtuse; capsules globose.—Aug.–Sept. Ponds; Honshu (near Tokyo).

11. *Utricularia tenuicaulis* Miki. ITO-TANUKI-MO. Resembles the preceding; plants free-floating, slender, respiratory branches absent; leaves pinnately dissected into finely spinulose-toothed segments; bladders few; scapes 10–15 cm. long, with few ovate, membranous scalelike leaves; flowers 3–7, the bracts broadly ovate, membranous, rounded at apex, about 3 mm.

long, the pedicels 1.5–2 cm. long, ascending, deflexed in fruit, sometimes slightly thickened above; calyx-segments membranous, broadly ovate, 3–4 mm. long, obtuse, the upper ones slightly longer or nearly as long; corolla about 1 cm. across, pale yellow, the spur shorter than the lower lip; capsules globose, about 4 mm. across, with a beaklike short style at tip; seeds angled, truncate at the ends.—Aug.–Sept. Ponds; Honshu, Shikoku, Kyushu.

12. *Utricularia dimorphantha* Makino. FUSA-TANUKI-MO. Floating stems rather slender; respiratory branches absent; leaves pinnately dissected, the segments very slender, 3–4 cm. long, the teeth and spines not prominent; bladders absent or rarely 1 or 2, small; scapes 7–15 cm. long, rather slender,

with a solitary cleistogamic flower at base and in axils of floating stems near the base of scape; pedicels of cleistogamic flowers short, 3–5 mm. long; scalelike leaves on scapes absent; flowers 3–10, the bracts membranous, elliptic to broadly ovate, 2–2.5 mm. long, subacute, the pedicels 4–5 mm. long, ascending in fruit, spreading or deflexed; calyx about 2 mm. long, the segments equal, orbicular, sometimes retuse, scarcely accrescent in fruit; corolla pale yellow, about 1 cm. across, the spur about 3 mm. long, shorter than the lower lip, straight, ovate-oblong, curved forward; capsules globose, about 3 mm. across, nearly as long as the calyx, with a very short style at apex; seeds angled, with convex faces.—July–Sept. Ponds; Honshu (centr. and Kinki Distr.).

2. PINGUICULA L. MUSHI-TORI-SUMIRE ZOKU

Perennial acaulescent herbs of wet rocky cliffs and sphagnum moors; leaves rosulate, radical, entire, somewhat fleshy with glandular-tipped hairs and dots above, more or less involute on margin; scapes 1- or 2-flowered, leafless, ebracteate; flowers terminal, purple or violet, sometimes yellowish; calyx bilabiate, the upper lip 3-lobed, the lower lip retuse or 2-parted; corolla bilabiate, the lobes spreading, entire or retuse, the upper lip shorter than lower, the throat open; filaments slightly curved, the anthers transverse, the locules confluent; upper stigma lobe larger, often fringed, the lower lobe small or absent; capsules 2- or 4-valved; seeds oblong, rugose.—About 30 species, in the temperate and cooler regions of the N. Hemisphere, sub-Antarctic, and high mountains of S. America.

- 1A. Scapes 1-flowered; flowers 12–18 mm. long; capsules ovoid-conical, 4–6 mm. long. 1. *P. vulgaris* var. *macroceras*
 1B. Scapes often branched at base, 1- or 2-(3)-flowered; flowers 5–7 mm. long; capsules depressed-obovate, 2.5–3.5 mm. long. 2. *P. ramosa*

1. *Pinguicula vulgaris* L. var. *macroceras* (Pall. ex Link) Herd. *P. macroceras* Pall. ex Link—MUSHI-TORI-SUMIRE. Rather fleshy, pale green, fragile perennial; leaves few, spreading, rosulate, short-petiolate, narrowly ovate to ovate-oblong, 3–5 cm. long, 1–2 cm. wide, obtuse, more or less incurved on margin, glandular-hairy on upper side, becoming soft-pubescent toward base; scapes 1-flowered, 5–15 cm. long, loosely short glandular-puberulent in upper part; calyx 5-parted, 2–4 mm. long, the segments oblong, obtuse; corolla violet, the upper lip about half as long as the lower, subrounded at apex, the spur linear, 7–10 mm. long, obtuse, abruptly thickened toward the base; capsules ovoid-conical; seeds pale brown, obscurely reticulate, obovate-fusiform, about 0.8 mm. long.—July–Aug. Wet rocky cliffs, rarely on wet mountain slopes; Hokkaido, Honshu (centr. and n. distr.),

Shikoku.—Kuriles and widely distributed in mountain areas adjacent to the northern Pacific area. The typical phase is widely distributed in mountainous areas of the N. Hemisphere.

2. *Pinguicula ramosa* Miyoshi. *P. villosa* var. *ramosa* (Miyoshi) Tamura—KOSHIN-SO. Delicate perennial; leaves few, spreading, rosulate, pale green, ovate or elliptic, 7–15 mm. long, 5–8 mm. wide, obtuse or rounded at apex, incurved on margin, short-petiolate; scapes slender, 3–8 cm. long, often branched at base or near the middle, glandular-puberulent; flowers pale violet, 5–7 mm. long; calyx 2 mm. long, 5-fid, the lobes subequal, obtuse; upper lip of corolla short, the spur linear, 5–7 mm. long, obtuse, abruptly broadened toward base; capsules depressed-obovoid, 2.5–3.5 mm. long, often somewhat retuse.—June–July. Wet shaded rocky cliffs in mountains; Honshu (n. Kantō Distr.); very rare.

Fam. 182. ACANTHACEAE KITSUNE-NO-MAGO KA Acanthus Family

Herbs or shrubs, rarely scandent; leaves opposite, often with internal cystoliths; stipules absent; flowers bisexual, zygomorphic, often with a prominent bract; calyx-segments 4 or 5, imbricate or valvate, rarely reduced to an annulus; corolla bilabiate, often with a suppressed upper lip, the lobes imbricate or contorted in bud; stamens 4, didymous or 2, inserted on the corolla-tube, alternate with the lobes, the filaments free or more or less connate in pairs, the anthers 1- or 2-locular, longitudinally split; ovary superior, sessile, 2-locular, the placentae axile; style solitary, simple; ovules 2 or more in each locule; fruit a capsule, explosively dehiscent; endosperm usually absent.—About 240 genera, with about 2,200 species, mostly in the Tropics, few in temperate regions.

- 1A. Corolla-lobes nearly equal, scarcely bilabiate.
 2A. Corolla-lobes contorted in bud, the tube usually longer than the lobes. 1. *Strobilanthes*
 2B. Corolla-lobes imbricate in bud, the tube often not exceeding the lobes in length. 2. *Codonanctus*
 1B. Corolla distinctly bilabiate.
 3A. Seeds more than 4 in the capsule; corolla-lobes contorted in bud. 3. *Hygrophila*
 3B. Seeds 4 or fewer in the capsule; corolla-lobes imbricate in bud.
 4A. Bracts large and leaflike, slightly connate at base, enclosing 1 to several flowers; anther-locules 2, both alike, parallel, not mucronate. 4. *Discliptera*
 4B. Bracts small, the flowers spicate (in ours); anther-locules 2, not alike, one of them not mucronate and above the other, the one below mucronate or spurred at base. 5. *Justicia*

1. STROBILANTHES Bl. ISE-HANABI ZOKU

Erect or decumbent herbs or shrubs; leaves opposite, entire or toothed, sometimes the pairs unequal; flowers blue-purple or white, relatively large, solitary in axils of bracts, sessile or short-pedicelled, forming spikes or compound panicles; bracts sometimes leaflike, often small, the bracteoles narrow, small or absent; calyx 5-parted or toothed, the segments linear, equal or unequal; corolla-tube ampliate, the limb spreading, the lobes 5, contorted in bud, the upper 2 sometimes more or less connate at base; stamens usually 4, didymous, the upper pair sometimes reduced to staminodes, the anther-locules alike and parallel, obtuse; stigma with one of the lobes reduced; ovules 2(-3) in each locule; capsules 4-seeded, the retinaculum acute.—About 200 species, chiefly in India, also in Malaysia to China and Japan.

- 1A. Shrub; leaves rather thick, lustrous and minutely reticulate above, lanceolate or broadly so, 8-15 mm. wide; corolla 1.5-2 cm. long. 1. *S. japonica*
 1B. Herbs, sometimes woody at base; leaves membranous, broadly ovate or obovate-oblong, 3-6 cm. wide; corolla 2-5.5 cm. long.
 2A. Leaves obovate or ovate-oblong, 8-20 cm. long, 3-6 cm. wide, gradually narrowed at base; young parts brown appressed-puberulent; corolla 4.5-5.5 cm. long. 2. *S. cusia*
 2B. Leaves broadly ovate or broadly deltoid-ovate, 4-10 cm. long, 3-6 cm. wide, abruptly narrowed at base to a winged petiole; young parts long white-pubescent; corolla 2-3 cm. long. 3. *S. oligantha*

1. *Strobilanthes japonica* (Thunb.) Miq. *Ruellia japonica* Thunb.; *Rostellularia japonica* (Thunb.) Kanitz—Ise-Hanabi. Shrub; stems tufted, branched, terete, 30-60 cm. long, the nodes puberulent when young, thickened with age; leaves rather thick, lanceolate to broadly so, 3-5 cm. long, 8-15 mm. wide, acute with an obtuse tip, acuminate at base, deep green, lustrous, glabrous above with transversely aligned linear cystoliths, paler and short appressed-pilose on nerves beneath, loosely and undulate short-toothed or nearly entire, the petioles 2-5 mm. long; flowers sessile, more than 10, in a sessile short spike, the bracts small, leaflike, longer than the calyx; calyx about 6 mm. long; corolla pale purple, 1.5-2 cm. long; style loosely pubescent.—Sept.-Oct. Chinese plant long cultivated in our gardens, sometimes naturalized in warmer areas.—Ryukyus, Formosa, China, Indochina, and India.

2. *Strobilanthes cusia* (Nees) O. Kuntze. *Goldfussia cusia* Nees; *S. flaccidifolius* Nees—Ryūkyū-ai. Perennial herb dark green when dried; stems 30-70 cm. long, rather thick, slightly branched, obtusely angled, brown-puberulent while young; leaves obovate or ovate-oblong, 8-20 cm. long, inclusive of the 1-2 cm long petiole, 3-6 cm. wide, acute with an obtuse tip, gradually narrowed at the base, mucronately or

undulately toothed, glabrous and obsoletely lineolate with the cystoliths above, loosely brownish puberulent beneath on nerves while young, the lateral nerves 5 or 6 pairs; flowers sessile in a loose terminal spike, the bracts leaflike, rather small, caducous; calyx 1-1.4 cm. long, one segment often larger than the others; corolla 4.5-5.5 cm. long, pale purple.—Kyushu (s. distr.).—Ryukyus, Formosa, China, Indochina, and India.

3. *Strobilanthes oligantha* Miq. *Suzumushibana*, *Suzumushi-sō*. Perennial herb with short rhizomes; stems 30-60 cm. long, obtusely angled, loosely branched, with long white pubescence on upper part; leaves broadly ovate or broadly deltoid-ovate, 4-10 cm. long, 3-6 cm. wide, acute with an obtuse tip, abruptly narrowed at base to the winged petiole, obtusely toothed, loosely long-pubescent and obsoletely lineolate with short linear cystoliths above, long-pubescent beneath especially on nerves, the petioles 1-5 cm. long; flowers few, sessile, in a dense subcapitate short spike, the bracts small, leaflike, longer than the calyx, long-pubescent; calyx 6-10 mm. long, long-pubescent; corolla pale purple, 2-3 cm. long, often loosely pubescent externally; seeds broadly elliptic, about 3 mm. long, brown-puberulent.—Aug.-Oct. Woods in mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

2. CODONACANTHUS Nees ARIMORI-SŌ ZOKU

Small erect glabrous herbs; leaves entire; flowers rather small, white or pale purple, short-pedicelled, loosely arranged on elongate, one-sided racemes, the bracts and bracteoles minute, subtending the pedicels; calyx nearly 5-parted, the lobes short, narrow, nearly equal; corolla broadly campanulate, short-tubular, 5-lobed, the lobes flat, imbricate in bud, the upper 2 lobes slightly narrower, innermost in bud, the lower median lobe outermost; fertile stamens 2, the anthers 2-locular, broadly divergent, versatile; stigma capitate; ovules 2 in each locule; capsules oblong; seeds 4 or fewer, orbicular, smooth, lustrous.—Two species, India to Japan and se. Asia.

1. *Codonacanthus pauciflorus* (Nees) Nees. *Ayastasia pauciflora* Nees; *C. acuminatus* Nees—Arimori-sō. Small perennial herb; stems erect, 30-60 cm. long, slightly branched, often decumbent at base, with a line of short hairs; leaves oblong, 4-8 cm. long, 1-3 cm. wide, acute at both ends, entire or slightly undulate, deep green above, glabrous except loosely puberulent on nerves beneath while young, short-petiolate; racemes terminal, simple or slightly branched at base, peduncled, 8-15 cm. long, loosely about 10-flowered, puberulent, the

bracts and bracteoles linear-lanceolate, 1-2 mm. long, the pedicels suberect, short, slender, 2 or 3 times as long as the bract; calyx nearly as long as the pedicels, the segments broadly linear, erect; corolla white, 8-10 mm. long and as wide, the lobes ovate, rounded at apex, longer than the tube; capsules oblanceolate, narrowed to a stipelike base, 12-15 mm. long.—Oct. Woods in lowlands; Kyushu (Yakushima and Tanegashima).—Ryukyus, Formosa, China, and India.

3. HYGROPHILA R. Br. OGI-NO-TSUME ZOKU

Erect or decumbent herbs sometimes with axillary spines; leaves entire; flowers fasciculate in axils, nearly sessile, rarely solitary, the bracteoles linear; calyx-segments 5, narrow, slightly unequal, connate at base; corolla-tube slightly ampliate, the limb bilabiate, the lobes contorted in bud, the upper lip erect, 2-toothed or shallowly 2-lobed, concave, the lower lip nearly

spreading, strongly 3-lobed, with 2 plaits inside at base; stamens 4, fertile, didymous, the anther-locules parallel, equal, obtuse; disc obscure; stigma-lobes linear, the upper lobes much reduced; ovules 4 to many, rarely 2 in each locule; capsules many, more than 4-seeded; seeds obliquely ovate or orbicular.—About 30 species, widely distributed in the Tropics.

1. *Hygophila lancea* (Thunb.) Miq. *Justicia lancea* Thunb.—OGI-NO-TSUME. Stems short-creeping then erect, 30–60 cm long, branched, obtusely angled, loosely puberulent in upper part; leaves lanceolate or linear-lanceolate, 5–10 cm. long, 5–15 mm. wide, subobtusely, narrowed below to a short petiole, entire or slightly undulate, often loosely pilose on nerves beneath; flowers fasciculate in leaf-axils, sessile, the

bracts and bracteoles shorter than the calyx; calyx 6–8 mm. long, the segments broadly linear, connate on lower half, erect, usually loosely ciliate; corolla pale purple, 1–1.2 cm. long; capsules 1–1.2 cm. long, oblong-lanceolate, acute, about 15-seeded.—Sept.–Oct. Honshu (Tōtōmi and westw.), Shikoku, Kyushu.—Ryukyus and Formosa.

4. DICLIPTERA Juss. HAGURO-SŌ ZOKU

Herbs; leaves entire; flowers reddish or blue-purple, sessile, the bracts paired, leaflike, ovate or lanceolate, slightly connate at base, subtending 1 to many flowers; calyx scarious, 5-parted; corolla-tube slender, the limb bilabiate, the upper lip innermost in bud, entire or retuse, erect at anthesis, concave, the lower lip often broader than the upper one, spreading, rather flat, entire or shortly 3-lobed; stamens 2, inserted on the throat, the anthers 2-locular, alike, the locules parallel or of different lengths, usually not mucronate; ovules 2 in each locule; capsules rather flat, ovate or orbicular; seeds 4 or fewer, smooth or minutely tubercled.—More than 60 species, in the Tropics and subtropics.

1. *Dicliptera japonica* (Thunb.) Makino var. *subrotunda* Matsuda. *D. japonica* var. *elliptica* Matsuda—HAGURO-SŌ. Thinly pilose or glabrous perennial; stems 20–50 cm. long, often branched; leaves membranous, narrowly ovate-oblong, rarely broadly lanceolate, 5–10 cm. long, 1–3 cm. wide, acuminate with an obtuse tip, the bracts broadly ovate or elliptic, 1–2.5 cm. long, obtuse, usually rounded at base, free, ciliate on margin, the petioles 5–16 mm. long; calyx 2.5–3 mm. long, the segments narrow, acuminate; corolla pale rose-colored, 2.5–3 cm. long, bilabiate nearly to the middle, the lips narrowly oblong, equal, minutely 3-lobed; style

2–2.5 cm. long; capsules enclosed by a pair of leaflike persistent bracts, oblanceolate, 1–1.2 cm. long, loosely short-pilose; seeds elliptic, about 2.5 mm. long, minutely tuberculate.—July–Oct. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *japonica*. *Dianthera japonica* Thunb.; *Justicia japonica* (Thunb.) Vahl; *Dicliptera japonica* (Thunb.) Makino; *D. japonica* var. *ciliata* (Matsuda) Ohwi; *D. japonica* var. *elliptica* forma *ciliata* Matsuda—FUCHIGI-HAGURO-SŌ. Bracts long-ciliate.—Kyushu (s. distr.).—China and Korea.

5. JUSTICIA L. KITSUNE-NO-MAGO ZOKU

Herbs, rarely shrubs; leaves entire; flowers rather small, white or rose-colored, solitary in axils of bracts, forming a terminal spike (in ours), cyme, or panicle, the bracts and bracteoles various in shape; calyx 5-parted, the segments equal, narrow; corolla-limb bilabiate, the upper lip innermost in bud, the lower lip shallowly 3-lobed, spreading; fertile stamens 2, inserted on the throat, the anthers 2-locular, not alike, one of them not mucronate and above the other, short-spurred; ovules 2 in each locule; seeds 4, or fewer, orbicular, smooth or tubercled.—About 250 species, mostly in the Tropics.

1. *Justicia procumbens* L. var. *leucantha* Honda. *J. japonica* Thunb.; *J. procumbens* sensu auct. Japon., non L.—KITSUNE-NO-MAGO. Short-pubescent annual; stems 10–40 cm. long, from a much-branched decumbent base; leaves membranous, ovate, 2–4 cm. long, 1–2 cm. wide, subentire or loosely undulate-toothed, the petioles 5–15 mm. long; spikes 2–5 cm. long, densely flowered, the bracts, bracteoles, and calyx-segments nearly alike, narrowly lanceolate, 5–7 mm. long, pubescent on an elevated midrib, ciliate on a scarious margin;

corolla slightly longer than the calyx, 7–8 mm. long, slightly puberulent, white or pale rose-colored, the lower lip longer than the upper, ovate, trilobulate, with darker reddish dots; one locule of the anther with an obtuse spur nearly as long as the locule; capsules nearly as long as the calyx; seeds minutely rugose.—Aug.–Oct. Cultivated fields and waste grounds in lowlands; Honshu, Shikoku, Kyushu; very common.—Korea, Manchuria, China, Ryukyus, and Formosa. The typical phase occurs in e. Asia, India, Malaysia, and Australia.

Fam. 183. MYOPORACEAE HAMA-JINCHŌ KA Myoporium Family

Shrubs or rarely trees sometimes with scalelike or pinnate hairs; leaves alternate, rarely opposite, simple; stipules absent; flowers axillary, solitary or fascicled, bisexual, zygomorphic; calyx 5-parted, imbricate or not overlapping in bud; corolla gamopetalous, usually 5-lobed, the lobes imbricate in bud; stamens 4 or as many as the corolla-lobes and alternate with them, inserted on the corolla-tube, the anthers longitudinally dehiscent; ovary superior, usually 2-locular, 2(–8) ovules in each locule, rarely many locular; style simple; ovules pendulous; fruit a drupe; seeds with a straight or slightly curved embryo, nearly destitute of endosperm.—About 5 genera, with about 110 species, mainly in Australia and the Pacific Islands, few in e. Asia.

1. MYOPORUM Banks and Soland. HAMA-JINCHŌ ZOKU

Shrubs with glabrous or viscid parts; leaves usually alternate, simple; flowers small, white or purple; calyx 5-parted, not accrescent in fruit; corolla subcampanulate or infundibuliform, the lobes 5(–6), equal or the lower slightly larger; ovary 2- to 10-locular, the locules nearly equal, around the central axis, 1-ovuled in each locule, or rarely 2-locular, with 2 ovules in each

locule; drupe ovoid or subglobose, indehiscent, 2- to 10-seeded; seeds in one horizontal series around the axis, rarely longitudinally arranged, pendulous from the inner angle of the locule.—About 25 species, in Australia, the Pacific Islands, Malaysia, and se. Asia.

1. *Myoporum bontiooides* (Sieb. & Zucc.) A. Gray. *Pentacoelium bontiooides* Sieb. & Zucc.; *Polycoelium bontiooides* (Sieb. & Zucc.) A. DC.; *Polycoelium chinense* A. DC.—HAMA-JINCHŌ. Evergreen shrub, sparingly furfuraceous while very young, the branches rather stout; leaves rather coriaceous, narrowly oblong or broadly oblanceolate, 5–10 cm. long, 1.5–3 cm. wide, entire, acute with an obtuse tip, acuminate at base, with a raised midrib beneath, lateral nerves obscure, the petioles about 1 cm. long; few in leaf-axils, purple,

one-sided, 2.5–3 cm. long, about 2 cm. across, the pedicels 1–1.5 cm. long and thickened in upper part; calyx 5-parted nearly to the base, the segments narrowly deltoid-ovate, 4–6 mm. long, acuminate; fruit about 1 cm. across, with a long curved style while young, globose when mature; seeds few in one series around the axis.—Oct.–Nov. Wet places near the sea; Kyushu (western coast and Tanegashima).—Ryukyus, Formosa, and China.

Fam. 184. PHRYMACEAE HAE-DOKU-SŌ KA Phryma Family

Erect perennial; leaves opposite, toothed; spikes elongate, narrow, terminal or on upper part of the branches; flowers small, solitary in the axils of bracts, erect in bud, spreading at anthesis, deflexed in fruit; calyx tubular, 5-toothed, the 3 dorsal teeth becoming spinose and hooked in fruit, the 2 ventral teeth unchanged; corolla tubular, the limb bilabiate, the upper lip erect, shallowly 2-lobed, the lower one longer, spreading, 3-lobed; stamens 4, didymous; ovary oblique, 1-locular, 1-ovuled; style terminal, shallowly 2-fid; ovules erect, orthotropous, basal; fruit enclosed in the persistent calyx, the pericarp membranous, the testa adnate to the pericarp; endosperm absent.—One genus, with a single species.

1. PHRYMA L. HAE-DOKU-SŌ ZOKU

Characters of the family.

1. *Phryma leptostachya* L. var. *asiatica* Hara. *P. leptostachya* sensu auct. Japon., non L.; *P. humilis* Koidz.; *P. nana* Koidz.; *P. leptostachya* var. *humilis* (Koidz.) Hara; *P. leptostachya* var. *nana* (Koidz.) Hara—HAE-DOKU-SŌ. Roots rather thick; stems obtusely angled, erect, retorsely puberulent, often branched in upper part; leaves thinly membranous, ovate or broadly deltoid-ovate, 7–10 cm. long, 4–7 cm. wide, short-acuminate or abruptly acute with an obtuse tip, broadly cuneate to truncate at base, more or less pilose on both sides especially on nerves, toothed, petiolate; spikes 10–20 cm. long, loosely flowered, peduncled, often branched at base, puberu-

lent on the axis; calyx 5-ribbed, lanceolate, about 3 mm. long in anthesis, 5–6 mm. long in fruit, nearly glabrous, the hooked spines about 1.5 mm. long; corolla pale rose or white, about 5 mm. long.—June–Aug. Woods in hills and low elevations in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and slightly variable.—Forma *oblongifolia* (Koidz.) Ohwi. *P. leptostachya* var. *oblongifolia* (Koidz.) Honda; *P. oblongifolia* Koidz.—NAGABA-HAE-DOKU-SŌ. Leaves ovate-oblong, mostly on the upper part of stems.—Often occurs with var. *asiatica*.—Korea, China, Himalayas, and e. Siberia. The typical phase occurs in N. America.

Fam. 185. PLANTAGINACEAE ŌBA-KO KA Plantain Family

Herbs with radical, alternate or opposite simple leaves often dilated on the petiole; flowers bisexual, actinomorphic, in spikes; calyx herbaceous, 4-parted or -divided, sometimes the outer 2 more or less connate; corolla gamopetalous, scarious, 3- or 4-lobed, the lobes imbricate in bud; stamens 1 to 4, inserted on the tube and alternate with the lobes or inserted at the base of the ovary; anthers 2-locular, longitudinally split; ovary superior, 1- to 4-locular; style simple; ovules 1 or more, basal or attached to the axis; fruit a circumscissile capsule or bony nut; seeds peltately attached, the embryo straight, rarely curved, in the center of the fleshy endosperm.—Three genera, with about 300 species. Cosmopolitan.

1. PLANTAGO L. ŌBA-KO ZOKU

Annuals or perennials with radical leaves; flowers bisexual, rarely polygamous or unisexual, small; stamens long-exserted, usually on much-elongate capillary filaments; ovary 2-locular or falsely 4-locular, each locule with 1 to many ovules; capsules membranous, usually circumscissile; seeds peltately attached on the ventral face, angled or planoconvex, sometimes grooved on the ventral face.—About 200 species, of wide distribution.

1A. Flowers bisexual; perennials; corolla-lobes spreading, not closing the top of the capsule.

2A. Seeds flat on the ventral face; spikes densely to loosely flowered, elongate; leaves oblong to ovate-orbicular, spreading to ascending.

3A. Seeds 4–12; spikes densely more than 20-flowered.

4A. Seeds glabrous or rarely soft-pubescent; leaves usually ovate, long-petiolate.

5A. Seeds 4–6(–10), 1.5–1.8 mm. long, black-brown; valves conic-subglobose or conic-ovoid. 1. *P. asiatica*

5B. Seeds 8–12, 0.8–1.2 mm. long, dark brown; valves subglobose. 2. *P. major* var. *japonica*

4B. Seeds usually long-pubescent; leaves oblong, short-petiolate. 3. *P. camtschatica*

3B. Seed solitary; spikes loosely 10- to 20-flowered. 4. *P. hakusanensis*

2B. Seeds 2, grooved on the ventral face, very convex on back; spikes very densely many-flowered, narrowly ovate to short-cylindric; leaves lanceolate, erect. 5. *P. lanceolata*

1B. Flowers dioecious or polygamous; annual or biennial; corolla-lobes erect, enclosing upper part of the capsule. 6. *P. virginica*

1. *Plantago asiatica* L. *P. major* var. *asiatica* (L.) Decne.; *P. asiatica* var. *densiuscula* Pilger; *P. asiatica* var. *lobulata* Pilger; *P. yezoensis* Pilger; *P. asiatica* var. *yezoensis* (Pilger) Hara; *P. mohrii* Miq.; *P. major* forma *contorta* Makino; *P. contorta* (Makino) Ikeno—*ÔBA-KO*. Perennial; leaves thinly herbaceous, radical, rosulate, ovate or broadly so, rarely elliptic, 5–15 cm. long, 3–8 cm. wide, obtuse, with few parallel nerves, abruptly long-petiolate, glabrous or nearly so, the petioles dilated; scapes few to many, 10–50 cm. long, erect; spikes solitary, densely many-flowered, usually glabrous, the bracts narrowly ovate, shorter than the calyx, obtusely keeled on back, slightly dilated at base; flowers sessile; calyx-segments obovate-elliptic, about 2 mm. long, rounded at apex, white-scarious, green, with a stout rib on back; stamens long-exserted, the anthers cordate-obicular, mucronate; capsules ovoid-oblong, nearly twice as long as the calyx; seeds 4–6, rarely 8–10, black-brown, elliptic, planoconvex.—Apr.–Oct. Woods and waste grounds in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—s. Korea, Kyurik, Sakhalin, Ryukyus, Formosa, China, e. Siberia, and Malaysia.

Var. *yakusimensis* (Masam.) Ohwi. *P. yakusimensis* Masam.—*YAKUSHIMA-ÔBA-KO*. Plant smaller; leaves soft-pubescent.—Honshu (Izu Is.), Kyushu (Yakushima).

2. *Plantago major* L. var. *japonica* (Fr. & Sav.) Miyabe. *P. japonica* Fr. & Sav.—*TÔ-ÔBA-KO*. Usually glabrous perennial; leaves rather thick-herbaceous, ovate or ovate-elliptic, 10–30 cm. long, 5–15 cm. wide, few-nerved, subobtusely, long-petiolate; scapes erect, few, 50–100 cm. long, rather stout; spikes erect, usually glabrous, brownish when dry, the bracts narrowly ovate, obtuse, obtusely keeled on back, rarely slightly gibbous; calyx-segments elliptic, about 2 mm. long, rounded at apex, more or less white-scarious on margin; capsules ellipsoidal, about twice as long as the calyx; seeds about 10, small, dark brown, plano-convex, 0.8–1.2 mm. long.—July–Aug. Wet places in lowlands near the sea; Honshu, Shikoku, Kyushu.—Forma *yezomaritima* (Koidz.) Ohwi. *P. yezomaritima* Koidz.; *P. japonica* var. *yezomaritima* (Koidz.) Hara—*TERIHA-ÔBA-KO*. Leaves thicker.—Wet places near the sea; Hokkaido.

Plantago togashii Miyabe & Tatew. *ISO-ÔBA-KO*. A smaller plant; leaves to 10 cm. long; scapes 10–20 cm. long.—Resembles forma *yezomaritima* of the preceding species and possibly not distinct from it. Reported from Hokkaido (Okushiri Isl.).

3. *Plantago camtschatica* Cham. *P. villifera* Franch.; *P. depressa* subsp. *camtschatica* (Link) Pilger—*EZO-ÔBA-KO*. White-pubescent, rarely glabrescent perennial with thick rhizomes; leaves oblong to narrowly so, 5–10 cm. long, 2.5–4 cm. wide, acute, short-petiolate and slightly dilated at base, few-nerved; scapes erect, 15–30 cm. long; spike solitary, 3–10 cm. long, densely many-flowered, the bracts glabrous, elliptic or ovate, shorter than the calyx; calyx glabrous, ellipsoidal, 2–2.5 mm. long, the segments very obtuse, white-scarious on margin, with a broad green midrib; capsules narrowly ovoid or ovoid-oblong, 1.5–2 times as long as the calyx; seeds 4, elliptic or

ovate, dark brown, 1.2–1.5 mm. long.—May–Aug. Along sandy seashores; Hokkaido, Honshu, Kyushu.—Forma *glabra* (Makino & Honda) Ohwi. *P. camtschatica* var. *glabra* Makino & Honda—*KE-NASHI-EZO-ÔBA-KO*. Plant glabrescent.—Korea, Sakhalin, Kuriles, and Ochotsk Sea region.

Plantago depressa Willd. *MUJINA-ÔBA-KO*. Closely allied to the preceding species, but with smaller flowers and anthers. Sparingly naturalized in our area.—n. China, Korea, Manchuria, and e. Siberia.

4. *Plantago hakusanensis* Koidz. *P. mohrii* sensu auct. Japon., non Miq.—*HAKUSAN-ÔBA-KO*. Rhizomes short and stout; leaves slightly fleshy, soft, elliptic to oblong, 3–5(–8) cm. long, 2–3(–4) cm. wide, few-nerved, glabrous or loosely pubescent, narrowed to a rather short petiolelike base; scapes 7–12 cm. long, slender, glabrous, often ascending from base; spikes simple, loosely 10- to 20-flowered, the bracts broadly ovate, broadly thin-scarious on margin, as long as to shorter than the calyx; calyx-segments elliptic, 2–2.5 mm. long, with a broad green back, rounded at apex; anthers cordate-obicular, rather large; capsules 1.5–2 times as long as the calyx, ovoid-ellipsoid; seeds solitary, oblong, black-brown, about 2 mm. long, slightly depressed on the ventral side.—July–Aug. Wet alluvial slopes on Japan Sea side; Honshu (centr. and n. distr.).

5. *Plantago lanceolata* L. *HERA-ÔBA-KO*. More or less white-pubescent perennial with thick rhizomes; leaves erect, lanceolate, 10–20 cm. long, 1.5–3 cm. wide, acute or gradually so, few-nerved, gradually narrowed to a long petiole; scapes erect, 40–60 cm. long; inflorescence densely many-flowered, narrowly ovoid in anthesis, slightly elongate and short-cylindrical in fruit, 3–5 cm. long, the bracts nearly orbicular, mucronate, as long as to slightly longer than the calyx, thinly scarious, translucent, with a narrow midrib; calyx-segments thinly scarious, translucent, about 2.5 mm. long, rounded at apex, with a narrow green loosely pilose midrib; style very long; anthers ovoid, 2–2.5 mm. long, short-mucronate, cordate at base; capsules ovoid-globose; seeds 2, black-brown, oblong, 1.7–2 mm. long, with a broad groove on the ventral face.—June–Aug. Widely naturalized; introduced from Europe.

6. *Plantago virginica* L. *TACHI-ÔBA-KO*, *TSUBOMI-ÔBA-KO*. Annual or biennial with long soft whitish pubescence; leaves narrowly obovate to broadly oblanceolate, 4–5 cm. long, 1.5–3 cm. wide, few-nerved, gray-green, gradually narrowed to a rather long petiole; scapes 10–30 cm. long, rather slender, striate; spikes 10–20 cm. long, densely many-flowered, pale yellow to brownish white, the bracts narrowly ovate, shorter than the calyx, pubescent on the prominently raised midrib; calyx-segments oblong, about 2 mm. long, pubescent especially on the midrib; corolla-lobes narrowly ovate, as long as the calyx-segments, erect and covering the upper part of capsule, 1-nerved; capsules scarcely longer than the calyx-segments, broadly ovoid; seeds 2, pale red-brown, about 1.8 mm. long, with a groove on the ventral face.—May–June. Recently naturalized in our area; introduced from N. America.

Fam. 186. RUBIACEAE

AKANE KA Madder Family

Herbs, shrubs, or trees; leaves opposite or rarely verticillate, entire or toothed, simple; stipules free or connate, sometimes leaf-like, interpetiolar or intrapetiolar; flowers usually bisexual, actinomorphic, rarely slightly zygomorphic, solitary or variously ar-

ranged; calyx-tube adnate to the ovary; corolla usually tubular, the lobes 4-10, contorted or imbricate in bud, sometimes valvate; stamens as many as and alternate with the corolla-lobes; ovary 2- to several-locular, the placenta axile or apparently basal, or the ovary rarely 1-locular with parietal placenta; ovules 1 to many in each locule; fruit a capsule, berry, or drupe; seeds usually with endosperm.—About 350 genera, with about 4,500 species, nearly cosmopolitan, especially abundant in the Tropics.

1A. Ovary many-ovuled.

* 2A. Herbs or subshrubs.

3A. Inflorescence a helicoid cyme (cinicinnus); capsules laterally flattened, obcordate. 1. *Ophiorrhiza*

3B. Inflorescence in cymes or panicles; capsules not flattened, usually globose or hemispherical. 2. *Hedyotis*

2B. Woody plants.

4A. Flowers in heads; fruit dry.

5A. Bracteoles between the flowers scalelike; unarmed erect trees or large shrubs. 3. *Adina*

5B. Bracteoles between the flowers absent or minute; scandent shrubs or small trees with hooked spines at the nodes. ... 4. *Uncaria*

4B. Flowers solitary or in corymbose cymes; fruit a berry, often fleshy.

6A. Inflorescence terminal.

7A. Corolla-lobes valvate in bud; one calyx-segment of some outer flowers becoming enlarged and petaloid. 5. *Mussaenda*

7B. Corolla-lobes contorted in bud; calyx-segments equal, not petaloid. 6. *Tarenna*

6B. Inflorescence or flowers axillary.

8A. Ovary 2-locular; flowers usually in cymes or fascicles. 7. *Randia*

8B. Ovary 1-locular; flowers solitary in leaf-axils. 8. *Gardenia*

1B. Ovary with 1 ovule in each locule.

9A. Woody plants.

10A. Flowers umbellate. 9. *Morinda*

10B. Flowers solitary or fascicled, sometimes in cymes.

11A. Fruit fleshy.

12A. Flowers in cymes. 10. *Psychotria*

12B. Flowers solitary or fascicled.

13A. Flowers 5-merous; spines absent. 11. *Lasianthus*

13B. Flowers 4-merous; spines present. 12. *Damnacanthus*

11B. Fruit dry, capsular. 13. *Leptodermis*

9B. Herbaceous plants.

14A. Stipules small, between the leaves.

15A. Scandent herbs with much-elongate stems. 14. *Paederia*

15B. Erect or decumbent herbs.

16A. Stems ascending to erect; leaves not evergreen; fruit dry. 15. *Pseudopyxis*

16B. Stems long-creeping on the ground; leaves evergreen; fruit a berry. 16. *Mitchella*

14B. Stipules relatively large, leaflike, with the aspect of verticillate leaves.

17A. Corolla rotate.

18A. Fruit fleshy; flowers usually 5-merous. 17. *Rubia*

18B. Fruit dry; flowers usually 3- or 4-merous. 18. *Galium*

17B. Corolla infundibuliform, sometimes nearly campanulate. 19. *Asperula*

1. OPHIORRHIZA L. SATSUMA-INAMORI ZOKU

Erect or decumbent perennial herbs or subshrubs; leaves opposite, often unlike; stipules interpetiolar, solitary or 2; flowers in helicoid cymes, short-pedicelled, usually small, white, reddish, or greenish, often bracteolate; calyx-tube short, the lobes 5, small, persistent; corolla infundibuliform or tubular, the lobes 5, valvate in bud; stamens 5, inserted at base of the throat, the disc annular; ovary 2-locular; style long, the stigma 2-fid; ovules many; capsules rather flat, obcordate; seeds many, small, angled, the endosperm fleshy.—About 100 species, abundant in tropical Asia and the Pacific Islands, few in Australia and Japan.

1A. Inflorescence with linear bracts; flowers 1.5-2 cm. long, pedicelled; corolla-lobes white-pubescent inside. 1. *O. japonica*

1B. Inflorescence without bracts; flowers about 5 mm. long, nearly sessile; corolla-lobes densely yellow-puberulous inside. 2. *O. pumila*

1. *Ophiorrhiza japonica* Bl. SATSUMA-INAMORI, KIDACHI-INAMORI-SŌ.

Long-creeping perennial herb with brownish short crisped hairs; stems slender, erect, 10-20 cm. long, simple; leaves narrowly ovate to narrowly oblong-ovate, 3-5 cm. long, 1.5-2 cm. wide, often reddish when dried, acute or subacuminate, acute at base, nearly glabrous above, pilose on the nerves beneath, the lateral nerves 7 or 8 pairs, the petioles 1-3 cm. long; flowers few to more than 10, white, in a rather dense cyme, the peduncles 2-5 cm. long, the bracts linear, 3-7 mm. long, puberulent; corolla tubular; fruit depressed-obtriangular, flattened, about 4 mm. long, about 1 cm. across at the apex; seeds minute, elliptic, punctulate.—Nov.-Apr. Woods

in low mountains; Honshu (Awa and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

Var. *tashiroi* (Maxim.) Ohwi. *O. tashiroi* Maxim.—NAGABA-INAMORI-SŌ. Leaves narrowly lanceolate, 5-12 cm. long, 1-2.5 cm. wide.—Kyushu (Yakushima).

2. *Ophiorrhiza pumila* Champ. *O. inflata* Maxim.; *O. pumila* var. *inflata* (Maxim.) Masam.—CHABO-INAMORI, YAEYAMA-INAMORI-SŌ. Stems slightly branched and decumbent at base, slender, 10-20 cm. long, with short yellowish puberulence especially toward the top; leaves broadly oblanceolate to narrowly oblong or rarely narrowly ovate, acute, puberulent on nerves beneath, the petioles 5-20 mm. long; cymes

terminal, densely yellow-puberulent, the peduncles to 10 cm. long or sometimes absent; flowers about 10, subsessile, the bracts and bracteoles absent; calyx-teeth minute; corolla about 5 mm. long; fruit flat, depressed, obtriangular, about 3 mm.

long, 6-8 mm. wide; seeds minute, punctulate, obtusely angled.—Kyushu (Yakushima); rather rare.—Ryukyus, Formosa, and China.

2. HEDYOTIS L. FUTABA-MUGURA ZOKU

Herbs or shrubs, rarely scandent; leaves opposite or rarely verticillate, linear to ovate-orbicular; stipules often adnate to the petiole and forming a short sheath; flowers usually white, small, in cymes or panicles; calyx-tube short, the lobes 4, short, persistent; corolla rotate, infundibuliform, or hypocrateriform, sometimes campanulate, the lobes valvate in bud; ovary 2-locular; style slender, the stigma shortly 2-lobed or entire; ovules many; fruit a capsule; seeds small, angled, globose, or planoconvex.—More than 200 species, chiefly in the tropics and the warmer regions, abundant in s. Asia.

1A. Leaves linear to broadly so.

2A. Stipules short-toothed; leaves herbaceous; calyx-tube depressed-globose, with 4 obtuse shallow sinuses, the teeth separate in fruit, obliquely recurved. 1. *H. diffusa*

2B. Stipules spinulose-toothed; leaves mostly coriaceous; calyx-tube ovoid-globose, nearly sessile, the teeth contiguous at base, erect. 2. *H. tenelliflora*

1B. Leaves oblanceolate, narrowly oblong to elliptic, or broadly ovate.

3A. Flowers (1-3), pedicelled, terminal and in upper axils; leaves rather fleshy, oblanceolate to oblong. 3. *H. biflora* var. *parvifolia*

3B. Flowers more than 3, fasciated in leaf-axils, very short-pedicelled; leaves herbaceous or membranous, narrowly oblong to broadly ovate.

4A. Plant slightly white-pubescent or nearly glabrous, black when dry; lateral nerves of leaves 4(-5) pairs. 4. *H. lindleyana*

4B. Plant prominently pubescent with yellowish long hairs, yellow-green when dried; lateral nerves of leaves 3 pairs.

5. *H. chrysotricha*

1. *Hedyotis diffusa* Willd. *H. diffusa* var. *longipes* Nakai; *Oldenlandia diffusa* (Willd.) Roxb.; *O. angustifolia* var. *pedicellata* Miq.—FUTABA-MUGURA. Annual, glabrous except the slightly scabrous leaf margins; stems branched and ascending from the base, 10-20 cm. long; leaves herbaceous, linear, 1-3.5 cm. long, 1.5-3 mm. wide, 1-nerved, with a minute awn at apex, slightly narrowed to a nearly sessile base; flowers axillary, white, about 2 mm. across, sessile or on very short pedicels to 3 mm. long; calyx-teeth acuminate, spreading, about 1.5 mm. long; corolla 4-lobed, the lobes as long as the tube; calyx-tube globose in fruit, about 5 mm. across; seeds minute, many, angled.—Sept.-Oct. Waste grounds, cultivated fields, and grassy slopes in lowlands; Honshu, Shikoku, Kyushu.—Korea, Ryukyus, Formosa, China, and tropical Asia.

2. *Hedyotis tenelliflora* Bl. *H. angustifolia* Cham. & Schtdl.; *Oldenlandia tenelliflora* (Bl.) O. Kuntze.—KE-NIOGUSA. Perennial, rather firm, glabrous, slightly scabrous on leaf-margins; stems tufted, erect, slender, 10-30 cm. long, sparsely branched, 4-angled; leaves broadly linear, 2-3 cm. long, 2-3 mm. wide, short-awned at apex, obtuse and subsessile at base, 1-nerved, the margins recurved; stipules short, the linear lobes 2 or 3, 2-5 mm. long; flowers axillary, nearly sessile; calyx-teeth erect, acuminate, 2-2.5 mm. long; corolla white, about 2 mm. long; capsules ovoid-globose, about 3 mm. long, adnate to the calyx.—July-Sept. Lowlands; Kyushu (Yakushima)—Ryukyus, Formosa, s. China, Malaysia, and India.

3. *Hedyotis biflora* (L.) Lam. var. *parvifolia* Hook. & Arn. *Oldenlandia crassifolia* DC.—SONARE-MUGURA. Rather fleshy glabrous perennial; stems tufted, branched, decumbent or ascending at base, 5-20 cm. long; leaves oblong, obovate, or broadly spatulate-oblanceolate, 1-2.5 cm. long, 7-12 mm. wide, rounded or very obtuse, narrowed to a petiole-like base, 1-nerved, slightly recurved on margin, lustrous above; stipules small, 2-toothed; flowers on upper part of branches, in 1-3's, the pedicels 3-10 mm. long; calyx-teeth short, broadly ovate-deltoid, erect, 1-1.5 mm. long; corolla

white, 1.5-2 mm. long; calyx-tube in fruit depressed, obovoid-globose, 4-5 mm. across, subtruncate; seeds minute, rather many, ovoid.—Aug.-Nov. Rocks near seacoast; Honshu (Awa and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, Philippines, and India.

4. *Hedyotis lindleyana* Hook. var. *hirsuta* (L. f.) Hara. *Oldenlandia hirsuta* L. f.; *H. hirsuta* (L. f.) Spreng., non Lam.; *O. japonica* Miq.; *H. japonica* (Miq.) Masam.—HASHIKAGUSA. Annual, more or less whitish pubescent; stems decumbent, elongate, branched; leaves herbaceous, ovate, 2-4 cm. long, 1-2 cm. wide, acute, rounded to broadly cuneate at base, with 4(-5) pairs of ascending arcuate lateral nerves, the petioles 5-15 mm. long; stipules semirounded, short, with 2-4 filiform lobes; flowers few in leaf-axils, sessile or short-pedicelled; calyx-teeth ovate, about 2 mm. long, obtuse, spreading, recurved in fruit; corolla white, infundibuliform, with a narrow tube, 3-4 mm. long; calyx-tube depressed-globose in fruit, about 4 mm. across; seeds small, many, ovoid, minutely impressed-punctulate.—Aug.-Oct. Woods and grassy places along streams in hills and low mountains; Honshu, Shikoku, Kyushu.—China and Malaysia.

Var. *glabra* (Honda) Hara. *Oldenlandia hirsuta* var. *glabra* Honda; *O. glabra* (Honda) Honda, non O. Kuntze; *O. hondae* Hara.—HASHIKAGUSA. Plant larger, glabrate or slightly pubescent; leaves to 4.5 cm. long.—Aug.-Oct. Woods in mountains (n. Kantō and n. distr. to Echigo Prov.).

5. *Hedyotis chrysotricha* (Palib.) Merr. *Anotis chrysotricha* Palib.; *Oldenlandia kiusiana* Makino; *O. chrysotricha* (Palib.) Chun.—KOBAN-MUGURA. Plant prominently yellowish long soft pubescent; stems creeping; leaves oblong or ovate, sometimes elliptic, 1-2 cm. long, 7-12 mm. wide, acute, sometimes minutely mucronate, rounded at base, with 3 pairs of lateral nerves arising from the lower part, the petioles 1-3 mm. long; stipules with 1 or 2 filiform lobes; flowers few in axils, the pedicels 3-6 mm. long; calyx-lobes broadly lanceolate, acuminate, 3-3.5 mm. long; corolla infundibuliform, 5-6 mm. long, 4-fid, the lobes minutely papillose inside.—June-Oct. Kyushu (w. distr.).—China.

3. ADINA Salisb. TANI-WATARI-NO-KI ZOKU

Trees or shrubs; leaves opposite, petiolate; stipules deciduous; flower-heads solitary or in peduncled panicles or racemes, bracteate or ebracteate, the receptacles or shortened axis hairy; flowers many, small, with scalcklike bracteoles at base; calyx connate, the tube angled, the lobes 5, sometimes deciduous; corolla tubular, elongate, the lobes 5, valvate in bud; stamens 5, inserted on the corolla-throat, the disc cup-shaped; ovary 2-locular; style elongate, the stigma clavate or capitate; ovules many; capsules septicidal, 2-valved, the valves inflexed, opening internally; seeds oblong, winged on each side.—Several species, in the Tropics of Asia and America.

1A. Leaves evergreen, broadly oblanceolate, acute at base, the petioles 4–10 mm. long; heads solitary, axillary, slenderly pedunculate.

1. *A. pilulifera*

1B. Leaves deciduous, ovate, rounded to shallowly cordate at base, the petioles 3–5 cm. long; heads few in a terminal raceme, on thick and rather short peduncles. 2. *A. racemosa*

1. *Adina pilulifera* (Lam.) Franch. *Nauclea orientalis* L., pro parte; *Cephalanthus pilulifera* Lam.; *A. globiflora* Salisb.; *A. globiflora* var. *macrophylla* Nakai; *N. nipponica* Masam.—TANI-WATARI-NO-KI. Large, slender, much-branched evergreen shrub or small tree, puberulent on young branchlets and inflorescence; leaves somewhat coriaceous, broadly oblanceolate or narrowly oblong, 5–10 cm. long, 2–3.5 cm. wide, acuminate with an obtuse tip, acute at base, with 7–9 pairs of slender lateral nerves, the petioles 4–10 mm. long; stipules 4, free, lanceolate, 3–6 mm. long, acuminate, caducous; peduncles 4–6 cm. long, slender, the heads about 12 mm. across; corolla pale yellow, tubular, about 5 mm. long, glabrous outside; capsules narrowly cuneate, about 2.5 mm. long, with broadly linear persistent calyx-lobes at apex.—Aug.–Oct. Kyushu (s. distr. and Amakusa Isl.).—China and Indochina.

2. *Adina racemosa* (Sieb. & Zucc.) Miq. *Nauclea racemosa* Sieb. & Zucc.—HETSUKA-NIGAKI, HA-NIGAKI. Deciduous tree with rather stout glabrous branches; leaves rather coriaceous, ovate or oblong-ovate, 8–12 cm. long, 4–7 cm. wide, abruptly short-acuminate, rounded or shallowly cordate at base, with about 10 pairs of prominent lateral nerves beneath, lustrous and glabrous above, short-pubescent on nerves beneath while young, long-petiolate; stipules connate; inflorescence a several-headed raceme, the heads about 15 mm. across, the peduncles 1.5–2 times as long as the head; corolla about 7 mm. long, tubular, pale yellow, puberulent externally; fruit cuneate at base, about 3 mm. long, with minute calyx-teeth at apex.—July–Aug. Shikoku, Kyushu.—Ryukyus, Formosa, and China.

4. UNCARIA Schreb. KAGI-KATSURA ZOKU

Scandent woody plants, with curved spiny short spurs; leaves opposite, stipulate; heads axillary, peduncled, usually solitary; flowers yellowish, usually pilose, sessile or pedicelled, the bracteoles absent or minute; calyx-tube fusiform, the lobes 5; corolla-tube elongate, narrow, the lobes valvate in bud; anthers 2-spinulose at base; disc obscure; ovary fusiform, 2-locular; style long and exerted, the stigma capitate; ovules many; capsules 2-locular, septicidal, 2-valved, bifid; seeds many, long-winged on each side.—More than 30 species, mainly in Malaysia and e. India, few in e. Asia, Africa, and S. America.

1. *Uncaria rhynchophylla* (Miq.) Miq. *Nauclea rhynchophylla* Miq.; *Ouroparia rhynchophylla* (Miq.) Matsum. KAGI-KATSURA, KAGI-KAZURA. FIG. 16. Plant with horizontally spreading branches; leaves oblong or ovate, 5–12 cm. long, 3–7 cm. wide, abruptly acuminate, rounded or abruptly acute at base, with 4 or 5 pairs of lateral nerves, lustrous and green above, glaucous beneath, the petioles about 1 cm. long; stipules nearly free, 4 on a node, broadly linear, caducous; spines soli-

tary in axils, thickened at base, gently recurved toward tip; heads many-flowered, about 2 cm. across, solitary, terminal and axillary, the peduncles 2–3 cm. long; flowers pale green, the tube glabrous outside, 7–8 mm. long; fruit fusiform, slightly pilose, about 4.5 mm. long, sessile, with persistent short calyx-teeth at apex; seeds minute, long wing-tipped.—July. Woods; Honshu (Awa Prov. and westw.), Shikoku, Kyushu.

5. MUSSAENDA L. KONRON-KA ZOKU

Plants woody, rarely herbaceous, often slightly scandent; leaves opposite, sometimes ternate, rather large, stipulate; flowers small, yellowish, many, forming a terminal cyme, pedicelled, the bracts and bracteoles deciduous; calyx-lobes 5, the tube oblong or obconic, the outer calyx-segment of some outer flowers becoming large and petaloid, colored or white; corolla infundibuliform, the tube long, lobes 5, valvate in bud; ovary 2-locular; style elongate, the stigma 2-lobed; ovules many; fruit usually fleshy; seeds many, small.—About 50 species, in the tropical regions of Asia, Africa, and the Pacific Islands.

1A. Leaves narrowly oblong, 3–4 cm. wide, acuminate; stipules free; inflorescence slightly pubescent; bracts and calyx-lobes broadly linear. 1. *M. parviflora*

1B. Leaves broadly ovate, 6–12 cm. wide, cuspidate; stipules connate; inflorescence prominently puberulent; bracts and calyx-lobes lanceolate. 2. *M. thibetiana*

1. *Mussaenda parviflora* Miq. KONRON-KA. Evergreen scandent shrub, sparingly appressed-pilose with coarse hairs; leaves oblong or narrowly so, 8–13 cm. long, 3–4(–5) cm. wide, acuminate, acute at base, with about 5 pairs of

lateral nerves, the petioles about 1 cm. long; stipules 4–7 mm. long; inflorescence rather many-flowered; calyx-lobes 5–6 mm. long, as long as or shorter than the deciduous bract, the petaloid lobe broadly ovate, 3–4 cm. long, white, stipitate; corolla

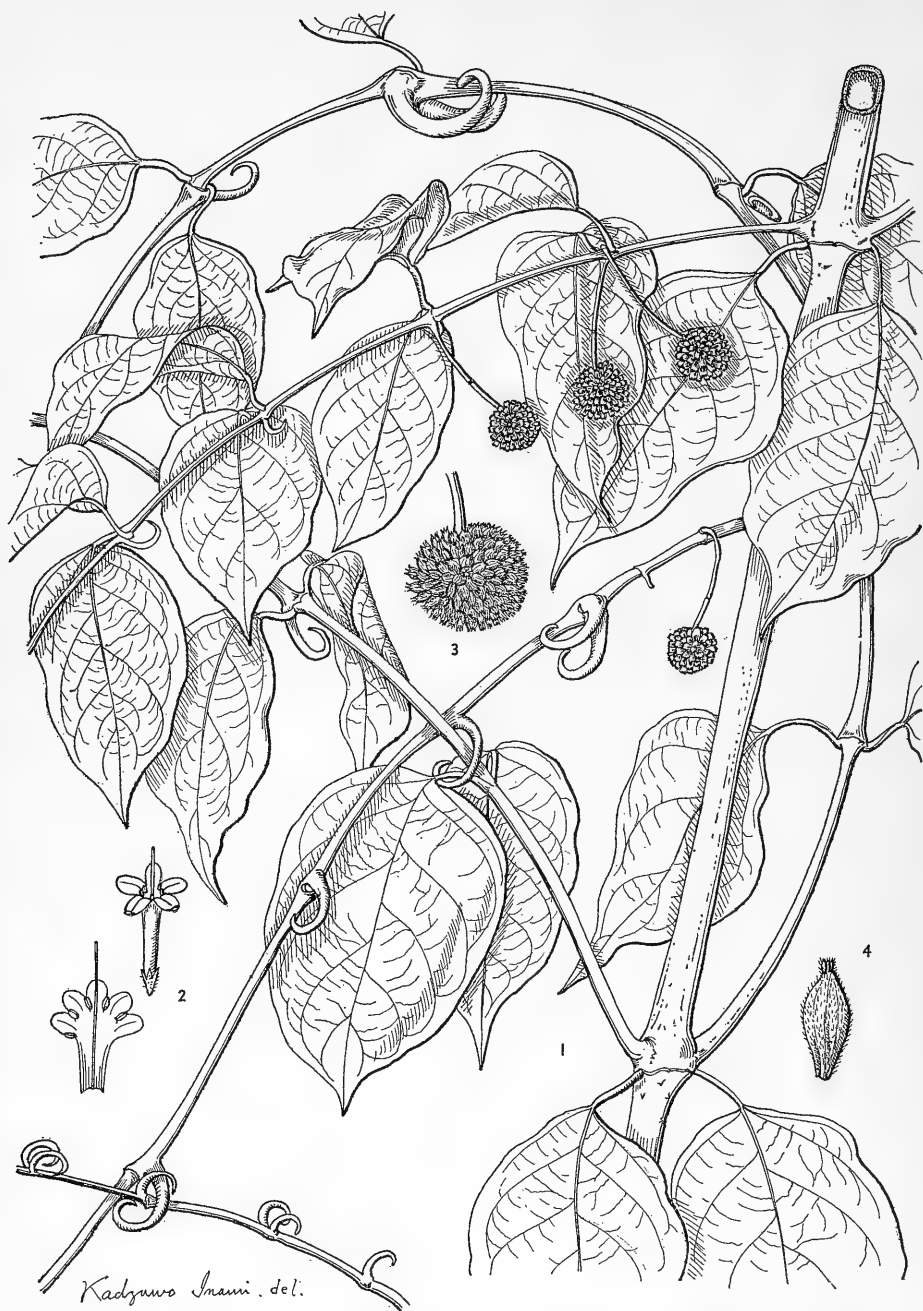

FIG. 16.—*Uncaria rhynchophylla* (Miq.) Miq. 1, Flowering branch; 2, flowers; 3, inflorescence at fruiting stage; 4, capsule.

12-15 mm. long, the lobes short, yellow-villous inside near base; fruit purple-black, ellipsoidal, 8-10 mm. long.—Kyushu (Yakushima).—Ryukyus and Formosa.

2. *Mussaenda shikokiana* Makino. HIRO-HA-KONRON-KA. Deciduous shrub, prominently short-pilose on inflorescence and young vegetative parts, the branches brownish; leaves thin, broadly ovate or broadly elliptic, abruptly acute to cuspidate, rounded and decurrent to a winged petiole or acuminate at base, with 7-10 pairs of lateral nerves, the peti-

oles 1-5 cm. long; stipules 2 at the node, ovate-deltoid, caducous, 8-10 mm. long; inflorescence rather many-flowered; calyx-lobes thin, lanceolate or broadly so, 7-10 mm. long, acuminate, as long as to slightly shorter than the bract, the petaloid lobe ovate-obicular or broadly ovate, whitish, 3-5 cm. long; corolla 13-15 mm. long, densely white-villous externally, the lobes short, acuminate; fruit ellipsoidal, 8-10 mm. long.—May-July. Honshu (Kii Prov.), Shikoku, Kyushu.

6. TARENNA Gaertn. GYOKUSHIN-KA ZOKU

Trees or shrubs; leaves opposite, petiolate, stipulate; flowers in terminal cymes, the pedicels usually ebracteolate; calyx 5(4-6)-toothed; corolla hypocrateriform or infundibuliform, the lobes contorted in bud; filaments short or nearly absent; ovary 2-locular, few- to many-ovuled in each locule; style elongate, usually exserted, the stigma fusiform or slender; berry coriaceous or fleshy, 2-locular, with 1 to many seeds in each locule; seeds with fleshy or cartilaginous endosperm.—More than 40 species, mainly in the Tropics of Asia, Africa, and the Pacific Islands, few in Australia.

1. *Tarenna gyokushinkwa* Ohwi. *Webera corymbosa* sensu auct. Japon., non Willd.; *Chomelia corymbosa* sensu auct. Japon., non K. Schum.; *T. zeylanica* sensu auct. Japon., non Gaertn.—GYOKUSHIN-KA. Large evergreen shrub, blackish when dry; young branchlets, underside of leaves on nerves, petioles, and inflorescence short appressed-pilose; branches of 2d year gray-brown; leaves chartaceous or thinly herbaceous, oblong, 10-15 cm. long, 4-7 cm. wide, short-acuminate or acute at both ends, deep green above, the peti-

oles 1-2 cm. long; stipules 4, connate into 2 ovate-deltoid lobes about 5 mm. long; inflorescence terminal, many-flowered, with small deltoid bracts, the pedicels 1-1.5 cm. long; flowers white; calyx short-toothed; corolla hypocrateriform, the tube about 3 mm. long, the lobes 5, spreading, oblanceolate, about 1 cm. long; anthers linear, elongate, on very short filaments; fruit broadly ellipsoidal, about 1 cm. long, 4-seeded.—June-Aug. Kyushu.—Ryukyus and Formosa.

7. RANDIA L. MISAO-NO-KI ZOKU

Trees or shrubs, sometimes scandent, sometimes with spines; leaves usually coriaceous, opposite, often reduced and scalelike in those subtending the inflorescence branches; stipules often connate at base; flowers large, axillary, solitary or in cymes or fascicles, very rarely terminal, white or yellowish, rarely reddish; calyx-limb truncate or toothed, the lobes rarely leaflike; corolla hypocrateriform, infundibuliform or campanulate, the lobes 4 or 5, contorted in bud; ovary 2(-4)-locular; style rather thick, with a clavate or bifid stigma; berry 2-locular, many-seeded.—More than 150 species, in the Tropics, abundant in Asia and Africa.

1. *Randia cochinchinensis* (Lour.) Merr. *Aidia cochinchinensis* Lour.; *Stylocoryne racemosa* Cav.; *Webera densiflora* Wall.; *R. densiflora* (Wall.) Benth.; *R. racemosa* (Cav.) F. Vill.; *R. nipponensis* Makino.—MISAO-NO-KI. Small evergreen unarmed glabrous tree; leaves rather coriaceous, lustrous, oblong to broadly lanceolate, 7-12(-15) cm. long, 2.5-5 cm. wide, acuminate, acute at base, with 4-6 pairs of lateral nerves, young leaves beneath with a few hairs in axillary tufts, the petioles about 1 cm. long; stipules 2, deltoid, 5-7

mm. long, long-cuspidate, deciduous; inflorescence a rather many-flowered nearly sessile cyme, the bracts narrowly deltoid, small, minutely ciliate, the pedicels short; calyx small; corolla yellow, the tube short, the lobes 4, reflexed, narrowly oblong, 7-8 mm. long, as long as the anthers; stigma elongate, entire; fruit globose, 6-7 mm. across, black when mature.—May-June. Honshu (Kii Prov.), Shikoku, Kyushu.—Ryukyus, Formosa, China, Malaysia, India, and Australia.

8. GARDENIA L. KUCHI-NASHI ZOKU

Rarely spiny shrubs or trees; leaves opposite, rarely ternate; flowers axillary, solitary, white or yellow; calyx-limb tubular, bractlike, or lobed, usually persistent; corolla hypocrateriform, campanulate, or infundibuliform, the tube longer than the calyx, the limb 5- to 9-fid, the lobes contorted in bud; ovary 1-locular or falsely 2-locular; style thick, more so above, entire or bifid; ovules many; fruit sessile, many seeded.—About 100 species, of wide distribution in the Tropics and subtropics.

1. *Gardenia jasminoides* Ellis. *G. florida* L.—KORIN-KUCHI-NASHI. Branched evergreen shrub, thinly furfuraceous on young branchlets; leaves broadly lanceolate, narrowly oblong, or broadly rhombic-oblancheolate, 6-12 cm. long, 1.5-4 cm. wide, attenuate, acute with an obtuse tip, deep green above, glabrous, short-petiolate; stipules deciduous, bractlike, connate at base; flowers solitary, short-pedicelled; calyx-lobes broadly linear, 1-2 cm. long, laterally compressed, as long as to longer than the tube, persistent; corolla white,

hypocrateriform, the tube about 3 cm. long, the lobes 6 or 7, spreading, broadly oblanceolate, 2.5-3 cm. long; anthers linear; fruit obovoid or oblong, 1.5-2.5 cm. in diameter.—June-July. Kyushu; variable.—Forma *grandiflora* (Lour.) Makino. *G. grandiflora* Lour.; *G. florida* var. *grandiflora* (Lour.) Fr. & Sav.—KUCHI-NASHI. Flowers larger, with broader corolla-lobes.—Spontaneous in Honshu (Suruga Prov. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and China. Much planted in our gardens.

Var. *radicans* (Thunb.) Makino. *G. radicans* Thunb.; *G. florida* var. *radicans* (Thunb.) Matsum.—KO-KUCHI-NASHI. Much-branched shrub with ascending branches, de-

cumbent at base; leaves oblanceolate, 4-6(-8) cm. long, 1-2 cm. wide; flowers small, single or double. Known only in cultivation.

9. MORINDA L. YAEYAMA-AOKI ZOKU

Trees or shrubs, sometimes scandent; leaves opposite or ternate, usually membranous or slightly fleshy; stipules 2, forming a sheath at the base of the petioles; heads pedunculate, axillary or terminal, often umbellate; flowers white, rarely unisexual; calyx-lobes short, persistent, truncate or obsoletely toothed; corolla infundibuliform or hypocrateriform, the tube short, the lobes 5(4-7); ovary 2 (or imperfectly 4)-locular; fruit connate and forming a headlike, juicy, many-stoned syncarp; stones free or few-connate, 1-seeded.—About 60 species, in the Tropics, mainly in Asia and the Pacific Islands.

1. *Morinda umbellata* L. *Stigmanthus cymosus* Lour.—HANAGASA-NO-KI. Nearly glabrous scandent or twining shrub; leaves chartaceous, oblong or narrowly obovate, 7-12 cm. long inclusive of a petiole about 1 cm. long, 2.5-4.5 cm. wide, acute at both ends, with tufts of axillary hairs beneath; stipules connate and sheathlike, 3-4 mm. long, membranous, truncate; heads umbellate, puberulent, terminal, about 10, the

simple peduncles 1-2.5 cm. long, few-flowered; calyx shallowly cup-shaped, connate in fruit; corolla about 4 mm. long, hypocrateriform, short-tubular, the lobes 4, white-villous inside at base; syncarp irregularly globose, about 8 mm. across, black when mature.—July-Aug. Kyushu (Yakushima and Tanegashima).—Ryukyus, Formosa, China to Malaysia, and India.

10. PSYCHOTRIA L. BOCHŌJI ZOKU

Trees or shrubs, sometimes scandent; leaves opposite, rarely verticillate in 3's or 4's; stipules interpetiolar, often forming a connate sheath; flowers in a terminal or rarely axillary thyrs, cyme, or panicle, sometimes fasciated in leaf-axils, or capitate, small, white, reddish, or yellow, bracteate or ebracteate, the bracts sometimes involucrelike; calyx-tube short; corolla hypocrateriform, subrotate to infundibuliform, the lobes 5(4-6), valvate in bud; ovary 2-locular; style short, 2-lobed; ovules solitary in each locule, anatropous, drupe small, with 2 stones, the stones often grooved.—More than 500 species, in the Tropics, especially abundant in America.

- 1A. Erect shrub or small tree; leaves 12-20 cm. long; fruit red. 1. *P. rubra*
1B. Scandent, with aerial roots; leaves 2-4.5 cm. long; fruit white. 2. *P. serpens*

1. *Psychotria rubra* (Lour.) Poir. *Antherura rubra* Lour.; *P. elliptica* Ker-Gawl.; *P. reevesii* Wall.; *Aucubaephyllum lioukiense* Ahlburg.—BOCHŌJI, RYŪKYŪ-AOKI. Large glabrous shrub slightly tinged with red when dry; branchlets terete, rather thick, green; leaves thick, broadly oblanceolate, 12-20 cm. long, 2.5-5 cm. wide, acuminate with a minute obtuse tip, gradually narrowed at base, with 10-13 pairs of weak lateral nerves, the petioles 1-2 cm. long; cymes terminal, sessile, 4-7 cm. across, many-flowered; flowers small, white, about 5 mm. long, pedicelled; calyx nearly truncate at apex; corolla infundibuliform, with white hairs on throat inside, the lobes slightly less than half as long as the corolla; fruit globose, red, about 6 mm. long; seeds with longitudinal grooves on

back.—Aug. Woods in low mountains and hills; Kyushu (Yakushima).—Ryukyus, Formosa, China, and Indochina.

2. *Psychotria serpens* L. *P. scandens* Hook. & Arn.—SHIRATAMA-KAZURA. Scandent woody plant, climbing by aid of aerial roots; leaves thick, elliptic or ovate-elliptic, 2-4.5 cm. long, 1-2.2 cm. wide, obtuse or subacute, acute at base, the lateral nerves obscure, the petioles 2-4 mm. long; stipules 2 at each node, ovate, caducous; inflorescence a terminal cyme, rather many-flowered, the bracts small; flowers white, 4-5 mm. long, on short pedicels; fruit globose or ellipsoidal, 4-5 mm. long, white at maturity.—On tree trunks in low mountains and hills; Honshu (Kii Prov.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and Indochina.

11. LASIANTHUS Jack RURI-MI-NO-KI ZOKU

Shrubs; leaves opposite, short-petioled, usually entire, with prominent transverse veinlets; stipules interpetiolar, usually caducous; flowers small, 5-merous, fasciculate in leaf-axils, bracteate, white, greenish, or yellowish; calyx-tube and limb short, teeth or lobes persistent; corolla infundibuliform or hypocrateriform, the lobes 4-9, valvate in bud; ovary 4- to 9-locular; style 4- to 9-lobed; ovules solitary in each locule, erect, anatropous; drupe 4- to 9-stoned.—More than 100 species, in tropical regions of Asia, few in e. Asia, Australia, Cuba, and w. Africa.

- 1A. Calyx-teeth shorter than the limb of calyx; corolla about 1 cm. long.
2A. Petioles and underside of leaves thinly appressed-pilose or nearly glabrous. 1. *L. japonicus*
2B. Petioles and underside of leaves especially on nerves with spreading hairs. 2. *L. satsumensis*
1B. Calyx-teeth longer than to as long as the limb of calyx; corolla 6-7 mm. long.
3A. Petioles and nerves on underside of leaves appressed-pubescent; young branches slightly appressed-pubescent or glabrous. 3. *L. tashiroi*
3B. Petioles and nerves on underside of leaves brownish yellow spreading-pubescent; young branches densely brownish hairy. 4. *L. tawadac*

1. *Lasianthus japonicus* Miq. *Mephitidia japonica* (Miq.) Nakai—RURI-MI-NO-KI. Evergreen shrub with slender, elongate glabrous or slightly appressed-pilose branches; leaves chartaceous, narrowly oblong or broadly oblanceolate, 8–15 cm. long, 2–4 cm. wide, caudate-acuminate, acute to obtuse at base, glabrous above, nearly glabrous to sparingly appressed-pilose beneath, the lateral nerves spreading and arcuate above, the petioles about 1 cm. long; flowers few in leaf-axils, nearly sessile, white; calyx short, the limb about 1 mm. long, short-toothed; fruit globose, dark blue, about 4 mm. across.—Woods in low mountains; Honshu (Izu Prov. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and s. China.

2. *Lasianthus satsumensis* Matsum. *Mephitidia satsumensis* (Matsum.) Nakai; *L. japonicus* var. *satsumensis* (Matsum.) Makino—SATSUMA-RURI-MI-NO-KI. Closely resembles the preceding species; branches slightly pilose with ascending brownish hairs; leaves 8–10 cm. long, caudate-acuminate, nearly glabrous or thinly pilose on nerves above, with spreading brownish hairs beneath especially on nerves, the petioles spreading-pilose, about 1 cm. long; flowers few in leaf-axils, nearly sessile; calyx short, the limb about 1 mm. long, with depressed teeth; fruit globose, about 4 mm. across, dark blue.—Woods in low mountains; Honshu (Kii Prov.), Shikoku, Kyushu.

3. *Lasianthus tashiroi* Matsum. *Mephitidia tashiroi* (Matsum.) Nakai—RYÜKYÜ-RURI-MI-NO-KI, MIYAMA-RURI-

MI-NO-KI. Resembles the preceding; branches with scattered appressed short pubescence while young, or glabrous; leaves firmly chartaceous, oblong or ovate-oblong, sometimes broadly oblanceolate, 6–12 cm. long, 2–4 cm. wide, caudate-acuminate, subacute at base, glabrous and lustrous on upper side, thinly appressed-hairy on nerves beneath, the petioles about 1 cm. long; flowers white, 6–7 mm. long, few in leaf-axils, nearly sessile; calyx-teeth longer than to as long as the limb of calyx, suberect, narrowly deltoid, subacute; corolla 6–7 mm. long, glabrous, the lobes 5, ovate, about half as long as the tube, white-pubescent inside; anthers about half as long as the corolla-lobes; fruit globose, about 4 mm. across.—Kyushu (Yakushima).—Ryukyus, Formosa, Hainan Island, and Philippines.

4. *Lasianthus tawadae* Ohwi. *L. tashiroi* var. *pubescens* Matsum.; *Mephitidia tashiroi* var. *pubescens* (Matsum.) Nakai—KE-HADA-RURI-MI-NO-KI, KE-MIYAMA-RURI-MI-NO-KI. Closely resembles the preceding; young branches densely ascending yellow-brown pubescent; leaves chartaceous, oblong to narrowly so, or ovate-oblong, 6–10 cm. long, 2–4 cm. wide, caudate-acuminate, glabrous above, densely spreading yellow-brown pubescent beneath, especially on nerves, the lateral nerves obliquely spreading, arcuate, the petioles yellow-brown pubescent, 5–8 mm. long; flowers few, in leaf-axils, sessile, densely brownish yellow hairy; calyx short, the lobes or teeth linear-deltoid, 2.5–3 mm. long, acute; fruit globose, about 4 mm. across.—Kyushu (Yakushima).—Ryukyus.

12. DAMNACANTHUS Gaertn. f. ARIDÖSHI ZOKU

Evergreen much-branched frequently spinose shrubs; leaves opposite, coriaceous, ovate, subsessile; flowers rather small, 4-merous, white, 1 or 2 in leaf-axils, short-pedicellate, with minute bracteoles at base; calyx small, the limb 4- or 5-toothed, the teeth persistent; corolla infundibuliform, the lobes 4(–5), valvate in bud; ovary 2- to 4-locular; style slender, filiform, the stigma 2- to 4-lobed; ovules solitary in each locule; drupe 1- to 4-stoned.—Few species, in e. Asia and Bengal.

- 1A. Spines 1–3 mm. long or nearly absent, not longer than the petioles; roots moniliform; leaves 8–13 cm. long. 1. *D. macrophyllus*
 1B. Spines 1–2 cm. long; root not moniliform; leaves 1–5 cm., rarely to 6.5 cm. long.
 2A. Spines about 1 cm. long, $\frac{1}{4}$ – $\frac{1}{2}$ as long as the leaves. 2. *D. major*
 2B. Spines 1–2 cm. long, as long as to half as long as the leaves. 3. *D. indicus*

1. *Damnacanthus macrophyllus* Sieb. ex Miq. *D. major* var. *submitis* Maxim. ex Regel; *D. major* var. *macrophyllus* (Sieb.) Maxim.; *D. indicus* var. *macrophyllus* (Sieb.) Makino—ÖBA-JUZUNE-NO-KI, ÖBA-NO-ARIDÖSHI. Roots moniliform; plant glabrous or minutely puberulent on young parts, the branches grayish; leaves rather thin, lustrous, elliptic, ovate-elliptic, or oblong, 3–8 cm. long, 1.5–4 cm. wide, short-acuminate, rounded at base, glabrous, spines absent or 1–3 mm. long; flowers 1 or 2 in leaf-axils, the pedicels 2–3 mm. long; calyx-teeth short, acuminate, about 1 mm. long; corolla white; fruit globose, red, 5–6 mm. across.—Shikoku, Kyushu.

Var. *giganteus* (Makino) Koidz. *D. indicus* var. *giganteus* Makino; *D. giganteus* (Makino) Nakai.—NABAGA-JUZUNE-NO-KI. Leaves broadly lanceolate or narrowly oblong, 5–13 cm. long, long-acuminate, acute at base.—Honshu (Mikawa Prov. and westw.), Shikoku, Kyushu.

Var. *parvispinis* (Koidz.) Takah.—*D. major* var. *parvispinis* Koidz.; *D. moniliformis* Koidz.; *D. minutispinis* Koidz.; *D. major* var. *minutispinis* Koidz.; *D. major* var. *moniliformis* (Koidz.) Hara—MARUBA-JUZUNE-NO-KI.

Leaves smaller, broadly ovate-rotundate, rounded at base.—Honshu (Kinki Distr. and westw.), Kyushu.

2. *Damnacanthus major* Sieb. & Zucc. *D. indicus* var. *major* (Sieb. & Zucc.) Makino; *D. indicus* var. *latifolius* Nakai—JUZUNE-NO-KI. Much-branched shrub, sometimes with thickened roots, the branches minutely puberulent, grayish; leaves somewhat coriaceous, lustrous, short-petiolate, ovate or broadly so, 1.5–4 cm. long, 1–2 cm. wide, acute to short-acuminate, rounded or very obtuse at base, glabrescent, the spines about 1 cm. long; flowers 1 or 2 in leaf-axils, short-pedicelled; calyx short, the teeth narrowly deltoid, 1.5–2 mm. long; corolla white, 15–18 mm. long, the lobes short, about 4 mm. long; fruit red, globose, about 5 mm. across.—May. Woods; Honshu (nc. Kantō Distr. and westw.), Shikoku, Kyushu; variable.

Var. *parvifolius* Koidz. KOBA-NO-NISE-JUZUNE-NO-KI. Leaves smaller, 1–3.5 cm. long.—Honshu (Izu Prov. and westw.), Kyushu.—Ryukyus and s. Korea.

Var. *lanceifolius* (Makino) Ohwi. *D. indicus* var. *lanceifolius* Makino; *D. lanceifolius* (Makino) Koidz.—HOSOBANISE-JUZUNE-NO-KI. Leaves broadly lanceolate, 3–6.5 cm.

long, gradually narrowed at both ends.—Honshu (Suruga, Echizen, and westw. to Kinki Distr.).

3. *Damnacanthus indicus* Gaertn. f. *ARIDŌSHI*. Much-branched shrub, crisped puberulent on branches, petioles, and sometimes on leaves of midrib beneath; branches slender, horizontally spreading; leaves coriaceous, lustrous, broadly ovate or broadly elliptic, 1–2.5 cm. long, 7–20 mm. wide, abruptly acute and short-awned, rounded at base, short-petioled, the spines 1–2 cm. long, as long as the leaves; flowers 1 or 2 in leaf-axils, short-pedicelled, white, about 15 mm. long;

calyx short, about 1.5 mm. long, the teeth narrowly deltoid; corolla tubular, slightly amplate, the lobes 4, spreading, very short; fruit globose, 5–6 mm. across, red.—May. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus, s. Korea, China, ne. India, and Thailand.

Var. *microphyllus* Makino. *HIME-ARIDŌSHI*. Plants much branched; leaves small, about 1 cm. long; occurs with the typical phase.

Var. *ovatus* Koidz. *TAMAGŌBA-ARIDŌSHI*. Spines prominent; leaves ovate.—Honshu (centr. and w. distr.), Shikoku.

13. LEPTODERMIS Wall. SHICHŌGE ZOKU

Slender much-branched shrubs; leaves short-petioled, opposite, lanceolate, with broad persistent stipules; flowers dimorphic, white or purple, subtended by 2 connate bracteoles, in sessile terminal cymes or heads on branches and on short spurs; calyx-lobes 5-toothed; corolla narrowly infundibuliform, the lobes (4 or 5), valvate in bud; ovary 5-locular; style slender, 5-lobed; ovules solitary in each locule, anatropous; capsules 5-valved, oblong, ribbed, 1-seeded in each valve; seeds linear.—About 30 species, in e. Asia, e. Bengal, and the Himalayas.

1. *Leptodermis pulchella* Yatabe. *SHICHŌGE*. Foetid-smelling shrub, while young with dark gray puberulent branches; leaves narrowly ovate or broadly lanceolate, 1.5–4 cm. long, subacute, acute at base, glabrous or thinly puberulent on midrib above, the petioles 1–3 mm. long, the stipules 2, depressed-deltoid, short spine-tipped; flowers few, sessile, the

bracteoles connate at base, membranous, 3–4 mm. long, about as long as and surrounding the calyx in anthesis; calyx-teeth elliptic, about 2 mm. long, erect, ciliate; corolla purple, 15–18 mm. long, puberulent externally; fruiting calyx oblong, 7–8 mm. long.—July. Honshu (s. Kinki Distr.), Shikoku.

14. PAEDERIA L. HEKUSO-KAZURA ZOKU

Scandent, foetid herbs or shrubs; leaves opposite, petiolate; stipules deciduous; flowers rather small, in axillary and terminal cymes, bracteolate; calyx-lobes 4- or 5-toothed, persistent; corolla tubular-campulate or infundibuliform, granular-pilose, the tube rather broad, the lobes 4 or 5, induplicate in bud; ovary 2-locular; styles 2, filiform, often connate at base; ovules solitary in each locule, erect, anatropous; fruit globose, the pericarp crustaceous; stones 1-seeded, flattened.—About 20 species, in the Tropics of Asia and S. America.

1. *Paederia scandens* (Lour.) Merr. var. *mairei* (Lév.) Hara. *P. foetida* sensu auct. Japon., non L.; *P. tomentosa* sensu auct. Japon., non Bl.; *P. tomentosa* var. *mairei* Lév.—*HEKUSO-KAZURA*, *YAITOBANA*. Scandent, somewhat pubescent perennial herb often woody at base; leaves petiolate, membranous or thinly herbaceous, ovate to narrowly so, or the upper ones broadly lanceolate, 4–10 cm. long, 1–7 cm. wide, short-acuminate, cordate or sometimes rounded at base; stipules 2, ovate, green, obliquely ascending; cymes rather many-flowered; flowers sessile in the terminal ones, short-pedicelled in the lateral ones; calyx-teeth short, obliquely spreading; corolla-tube white, red-purple inside, about 10 mm. long, rather broad, the limb spreading, 7–8 mm. across, the lobes depressed, white, undulate on margin; fruit yellow, globose, about 5 mm. across.

—Aug.–Sept. Thickets and thin woods in lowlands and low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—Korea, China to Philippines.

Var. *longituba* (Nakai) Hara. *P. longituba* Nakai.—*TSUTSU-NAGA-YAITOBANA*. Corolla-tube narrow.—Honshu, Kyushu.

Var. *maritima* (Koidz.) Hara. *P. chinensis* var. *maritima* Koidz.—*HAMA-SAOTOME-KAZURA*. Glabrescent maritime phase with thicker lustrous leaves.—Thickets near seashores; Honshu, Shikoku, Kyushu.—China.

Var. *velutina* (Nakai) Nakai. *P. chinensis* var. *velutina* Nakai.—*HIRŌDO-YAITOBANA*. Leaves densely villous.—Often found with the typical phase.

15. PSEUDOPYXIS Miq. INAMORI-SŌ ZOKU

Small erect herbs with creeping rhizomes and multicellular pubescence; leaves membranous, opposite, petiolate, ovate; stipules intrapetaly; flowers white or pale purple, 1 or 2, terminal and in upper axils, the pedicels short, 2-bracteolate; calyx short, the limb 5-parted, the segments broadly lanceolate at anthesis, accrescent, net-veined in fruit; corolla narrowly infundibuliform, lobes 5, induplicate in bud; ovary 4- or 5-locular; style slender, 4- or 5-lobed; ovules solitary in each locule, ascending from the inner angle, anatropous; fruit small, surrounded by stellately spreading calyx-lobes, circumscissile; seeds obovate, longitudinally grooved.—Two species, in Japan.

- 1A. Stems 5–10 cm. long, uniformly pubescent; upper 2 pairs of leaves frequently approximate and falsely verticillate; pedicels about 1 mm. long; corolla pale purple, about 2.5 cm. long, the lobes half as long as the tube. 1. *P. depressa*
 1B. Stems 15–30 cm. long, with 2 series of short hairs; leaves in pairs, the upper leaves not as above; pedicels 4–6 mm. long; corolla white, 8–10 mm. long, the lobes nearly as long as the tube. 2. *P. heterophylla*

1. *Pseudopyxis depressa* Miq. *P. longituba* Fr. & Sav. —INAMORI-SŌ. Pubescent perennial herb, with slender creeping rhizomes; stems 5–10 cm. long, with 2 or 3 pairs of leaves; leaves petiolate, ovate or deltoid-ovate, 3–6 cm. long, acute or subacute, truncate to rounded, sometimes shallowly cordate, the lower leaves sometimes 1–2 cm. long; upper 2 pairs of leaves frequently approximate and falsely verticillate; calyx long-pubescent, the lobes narrowly deltoid in fruit, about 5 mm. long, acuminate and spine-tipped; corolla glabrous or thinly puberulent, pale purple, about 2.5 cm. long, the lobes half as long as the tube, ovate, about 7 mm. long; seeds about 2.5 mm. long, with raised longitudinal lines.—May–June. Woods in mountains; Honshu (centr. and s. distr.), Shikoku, Kyushu.

16. MITCHELLA L. TSURU-ARIDŌSHI ZOKU

Small creeping evergreen herbs; leaves opposite, short-petiolate, small, with minute stipules; flowers small, in pairs, axillary and terminal, white, bractless, on a short common peduncle; calyx short, the limb 3- to 6-toothed, persistent; corolla infundibuliform, hairy on the throat inside, the limb 3- to 6-lobed, valvate in bud; ovary 4-locular; style slender, 4-fid; ovules 4, erect, anatropous; fruit 4-stoned, the stones bony, each 1-seeded.—Two species, one in e. Asia and the other in eastern N. America.

1. *Mitchella undulata* Sieb. & Zucc. *M. repens* var. *undulata* (Sieb. & Zucc.) Makino.—TSURU-ARIDŌSHI. Glabrous evergreen deep green herb; stems slender, leafy, elongate, much branched, creeping; leaves short-petioled, deltoid-ovate, ovate or broadly so, 1–1.5 cm. long, 7–12 mm. wide, subacute to obtuse, rounded at base, slightly undulate on margin; flow-

2. *Pseudopyxis heterophylla* (Miq.) Maxim. *Oldenlandia heterophylla* Miq.; *Lysimachia quadriflora* Petitm.; *P. quadriflora* (Petitm.) Koidz.—SHIROBANA-INAMORI-SŌ. Loosely pubescent perennial herb with slender woody rhizomes; stems 15–30 cm. long, with 2 series of short hairs; leaves 4–6 pairs, ovate or deltoid-ovate, 2–6 cm. long, 1–2.5 cm. wide, acute, broadly cuneate or sometimes nearly rounded at base, the petioles 1–1.5 cm. long, the uppermost leaves sessile; calyx-lobes obliquely spreading in fruit, ovate or broadly elliptic, the lobes abruptly acute, about 5 mm. long; corolla white, 8–10 mm. long, glabrous; seeds broadly elliptic, about 2.5 mm. long, with raised slender longitudinal lines and horizontal short striae.—July–Aug. Honshu (centr. distr.).

ers sessile, in pairs on a short common peduncle; ovary connate; corolla white, about 15 mm. long, the tube slender, 1.5–2 times as long as the lobes; fruit globose, red, about 8 mm. across.—June. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—s. Korea.

17. RUBIA L. AKANE ZOKU

Herbs, sometimes woody at base; leaves apparently in verticils of 4–8, very rarely opposite, stipulate; flowers small, usually 5-merous, in axillary and terminal cymes, the pedicels jointed with the calyx; calyx-teeth obscure; corolla rotate or subcampanulate, the lobes 4 or 5, valvate in bud; filaments short; ovary 2-locular or 1-locular by reduction, each locule with an erect amphitropous ovule; styles 2, free or connate, short, the stigma capitate; fruit fleshy, (1–)2-locular, (1–)2-seeded.—About 35 species, in temperate to warmer regions of the N. Hemisphere, S. Africa, and S. America.

- 1A. Leaves broadly lanceolate, gradually narrowed toward base, sessile or nearly so. 1. *R. jesoensis*
- 1B. Leaves ovate to lanceolate, rounded to cordate at base, distinctly petiolate. 2. *R. chinensis*
- 2A. Stems erect, not retrorsely aculeolate. 2. *R. chinensis*
- 2B. Stems usually scandent, retrorsely aculeolate. 3. *R. akane*
- 3A. Leaves 4 in each verticil. 3. *R. akane*
- 3B. Leaves, at least on the main stems, 6(–12) in each verticil, but on the branches 4–6. 4. *R. hexaphylla*
- 4A. Leaves in 4's to 6's on main stems, cordate to ovate-cordate. 4. *R. hexaphylla*
- 4B. Leaves in 6's to 10's on main stems, ovate-oblong, shallowly cordate to rounded at base. 5. *R. cordifolia* var. *pratensis*

1. *Rubia jesoensis* (Miq.) Miyabe & Miyake. *Galium jesoense* Miq.; *R. tatarica* var. *grandis* F. Schmidt; *R. grandis* (F. Schmidt) Komar.—AKANE-MUGURA, Ō-AKANE. Rhizomes slender, creeping; stems 40–80 cm. long, erect, usually simple, 4-angled, retrorsely aculeolate on angles; leaves in verticils of 4's, lanceolate, 5–8 cm. long, 6–15 mm. wide, acuminate at both ends, retrorsely aculeolate on margin and on nerves beneath, spreading pilosulous beneath, sessile or nearly so; cymes axillary, rather many-flowered, slightly shorter than to as long as the leaves, peduncled, 15–25 mm. across; flowers small, whitish; ovary smooth; corolla rotate, 3–4 mm. across; fruit globose.—June–July. Hokkaido, Honshu (n. and Hokuriku distr.).—s. Kuriles, Sakhalin, Korea, and Ussuri.

2. *Rubia chinensis* Regel & Maack var. *glabrescens* (Nakai) Kitag. (?) *R. mitis* Miq.; *R. mitis* forma *glabrescens* Nakai; *R. pedicellata* Nakai.—Ō-KINUTA-SŌ. Smooth perennial herb with slender creeping rhizomes; stems simple,

nearly erect; leaves thinly membranous, ovate or ovate-oblong, 6–10 cm. long, 2.5–5 cm. wide, acuminate, rounded to shallowly cordate at base, glabrous or nearly so, 5- to 7-nerved, the petioles 1–2 cm. long; cymes sometimes paniculate, terminal and in upper axils; flowers greenish white, on slender pedicels; ovary glabrous; corolla 4- or 5-lobed, rotate, 3–4 mm. across; fruit globose, black when mature.—May–July. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

Var. *chinensis*. MANSŌ-Ō-KINUTA-SŌ. Plant prominently pilose.—Honshu (centr. distr.).—Korea, Manchuria, N. China, and Amur regions.

3. *Rubia akane* Nakai. *R. cordifolia* sensu auct. Japon., non L.; *R. cordata* var. *mungista* Miq., excl. syn.; *R. cordata* var. *laxa* Nakai.—AKANE. Perennial herb with much-branched yellowish rhizomes; stems much branched, elongate, 4-angled, retrorsely aculeolate on the angles; leaves in verticils of 4's, petiolate, ovate to ovate-cordate, 3–7 cm. long, 1–3 cm.

wide, acuminate, cordate at base, with 5 nerves from the base, retrorsely aculeolate on petioles, on margins, and on nerves of leaves beneath; inflorescence subpaniculate, axillary and terminal, often compound, the pedicels short; flowers pale yellow, 3.5–4 mm. across; ovary smooth; corolla rotate, 4- or 5-lobed; fruit black.—Aug.–Oct. Thickets and hedges in lowlands and low elevations in the mountains; Honshu, Shikoku, Kyushu; rather common.—Korea, China, and Formosa.

4. *Rubia hexaphylla* (Makino) Makino. *R. cordifolia* var. *hexaphylla* Makino.—O-AKANE. Resembles the preceding but larger; stem-leaves in verticils of 4's to 6's, cordate or ovate-cordate, 5–13 cm. long, 3–7 cm. wide, long-petiolate, (5 or) 7-nerved, the leaves on branches smaller, broadly deltoid-ovate, rounded at base; inflorescence rather few-flowered, the pedicels 4–7 mm. long; ovary glabrous, smooth; corolla cam-

panulate-rotate, 5-lobed, about 3 mm. across; fruit black.—July–Sept. Mountains; Honshu, Kyushu.—Korea.

5. *Rubia cordifolia* L. var. *pratensis* Maxim. *R. pratensis* (Maxim.) Nakai; *R. cordifolia* var. *lancifolia* sensu auct. Japon., non Regel.—KURUMABA-AKANE, TSUSHIMA-AKANE. Resembles No. 3; leaves rather thick, on main stems in verticils of 6's to 10's, on the branches in 4's to 6's, ovate-oblong, 2–4 cm. long, 1–2 cm. wide, cuspidate or abruptly acute, rounded or slightly cordate at base, petiolate, usually 5-nerved, prominently retrorsely aculeolate on margin and on nerves beneath; inflorescence paniculate, axillary and terminal; flowers pedicelled, about 3.5 mm. across; ovary glabrous; corolla 5-lobed, rotate; fruit black.—Oct. Honshu (Chūgoku Distr.), Kyushu (n. distr.).—Korea, Manchuria, Ussuri, and Amur.

18. GALIUM L. YAE-MUGURA ZOKU

Annuals, biennials, or perennials, often retrorsely scabrous; stems erect or scandent; leaves whorled, (3–)4 to many in a whorl; flowers small, usually 4-merous, in axillary cymes or terminal panicles, white, pale yellow, or greenish, bractless, the pedicels jointed with the calyx; calyx-teeth obsolete; corolla rotate, (3–)4-lobed, the lobes valvate in bud; stamens (3–)4, the filaments short; ovary 2-locular; styles 2, short; ovules solitary in each locule; fruit usually dry, globose, separating at maturity into 2 seedlike indehiscent 1-seeded carpels, smooth or scabrous, often prickly.—About 300 species, nearly worldwide, except Australia.

1A. Leaves on the main stems in verticils of 6's to 10's.

2A. Stems erect; leaves linear, short-pubescent, especially at the nodes; flowers greenish white to pale yellow. 1. *G. verum*

2B. Stems weak and decumbent or creeping, retrorsely aculeolate on the angles; flowers white to pale green.

3A. Leaves not aculeolate on margin.

4A. Cymes nearly all terminal.

5A. Leaves narrowly oblong, rounded to obtuse, mucronate, deep green when dry. 2. *G. trifloriforme*

5B. Leaves narrowly ovate or broadly lanceolate, acute, mucronate, black-green when dry. 3. *G. japonicum*

4B. Cymes axillary and terminal; leaves narrowly ovate-oblong. 4. *G. triflorum*

3B. Leaves retrorsely aculeolate on margin.

6A. Straggling annual or biennial; leaves awn-tipped; inflorescence axillary and terminal; flowers pale green. 5. *G. spurium*

6B. Perennial, very slender, simple or sparsely branched, with slender creeping rhizomes; leaves short-mucronate; inflorescence nearly terminal; flowers white. 6. *G. dahuricum*

1B. Leaves on main stems in verticils of 4's, sometimes in 5's or 6's.

7A. Leaves retrorsely aculeolate on margin, in verticils of 5's to 6's on main stems.

8A. Leaves rounded to very obtuse; corolla 3- or 4-lobed; fruitlets subglobose, glabrous. 7. *G. trifidum* var. *brevipedunculatum*

8B. Leaves rounded or obtuse, mucronate-tipped; corolla 4-lobed; fruitlets ellipsoidal, usually with hooked prickles.

8. *G. pseudoasprellum*

7B. Leaves not retrorsely aculeolate, in verticils of 4's (–5's) on main stems.

9A. Leaves 1-nerved or obscurely so.

10A. Leaves nearly glabrous or loosely appressed-pilose on margin and on upper surface near margin.

11A. Stems 5–20 cm. long, usually simple; leaves in a verticil often unequal in size; inflorescence nearly terminal.

12A. Leaves 1–4 cm. long inclusive of the petiole; fruitlets with hooked prickles. 9. *G. paradoxum*

12B. Leaves 0.6–1.2 cm. long inclusive of the petiole; fruitlets puberulent. 10. *G. yakusimense*

11B. Stems 30–80 cm. long, often branched; leaves in a verticil equal or nearly equal in size; inflorescence axillary and terminal.

13A. Pedicels much longer than the fruit; bracts 2(–3); fruitlets glabrous. 11. *G. newerthii*

13B. Pedicels shorter than the fruit; bracts solitary; fruitlets rather densely pilosulous. 12. *G. kikumugura*

10B. Leaves with obliquely spreading long hairs on midrib beneath and on margin.

14A. Pedicels 1–3 mm. long; leaves yellow-green or pale green when dry.

15A. Leaves ovate-oblong, elliptic, or ovate. 13. *G. trachyspermum*

15B. Leaves oblong-linear or linear-lanceolate. 14. *G. gracilens*

14B. Pedicels (3–)5–10 mm. long; leaves vivid green when dry. 15. *G. pogonanthum*

9B. Leaves distinctly 3-nerved.

16A. Leaves thinly membranous, rounded and mucronulate-tipped, rarely acute; fruitlets densely prickly. 16. *G. kamschaticum*

16B. Leaves thicker, gradually acute with an obtuse tip, or acute to acuminate; fruitlets glabrous or short-hairy.

17A. Inflorescence a large terminal many-flowered panicle.

18A. Leaves lanceolate to ovate-oblong, acuminate or acute with an obtuse tip; inflorescence densely flowered, the branches short; pedicels very short. 17. *G. boreale* var. *kamschaticum*

18B. Leaves ovate to narrowly so, acuminate; inflorescence loosely flowered, with rather slender branches; pedicels slender.

18. *G. kintu*

17B. Inflorescence loosely cymose, terminal, 3- to 7-flowered. 19. *G. nakaii*

1. *Galium verum* L. var. *asiaticum* Nakai. *G. verum* var. *luteum* Nakai, excl. syn.; *G. verum* var. *japonalpinum* Nakai—KIBANA-KAWARA-MATSUBA. Perennial herb; stems erect, slightly branched in upper part, short-pubescent especially at the nodes; leaves in verticils of 8's to 10's (12's), linear, 2-3 cm. long, 1.5-3 mm. wide, short spine-tipped, pubescent beneath; inflorescence a terminal and axillary densely many-flowered panicle; flowers greenish white to pale yellow, about 2.5 mm. across; fruitlets ellipsoidal, glabrous.—July-Oct. Grassy slopes in mountains; Hokkaido, Honshu, Kyushu; very variable in flower color and in the indument.—Forma *luteum* Makino. USUIRO-KAWARA-MATSUBA. With pale yellow flowers.—Forma *nikkoense* (Nakai) Ohwi. *G. verum* var. *lacteum* sensu auct. Japon., non Maxim.; *G. verum* var. *nikkoense* Nakai—KAWARA-MATSUBA. With pale flowers, and the leaves glabrous on upper surface.

Var. *trachycarpum* DC. *G. verum* var. *ruthenicum* Nakai, excl. syn.—EZO-KAWARA-MATSUBA. Ovary densely pilose; flowers pale yellow.—Grassy places in mountains; Hokkaido, Honshu; variable.—Forma *album* Nakai. CHŌSEN-KAWARA-MATSUBA. Flowers white.—Forma *intermedium* Nakai. USUKI-KAWARA-MATSUBA. Flowers creamy white.—Forma *tomentosum* Nakai. EZO-NO-KE-KAWARA-MATSUBA. Prominently pubescent throughout.—The species occurs widely from e. Asia to e. Europe.

2. *Galium trifloriforme* Komar. *G. japonicum* Makino, pro parte; *G. nipponicum* Makino, pro parte—OKU-KURUMA-MUGURA, CHŌSEN-KURUMA-MUGURA. Perennial herb, deep green when dry; stems ascending, 20-50 cm. long, 4-angled, retrorsely scabrous on the angles; leaves usually in verticils of 6's, narrowly oblong, 2.5-4 cm. long, 7-10 mm. wide, rounded to obtuse, mucronate, acute at base, the midrib usually smooth; cymes loosely few-flowered, axillary and terminal; flowers white, pedicelled; fruitlets with long hooked spines, densely so.—July-Aug. Damp woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Kuriles, Sakhalin, Korea, Manchuria, and China.

3. *Galium japonicum* Makino. *G. japonicum* Makino, pro parte; *G. nipponicum* Makino, pro parte; *G. trifloriforme* var. *nipponicum* (Makino) Nakai—KURUMA-MUGURA. Resembles the preceding, blackish when dry; stems usually smooth; leaves narrowly ovate or broadly lanceolate, acute, mucronate, smooth except the margin and the upper surface near the margin; fruitlets with long prickles.—May-July. Damp woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

4. *Galium triflorum* Michx. YATSUGATAKE-MUGURA. Perennial; stems decumbent, 20-40 cm. long, retrorsely prickly on the angles; leaves in verticils of 6's, narrowly ovate-oblong, 1-3 cm. long, abruptly cuspidate, with retrorsely directed prickles on midrib beneath; inflorescence axillary and terminal, several-flowered; flowers white, small, pedicelled; fruitlets relatively long-prickled.—July. Damp coniferous woods; Honshu; very rare.—Kuriles, Sakhalin, and northern regions of the N. Hemisphere.

5. *Galium spurium* L. var. *echinospermon* (Wallr.) Hayek. *G. vaillantii* DC.; *G. strigosum* Thunb.; *G. agreste* var. *echinospermon* Wallr.; *G. spurium* var. *vaillantii* (DC.) Gaud.; *G. aparine* var. *echinospermon* (Wallr.) Farwell—YAE-MUGURA. Straggling annual or biennial; stems elongate, much branched, retrorsely scabrous; leaves in verticils of 6's to 8's, narrowly oblanceolate or broadly linear, 1-3 cm. long,

1.5-4 mm. wide, obtuse and short awn-tipped, gradually narrowed at base, retrorsely scabrous on margin and on midrib beneath; inflorescence few flowered, axillary and terminal; flowers small, pale green, on spreading pedicels; fruit with hooked prickles.—May-July. Grassy slopes, waste grounds and thickets in lowlands and low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Sakhalin, Korea, China, Ryukyus, to Europe and Africa.

Var. *spurium*. *G. agreste* var. *leiospermon* Wallr.; *G. aparine* var. *spurium* (L.) Wimmer—TOGE-NASHI-YAE-MUGURA. Fruitlets not prickly.—The typical phase is doubtfully naturalized in Hokkaido.—Eurasia.

6. *Galium dahuricum* Turcz. var. *tokyoense* (Makino) Cufodontis. *G. tokyoense* Makino; *G. asprellum* var. *tokyoense* (Makino) Nakai—HANA-MUGURA. Very slender simple or sparsely branched perennial with slender creeping rhizomes; stems 30-60 cm. long, retrorsely scabrous on the angles; leaves usually in verticils of 6's, oblanceolate to narrowly so, 2-3 cm. long, 4-7 mm. wide, rounded, slightly retuse, or obtuse, short-mucronate, retrorsely scabrous on margin and on the midrib beneath; inflorescence rather many-flowered; flowers white, pedicelled; fruit glabrous.—June-July. Wet grassy places along rivers in lowlands; Honshu (centr. and n. distr.).—Korea and Manchuria.

Var. *dahuricum*. *G. asprellum* var. *dahuricum* Maxim.—EZO-MUGURA. Leaves acuminate, short awn-tipped.—Reported from Hokkaido.—Korea and the temperate regions of e. Asia.

7. *Galium trifidum* L. var. *brevipedunculatum* Regel. *G. trifidum* var. *pacificum* Wieg.; *G. trifidum* sensu auct. Japon., non L.—HOSOGA-NO-YOTSUBA-MUGURA. Rather delicate perennial, black when dry; stems 15-40 cm. long, often weakly scabrous-prickly; leaves in verticils of 4's or sometimes in 5's, narrowly oblong to oblanceolate, sometimes slightly unequal in the same whorl, rounded to very obtuse at apex, narrowed at base, with sparse retrorse prickles on margins and on midrib beneath; cymes few-flowered, terminal; flowers small, white, 3- or 4-lobed, the pedicels spreading; fruitlets subglobose, glabrous.—May-July. Wet boggy places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—e. Asia and N. America. The typical phase occurs in Eurasia.

8. *Galium pseudoasprellum* Makino. *G. asprellum* var. *lasiocarpum* Makino—ŌBA-NO-YAE-MUGURA. Green perennial; stems much elongate and branched, ascending, with retrorse prickles; leaves in verticils of 5's or 6's on the main branches, the uppermost ones in 4's or 5's, broadly oblanceolate to narrowly obovate-oblong, or oblanceolate in the upper ones, 1.5-3 cm. long, 5-10 mm. wide, obtuse to rounded, mucronate-tipped, sometimes acuminate in the upper ones, retrorse-prickly on the margins and on the midrib beneath; inflorescence axillary and terminal, loosely flowered, with slender branches and pedicels; corolla 4-lobed; fruitlets ellipsoidal, usually with hooked prickles.—Aug.-Oct. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and China.

9. *Galium paradoxum* Maxim. *G. stellariifolium* Fr. & Sav.—MIYAMA-MUGURA. Rather soft perennial, deep green when dried; stems 10-25 cm. long, smooth, with 3 to 5 whorls of leaves; leaves in verticils of 4's, one of the pairs smaller than the other, ovate to broadly so, 1-4 cm. long, 1-2 cm. wide, acute, rounded or acute at base, loosely strigose on margin and on upper side toward the margin, the petioles 4-12 mm. long; cymes pedunculate, few-flowered; flowers white; fruit long-

pedicellate, with hooked prickles.—July–Aug. Damp coniferous woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, China, Manchuria, and e. Siberia.

10. *Galium yakusimense* Masam. YAKUSHIMA-MUGURA. Delicate perennial; stems 5–10 cm. long, smooth, with few whorls of leaves; leaves in verticils of 4's, rather unequal in a whorl, narrowly obovate or obovate-oblong, 6–10(–12) mm. long, 2–3 mm. wide, acute, minutely awn-tipped, narrowed at base, subsessile, deep green, loosely strigose on margins and on midrib beneath; cymes few-flowered, the pedicels rather slender, 2–5 mm. long; fruit puberulent.—Aug.–Oct. Kyushu (Yakushima); rare.

11. *Galium newerthii* Fr. & Sav. YABU-MUGURA. Perennial; stems elongate, slender, smooth, 4-angled, 50–70 cm. long; leaves in verticils of 4's or 5's, narrowly obovate to oblong, 1–1.5(–2) cm. long, abruptly cuspidate, acute at base, loosely strigose on margin, on upper side toward margin, and on under side; inflorescence axillary, loosely few-flowered, the pedicels much longer than the fruit, the bracts 2(–3); fruitlets oblong, glabrous.—Aug. Honshu (Kantō Distr.).

12. *Galium kikumugura* Ohwi. *G. brachypodium* Maxim. non Jord.—KIKU-MUGURA. Perennial; stems much elongate, smooth, 30–50 cm. long; leaves membranous, vivid green when dry, narrowly ovate or oblong, 1–1.5(–2.5) cm. long, 5–8 mm. wide, rounded to obtuse, mucronate, thinly strigose on margin and on upper surface near the margin; cymes terminal and axillary, few-flowered, on rather long slender peduncles, the pedicels unequal, 1–5 mm. long, shorter than the fruit, the bracts solitary; flowers white, sometimes bracteate at base; fruitlets oblong, rather densely pilosulous.—May–June. Hokkaido, Honshu, Shikoku, Kyushu.

13. *Galium trachyspermum* A. Gray. *G. gracile* sensu auct. Japon., non Bunge; *G. bungei* var. *trachyspermum* (A. Gray) Cufodontis.—YOTSUBA-MUGURA. Delicate nearly erect perennial; stems slender, 4-angled, glabrous or nearly so, 30–50 cm. long; leaves verticillate in 4's, ovate-oblong, elliptic, or ovate, 1–1.5 cm. long, 3–6 mm. wide, obtuse or subacute, rounded at base, with spreading whitish hairs on margin and on lower surface; cymes axillary, densely about 10-flowered, the pedicels 1–3 mm. long; flowers small, pale yellowish green; fruit relatively small, densely warty.—May–June. Thickets in hills and low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea and China.—Forma *hispidum* (Matsuda) Ohwi. *G. gracile* forma *hispidum* Matsuda.—KE-YOTSUBA-MUGURA. With prominent white hairs throughout.—Occurs with the typical phase.

Var. *nudicarpum* Honda. KE-NASHI-YOTSUBA-MUGURA. Fruitlets smooth or nearly so.—Occurs with the typical phase.

14. *Galium gracilens* (A. Gray) Makino. *G. trachyspermum* var. *gracilens* A. Gray.—HIME-YOTSUBA-MUGURA. Resembles the preceding; stems 30–40 cm. long; leaves in verticils of 4's, oblong-linear or linear-lanceolate, 6–12 mm. long, 1.5–2.5 mm. wide, obtuse at both ends, with spreading white hairs on margin and on midrib; cymes rather small, loosely flowered, the pedicels slender; flowers relatively small, pale green; fruit rather small, densely warty.—May–June. Hills and mountains; Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, and Korea.

15. *Galium pogonanthum* Fr. & Sav. *G. trachyspermum* var. *setuliflorum* A. Gray; *G. setuliflorum* (A. Gray) Makino.—YAMA-MUGURA. Resembles species Nos. 13 and 14, but slightly larger; stems 30–50 cm. long, slender, glabrous;

leaves in verticils of 4's, broadly linear or oblong-lanceolate, 1.5–2.5(–3) cm. long, 2–3.5 mm. wide, acute, narrowed to the base, slightly scabrous on margin and on midrib beneath; cymes terminal or nearly so, trichotomously branched, few-flowered, the pedicels 3–10 mm. long; flowers pale green, the corolla-lobes usually with few simple long hairs externally; fruit densely warty.—May–June. Woods and thickets in mountains; Honshu, Shikoku, Kyushu.—Korea.—Forma *trichopetalum* (Nakai) Ohwi. *G. trichopetalum* Nakai.—OYAMA-MUGURA. Stems spreading-pilose.—Forma *nudiflorum* (Makino) Ohwi. *G. setuliflorum* var. *nudiflorum* Makino.—KE-NASHI-YAMA-MUGURA. Corolla glabrous.

16. *Galium kamschatcicum* Steller ex Roem. & Schult. *G. obovatum* sensu auct. Japon., non H.B.K.—EZO-NO-YOTSUBA-MUGURA. Small perennial 5–15 cm. high; stems smooth, glabrous, weak; leaves thinly membranous, in verticils of 4's, elliptic to broadly so, sometimes obovate-elliptic or oblong, 1–2.5 cm. long, 7–12 mm. wide, rounded and mucronate-tipped, 3-nerved, rather long coarse-hairy on margins and upper surface; cymes nearly terminal, trichotomously branched, few- to about 10-flowered; flowers pale yellow-green, the pedicels spreading, rather thick; fruit densely hooked-prickly.—July–Aug. Damp coniferous woods in mountains; Hokkaido, Honshu (centr. and n. distr.).—Forma *intermedium* Takeda. KE-NASHI-EZO-NO-YOTSUBA-MUGURA. Plant short-hairy.—Occurs with the typical phase.—Kuriles, Sakhalin, Korea, Ussuri, Kamchatka, and N. America.

Var. *acutifolium* Hara. *G. kamschatcicum* var. *oreganum* sensu auct. Japon., non Piper.—OBA-NO-YOTSUBA-MUGURA. Plant slightly larger; stems 15–30 cm. long; leaves oblong, narrowly obovate, or elliptic, 2–3.5 cm. long, 1–2 cm. wide, obtuse and mucronate or subacute.—Damp coniferous woods; Hokkaido, Honshu, Shikoku.—Kuriles and Sakhalin.

17. *Galium boreale* L. var. *kamschatcicum* Maxim. *G. boreale* var. *ciliatum* Nakai; *G. boreale* var. *genuinum* sensu auct. Japon., non Gren. & Godr.—EZO-KINUTA-SŌ. Perennial; stems rather firm, erect, 20–30 cm. long, often branched, puberulent; leaves in verticils of 4's, lanceolate to ovate-oblong, 1.5–3 cm. long, 2–5 mm. wide, acute to acuminate with an obtuse tip, 3-nerved, puberulent above, on margin, and on the nerves beneath; inflorescence a terminal densely flowered panicle, the pedicels very short; flowers white; fruitlets soft-pubescent.—July–Aug. Hokkaido.—Sakhalin, Kuriles, and Kamchatka. The typical phase is widely spread throughout the cooler regions of the N. Hemisphere.

18. *Galium kinuta* Nakai & Hara. *G. boreale* var. *japonicum* Maxim.; *G. japonicum* (Maxim.) Makino & Nakai (1908), non Makino (1903)—KINUTA-SŌ. Perennial; stems erect, glabrous, purplish, simple, 40–50 cm. long, with several whorls of leaves; leaves chartaceous, in verticils of 4's, ovate to narrowly so, 3–5 cm. long, 1–2 cm. wide, gradually acuminate, 3(–5)-nerved, short-strigose on margin and on upper surface, especially on the nerves; inflorescence loosely flowered, in a terminal rather large panicle, with slender long branches and pedicels; flowers many, rather loosely arranged, white; fruitlets glabrous.—July–Aug. Mountains; Honshu, Shikoku; rather variable.—Forma *bracteatum* (Nakai) Hara. *G. japonicum* var. *bracteatum* Nakai.—OTOGIRI-KINUTA-SŌ. With broad bracts.—Forma *viridescens* (Matsum. & Nakai) Hara. *G. japonicum* var. *viridescens* Matsum. & Nakai.—AO-KINUTA-SŌ. With green stems and inflorescence.

19. *Galium nakaii* Kudo ex Hara. *G. japonicum* var. *intermedium* Nakai.—MIYAMA-KINUTA-SŌ. Perennial; stems erect, 15–25(–40) cm. long, glabrous, 4-angled; leaves in verticils of 4's, ovate to ovate-lanceolate, 2.5–5 cm. long, 1–2.5 cm. wide, usually acute, 3-nerved, strigose on margin and nerves;

inflorescence terminal and in upper axils, 1–3 cm. long, much shorter than the leaves, 3- to 7-flowered; fruitlets strigose, the hairs incurved.—July–Aug. Mountains; Hokkaido, Honshu (n. distr.).

19. ASPERULA L. KURUMABA-SŌ ZOKU

Herbs; stems 4-angled; leaves in whorls, sometimes opposite in the upper ones; flowers small, white or reddish, the pedicels jointed with the calyx; calyx 4-toothed or absent; corolla infundibuliform, rarely subcampanulate, the lobes 4, spreading, valvate in bud; stamens 4, on the throat, the filaments filiform; ovary 2-locular, with 1 ovule in each locule; styles 2, often connate at base; fruit dry or slightly fleshy, divided into 2 fruitlets; seeds solitary in each fruitlet, adnate to the pericarp.—About 80 species, in Asia, Europe, and Australia.

- 1A. Leaves in verticils of 6's to 10's, 2.5–4 cm. long; fruitlets with spreading long hooked prickles. 1. *A. odorata*
 1B. Leaves in verticils of 4's, 8–15 mm. long; fruitlets glabrous. 2. *A. trifida*

1. *Asperula odorata* L. KURUMABA-SŌ. Resembles *Galium japonicum*, deep green when dry; stems erect, simple, with few whorls of leaves, 25–40 cm. long, 4-angled, glabrous; leaves in verticils of 6's to 10's, narrowly oblong or oblong-lanceolate, 2.5–4 cm. long, 5–10 mm. wide, obtuse and mucronate or acute, acute at base, strigose on margin and on midrib beneath; cymes terminal, trichotomously branched, few- to many-flowered; flowers white, infundibuliform, 4–5 mm. across; fruitlets with spreading long hooked prickles.—June–July. Woods in mountains; Hokkaido, Honshu.—Korea, s. Kuriles, Sakhalin, and Europe.

2. *Asperula trifida* Makino. *Galium shikokianum* Nakai.—USU-YUKI-MUGURA. Slender green perennial; stems 20–30 cm. long, erect, glabrous, 4-angled; leaves in verticils of 4's, ovate or narrowly so, 8–15 mm. long, 5–8 mm. wide, obtuse, sometimes minutely mucronate, strigose on margin and on nerves beneath; cymes rather loose, on upper portion of the stem, few- to many-flowered; flowers pedicelled, white, infundibuliform, about 2.5 mm. across; fruit glabrous.—June–Aug. Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.

Fam. 187. CAPRIFOLIACEAE SUI-KAZURA KA Honeysuckle Family

Shrubs or rarely herbs; leaves opposite, simple, rarely pinnately compound; stipules small or more often absent; flowers bisexual, actinomorphic or zygomorphic, usually in cymes; calyx adnate to the ovary, 5-lobed or -toothed; corolla gamopetalous, sometimes bilabiate, the lobes imbricate in bud; stamens inserted on the corolla-tube and alternate with the lobes, the anthers 2-locular, longitudinally split; ovary 2- to 5-locular; style solitary, simple, terminal; fruit a berry or capsule; seeds with copious endosperm.—About 18 genera, with about 300 species, mainly in the temperate regions of the N. Hemisphere.

- 1A. Corolla usually rotate, small, actinomorphic; style very short or absent.
 2A. Leaves pinnately compound; fruit berrylike, 3- to 5-seeded. 1. *Sambucus*
 2B. Leaves simple, rarely lobed or cleft; fruit a 1-seeded drupe. 2. *Viburnum*
 1B. Corolla tubular or campanulate, relatively large, sometimes zygomorphic; style elongate.
 3A. Stamens 4.
 4A. Fruit narrowly oblong, the calyx-lobes persistent, slightly accrescent after anthesis; erect much-branched shrubs. 3. *Abelia*
 4B. Fruit ovoid to ovoid-globose, the calyx-lobes deciduous; creeping subshrub. 4. *Linnæa*
 3B. Stamens 5.
 5A. Herbs; ovules solitary in each locule; corolla gibbous. 5. *Triosteum*
 5B. Shrubs.
 6A. Fruit a 2-valved capsule; seeds many; corolla nearly actinomorphic. 6. *Weigela*
 6B. Fruit a berry; seeds few; corolla usually zygomorphic, rarely actinomorphic. 7. *Lonicera*

1. SAMBUCUS L. NIWATOKO ZOKU

Small trees or shrubs, sometimes merely giant herbs with stout stems; leaves opposite, pinnately compound, the leaflets toothed, the petioles sometimes with few discoid glands; flowers small, white, yellowish, or reddish, bracteolate, in large umbellate corymbs; calyx-teeth 3 to 5; corolla rotate or rotate-campanulate, 3- to 5-lobed, the lobes imbricate, rarely valvate in bud; stamens 5, the anther-locules splitting on outer margin; ovary 3- to 5-locular; style short, 3-lobed; ovules solitary in each locule; drupe berrylike, 3- to 5-seeded.—About 30 species, in the temperate regions and mountains of the Tropics except S. Africa.

- 1A. Large shrub without discoid glands on the panicle inflorescence. 1. *S. sieboldiana*
 1B. Large herb, rarely somewhat woody at base, with few large obconical glands on the corymbose inflorescence. 2. *S. chinensis*

1. *Sambucus sieboldiana* Bl. ex Graebn. *S. racemosa* var. *sieboldiana* Miq.—NIWATOKO. Large shrub with grayish yellow-brown lenticellate branchlets; leaves 12–30 cm. long, petiolate, the leaflets (5–)7, oblong or narrowly so, 4–12 cm. long, toothed; panicles terminal, pyramidal, pedunculate, with minute warty tubercles on the branches; flowers white,

3–4 mm. across; fruit red, rarely yellow or orange-yellow, globose or ellipsoidal, about 4 mm. across; stones obsoletely rugose.—Apr. Thickets and woods in hills and low elevations in the mountains; Honshu, Shikoku, Kyushu; very common and variable.—Korea.

Var. *miquellii* (Nakai) Hara. *S. buergeriana* Bl. ex Nakai; *S. racemosa* var. *miquellii* Nakai; *S. racemosa* var. *pubescens* Schwerin, non Dipp.; *S. latipinna* var. *miquellii* (Nakai) Nakai; *S. miquellii* Nakai ex Komar. & Alisova—Ezo-NIWATOKO. Warty tubercles of inflorescence elongate and hairlike.—Woods and thickets in mountains; Hokkaido, Honshu (centr. distr.).—s. Kuriles, Sakhalin, Korea, and Ussuri.

2. *Sambucus chinensis* Lindl. (?) *S. thunbergii* G. Don; *S. thunbergiana* Bl.; *S. javanica* sensu auct. Japon., non Bl.; *Ebulis chinensis* (Lindl.) Nakai; *S. formosana* Nakai—

Sokozu. Rather stout green erect herb with creeping rhizomes; stems 1–1.5 m. long; leaves petiolate, rather large, the leaflets 5–7, broadly lanceolate to narrowly ovate, 5–17 cm. long, 2–6 cm. wide, toothed; inflorescence flat-topped, large, nearly glabrous, glands yellowish, nearly obconical; flowers white, 3–4 mm. long, on slender pedicels; fruit globose, about 4 mm. long, red.—Aug.–Sept. Thickets and woods in hills and low elevations in the mountains; Honshu, Shikoku, Kyushu.—China, Ryukyu, Formosa, and Bonins.

2. VIBURNUM L. GAMAZUMI ZOKU

Shrubs or trees; leaves opposite, simple, or rarely palmately lobed, toothed; stipules usually small or absent; flowers in axillary or terminal subumbellate corymbs or panicles, white or pink, bisexual or sometimes the peripheral ones sterile with a large corolla; calyx-teeth small; corolla rotate or tubular, the lobes 5, imbricate in bud; stamens 5; ovary 1- to 3-locular; style short; ovules solitary in each locule; drupe fleshy or dry, 1-seeded.—About 150 species, in the temperate to warmer regions of the N. Hemisphere and S. America.

1A. Corolla rotate.

2A. Inflorescence with large sterile flowers on the periphery.

3A. Leaves 3-lobed, 3-nerved from the base, with sessile discoid glands at the top of petioles; flowering branchlets usually with 2 pairs of leaves. 1. *V. opulus* var. *calvescens*

3B. Leaves toothed, not lobed, penninerved, glandless; flowering branchlets with one pair of leaves.

4A. Leaves cordate; inflorescence without a common peduncle. 2. *V. furcatum*

4B. Leaves rounded to cuneate at base; inflorescence with a common peduncle. 3. *V. plicatum*

2B. Inflorescence without large sterile flowers on the periphery.

5A. Inflorescence a panicle with a short main axis. 4. *V. sieboldii*

5B. Inflorescence flat-topped, without an elongate main axis.

6A. Inflorescence large, usually many-flowered, erect.

7A. Stamens shorter than the corolla; leaves subcoriaceous.

8A. Evergreen shrub or small tree, glabrous. 5. *V. japonicum*

8B. Deciduous shrub, stellate-pilose on young branchlets, under side of leaves and inflorescence. 6. *V. brachyandrum*

7B. Stamens longer than the corolla; leaves membranous or herbaceous.

9A. Petioles 1–1.5 cm. long; stipules absent.

10A. Leaves coarsely pilose on both sides; young branches and inflorescence scabrous. 7. *V. dilatatum*

10B. Leaves usually glabrous above; young branches and inflorescence with scattered long-appressed hairs. 8. *V. wrightii*

9B. Petioles 2–5 mm. long; stipules subulate, minute. 9. *V. erosum*

6B. Inflorescence rather small and few-flowered, nodding or nearly pendulous. 10. *V. phlebotrachum*

1B. Corolla tubular or hypocrateriform, the tube longer than the lobes.

11A. Evergreen shrubs; inflorescence a panicle; leaves coriaceous.

12A. Leaves 8–20 cm. long, the petioles 2.5–4 cm. long. 11. *V. awabuki*

12B. Leaves 5–8 cm. long, the petioles 5–10 mm. long. 12. *V. suspensum*

11B. Deciduous shrubs; inflorescence a corymb; leaves membranous.

13A. Corolla-tube 1–1.3 cm. long, with spreading lobes about half as long as the tube. 13. *V. carlesii*

13B. Corolla-tube shorter with erect lobes about 1 mm. long. 14. *V. urceolatum*

1. *Viburnum opulus* L. var. *calvescens* (Rehd.) Hara. *V. sargentii* var. *calvescens* Rehd.; *V. sargentii* Koehne; *V. opulus* var. *sargentii* (Koehne) Takeda; *V. pubinerve* Bl. ex Nakai—KAMBOKU. Deciduous shrub often white-pubescent on lower side of leaves and inflorescence; flowering branchlets usually with 2 pairs of leaves; leaves obovate-orbicular, 6–10 cm. long and as wide, truncate, shallowly cordate, or broadly cuneate at base, 3-lobed, incised, and few-toothed, 3-nerved from the base, the lobes more or less cuspidate or short-caudate, the petioles 3–4 cm. long, with a pair of sessile discoid glands at the top; inflorescence many-flowered, flat-topped, 6–12 cm. across, with a few large bractlike neutral flowers on the outer margin; anthers dark purple; fruit globose, 8–10 mm. across, red.—May–June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Amur, Ussuri, Manchuria, China, s. Kuriles, and Sakhalin.

2. *Viburnum furcatum* Bl. *Ö-KAME-NO-KI*, MUSHIKARI. Large shrub, yellowish furfuraceous while young, the branches dark purple; leaves ovate-orbicular or broadly ovate, 7–15 cm.

long, 5–10 cm. wide, abruptly acute, cordate at base, toothed, with 7–10 pairs of parallel lateral nerves, the petioles reddish, 2–4 cm. long; inflorescence sessile, 7–12 cm. across, 2-leaved at the base, many-flowered, with few neutral flowers on margin; stamens about half as long as the corolla-lobes; fruit ellipsoidal, about 8 mm. long, becoming red, then black at maturity.—May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common northward.—s. Kuriles, Sakhalin, and Korea (Quelpaert and Dagelet Is.).

3. *Viburnum plicatum* Thunb. var. *tomentosum* (Thunb.) Miq. *V. tomentosum* Thunb.; *V. plicatum* forma *tomentosum* (Thunb.) Rehd.—YABU-DEMARI. Large deciduous shrub pubescent while young, the branches gray-brown; leaves ovate to broadly so, or obovate, 7–10 cm. long inclusive of the petioles, 4–7 cm. wide, abruptly acute, rounded to cuneate at base, with deltoid mucronate teeth except near base, pale green beneath, with 10–15 pairs of parallel lateral nerves, the petioles 1.5–2.5 cm. long; inflorescence rather large, terminal on short 2-leaved branchlets, peduncled, with large

sterile flowers on margin, the bracts and bracteoles small, deciduous; stamens about 1.5 times as long as the corolla-lobes, the anthers pale yellow; fruit broadly ellipsoidal, 5-6 mm. long, becoming red, then black at maturity.—May-June. Thickets in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Formosa and China.

Var. *glabrum* (Koidz.) Hara. *V. tomentosum* var. *glabrum* Koidz. ex Nakai; *V. amplissimum* Satake—KE-NASHI-YARU-DEMARI. Plant larger, less pubescent, soon almost glabrous; leaves to 15 cm. long.—Honshu (Japan Sea side of centr. and n. distr.).

4. *Viburnum sieboldii* Miq. GOMA-KI. Large deciduous foetid-smelling shrub with gray-brown branches, the branchlets, under side of leaves especially on nerves, and inflorescence with fasciated white hairs while young; leaves obovate-oblong, oblong or obovate, 8-15 cm. long, inclusive of petioles, 15-25 mm. long, 4-8 cm. wide, abruptly acute to rounded, cuneate or acute at base, toothed toward the tip, pale green beneath, with 9-12 pairs of parallel lateral nerves, the petioles 15-25 mm. long; inflorescence a panicle, 7-15 cm. across, on short 2- or 4-leaved branchlets; stamens shorter than the corolla-lobes; fruit ellipsoidal, about 1 cm. long, red.—Apr.-May. Thickets in lowlands and low mountains; Honshu, Shikoku, Kyushu.

Var. *obovatifolium* (Yanagita) Sugimoto. *V. obovatifolium* Yanigita—MARUBA-GOMA-KI. Leaves obovate to broadly so, to 25 cm. long.—Japan Sea side of Honshu.

5. *Viburnum japonicum* (Thunb.) Spreng. *Cornus japonica* Thunb.; *V. buergeri* Miq.; *V. macrophyllum* Bl.—HAKUSAN-BOKU. Large evergreen foetid-smelling shrub or small tree; branches dark purple-brown, glabrous, often glandular-dotted while young, as well as the inflorescence; leaves subcoriaceous, glabrous, lustrous, broadly ovate, broadly obovate, or ovate-obicular, 7-20 cm. long, 5-17 cm. wide, abruptly acute, broadly cuneate or rounded at base, undulate-toothed toward the tip, minutely glandular-dotted beneath, with 5-8 pairs of parallel lateral nerves, the petioles 1.5-5 cm. long; inflorescence on short 2-leaved branchlets, short-peduncled, glabrous, 8-15 cm. across; stamens slightly shorter than the corolla-lobes; fruit ovoid, 6-8 mm. long, red.—Mar.-Apr. Honshu, Kyushu.—Formosa and Ryukyus.

Var. *fruticosum* Nakai. KO-HAKUSAN-BOKU. Smaller ascending shrub less than 2 m. high.—Honshu (Izu Peninsula and Izu Is.).

6. *Viburnum brachyandrum* Nakai. *V. dilatatum* var. *brachyandrum* (Nakai) Makino—SHIMA-GAMAZUMI. Deciduous shrub; branches dark purple-brown, long-pubescent and stellate-pilose while young; leaves broadly obovate, obovate-obicular, or rhombic-obicular, 8-13 cm. long, abruptly acute, rounded to cuneate at base, deltoid-toothed, the petioles 1-1.5 cm. long, villous; inflorescence relatively large, short-peduncled, terminal on short 2-leaved branchlets, long-pubescent and stellate-pilose while young; stamens shorter than the corolla-lobes.—Apr. Honshu (Izu Isl.).

7. *Viburnum dilatatum* Thunb. *V. lantana* var. *japonicum* Fr. & Sav.—GAMAZUMI. Coarsely pilose deciduous shrub; young branches and inflorescence more or less scabrous; leaves obovate to broadly so, broadly ovate or obovate-obicular, 3-12 cm. long, 2-8 cm. wide, abruptly acute, rounded to obtuse or sometimes cuneate at base, short mucronate-toothed, pale green and glandular-dotted beneath, coarsely pilose on both sides, the petioles (5-)10-15 mm. long; inflorescence 4-10 cm.

across, peduncled, on short 2-leaved branchlets; stamens longer than the corolla-lobes; fruit ovoid, about 5 mm. long, red.—May-June. Thickets in hills and low elevations in the mountains; common and extremely variable.—Forma *xanthocarpum* Rehd. KIMINO-GAMAZUMI. Yellow-fruited.

Viburnum hizenense Hatus. *V. dilatatum* subsp. *hizenense* Hatus.; *V. dilatatum* var. *hizenense* (Hatus.) Ohwi. Alleged hybrid of *V. dilatatum* and *V. japonicum*. Plants nearly glabrous except the nerves of leaves beneath, the young branchlets sometimes short-pilose.—Kyushu (n. distr.).

8. *Viburnum wrightii* Miq. MIYAMA-GAMAZUMI. Deciduous shrub with purple-brown branches, these glabrous when young; inflorescence with scattered long-appressed hairs while young; leaves ovate-obicular, broadly obovate, or broadly ovate, 7-12 cm. long, 4-9 cm. wide, abruptly acuminate, rounded to broadly cuneate at base, mucronate-toothed, usually glabrous above, usually minutely glandular-spotted and appressed-pubescent on nerves beneath, the petioles 1-1.5 cm. long, purplish red, long appressed-pubescent; inflorescence on short 2-leaved branchlets, glabrous or long-pubescent, sometimes with minute glandular dots; fruit ovoid, red, 6-7 mm. long.—May-June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin, Korea, and China.

9. *Viburnum erosum* Thunb. *V. erosum* var. *punctata* Fr. & Sav.; *V. erosum* var. *laevis* Fr. & Sav.; *V. erosum* var. *furcifula* Fr. & Sav.; (?) *V. shikokianum* Koidz.—KOBANO-GAMAZUMI. Deciduous shrub with gray or purplish branches; young branches, leaves, and inflorescence with stellate and short coarse hairs; stipules subulate, minute; leaves narrowly ovate, elliptic, oblong or obovate, 3-10 cm. long, 2-5 cm. wide, acute, obtusely rounded or cuneate at base, toothed, the petioles pilose, 2-5 mm. long; inflorescence 4-8 cm. across, short-peduncled, on short 2-leaved branchlets; fruit red, broadly ovoid, 6-7 mm. long.—May. Sunny hills and low elevations in the mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; very common and variable.—Forma *xanthocarpum* (Sugimoto) Hara. *V. erosum* var. *xanthocarpum* Sugimoto—KIMI-NO-KOBANO-GAMAZUMI. Yellow-fruited.—Korea and China.

Var. *taquetii* (Lév.) Rehd. *V. taquetii* Lév.—SAIKOKU-GAMAZUMI. Leaves irregularly incised.—Honshu (w. distr.), Shikoku, Kyushu.

10. *Viburnum phlebotrichum* Sieb. & Zucc. OTOKO-YŌZOME. Slender deciduous shrub with gray-brown branches; young branchlets, upper surface of leaves, and inflorescence glabrous or thinly long-pubescent; leaves nearly membranous, ovate, elliptic, or rhombic-ovate, 4-8 cm. long, 2.5-4 cm. wide, acute or acuminate, obtuse to subacute at base, coarsely mucronate-toothed, with appressed silky-pubescent on nerves, the petioles 3-7 mm. long, usually glabrous; inflorescence 3-6 cm. across, rather small, few-flowered, nodding or nearly pendulous on 2-leaved short branchlets; flowers white, often pinkish; stamens shorter than the corolla-lobes, suberect; fruit broadly ovoid, 7-8 mm. long, red.—May. Mountains; Honshu, Shikoku, Kyushu.

11. *Viburnum awabuki* K. Koch. *V. odoratissimum* sensu auct. Japon., non Ker-Gawl.; *V. odoratissimum* var. *awabuki* (K. Koch) K. Koch ex Ruempler—SANGO-JU. Large evergreen nearly glabrous shrub or small tree; branches rather stout, gray-brown; leaves coriaceous, narrowly oblong, 8-20 cm. long, 4-8 cm. wide, obtuse or acute at both ends, undulately short-toothed on upper half or nearly entire, lustrous

above, pale green beneath, with 6-8 pairs of upwardly directed lateral nerves, the petioles 2.5-4 cm. long, stout; inflorescence paniculate, rather large, on short 4-leaved branchlets, peduncled, rusty-brown pubescent on nodes when young; calyx-limb shallowly 5-lobed; corolla about 6 mm. long, the lobes about 2 mm. long, spreading; filaments short; fruit ellipsoidal, 7-8 mm. long, red.—June. Lowlands, especially near the sea; Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu; frequently planted for hedges.—s. Korea, Ryukyus, and Formosa.

12. *Viburnum suspensum* Lindl. *V. sandankwa* Hassk.—GOMO-JU, KO-URUME. Evergreen much-branched shrub with red-brown branches, minutely stellate-pilose; leaves thick, coriaceous, elliptic or obovate-elliptic, 5-8 cm. long, 2-4 cm. wide, rounded or very obtuse, obtuse to acute at base, with obtuse appressed teeth, lustrous, glabrous, with impressed nerves and veinlets above, pale green and nearly glabrous beneath except the axillary tufts of hairs, the lateral nerves of 3 or 4 pairs, the petioles 5-10 mm. long; inflorescence terminal, 2-4 cm. long, on the previous year's branches, peduncled; calyx-limb 5-lobed; corolla about 1 cm. long, the lobes 2-3 mm. long, spreading; fruit ellipsoidal, about 5 mm. long, red.—Mar.-Apr.—Sometimes cultivated in our area.—Ryukyus and Formosa.

13. *Viburnum carlesii* Hemsl. *Solenolantana carlesii* (Hemsl.) Nakai.—Ō-CHŌJI-GAMAZUMI. Deciduous much-branched shrub; stems, leaves and inflorescence stellate-pilose and tufted furfuraceous-puberulent; leaves ovate-obovate or broadly ovate, abruptly acute, 3-7 cm. long, 2.5-6 cm. wide, rounded to shallowly cordate at base, mucronate-toothed, with

4-6 pairs of lateral nerves, the petioles 3-5 mm. long; inflorescence cymose, short-peduncled, 2-5 cm. across, on short 2-leaved branchlets; calyx-limb 5-lobed; corolla white or pale rose, the tube 1-1.3 cm. long, the lobes about half as long as the tube; fruit ellipsoidal, about 8 mm. long, black.—Apr.-May. Kyushu (Tsushima Isl.).—Korea.

Var. *bitchiense* (Makino) Nakai. *V. bitchiense* Makino; *V. carlesii* var. *syringaeiflora* Hutchins.; *V. burejaeticum* sensu aut. Japon., non Regel & Herder; *Solenolantana carlesii* var. *bitchiensis* (Makino) Nakai.—CHŌJI-GAMAZUMI. Leaves oblong or ovate, acute, the petioles 4-8 mm. long; flowers smaller.—Honshu (Chūgoku Distr.), Shikoku (Azu-kijima), Kyushu (Buzen Prov.).—Korea.

14. *Viburnum urceolatum* Sieb. & Zucc. *V. urceolatum* forma *brevifolium* Makino—YAMA-SHIGURE, MARUBA-MI-YAMA-SHIGURE. Nearly glabrous deciduous shrub with purple-brown branches; leaves ovate to ovate-oblong, 6-12 cm. long, 2.5-5 cm. wide, acuminate to acute, usually rounded at base, obtusely serrulate, deep green and glabrous above, pale green and the nerves minutely stellate-puberulent beneath, with 4 or 5 pairs of lateral nerves, the petioles 1-2 cm. long, minutely stellate-puberulent; inflorescence 3-4 cm. across, on 4- rarely 2-leaved branchlets, puberulent, peduncled; corolla 3-3.5 mm. long, short-tubular, the lobes erect, about 1 mm. long; stamens exserted; fruit broadly ellipsoidal, about 6 mm. long, red.—June-July. Woods in mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Var. *procumbens* Nakai. MIYAMA-SHIGURE. Stems long-creeping.—Damp coniferous woods; Honshu (centr. and n. distr.).

3. ABELIA R. Br. TSUKUBANE-UTSUGI ZOKU

Erect or suberect shrubs; leaves opposite, petiolate, entire or toothed; stipules absent; inflorescence usually a 3- or rarely 1-flowered axillary or terminal cyme; flowers usually sessile, white, pink, reddish or yellowish, 2- to 4-bracteate at base; calyx-tube narrow, flat, the lobes 2-5, persistent; corolla tubular-campanulate or infundibuliform, the limb 5-lobed, nearly regular; stamens 4; ovary 3-locular, usually one locule maturing; fruit coriaceous, 1-seeded, narrowly oblong, the calyx-lobes persistent, slightly accrescent after anthesis.—About 30 species, in e. Asia and the Himalayas, 2 or 3 in Mexico.

- 1A. Branches scarcely thickened at the nodes, not fissured; corolla campanulate-infundibuliform, the tube amplate, much longer than the calyx-lobes; fruit barely flattened. 1. *A. serrata*
- 2A. Calyx-lobes 2 or 3; peduncles 2- to 7-flowered. 1. *A. serrata*
- 2B. Calyx-lobes 4 or 5; peduncles 1- or 2-flowered. 2. *A. spatulata*
- 3A. Calyx-lobes 5. 2. *A. spatulata*
- 3B. Calyx-lobes 4. 3. *A. tetrasepala*
- 1B. Branches much thickened at the nodes, with 6 longitudinal fissures; corolla hypocrateriform, the tube scarcely amplate, as long as or shorter than the calyx-lobes; fruit flattened. 4. *A. integrifolia*

1. *Abelia serrata* Sieb. & Zucc. *Linnaea serrata* (Sieb. & Zucc.) Graebn.—KO-TSUKUBANE-UTSUGI. Deciduous shrub 1-1.5 m. high, with irregularly fissured bark, young branches often puberulent; leaves rhombic-ovate, 1-2.5 cm. long, 5-10 mm. wide, obtuse or acuminate with an obtuse tip, obtusely few-toothed, short-pilose on both sides, short-petiolate; flowers (1-)-2-7, short-pedunculate, bracteate and bracteolate at base; calyx-lobes 2, sometimes 3, oblong or elliptic, often shallowly 2-lobed; corolla campanulate-infundibuliform, 1-1.5 cm. long, pale yellow.—May. Hills and mountains; Honshu (centr. distr. and westw.), Shikoku, Kyushu; variable.

Var. *buchwaldii* (Graebn.) Nakai. *Linnaea buchwaldii* Graebn.; *A. buchwaldii* (Graebn.) Rehd.—KIBANA-TSUKU-

BANE-UTSUGI. Leaves larger, 3-5 cm. long; corolla 2-3 cm. long.—Honshu (centr. and w. distr.), Shikoku, Kyushu.

Var. *gymnocarpa* (Graebn.) Nakai. *Linnaea gymnocarpa* Graebn.—HIRO-HA-TSUKUBANE-UTSUGI. Resembles the preceding variety, the plant glabrous.—Honshu (centr. distr.).

Var. *tomentosa* (Koidz.) Nakai. ONI-TSUKUBANE-UTSUGI. Plant pilose.—Shikoku.

Var. *integerrima* Nakai. MARUBA-TSUKUBANE-UTSUGI. Leaves and calyx-lobes entire.—Honshu (w. distr.).

2. *Abelia spatulata* Sieb. & Zucc. *A. spatulata* var. *elliptica* Miq.—TSUKUBANE-UTSUGI. Deciduous shrub with grey-brown bark; young branches red-brown, often puberulent; leaves narrowly rhombic-ovate to broadly so, 2.5-6 cm.

long, 1.5–3.5 cm. wide, abruptly acuminate with an obtuse tip, few-toothed, more or less pilose on both sides, short-petiolate; flowers (1 or) 2, sessile, short-pedunculate, bracteate and bracteolate at base; calyx-lobes 5, persistent, obconic or oblong; corolla pale yellow, 2–3 cm. long.—May. Sunny thickets in mountains; Honshu, Shikoku, Kyushu; common and variable.

Var. *sanguinea* Makino. *A. sanguinea* Makino; *A. curviflora* Nakai; *A. sanguinea* var. *purpurascens* Honda—BENI-BANA-NO-TSUKUBANE-UTSUGI. Plant slender; corolla reddish, 1.5–2 cm. long.—Honshu.

Var. *stenophylla* Honda. *A. spathulata* var. *macrophylla* Honda & var. *ionostachya* Honda—UGO-TSUKUBANE-UTSUGI. Usually larger in all parts; branchlets and leaves spreading-pilose.—Honshu (Japan Sea side of n. distr.).

3. *Abelia tetrapala* (Koidz.) Hara & Kurosawa. *A. spathulata* var. *tetrapala* Koidz.; *A. spathulata* var. *subtetrapala* Makino—Ô-TSUKUBANE-UTSUGI, ME-TSUKUBANE-UTSUGI. Resembles No. 2, but the petioles and underside of

leaves spreading-pilose especially on midvein; calyx pilose, the segments 4; corollas large, 3–4 cm. long, with slender tube.—Honshu (Iwashi and westw.), Shikoku, Kyushu.

4. *Abelia integrifolia* Koidz. *A. shikokiana* Makino; *Zabelia shikokiana* (Makino) Makino; *Z. integrifolia* (Koidz.) Makino.—IWA-TSUKUBANE-UTSUGI. Much-branched deciduous shrub; branches with 6 longitudinal fissures, the nodes much thickened, young branchlets red-brown, glabrous or with recurved coarse hairs; leaves chartaceous, obovate, or obovate-oblong, sometimes ovate-elliptic, 2–5 cm. long, 1.5–2.5 cm. wide, acute at both ends, entire or with few incisions, coarsely pilose on both sides especially on margin and on nerves beneath, short-petiolate; flowers 1 or 2, short-pedunculate, bracteate and bracteolate at base; calyx-lobes obconic; corolla whitish, hypocrateriform, about 2 cm. long, the tube as long as or shorter than the calyx-lobes, the lobes spreading, 3–4 mm. long; fruit flattened, about 1.5 cm. long, lustrous.—May–June. Mountains; Honshu (Kantô Distr. and westw.), Shikoku, Kyushu; rather rare.

4. LINNAEA Gronov. ex L. RINNE-SÔ ZOKU

Subshrubs with slender creeping branches; leaves evergreen, small, opposite, nearly orbicular, short-petiolate, few-toothed; stipules absent; peduncles terminal on erect short branchlets, naked, with 2 pedicelled flowers at apex, the bracts and bracteoles small; flowers pale rose-colored; calyx-tube ovoid, the limb deciduous, 5-keeled; corolla campanulate-infundibuliform, the lobes 5, nearly equal, imbricate in bud; stamens 4; ovary 3-locular, only 1 locule maturing; style slender; ovules many, pendulous; fruit subglobose, coriaceous, 1-seeded; seeds oblong, with fleshy endosperm, the embryo cylindric.—A single widely distributed species in cooler regions of the N. Hemisphere.

1. *Linnaea borealis* L. RINNE-SÔ. Branches about 1 mm. thick, brownish, puberulent when young; leaves ovate-orbicular to obovate-orbicular, 7–15 mm. long, and as wide, rounded at apex, few-toothed, usually short appressed-pilose and the nerves impressed above; peduncles 5–10 cm. long, short glandular-pilose; flowers nodding, the pedicels 6–15 mm.

long; calyx-segments lanceolate, 2–3 mm. long; corolla 8–10 mm. long, the bracteoles broadly ovate, as long as the ovary and surrounding it.—June–July. Damp coniferous woods in mountains; Hokkaido, Honshu (centr. and n. distr.); rather rare.—Cooler regions of the N. Hemisphere inclusive of the Kuriles and Sakhalin.

5. TRIOSTEUM L. TSUKI-NUKI-SÔ ZOKU

Erect herbs; leaves opposite, sessile, often perfoliate; flowers usually axillary, sometimes in a terminal spike, yellow, white or purple, with 2 bracteoles at base; calyx-tube ovoid, the lobes 5, persistent; corolla tubular-campanulate, gibbous, the lobes oblique, unequal, imbricate in bud; stamens 5; ovary 3- to 5-locular; style elongate; ovules solitary in each locule; berry coriaceous or fleshy, 2(–5)-locular, 2- or 3-seeded.—Few species, in the Himalayas, e. Asia, and N. America.

1A. Leaves pinnatifid into 5 acuminate lobes, scarcely perfoliate at base; flowers in a terminal pedunculate spike, about 10 mm. long.

1. *T. pinnatifidum*

1B. Leaves entire or with an obtuse sinus on each side, perfoliate at base; flowers 1 or 2 in axils of upper leaves, about 2.5 cm. long.

2. *T. sinuatum*

1. *Triosteum pinnatifidum* Maxim. *T. murayamae* Ohwi—HOZAKI-TSUKI-NUKI-SÔ. Densely pubescent herb with long spreading hairs throughout, and with short glandular hairs on upper part; stems erect, about 30 cm. long; leaves in few pairs, obovate-rhombic, 7–12 cm. long, nearly as wide, abruptly narrowed to broadly cuneate at base, scarcely perfoliate, pinnatifid, the lobes long-acuminate; spikes erect, solitary, 2–5 cm. long including the peduncle; flowers sessile; calyx-limb minute, 5-dentate; corolla tubular, obliquely spreading, about 10 mm. long, pale green, the lobes short, brownish inside; drupe nearly globose, about 8 mm. across, white when ripe, juicy and somewhat sweet, the pyrenes 3, ovate, biconvex.—May. Honshu (Kai Prov.); very rare.—China.

2. *Triosteum sinuatum* Maxim. TSUKI-NUKI-SÔ. Perennial glandular-pubescent herb; stems 60–80 cm. long, terete, green; leaves ovate or elliptic, 10–15 cm. long, 6–8 cm. wide, acute, narrowed below and usually perfoliate, spreading, entire or with an obtuse sinus on each side; flowers 1 or 2 in axils of upper leaves, sessile, erect; calyx-lobes lanceolate or narrowly oblong, obtuse, erect, 6–10 mm. long; corolla about 2.5 cm. long, yellow-green with purple-brown striations inside, soft-pubescent; fruit ovoid-globose, obtusely 3-angled, about 1 cm. long and as wide, pubescent, crowned with the persistent calyx-lobes.—May–June. Honshu (Shinano Prov.).—China to Amur.

6. WEIGELA Thunb. TANI-UTSUGI ZOKU

Deciduous shrubs; leaves opposite, petiolate, toothed; flowers in axillary and terminal often trichotomously divided corymbs; calyx-tube narrow, the lobes 5, deciduous or persistent; corolla campanulate-infundibuliform, nearly actinomorphic, white or reddish, sometimes yellowish, the tube amplate, the limb nearly equally 5-lobed, the lobes imbricate in bud; stamens 5; style slender; ovary 2-locular, many-ovuled; capsules coriaceous or slightly woody, narrow, 2-valved, septically dehiscent, the axis and base of style persistent; seeds many.—Ten or more species in e. Asia.

- 1A. Flowers white or reddish; calyx-limb regular, 5-lobed or -divided.
 2A. Calyx-limb divided to the middle; seeds wingless.
 3A. Leaves glabrous on upper side. 1. *W. florida*
 3B. Leaves pilose on both surfaces. 2. *W. praecox*
 2B. Calyx-limb divided to the base; seeds narrowly winged.
 4A. Corolla glabrous outside.
 5A. Leaves glabrous beneath or with short coarse hairs on nerves.
 6A. Leaves 8–15 cm. long, 4–10 cm. wide, glabrous or nearly so; corolla-tube abruptly amplate on upper half. 3. *W. coraeensis*
 6B. Leaves 6–10 cm. long, 3–6 cm. wide, short-pilose on nerves beneath; corolla-tube gradually amplate on upper half. 4. *W. decora*
 5B. Leaves densely whitish short-pubescent beneath. 5. *W. hortensis*
 4B. Corolla pilose outside.
 7A. Ovary, young branches, and underside of leaves ascending-pilose; flowers usually white at anthesis, becoming reddish with age; petioles 5–8 mm. long. 6. *W. japonica*
 7B. Ovary, young branchlets, and underside of leaves spreading-pilose; flowers usually reddish at anthesis; petioles 1–5 mm. long.
 8A. Plant sparsely pubescent; petioles 1–3 mm. long. 7. *W. sanguinea*
 8B. Plant densely pubescent; petioles 3–5 mm. long. 8. *W. floribunda*
 1B. Flowers pale yellow; calyx-limb bilabiate.
 9A. Flowers pedunculate; calyx-limb persistent in fruit. 9. *W. middendorffiana*
 9B. Flowers sessile; calyx-limb deciduous in fruit. 10. *W. maximowiczii*

1. *Weigela florida* (Bunge) A. DC. *Calsiphyrum floridum* Bunge; *Diervilla florida* (Bunge) Sieb. & Zucc.; *W. pauciflora* DC.; *W. rosea* Lindl.—Ō-BENI-UTSUGI. Shrub with the young branches glabrous or with 2 longitudinal lines of short hairs; leaves ovate-oblong or obovate, 4–10 cm. long, 2–4 cm. wide, acuminate, toothed, glabrous above, densely pubescent on nerves beneath, the petioles 1–3 mm. long; flowers solitary in leaf-axils; calyx-tube glabrous or with scattered coarse hairs, the lobes 8–12 mm. long, lanceolate, acuminate, pilose; corolla 3–4 cm. long, soft-puberulent externally, reddish; style as long as the corolla; capsules 15–22 mm. long.—Kyushu.—Korea, n. China, and Manchuria.

2. *Weigela praecox* (Lemoine) L. H. Bailey. *Diervilla praecox* Lemoine—BIRŌDO-UTSUGI. Shrub with 2 longitudinal lines of hairs on young branches; leaves ovate or ovate-oblong, 4–7 cm. long, 2–3 cm. wide, prominently pubescent on both sides especially on nerves beneath, sessile or the petioles to 2 mm. long; flowers 1 or 2 in leaf-axils, sessile; ovary loosely pilose; calyx-segments lanceolate, 7–10 mm. long, unequally connate at base, pilose; corolla 3–4 cm. long, short-pubescent externally, infundibuliform-campanulate, abruptly amplate, reddish; style included; capsules about 15 mm. long.—May–June. Kyushu (reported from mountains of Chikuzen Prov.)—Korea and Manchuria.

3. *Weigela coreënsis* Thunb. *Diervilla grandiflora* Sieb. & Zucc.; *W. grandiflora* (Sieb. & Zucc.) K. Koch; *D. japonica* var. *grandiflora* Miq.—HAKONE-UTSUGI. Nearly glabrous shrub with thick gray-brown branches; leaves thick, broadly elliptic or obovate-elliptic, 8–15 cm. long, 4–10 cm. wide, abruptly acuminate, abruptly acute at base, glabrous or nearly so, lustrous above, the petioles 1–1.5 cm. long; flowers 2–8 in axillary short-pedunculate cymes; ovary glabrous; calyx-lobes broadly linear, nearly glabrous; corolla 3–4 cm. long, the tube abruptly amplate on upper half, white at first, becoming red with age (rarely not); style not exerted; capsules 2–3 cm.

long.—May–(June). Near seashores; Hokkaido, Honshu, Shikoku, Kyushu.

Var. *fragrans* (Ohwi) Hara. *W. fragrans* Ohwi—NIOR-UTSUGI. Flowers fragrant; corolla short, about 2 cm. long.—Honshu (Izu Isls.).

4. *Weigela decora* (Nakai) Nakai. *Diervilla decora* Nakai; *W. japonica* var. *decora* (Nakai) Okuyama; *W. versicolor* Sieb. & Zucc., pro parte; *D. floribunda* var. *versicolor* Rehd.; *D. nikoensis* Nakai; *W. hakonensis* Nakai—NISHIKI-UTSUGI. Shrub with gray-brown branches, the young branchlets glabrous or with 2 longitudinal lines of hairs; leaves obovate-elliptic, 6–10 cm. long, 3–6 cm. wide, abruptly acuminate, acute at base, slightly lustrous and nearly glabrous above, short-pilose on nerves beneath, the petioles about 1 cm. long, nearly glabrous; flowers 2 or 3 in leaf axils, often short-pedunculate; ovary glabrous or scattered hairy; calyx-segments broadly linear, slightly pilose; corolla white, reddish with age, the tube gradually amplate on upper half, essentially glabrous; style exerted.—May–June. Honshu, Shikoku, Kyushu.—Forma *unicolor* (Nakai) Hara. *W. decora* var. *unicolor* Nakai—BENIBANA-NISHIKI-UTSUGI. Flowers reddish from the first.

Var. *rosea* (Makino) Hara. *Diervilla fujiisanensis* var. *rosea* Makino; *W. fujiisanensis* var. *rosea* (Makino) Nakai—FUJI-BENI-UTSUGI. Leaves longer, acute; calyx-lobes longer, more densely pilose; corolla reddish.—Honshu (centr. distr.).—Forma *fujiisanensis* (Makino) Hara. *Diervilla fujiisanensis* Makino; *W. fujiisanensis* (Makino) Nakai—FUJI-BENI-UTSUGI. Corolla white, becoming reddish with age.

5. *Weigela hortensis* (Sieb. & Zucc.) K. Koch. *Diervilla hortensis* Sieb. & Zucc.; *D. japonica* var. *hortensis* (Sieb. & Zucc.) Maxim.—TANI-UTSUGI. Shrub with gray-brown branches, glabrous or often loosely pilose while young; leaves ovate-elliptic, ovate-oblong, or obovate, sometimes ovate, 6–10 cm. long, 2.5–5 cm. wide, acuminate, acute at base, short-

toothed, nearly glabrous above, densely whitish short-pubescent beneath, the petioles 4-8 mm. long; flowers 2 or 3 in upper leaf-axils, often short-pedunculate; ovary glabrous or scattered pilose; calyx-segments lanceolate-linear, 3-7 mm. long, slightly pilose; corolla reddish, 3-3.5 cm. long, glabrous or nearly so externally, gradually ampliate; style subexserted.—May-June. Hokkaido, Honshu.—*Forma albiflora* (Sieb. & Zucc.) Rehd. *Diervilla hortensis* var. *albiflora* Sieb. & Zucc.; *W. nivea* Carr.—SHIROBANA-UTSUGI. Flowers white.

6. *Weigela japonica* Thunb. *Diervilla japonica* (Thunb.) DC.; *D. versicolor* Sieb. & Zucc., pro parte; *D. floribunda* var. *versicolor* (Sieb. & Zucc.) Rehd.; *W. floribunda* var. *versicolor* (Sieb. & Zucc.) Rehd.—TSUKUSHI-YABU-UTSUGI. Shrub with gray-brown branches often pilose while young; leaves oblong, ovate-oblong, or elliptic, 3-5 cm. wide, 6-10 cm. long, acuminate, minutely toothed, loosely pubescent above while young, rather prominently ascending-pubescent beneath especially on nerves, the petioles 5-8 mm. long; flowers 1 or 2 in upper leaf-axils, sometimes short-pedunculate; ovary ascending-pilose; calyx-segments broadly linear, 7-10 mm. long, pilose; corolla 3-3.5 cm. long, white, becoming reddish with age, short crisped pilose externally, the tube rather prominently ampliate; style exserted.—May. Honshu (Chūgoku Distr.), Shikoku, Kyushu.

7. *Weigela sanguinea* (Nakai) Nakai. *Diervilla sanguinea* Nakai—KE-UTSUGI, BIRŌDO-UTSUGI. Shrub, sparsely pubescent; leaves ovate-oblong to ovate-elliptic, 6-12 cm. long, 2.5-6 cm. wide, acuminate, pilose on upper surface while young, spreading-pilose beneath especially on nerves, the petioles 1-3 mm. long; flowers 1 or 2 in upper leaf-axils, sometimes short-pedunculate; ovary pilose; calyx-segments 7-10 mm. long, pilose; corolla deep reddish, 3-3.5 cm. long, pubescent outside; style exserted.—May-June. Mountains; Honshu (centr. distr.).—*Forma leucantha* (Nakai) Hara. *Diervilla sanguinea* var. *leucantha* Nakai—SHIROBANA-BIRŌDO-UTSUGI. Flowers white.

8. *Weigela floribunda* (Sieb. & Zucc.) K. Koch. *Diervilla floribunda* Sieb. & Zucc.; *D. versicolor* Sieb. & Zucc.; *W. japonica* var. *floribunda* (Sieb. & Zucc.) Hara, in syn.—YABU-UTSUGI. Shrub, densely pubescent; leaves elliptic, ovate-oblong, or ovate, 6-12 cm. long, 2.5-6 cm. wide, acuminate, toothed, loosely pilose above, densely whitish spreading-

pilose especially on nerves beneath, the petioles 3-5 mm. long; flowers 1-3 in upper leaf-axils, subsessile or sessile; ovary pilose; corolla reddish, 3-3.5 cm. long, short-pubescent outside; style exserted.—May-June. Honshu (centr. and w. distr.), Shikoku. Variable.

Var. *nakaii* (Makino) Hara. *Diervilla sanguinea* var. *nakaii* Makino—CHISHIO-UTSUGI. Plants less densely pilose throughout; corolla white, becoming red with age.—Honshu (centr. distr.).—*Forma kariyosensis* (Nakai) Hara. *W. floribunda* var. *kariyosensis* Nakai—NISHIKI-BIRŌDO-UTSUGI. Flowers white. Intermediate between *W. floribunda* and *W. sanguinea*.—Honshu (mountains in Kai and Musashi Prov.).

9. *Weigela middendorffiana* (Carr.) K. Koch. *Diervilla middendorffiana* Carr.; *Macrodiervilla middendorffiana* (Carr.) Nakai; *Calyptrostigma middendorffiana* (Carr.) Trautv. & Mey.—UKON-UTSUGI. Shrub with exfoliating bark, young branches with 2 longitudinal lines of hairs; leaves oblong or narrowly ovate, acute or abruptly acuminate, acutely toothed, short-pilose on nerves of upper surface, coarsely hairy beneath especially on nerves, subsessile; flowers 1 or 2 in upper leaf-axils and terminal on branchlets; calyx deeply bifid, the upper lobes broadly oblanceolate, 3-toothed, the lower lobes narrower, entire or 2-lobed; corolla 3.5-4 cm. long, pale yellow; capsules narrowly fusiform-oblong, 1.5-2 cm. long, longitudinally striate, glabrous, crowned with persistent calyx-lobes.—July. Thickets on alpine slopes; Hokkaido, Honshu (n. distr.).—s. Kuriles, Sakhalin, Ussuri, Amur, and Ochotsk Sea region.

10. *Weigela maximowiczii* (S. Moore) Rehd. *Diervilla middendorffiana* var. *maximowiczii* S. Moore; *D. maximowiczii* (S. Moore) Makino; *Calyptrostigma maximowiczii* (S. Moore) Makino; *D. sakaii* Makino & Honda; *Weigelastrum maximowiczii* (S. Moore) Nakai—KIBANA-UTSUGI. Deciduous shrub with gray-brown branches, with 2 longitudinal lines of spreading hairs; leaves ovate-oblong, narrowly obovate, or ovate, 4-8(-10) cm. long, 2-3 cm. wide, abruptly acuminate, toothed, loosely appressed-hairy on both sides, sessile; flowers sessile; ovary glabrous; calyx-lobes 1-1.5 cm. long, loosely pilose, the limb deciduous in fruit; corolla pale yellow, 3.5-4 cm. long; capsules 2-3 cm. long.—May-June. Mountains; Honshu (centr. and n. distr.).

7. LONICERA L. SUI-KAZURA ZOKU

Erect or scandent shrubs; leaves opposite, petiolate, sessile, or perfoliate, usually entire; flowers usually paired, sessile, on a common peduncle, usually with connate bracts and bracteoles at base; calyx-tube ovoid or subglobose, the limb short, 5-toothed, deciduous or persistent; corolla tubular-infundibuliform or campanulate, usually zygomorphic, rarely actinomorphic, the limb oblique or bilabiate, often nearly regular, the lobes imbricate in bud; stamens 5; ovary 2- or 3-locular; style elongate; ovules many; berry 1- to 3-locular, each locule few seeded; seeds ovoid or oblong, with a crustaceous testa.—About 180 species, mainly in cooler regions of the N. Hemisphere, few species in Centr. America, Malaysia, and N. Africa.

1A. Scandent shrubs with hollow stems; fruit black or blue-black.

2A. Bracts leaflike, ovate; young branchlets, outer side of corolla, and young leaves more or less pubescent. 1. *L. japonica*

2B. Bracts minute, linear or linear-lanceolate; plants glabrous or soft-puberulent.

3A. Leaves glabrous, not glandular-dotted beneath. 2. *L. affinis*

3B. Leaves soft-puberulent, with red-brown glandular dots beneath. 3. *L. hypoglauca*

1B. Erect or nearly erect shrubs, with pithy or rarely entirely hollow stems; fruit red.

4A. Branches partially hollow; ovary and fruit usually paired, not connate.

5A. Peduncles 2-4 mm. long, shorter than to as long as the petioles; calyx-limb cup-shaped, 2-3 mm. long, 5-lobed.

4. *L. maackii*

5B. Peduncles 1-2.5 cm. long, much longer than the petioles; calyx-limb shorter.

6A. Leaves 6-10 cm. long, very acuminate. 5. *L. chrysantha*

6B. Leaves 2-4 cm. long, obtuse or acute with an obtuse tip.

- 7A. Flowers distinctly bilabiate; leaves usually acute at base, glaucescent beneath. 6. *L. demissa*
 7B. Flowers nearly actinomorphic; leaves usually obtuse at base, pale green beneath. 7. *L. morrowii*
 4B. Branches solid with white or brown pith; ovary and fruit solitary, or if paired, usually more or less connate.
 8A. Bracteoles bladderlike, enveloping the ovary, juicy in fruit, becoming blue-black and bloomy at maturity; corolla creamy-yellow. 8. *L. caerulea*
 8B. Bracteoles not enclosing the fruit, sometimes separate, scarcely accrescent, cup-shaped or bifid.
 9A. Corolla nearly actinomorphic (somewhat bilabiate in No. 9).
 10A. Flowers paired.
 11A. Bracteoles absent or obsolete.
 12A. Flowers white or pale yellow; bracts broadly ovate to broadly lanceolate; leaves 2-7 cm. wide.
 13A. Leaves subcoriaceous, loosely setose especially on margin and on midrib, obtuse, mucronate-tipped. 9. *L. harae*
 13B. Leaves membranous, pubescent at least beneath, acute or nearly acuminate.
 14A. Stamens not exerted; bracts large, ovate to broadly so; flowers opening with the leaves; leaves obsoletely veined; peduncles 1-2 cm. long. 10. *L. strophophora*
 14B. Stamens exerted; bracts broadly lanceolate; flowers opening before the leaves; leaves rather prominently veined; peduncles 3-8 mm. long. 11. *L. praeflorens*
 12B. Flowers rose-purple; bracts linear; leaves usually less than 1.5 cm. wide.
 15A. Peduncles 1.5-2.5 cm. long; leaves broadly lanceolate. 12. *L. linderifolia*
 15B. Peduncles 5-10 mm. long; leaves ovate or oblong. 13. *L. konoi*
 11B. Bracteoles prominent, nearly as long as the ovary. 14. *L. ramosissima*
 10B. Flowers solitary, rarely paired. 15. *L. gracilipes*
 9B. Corolla distinctly bilabiate.
 16A. Leaves loosely long-ciliate, obsoletely veined above; petioles 8-10 mm. long; bud-scales deciduous.
 17A. Peduncles 1-1.2 cm. long; leaves glabrous beneath; corolla-tube nearly as long as the limb. 16. *L. cerasina*
 17B. Peduncles 1.5-4.5 cm. long; leaves usually pilose beneath on nerves.
 18A. Bracteoles nearly as long as the ovary; peduncles 1.5-2 cm. long; stamens exerted. 17. *L. vidalii*
 18B. Bracteoles minute or absent; peduncles 2.5-4.5 cm. long; stamens not exerted. 18. *L. alpigena* var. *glehnii*
 16B. Leaves glabrous, rarely ciliate, prominently veined above; petioles 5(-7) mm. long or absent; bud-scales persistent.
 19A. Leaves sessile or the petioles about 1 mm. long, obtuse or rounded; peduncles 6-12 mm. long; flowers deep red. 19. *L. chamissoi*
 19B. Leaves with petioles 3-5(-7) mm. long, acuminate or acute, rarely obtuse; peduncles longer.
 20A. Peduncles 2.5 cm. long; leaves with slightly raised veinlets above; flowers white. 20. *L. tschonoskii*
 20B. Peduncles 1-2 cm. long; leaves strongly veined above.
 21A. Leaves glabrous, not ciliate, rarely thinly pilose on midrib beneath; flowers white. 21. *L. mochidzukiana*
 21B. Leaves rarely loosely long-pilose beneath, long-ciliate; flowers deep red. 22. *L. sachalinensis*

1. *Lonicera japonica* Thunb. *L. acuminata* var. *japonica* Miq.; *L. fauriei* Lévl. & Van't. SUI-KAZURA, NINDŌ. Scandent shrub; branches terete, hollow, glandular and prominently spreading-pubescent when young; leaves broadly lanceolate to ovate-elliptic, 3-7 cm. long, 1-3 cm. wide, acute or obtuse, mucronate-tipped, usually rounded at base, entire or the leaves of young plants often incised-sinuate, pubescent, pale green beneath, the petioles 3-8 mm. long, peduncles 3-10 mm. long, the bracts leaflike, ovate, 1-2 cm. long, the bracteoles free, about 1 mm. long, pilose, elliptic; calyx-tube glabrous, the lobes ovate, about 1 mm. long, ciliate; corolla 3-4 cm. long, soft-pubescent externally, white, changing to yellow with age, the tube narrow, the limb as long as the tube, bilabiate; fruit blue-black, 6-7 mm. across.—May-June. Thickets in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and China.

Var. *repens* (Sieb.) Rehd. *L. flexuosa* Thunb.; *L. brachypoda* var. *repens* Sieb.; *L. japonica* var. *flexuosa* (Thunb.) Nichols.; *L. japonica* var. *chinensis* Bak.—TERI-HA-NINDŌ. Less pubescent; corolla white to slightly purplish, the limb longer than the tube.—Honshu, Shikoku, Kyushu.—China.

2. *Lonicera affinis* Hook. & Arn. *L. buergeriana* Bl.—HAMA-NINDŌ, INU-NINDŌ. Scandent shrub; branches terete, glandular and white-puberulent while young; leaves broadly ovate or ovate-elliptic, 5-8 cm. long, 3-5 cm. wide, acute or short-acuminate, rounded at base, often glabrous on both sides, whitish beneath, mucronate, the petioles 5-10 mm. long, glandular and white-puberulent while young; flowers

paired, terminal, the peduncles axillary, 3-7 mm. long, the bracts lanceolate-deltoid, spreading, about 2 mm. long, the bracteoles free, semirounded, slightly pilose; calyx glabrous, the lobes narrowly deltoid; corolla 4-6 cm. long, glabrous externally, white, changing to yellow with age, the tube about half as long as the lobes, narrow; fruit globose, about 7 mm. in diameter, blue-black, white-bloomy.—May-June. Honshu (Kii Prov.) Shikoku, Kyushu.—Ryukyus and China.

3. *Lonicera hypoglauca* Miq. *L. mollissima* Bl., ex Maxim.; *L. affinis* var. *pubescens* Maxim.; *L. affinis* var. *hypoglauca* (Miq.) Rehd.; *L. affinis* var. *mollissima* (Bl.) Makino.—KIDACHI-NINDŌ, TŌ-NINDŌ. Scandent shrub; branches slender, elongate, terete, rather prominently soft-puberulent; leaves rather thin, ovate or oblong-ovate, 4-8(-10) cm. long, 1.5-5 cm. wide, abruptly acuminate at apex, rounded at base, glabrous above, glaucescent, puberulent and with red-brown glandular dots beneath; peduncles short, puberulent, the bracts deltoid-lanceolate, hairy, about 2 mm. long, the bracteoles small, free, semirounded; calyx-tube glabrous, the lobes narrowly deltoid, less than 1 mm. long; corolla bilabiate, 4-5 cm. long, slightly puberulent externally, white, changing to yellow with age.—May-June. Honshu (Tōkaidō, Chūgoku Distr.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

4. *Lonicera maackii* (Rupr.) Maxim. *Xylosteum maackii* Rupr.—HANA-HYŌTAN-BOKU. Shrub; young branches obtusely angled, puberulent; leaves membranous, ovate-oblong or obovate-elliptic, 5-8 cm. long, 2.5-3.5 cm. wide, acuminate, rounded or abruptly narrowed at base, slightly pubescent on both sides while young, the indument persistent on margin and

on midrib on both sides, the petioles 3-5 mm. long; peduncles 2-4 mm. long, loosely glandular-dotted, the bracts membranous, linear, slightly longer than the ovary, the bracteoles connate, as long as the ovary, shallowly 2-lobed, ciliate; calyx-limb cup-shaped, 2-3 mm. long, irregularly 5-lobed, deciduous; corolla white, slightly pubescent externally, about 2 cm. long, the tube short; fruit black, globose, 3-4 mm. in diameter.—May. Mountains; Honshu (centr. and n. distr.); rare.—Korea, Manchuria, Amur, Ussuri, and n. China.

5. *Lonicera chrysantha* Turcz. *Xylosteum gibbiflorum* Rupr.; *L. xylosteum* var. *chrysantha* (Turcz.) Regel.—NE-MURO-BUSHIDAMA. Shrub; young branches terete, slightly pubescent and minutely glandular-dotted; leaves obovate, ovate-elliptic, or oblong-ovate, 6-10 cm. long, 3-6 cm. wide, very acuminate, acute to rounded at base, pubescent especially on nerves beneath, the petioles 3-7 mm. long, the peduncles 1-2 cm. long, with spreading hairs or glabrate, the bracts broadly linear, 2-4 times as long as the ovary, the bracteoles elliptic, free, about half as long as the ovary; calyx-limb very short, the 5 teeth short; corolla pale yellow, 1.2-1.5 cm. long, the tube short, gibbous; fruit red, about 6 mm. across.—June. Hokkaido.—s. Kuriles, Sakhalin, Korea, and e. Siberia.

6. *Lonicera demissa* Rehd. *L. ibotaeformis* Nakai—IWATA-HYŌTAN-BOKU. Much-branched shrub; young branches, leaves and inflorescence ascendingly short-pilose; leaves thin, broadly oblanceolate to narrowly obovate, or sometimes narrowly oblong, 1.5-3.5 cm. long inclusive of the very short petiole, 7-12 mm. wide, acute with an obtuse tip, acute at base, glaucous beneath; peduncles 8-15 mm. long, slender, the bracts membranous, linear, 2-3 times as long as the ovary, the bracteoles free, nearly orbicular, nearly as long as the ovary; calyx-tube minutely glandular-dotted, the limb with 5 short obtuse teeth; corolla bilabiate, pale yellow, 1-1.2 cm. long, short-pubescent externally, the tube short, gibbous; fruit red.—June. Mountains; Honshu (southern part of centr. distr.).

7. *Lonicera morrowii* A. Gray. *Caprifolium morrowii* (A. Gray) O. Kuntze—KINGIN-BOKU. Prominently pubescent, much-branched shrub with terete branches; leaves oblong to elliptic, or ovate-elliptic, 2.5-4 cm. long, 1-2(-2.5) cm. wide, usually obtuse to sometimes subacute, rounded at base, pale green beneath; peduncles 1-1.5 cm. long, the bracts linear, somewhat leaflike, 2-4 times as long as the ovary, the bracteoles free, elliptic, slightly shorter than the ovary; calyx-limb deeply cleft, the segments broadly lanceolate, less than 1 mm. long; corolla about 1.3 cm. long, white, changing to yellow with age, pubescent externally, the tube short, slightly gibbous; fruit red, about 6 mm. across.—May. Hokkaido, Honshu, Shikoku.—Cv. *Xanthocarpa*. *L. morrowii* forma *xanthocarpa* (Nash) Hara; *L. morrowii* var. *xanthocarpa* Nash.—KIMI-NO-KINGIN-BOKU. Fruit yellow.—Cultivated.

8. *Lonicera caerulea* L. var. *edulis* Turcz. ex Herd. *L. caerulea* sensu auct. Japon., pro parte; *L. edulis* Turcz. ex Freyn; *L. caerulea* subsp. *edulis* (Turcz.) Hult.—KE-YONOMI. Much-branched shrub with exfoliating bark, the young branches prominently pubescent; leaves oblong, ovate-elliptic, or ovate, obtuse to subacute, or sometimes rounded at the tip, 2.5-4(-5) cm. long, 1-2 cm. wide, rounded to obtuse at base, prominently pubescent, short-petiolate; peduncles 2-10 mm. long, the bracts linear, 2-3 times as long as the calyx-tube, the bracteoles connate, bladderlike, completely enveloping the ovary, blue-black, bloomy, juicy when ripe; calyx-limb

short, with 5 short teeth; corolla creamy-white, infundibuliform, 1-1.3 cm. long, loosely pubescent externally, the lobes ascending more than half of the entire length; stamens usually slightly longer than the corolla-lobes; fruit sweet and edible, ellipsoidal, bloomy.—June-July. Hokkaido.—Kuriles, Sakhalin, e. Siberia, and Kamchatka.

Var. *emphylocalyx* (Maxim.) Nakai. *L. emphylocalyx* Maxim.; *L. caerulea* var. *altaica* sensu auct. Japon., non Sweet, incl. forma *emphylocalyx* (Maxim.) Rehd.; *L. caerulea* var. *glabrescens* forma *longibracteata* C. K. Schn.; *L. caerulea* var. *longibracteata* (C.K. Schn.) Hara.—KURUMI-NO-UGUISU-KAGURA. Plants less hairy, indument shorter, or nearly glabrate.—Hokkaido, Honshu (centr. distr.).

Var. *venulosa* (Maxim.) Rehd. *L. reticulata* Maxim., non Raf., non Champ.; *L. venulosa* Maxim.—MARUBA-YONOMI. Plants nearly glabrous; leaves prominently venulose beneath.—The typical phase of the species occurs in w. Europe to Japan, and N. America.

9. *Lonicera harae* Makino. *L. harae* var. *tashiroi* Nakai.—TSUSHIMA-HYŌTAN-BOKU, NOYAMA-HYŌTAN-BOKU. Shrub with grayish branches; young branchlets terete, with coarse hairs or nearly glabrous; leaves subcoriaceous, elliptic or ovate-elliptic, 3-6 cm. long, 2-4 cm. wide, obtuse to rounded, mucronate-tipped, usually rounded at base, short-petiolate, loosely setose especially on margin and midrib at least while young, becoming glabrous, nearly concolorous, with prominently raised veinlets on both surfaces; peduncles 3-8 mm. long, glabrous, the bracts lanceolate, 1.5-2.5 times as long as the calyx-tube; bracteoles absent; calyx-limb short, subtruncate; flowers with the leaves; corolla about 1 cm. long, somewhat bilabiate, yellow to white, the tube nearly as long as the limb, slightly gibbous.—Mar.-Apr. Shikoku, Kyushu.—Korea and Manchuria.

10. *Lonicera strophophora* Franch. *L. pilosa* Maxim.; *L. amherstii* Dipp., pro parte.—ARAGE-HYŌTAN-BOKU, ŌBA-HYŌTAN-BOKU. Shrub; branches gray-brown, slightly pilose while very young; leaves thinly membranous, broadly ovate to ovate-oblong, 5-10 cm. long, acuminate to acute, or sometimes obtuse, obtusely rounded at base, coarsely pilose on both surfaces especially on midrib beneath, often glaucous beneath, the petioles 3-7 mm. long, loosely pilose and sparingly glandular-pilose; flowers with the leaves, the peduncles deflexed, 1-2 cm. long, loosely glandular-pilose, the bracts membranous, ovate to broadly so, 1-2 cm. long, subacute, pale green, ciliate, weakly many-nerved, bracteoles absent; calyx-limb short, irregularly lobed; corolla pale yellow, narrowly infundibuliform, 2-2.5 cm. long, loosely pilose or glabrous externally; fruit red, globose.—Apr.-June. Mountains; Hokkaido, Honshu.

Var. *glabra* Nakai. DAISEN-HYŌTAN-BOKU. Ovary and lower half of style glabrous.—Honshu (centr. and westw.), Shikoku.

11. *Lonicera praeflorens* Batal. *L. kaiensis* Nakai.—HAYAZAKI-HYŌTAN-BOKU. Shrub with gray-brown exfoliating bark; young branchlets glabrous or puberulent; leaves membranous, broadly ovate, 3-6 cm. long, 2-4 cm. wide, acute or abruptly so, obtusely rounded at base, pubescent, especially on underside, glaucous and the veinlets rather prominently raised, the petioles 2-4 mm. long; flowers precocious, the peduncles glabrous, 3-8 mm. long, the bracts broadly lanceolate or narrowly ovate, 2-4 times as long as the ovary, ciliate, bracteoles absent; calyx-tube glabrous, the limb irregularly toothed, sparsely glandular-pilose on margin; corolla infundi-

buliform, nearly actinomorphic, glabrous externally, 12-15 mm. long, the tube obsoletely gibbous, as long as the limb; stamens exserted; fruit red, about 8 mm. across.—May. Mountains; Honshu (centr. distr.); rare.—Korea, Manchuria, and Ussuri.

12. *Lonicera linderifolia* Maxim. YABU-HYŌTAN-BOKU. Much-branched shrub with exfoliating bark; young branches puberulent; leaves membranous, broadly lanceolate or narrowly ovate-oblong, sometimes narrowly oblong, 2-4(-4.5) cm. long, 1-1.5 cm. wide, acute, sometimes with an obtuse tip, glaucescent and puberulent beneath, the petioles 2-3 mm. long; peduncles slender, 1.5-2.5 cm. long, puberulent; bracts linear, 3-5 mm. long, nearly glabrous, bracteoles absent; calyx glabrous, the calyx-limb short, nearly truncate; corolla purplish, about 10 mm. long.—Honshu (Mount Hayachine in Rikuchu Prov.); rare.

13. *Lonicera konoi* Makino. *L. tobitae* Nakai—KOGOME-HYŌTAN-BOKU, KUMOI-HYŌTAN-BOKU. Much-branched small shrub with gray-brown branches and exfoliating bark; young branchlets slender, loosely puberulent; leaves rather thin, ovate, elliptic, or obovate, 1-2(-2.5) cm. long, 6-8 mm. wide, obtuse or subacute, subacute at base, glaucous, puberulent especially along the midrib beneath, the petioles 2-3 mm. long; peduncles short-pilose, 5-10(-13) mm. long; bracts linear, glabrous, 2 or 3 times as long as the ovary, bracteoles obsolete; calyx-limb short, entire, glabrous; corolla deep purple, glabrous, infundibuliform, nearly actinomorphic, about 5 mm. long, the lobes 1.5 mm. long, the tube somewhat gibbous; fruit red, about 4 mm. across, few-seeded.—May. Alpine; Honshu (Mount Yatsugatake and Akaishi mountain range in centr. distr.); rare.

14. *Lonicera ramosissima* Fr. & Sav. KO-UGUISU-KAGURA. Much-branched shrub with slender branches; young branchlets short-pilose or nearly glabrous; leaves ovate, ovate-elliptic, or broadly ovate, 2-4 cm. long, 1-2.5 cm. wide, acute or obtuse, rounded or obtusely rounded at base, usually appressed-pubescent above, glaucescent and with incurved hairs beneath, the petioles 2-3 mm. long; peduncles slender, 1.5-2.5 cm. long, pubescent or glabrous; bracts lanceolate, 1.5-3 times as long as the ovary, the bracteoles connate, orbiculate, forming a lobe about half as long as the ovary; calyx-limb very short; corolla infundibuliform, pale yellow, often sparingly pilose externally, 12-15 mm. long, the tube long, gibbous; style long-exserted; fruit red.—May-June. Mountains; Honshu (centr. distr.).

Var. *kinkiensis* (Koidz.) Ohwi. *L. kinkiensis* Koidz.—KINKI-HYŌTAN-BOKU. Leaves narrower, acuminate, acute or subobtusate at the tip with shorter hairs on the upper side; bracts nearly as long as the ovary, slender, the bracteoles somewhat larger.—Honshu (Settsu, Tanba, and Aki Prov.).

Var. *fudzimoriana* (Makino) Nakai. *L. fudzimoriana* Makino; *L. bukoensis* Nakai; ? *L. ramosissima* var. *borealis* Koidz.—CHICHIBU-HYŌTAN-BOKU. Leaves broader, elliptic or oblong, rounded to cordate at base.—High mountain or northern phase; Honshu (Kantō Distr., Kai Prov. and n. distr.).

15. *Lonicera gracilipes* Miq. *Xylosteum phylomelae* Jacob-Makoy; *L. phylomelae* Carr.; *L. gracilipes* var. *genuina* Maxim.—YAMA-UGUISU-KAGURA. Branched shrub with slender, usually glabrous branches and branchlets; leaves narrowly to broadly ovate, ovate-elliptic, or rhombic-ovate, 2.5-6

cm. long, 1.5-5 cm. wide, acute with an obtuse tip, obtuse to acute at the base, whitish and sometimes brown-spotted beneath, usually coarsely pilose especially on midrib beneath, the petioles 2-5 mm. long; flowers solitary, rarely in pairs; peduncles slender, pendulous, 1.5-2.5 cm. long, usually glabrous; bracts solitary or rarely 2, narrowly lanceolate, 3-7 mm. long, bracteoles usually absent; calyx-limb shallowly cup-shaped, irregularly short-toothed; corolla pink, narrowly infundibuliform, nearly actinomorphic, 1.5-2 cm. long, the lobes short; style exserted; fruit ellipsoidal, red, about 1 cm. long.—Apr.-May. Hokkaido (s. distr.), Honshu, Shikoku, Kyushu; variable.—Forma *glabra* (Miq.) Hiyma. *L. gracilipes* var. *glabra* Miq.—UGUISU-KAGURA. Plant nearly glabrous.

Var. *glandulosa* Maxim. *L. tenuipes* Nakai; *L. tenuipes* var. *glandulosa* (Maxim.) Nakai; *L. glandulosa* (Maxim.) Koidz.; *L. macrocalyx* Nakai—MIYAMA-UGUISU-KAGURA. Plant coarsely pilose, the peduncles and ovaries glandular-pilose.—Higher elevations in the mountains.

16. *Lonicera cerasina* Maxim. *L. shikokiana* Makino USUBA-HYŌTAN-BOKU. Shrub with glabrous terete branchlets; leaves membranous, oblong to narrowly so, 7-12 cm. long, 2-4 cm. wide, long-acuminate with a minute obtuse tip, acute or subrounded at base, ascending-hairy on margin, sometimes scattered-pilose on upper surface, glabrous beneath, sparingly glandular-pilose, the petioles 7-10 mm. long; peduncles 1-1.2 cm. long, glabrous; bracts linear, 1-1.5 times as long as the ovary, the bracteoles nearly free, elliptic, slightly shorter than the ovary; calyx-limb very short; corolla bilabiate, yellowish white, about 1 cm. long, the tube nearly as long as the limb, gibbous; fruit red.—Apr.-May. Honshu (Kinki Distr. and westw.), Shikoku.

17. *Lonicera vidalii* Fr. & Sav. ONI-HYŌTAN-BOKU. Shrub; branches rather thick, terete, minutely glandular-dotted while young; leaves rather thin, elliptic, broadly ovate, or ovate-oblong, 6-12 cm. long, 2-6 cm. wide, abruptly acute to short-acuminate with an obtuse tip, abruptly acute to sometimes rounded at base, green above, paler beneath, short-pilose on nerves above, coarsely pilose beneath especially on the midrib, the petioles 1-1.5 cm. long; peduncles 1.5-2 cm. long, rather thick; bracts linear, nearly as long as to slightly longer than the ovary, the bracteoles orbicular, nearly as long as the ovary, connate at the base; calyx-limb very short; corolla bilabiate, about 12 mm. long, glabrous outside, pale yellow, gibbous; stamens slightly exserted; fruit red, about 7 mm. long.—May. Mountains; Honshu (Echigo, Shinano Prov. and Chūgoku Distr.).—s. Korea.

18. *Lonicera alpigena* L. var. *glehnii* (F. Schmidt) Nakai. *L. alpigena* sensu auct. Japon., non L.; *L. glehnii* F. Schmidt; *L. watanabeana* Makino; *L. watanabeana* var. *viridisima* Nakai—EZO-HYŌTAN-BOKU, SURUGA-HYŌTAN-BOKU, ŌBABUSHIDAMA. Resembles the preceding species; young branchlets obtusely angled, glabrous; leaves ovate-oblong or narrowly ovate, 6-10 cm. long, 2.5-5 cm. wide, acuminate, rounded to shallowly cordate at base, ciliate, puberulent on nerves above, spreading-hairy beneath especially on nerves, the petioles minutely glandular-dotted, 5-10 mm. long; peduncles 2.5-4.5 cm. long, sometimes minutely glandular-dotted; bracts linear, 3-5 times as long as the ovary, the bracteoles minute or absent; calyx-limb nearly absent; corolla bilabiate, yellowish, glabrous outside, 12-15 mm. long, deeply lobed, gibbous; stamens in-

cluded; fruit red, about 7 mm. long.—Hokkaido, Honshu (n. distr. to high mountains of centr. distr.).—Sakhalin and s. Kuriles.

19. *Lonicera chamissoi* Bunge. CHISHIMA-HYÖTAN-BOKU. Glabrous small shrub with slightly glaucous terete branchlets; leaves chartaceous to membranous, broadly ovate to elliptic, 2-4(-5) cm. long, 1.5-2.5 cm. wide, obtuse or rounded, rounded at base, with slightly raised veinlets beneath, sessile or the petioles up to 2 mm. long; peduncles 6-12 mm. long, the bracts and bracteoles broadly ovate or orbicular, less than 1 mm. long; calyx-limb short, minutely 5-toothed; corolla bilabiate, about 1 cm. long, deep red, glabrous outside, gibbous; fruit red.—June-July. Alpine; Hokkaido, Honshu (centr. distr. and northw.).—Kuriles, Sakhalin, Kamchatka, Amur, and Ochotsk Sea region.

20. *Lonicera tshonoskii* Maxim. *L. brandtii* Fr. & Sav. Ö-HYÖTAN-BOKU. Shrub; branches terete, obsoletely 4-striate, glabrous; leaves membranous or thinly chartaceous, narrowly obovate, oblong, or ovate-oblong, 7-13 cm. long, 3-5(-6) cm. wide, acuminate, acute at base, glabrous, often puberulent on midrib above, loosely pilose on margin and on midrib beneath while young, glaucous beneath, the petioles 7-13 cm. long; peduncles slender, 2-5 cm. long, glabrous; bracts lanceolate, about 3 mm. long, the bracteoles free, broadly ovate, about 2.5 mm. long; calyx-limb 5-cleft, deciduous; corolla bilabiate, about 15 mm. long, white, glabrous outside, gibbous; fruit red.—July. Alpine; Honshu (centr. distr.).

21. *Lonicera mochidzukiana* Makino. NIKKO-HYÖTAN-BOKU. Nearly glabrous shrub; branches prominently 4-angled; leaves chartaceous, ovate-oblong to ovate, sometimes broadly lanceolate, 4-8 cm. long, 1.5-3 cm. wide, acute to

acuminate, rounded at base, glabrous, rarely thinly pilose on midrib beneath, with the tertiary veinlets rather prominently raised on both sides, the petioles 3-5 mm. long; peduncles rather thick, 1-2 cm. long; bracts narrowly ovate or broadly lanceolate, 1-2 mm. long, the bracteoles orbicular, connate at base, about 1 mm. long, usually more or less glandular-dotted as well as the bracts; calyx-limb deeply 5-cleft, the lobes deciduous; corolla bilabiate, about 1 cm. long, white; fruit red.—June. Mountains; Honshu (Kantō Distr. and Kai Prov.).

Var. *nomurana* (Makino) Nakai. *L. nomurana* Makino.—YAMA-HYÖTAN-BOKU. Leaves broadly ovate to ovate-orbicular, 2.5-5 cm. long, 1.5-3 cm. wide, acute to obtuse.—Mountains; Honshu (Tōkaidō Distr., Kii Prov., and Chūgoku Distr.).

Var. *filiformis* Koidz. AKAISHI-HYÖTAN-BOKU. Leaves lustrous on upper surface; bracts filiform; segments of calyx-limb nearly as long as the ovary.—Alpine; Shikoku.

22. *Lonicera sachalinensis* (F. Schmidt) Nakai. *L. maximowiczii* var. *sachalinensis* F. Schmidt.—BENIBANA-HYÖTAN-BOKU. Shrub; branches glabrous, nearly terete, with 2 or 4 obtuse angles; leaves rather firmly chartaceous, ovate-oblong or ovate, sometimes elliptic, 4-8 cm. long, 2-3.5 cm. wide, acute to acuminate, sometimes subobtusely, rounded to acute at base, long-ciliate, glabrous or rarely loosely long-pilose beneath, with the tertiary veinlets prominent and raised, the petioles glabrous, 3-5 mm. long; peduncles 1.5-2 cm. long, glabrous; bracts broadly lanceolate to ovate, 1-3 mm. long, the bracteoles about 0.5 mm. long, connate, forming a broad lobe; calyx-limb deeply 5-cleft; corolla bilabiate, 8-10 mm. long, deep red; fruit red.—June-July. Hokkaido.—s. Kuriles, Sakhalin, n. Korea, Manchuria, and Ussuri.

Fam. 188. ADOXACEAE REMPUKU-SŌ KA Moschatel Family

Family of a single genus and species, widely distributed in the N. Hemisphere.

1. ADOXA L. REMPUKU-SŌ ZOKU

1. *Adoxa moschatellina* L. REMPUKU-SŌ. Delicate perennial herb 8-15 cm. high, with slender creeping rhizomes; radical leaves long-petiolate, 1- to 2-ternate, the leaflets ternately dissected and lobulate; cauline leaves a single pair, similar to the radical but short petiolate and less dissected, smaller; flowers sessile, small, greenish, 4-6 mm. across, capitate, 4-merous in the terminal one, 5- or 6-merous in the lateral ones, sessile; calyx 2- or 3-lobed; corolla rotate, 4- to 6-cleft, disc absent; stamens 4-6, bifid, the anthers 1-locular; ovary

partially superior, 3- to 5-locular, the styles 3- to 5-lobed; ovules solitary in each locule, pendulous; drupe 1- to 5-stoned; seeds with endosperm, the embryo small.—Apr.-May. Damp woods in mountains and hills; Hokkaido, Honshu (Kinki Distr. and northw.). The phase in e. Asia and India is without fragrance and is sometimes distinguished from the European phase as var. *inodora* Falconer ex C. B. Clarke.

Fam. 189. VALERIANACEAE OMINA-ESHI KA Valerian Family

Herbs often foetid when dry; leaves radical or opposite, often dissected, stipules absent; inflorescence usually determinate, cymose; flowers bisexual, sometimes unisexual (plants sometimes polygamodioecious), usually small, somewhat zygomorphic; calyx epigynous, plumose or sometimes coronate; corolla gamopetalous, tubular, infundibuliform or rotate, often gibbous or spurred at base, the lobes imbricate in bud; stamens 1-4 (rarely 5), on the corolla-tube, alternate with the lobes, the anthers 2-locular; ovary inferior, basically 3-locular, with 1 locule fertile; style solitary, slender; ovules solitary, pendulous; fruit a cypselate achene, the embryo straight, endosperm absent.—About 10 genera, with about 400 species, in the N. Hemisphere and S. America, few in Africa.

1A. Stamens 4; sterile locules of the achenes often winglike; calyx-lobes small, coronate. 1. *Patrinia*
1B. Stamens usually 3; sterile locules of the achenes usually inconspicuous; calyx-lobes much divided and plumose. 2. *Valeriana*

1. PATRINIA Juss. OMINA-ESHI ZOKU

Erect perennial herbs; leaves once or twice pinnately lobed, sometimes incised; cymes much branched, paniclelike, the bracts narrow, free, sometimes with a large bracteole appressed to the fruit; flowers usually yellow, sometimes white; calyx-limb small, obtusely toothed, coronate; corolla-tube short, the limb rather regularly 5-lobed; stamens 4; style entire; sterile locules of the achenes often winglike.—About 15 species, in e. and centr. Asia.

1A. Corolla gibbous or spurred.

2A. Leaves palmately lobed to cleft. 1. *P. triloba*

2B. Leaves pinnately incised. 2. *P. gibbosa*

1B. Corolla not gibbous or spurred.

3A. Stems 7–15 cm. long, naked or with 1 or 2 pairs of leaves; radical leaves many. 3. *P. sibirica*

3B. Stems 50–100 cm. long, with more than 2 pairs of cauline leaves.

4A. Achenes winged; flowers white; leaves coarsely pilose. 4. *P. villosa*

4B. Achenes wingless; flowers yellow; leaves nearly glabrous or sparingly puberulent. 5. *P. scabiosaefolia*

1. *Patrinia triloba* Miq. var. *triloba*. *P. palmata* var. *gibbosa* Makino; *P. gibbiferum* Nakai; *P. triloba* var. *gibbosa* (Makino) Matsum.—KO-KINREI-KA, KAKUSAN-OMINA-ESHI. Spur shorter than in var. *palmata*, saccate.—Mountains; Honshu (Kinki Distr. and eastw.).

Var. *palmata* (Maxim.) Hara. *P. palmata* Maxim.—KINREI-KA. Stoloniferous; rhizomes short-creeping; stems erect, nearly simple, 20–60 cm. long, glabrous at base, with 2 lines of short hairs in upper part; leaves petiolate, 5-angled, orbicular, 4–8 cm. long and as wide, cordate, palmately (3–)5-lobed to -cleft, the midlobe rhombic-ovate, caudate, irregularly incised and acutely toothed, nearly glabrous or coarsely pilose especially on nerves beneath; cymes terminal, many-flowered; corolla 7–8 mm. across, spurred at base, the spur 2.5–3 mm. long; stamens as long as the spreading corolla-lobes; achenes oblong, glabrous, about 4 mm. long, flat, with a thick broad band on the back, the wing twice as broad as the fruit.—July–Aug. Mountains; Honshu (centr. distr. and westw.), Kyushu.

Var. *kozushimensis* Honda. *P. kozushimensis* (Honda) Honda.—SHIMA-KINREI-KA. Leaves thicker, nearly glabrous; calyx-teeth more prominent.—Maritime; Honshu (Izu Is.).

Var. *takeuchiana* (Makino) Ohwi. *P. takeuchiana* Makino.—O-KINREI-KA. Plant larger; leaves to 15 cm. long; corolla with a short-cylindric spur; stamens exserted.—Honshu (Mount Aobayama in Tango).

2. *Patrinia gibbosa* Maxim. MARUBA-KINREI-KA. Rhizomes short-creeping; stems rather stout, erect, 50–70 cm. long, loosely short-pubescent or nearly glabrous; leaves broadly ovate or ovate-elliptic, 7–15 cm. long, acuminate to acute, rounded to broadly cuneate at base, pinnately incised and coarsely toothed, the petioles winged on upper part, the upper leaves subsessile, usually short-pilose on nerves beneath; cymes many-flowered, short-pubescent; corolla yellow, 4–5 mm. across, spurred at base; stamens exserted; achenes oblong, flat, broadly winged.—July–Aug. Mountains; Hokkaido, Honshu (n. distr. and Sado Isl.).

3. *Patrinia sibirica* (L.) Juss. *Valeriana sibirica* L.—TAKANE-OMINA-ESHI, CHISHIMA-KINREI-KA. Rhizomes stout, elongate; stems 7–15 cm. long, naked or with 1 or 2 pairs of leaves; radical leaves many, rosulate, elliptic or obovate, 2–4 cm. long, 1–2 cm. wide, obtusely toothed, incised or usually pinnately cleft, glabrous or scattered pilose, the petioles winged

on upper part; inflorescence rather many-flowered, the branches with prominent tuberclelike white hairs on one side; calyx-teeth broadly ovate, slightly accrescent, rather small; corolla yellow, about 4 mm. across; achenes elliptic, about 4 mm. long, the wing orbicular, 5–6 mm. across.—July–Aug. Alpine; Hokkaido.—Kuriles, Sakhalin, and e. Siberia.

4. *Patrinia villosa* (Thunb.) Juss. *Valeriana villosa* Thunb.; *Fedia villosa* Vahl; *P. villosa* var. *japonica* Lévl.; *P. villosa* var. *sinensis* Lévl.; *P. sinensis* (Lévl.) Koidz.—OTOKO-ESHI. Rather stout short-rhizomatous perennial; stolons well developed; stems sometimes branched, erect, 50–100 cm. long, leafy, densely whitish retrorse-pilose, especially on lower portion, nearly glabrous in upper portion; leaves simple and ovate to pinnately divided, 3–15 cm. long, toothed, more or less coarsely white-pilose, petiolate or sessile in the upper ones; inflorescence many-flowered, branched, the branches with 2 pilose lines of spreading or slightly deflexed white hairs; corolla white, about 4 mm. across, spurless; achenes obovate, 2–3 mm. long, rounded on back, thick, the wing orbicular-cordate, 5–6 mm. across.—Aug.–Oct. Sunny hills and low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Korea, Manchuria, and China.

Patrinia × *hybrida* Makino. OTOKO-OMINA-ESHI. Hybrid of *P. scabiosaefolia* × *P. villosa*.—Reported to occur in Honshu and Kyushu.

5. *Patrinia scabiosaefolia* Fisch. *P. serratulaefolia* Fisch.; *P. hispida* Bunge; *P. parviflora* Sieb. & Zucc.—OMINA-ESHI. Rhizomes rather thick, creeping; stems erect, 60–100 cm. long, rather stout, glabrescent in upper part, more or less coarsely hairy at base; leaves mostly cauline, subsessile or short-petiolate, pinnately divided, the lowest divisions smaller and stipulelike or auriculate, the upper divisions broadly lanceolate, coarsely toothed, nearly glabrous or sparingly puberulent on both sides, sparingly scabrous on margin; inflorescence rather flat-topped, many-flowered, the branches with short white tuberclelike hairs on one side; corolla yellow, 3–4 mm. across, the tube nearly as long as the lobes, loosely long-hairy inside, amplate; achenes wingless, oblong, 3–4 mm. long, more or less flat, 1-nerved on the ventral side, the dorsal side with a swollen appendage at base.—Aug.–Oct. Sunny grassy places in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Kuriles, Sakhalin, Ryukyus, Formosa, Korea, China, Manchuria, and e. Siberia.

2. VALERIANA L. KANOKO-SŌ ZOKU

Glabrous to hairy perennials (in ours); leaves entire or toothed, usually pinnate to pinnatifid or rarely bipinnatifid, often decurrent; inflorescence determinate, either aggregate-dichasial and thyrsoid or the cymes compound, dense and more or less

scorpioid, bracteate; flowers bisexual or unisexual (plants gynodioecious or polygamodioecious), white to pink; calyx initially involute, epigynous, later spreading, much divided and usually plumose; corolla infundibuliform, subcampanulate, or rotate, the tube gibbous or straight, the 5 lobes equal or subequal; stamens 3, rarely 4, the anthers included or exserted; achenes 3-nerved on the back, 1-nerved on face.—About 200 species, in the N. Hemisphere and S. America, few in the mountains of e. Africa, 1 in S. Africa.

- 1A. Stems rather stout, erect, 40–80 cm. long; leaves with deeply toothed segments, the lateral segments 2–5 cm. long; corolla 5–7 mm. long with a long tube; stamens and style long-exserted. 1. *V. fauriei*
 1B. Stems slender, becoming decumbent, 20–40 cm. long; leaves with shallowly toothed segments, the lateral segments 1–2.5 (–3) cm. long; corolla about 2 mm. long, with a short tube; stamens and style not exserted. 2. *V. flaccidissima*

1. *Valeriana fauriei* Briq. *V. officinalis* sensu auct. Japon., non L.; *V. officinalis* var. *angustifolia* Miq.; *V. officinalis* var. *latifolia* Miq.; *V. nipponica* Nakai—KANOKO-SŌ. Rhizomes short; stolons slender; stems erect, rather stout, 40–80 cm. long, with dense tuberclelike long white hairs on the nodes; radical leaves rather small, usually absent in anthesis; cauline leaves pinnate, the segments 5–7, oblong-lanceolate to oblanceolate, 2–5 (–7) cm. long, 7–15 (–25) mm. wide, coarsely obtuse-toothed, sessile, with ascending minute papillae on margin; inflorescence terminal, densely many-flowered, the bracts linear; corolla 5–7 mm. long, rosy, with a slender long tube, gibbous, the lobes about 1/5 the whole length; stamens long-exserted; achenes lanceolate, about 4 mm. long.—Mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather rare.—Korea, Manchuria, Formosa, Sakhalin, and S. Kuriles.

2. *Valeriana flaccidissima* Maxim. *V. hardwickii* var.

leiocarpa Miq.—TSURU-KANOKO-SŌ. Rhizomes short; stolons very slender and elongate; stems soft, slender, decumbent and flaccid after anthesis, 20–40 (–60) cm. long, short-pilose on the nodes; radical leaves and those of the stolons broadly ovate, 1.5–4 cm. long, simple or 3-foliate; cauline leaves of 2 or 3 pairs, petiolate or the upper sessile, 3–7 (–9)-foliate, short-pilose on margin, the terminal leaflets ovate or narrowly so, 2–5 cm. long, the lateral ones mostly ovate, 1–2 (–3) cm. long, smaller, the lowest pair often stipulelike or auricled; inflorescence densely flowered, the bracts linear, short; corolla white, sometimes pinkish, infundibuliform, about 2 mm. long, obsoletely gibbous; stamens and style not exserted; achenes 2–2.5 mm. long, broadly lanceolate.—Apr.–June. Wet woods and thickets along streams and ravines; Honshu, Shikoku, Kyushu.

Fam. 190. DIPSACACEAE MATSUMUSHI-SŌ KA Teasel Family

Herbs, rarely shrubs; leaves opposite or verticillate; stipules absent; flowers bisexual, zygomorphic, usually in dense heads, enveloped by an epicalyx; calyx cup-shaped, often lobed and divided into papuslike segments; corolla gamopetalous, 4- or 5-lobed, the lobes imbricate in bud; stamens usually 4, rarely 2 or 3, inserted near base of corolla-tube, alternate with the lobes, the filaments free, the anthers 2-locular, longitudinally split; ovary 1-locular and 1-ovuled, inferior; style slender; seeds with a straight embryo.—About 9 genera, with about 160 species, indigenous of the Old World, abundant in the Mediterranean region, a few naturalized elsewhere.

1A. Plant spiny or prickly, especially on the stem; heads globose or ellipsoidal; bracts of the receptacle and involucre spine-tipped.

1. *Dipsacus*

1B. Plant not spiny or prickly; heads depressed, subglobose to ovoid-conical; bracts of receptacle and involucre not spine-tipped.

2. *Scabiosa*

1. DIPSACUS NABE-NA ZOKU

Coarse spiny to prickly annuals, biennials, or perennials; leaves opposite, coarsely toothed, pinnately lobed, or divided; bracts of the involucre and of the receptacle firm, spine-tipped; flowers blue or whitish, in dense globose or ellipsoidal heads; involucre investing the ovary and achene 4-leaved; calyx-tube adnate to the ovary, the limb cup-shaped; corolla-limb nearly regularly 4-lobed; stamens 4; achenes more or less adnate to the involucre or free, 8-ribbed, usually crowned with the persistent calyx-limb.—About 12 species, in Europe, Asia, and n. Africa.

1. *Dipsacus japonicus* Miq. NABE-NA. Course stout prickly biennial; stems 1 m. long or longer, erect, branched, longitudinally striate, with scattered weak spines or prickles; leaves opposite, the lower simple to pinnately compound, the segments oblong-ovate, rhombic-ovate, or ovate, 6–15 cm. long, acutely toothed, winged-petiolate, the upper leaves smaller, sessile, usually simple; heads pedunculate, strict, glo-

bose or broadly ellipsoidal, 2–3 cm. long, many-flowered, with linear bracts 5–20 mm. long at base, the bracts on receptacles cuneate, 5–8 mm. long, densely appressed-puberulent on back, short spine-tipped; corolla rose-purple, 5–6 mm. long; achenes about 6 mm. long, cuneate-oblong, puberulent on upper half.—Aug.–Oct. Mountains; Honshu, Shikoku, Kyushu.—Korea, China, and Manchuria.

2. SCABIOSA L. MATSUMUSHI-SŌ ZOKU

Pubescent or sometimes nearly glabrous herbs, sometimes woody at the base; leaves entire or toothed to pinnate; heads depressed globose to ovoid-conical, many-flowered, usually pedunculate; involucre bracts 1- or 2-seriate; bracts on receptacles linear, small or absent; involucre adnate at base to the achene, the expanded portion cuplike, 2- to 4 (–8)-ribbed, toothed on the margin; corolla-limb 4- or 5-lobed, usually blue, sometimes white; stamens 4 or 2; style slender; achenes adnate about half way to the involucre, crowned with the calyx-teeth.—About 60 species, in Europe, Africa, Asia, abundant in the Mediterranean region.

1. *Scabiosa japonica* Miq. *S. fischeri* var. *japonica* (Miq.) Nakai; *S. comosa* var. *japonica* (Miq.) Tatew.; *S. tschiliensis* var. *japonica* (Miq.) Hurusawa—MATSUMUSHI-SŌ. Slightly pubescent biennial herb with a thick root; stems 30–80 cm. long, erect, branched; cauline leaves slightly thickened at base, pinnately compound, 5–10 cm. long, the lobes ovate, incised or again cleft into nearly linear segments; peduncles very long; heads at anthesis flat, 2.5–5 cm. across, globose in fruit, about 1.5 cm. across; corollas blue, the marginal rays elongate; fruit fusiform, about 3.5 mm. long, gla-

brous, invested by an 8-ribbed pilose involucre.—Aug.–Oct. Sunny grassy slopes in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.

Var. *acutiloba* Hara. *S. jezoensis* Nakai—EZO-MATSUMUSHI-SŌ. Lobes of leaves more acute at apex.—Northern phase; Hokkaido, Honshu (n. distr.).

Var. *alpina* Takeda. *S. fischeri* var. *longiseta* Hara—TAKANE-MATSUMUSHI-SŌ. Plant dwarf; flowers rather large; calyx rather long-spined.—Alpine; Honshu and Shikoku.

Fam. 191. CUCURBITACEAE URI KA Gourd Family

Tendrill-bearing scandent (rarely otherwise) herbs, sometimes woody at base, often scabrid; flowers unisexual, actinomorphic (plants monoecious or dioecious); calyx of the staminate flowers short-tubular or obconical, the lobes imbricate or not overlapping in bud; corolla gamopetalous or polypetalous, the petals imbricate or induplicate-valvate in bud; stamens usually 3, free or variously connate, one of the anthers 1-locular, the others 2-locular, locules straight or flexuous; calyx-tube of the pistillate flowers adnate to the ovary; ovary inferior, with 3 parietal placentae often meeting in the center; ovules many or sometimes few; style simple or rarely 3, free, the stigma thickened; fruit a pepo, usually fleshy; seeds usually flat, without endosperm.—About 100 genera, with about 860 species, chiefly in the Tropics and warmer temperate regions.

- 1A. Flowers rather large, more than 1 cm. across; fruit more than 2 cm. long.
- 2A. Flowers less than 6 cm. across, white; corolla finely fimbriate on margin; fruit 5–10 cm. long. 1. *Trichosanthes*
- 2B. Flowers 6–7 cm. across, yellow; corolla not fimbriate; fruit 4–5 cm. long. 2. *Thladiantha*
- 1B. Flowers small and less than 1 cm. across; fruit small, to 2 cm. long.
- 3A. Leaves simple or often lobed; stamens free or connate only at base.
- 4A. Stamens 5; corolla-lobes caudate; fruit circumscissile; seeds 2–4, rather large. 3. *Actinostemma*
- 4B. Stamens 3; corolla-lobes acute; fruit not circumscissile.
- 5A. Seeds horizontal within the fruit, many. 4. *Melothria*
- 5B. Seeds perpendicular within the fruit, solitary in each locule. 5. *Schizopepon*
- 3B. Leaves palmately compound, (3-)5-foliate; stamens connate, forming a column; fruit black. 6. *Gynostemma*

1. TRICHOSANTHES L. KARASU-URI ZOKU

Annuals or perennials often with thickened roots; leaves 3- to 5-lobed or undivided; tendrils with 1–5 branches; flowers unisexual (plants often dioecious), the staminate solitary or in racemes, more than 1 cm. across, white; calyx-lobes 5-lobed; corolla hypocrateriform, the limb nearly 5-parted, the segments fimbriate on margin; stamens 3, the filaments very short, the anther-locules S-shaped; pistillate flowers solitary; ovary oblong, 1-locular, the placentae 3–5, parietal, bifid; style short, the stigma capitate, entire or shallowly 3-lobed; ovules many, horizontal or slightly pendulous; fruit oblong or ovoid-globose, rarely elongate-cylindric, 5–10 cm. long, many-seeded.—About 50 species, in s. and e. Asia, and Australia.

- 1A. Stems soon glabrous; seeds flat, 1-locular, usually ellipsoidal, without a longitudinal band.
- 2A. Calyx-segments toothed; leaves palmately 5- to 7-cleft, scabrous; fruiting peduncles 2–3 cm. long; seeds truncate. 1. *T. bracteata*
- 2B. Calyx-segments entire.
- 3A. Calyx-tube of pistillate flowers 2–2.5 cm. long; calyx-segments in both sexes 5–6 mm. long; fruiting peduncles 7–25 cm. long; fruit red. 2. *T. multiloba*
- 3B. Calyx-tube of pistillate flowers 3.5–4 cm. long; calyx-segments in both sexes 10–12 mm. long; fruiting peduncles 2–3 cm. long; fruit yellow. 3. *T. kirilowii* var. *japonica*
- 1B. Stems puberulent; seeds slightly inflated, usually 3-locular, usually broader than long, with a longitudinal broad band on the face.
- 4A. Calyx-segments 3–4 mm. long; tendrils with 1 or 2 branches; fruit rounded at apex. 4. *T. cucumeroides*
- 4B. Calyx-segments 8–10 mm. long; tendrils with 2 or 3 branches; fruit beaked at apex. 5. *T. rostrata*

1. *Trichosanthes bracteata* (Lam.) Voigt. *Modecca* (?) *bracteata* Lam.; *T. shikokiana* Makino—Ō-KARASU-URI. Roots thickened; stems glabrous; leaves petiolate, cordate or reniform-cordate, 8–15 cm. long and as wide, scabrous, loosely short-pubescent beneath especially on nerves while young, palmately 5- to 7-cleft, the terminal lobe ovate or ovate-deltoid; tendrils 3-lobed; fruiting peduncles 2–3 cm. long; staminate spikes elongate, to 3 cm. long; bracts large, green, 3–4 cm. long, obovate, finely lobulate on margin; calyx-segments narrowly ovate or broadly lanceolate, 12–15 mm. long, 5–7 mm. wide, toothed; fruit broadly ellipsoidal, about 7 cm. long, red; seeds gray, oblong, 12–13 mm. long, truncate.—Aug.–Sept. Shikoku, Kyushu.—Ryukyu, Formosa, China, India, and Malaysia.

2. *Trichosanthes multiloba* Miq. MOMIJI-KARASU-URI. Roots thickened; stems and leaves soft brown-pubescent while young; leaves orbicular-cordate, short-pilose on both sides and slightly scabrous, palmately 5- to 9-cleft, the lobes broadly lanceolate or nearly obovate, acuminate; fruiting peduncles 7–25 cm. long; staminate spikes 10–25 cm. long; bracts broadly ovate or obovate, 1–1.5 cm. long, toothed, the calyx-segments broadly linear to narrowly lanceolate; calyx-tube of pistillate flowers 2–2.5 cm. long; fruit ovoid-globose, about 10 cm. long, red, with longitudinal orange striations; seeds broadly elliptic, 10–11 mm. long, dark brown.—Aug. Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

3. *Trichosanthes kirilowii* Maxim. var. *japonica* (Miq.) Kitam. *Gymnopetalum japonicum* Miq.; *T. quadricirra*

Miq.; *T. japonica* Regel.—KI-KARASU-URI. Roots thickened; stems slender, soft brown-pubescent while young; leaves ovate to orbicular, 5-angled, cordate, palmately 3- to 5(-7)-lobed or -cleft, short-pilose above; fruiting peduncles 2-3 cm. long; staminate spikes 10-20 cm. long; bracts broadly ovate to obovate, 1.5-2.5 cm. long, coarsely toothed; calyx-segments broadly linear, 8-12 mm. long; calyx-segments of pistillate flowers 3.5-4 cm. long; fruit ovate-globose, to 10 cm. long, yellow, the peduncles 2-3(-4.5) cm. long; seeds oblong to ovate-orbicular, 11-14 mm. long, dark brown.—Aug.-Sept. Hokkaido (Okushiri Isl.), Honshu, Shikoku, Kyushu.—Ryukyus. The typical phase with pale brown seeds, occurs in the temperate to warmer regions of e. Asia.

4. *Trichosanthes cucumeroides* (Ser.) Maxim. *Bryonia cucumeroides* Ser.; *Platygonia kaempferi* Naud.—KARASU-URI. Roots fasciculate, thickened; stems slender, white-puberulent; leaves membranous, the tendrils with 1 or 2 branches; ovate-cordate to cordate-reniform, usually 6-10 cm. long and as wide, usually 3- to 5-lobed or angled, sometimes 5-cleft, white-puberulent; staminate spikes 2-10 cm. long;

bracts small, lanceolate, 2-3 mm. long; calyx-segments 3-4 mm. long; corolla-tube in staminate flowers 6-7 cm. long; fruit globose to oblong, red, 5-7 cm. long, the peduncles about 1 cm. long; seeds brown, about 1 cm. long, 7-9 mm. wide, with a raised longitudinal band 4-5 mm. wide.—Aug.-Sept. Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, and China.

5. *Trichosanthes rostrata* Kitam. KE-KARASU-URI, TENGU-KARASU-URI. Roots elongate, somewhat thickened; stems puberulent, 5-angled; tendrils with 2 or 3 branches; leaves thick-membranous, broadly ovate-cordate or reniform-cordate, 3- to 5-lobed, puberulent, with scattered multicellular hairs on nerves beneath; staminate spikes 6-12 cm. long; bracts cuneate or narrowly oblong, 1-1.5 cm. long, toothed on upper margin; calyx-segments 8-10 mm. long; corolla-tube about 7 cm. long; fruit 4.5-7 cm. long, beaked, red, the peduncles 1.5-2 cm. long; seeds dark brown, 7-8 mm. long, 6.5-7.5 mm. wide, with a longitudinal band 3.5-4 mm. wide.—Aug. Kyushu (Oosumi Prov.).—Ryukyus.

2. *THLADIANTHA* Bunge Ō-SUZUME-URI ZOKU

Dioecious perennials with tendrils and tuberous roots; leaves ovate, rarely deeply 3-lobed to pedately compound into 3-7 leaflets; tendrils simple or bifid; flowers yellow, the staminate in racemes or solitary; calyx-tube short-campanulate to rotate, with 1-3 scalelike appendages on the throat, the lobes linear; corolla campanulate, with 5 large, reflexed lobes; stamens in pairs; calyx of pistillate flowers without scalelike appendages on the throat; staminodes 5, elongate; style cylindric, 3-lobed, the stigma dilated or 2-lobed; fruit oblong, indehiscent; seeds many, obovate, flat.—About 24 species, in centr. to e. Asia, and tropical Asia.

1. *Thladiantha dubia* Bunge. Ō-SUZUME-URI. Perennial herb, densely long spreading-hairy with simple tendrils; leaves ovate-cordate, irregularly mucronate-dentate; flowers yellow, 6-7 cm. across, the staminate axillary, solitary, the

pedicels densely pubescent; calyx short-campanulate; corolla lobes oblong, reflexed; stamens in pairs; fruit oblong, 4-5 cm. long.—Naturalized; Honshu (Shinano and Iwaki Prov.).—Korea, Manchuria, and China.

3. *ACTINOSTEMMA* Griff. GOKIZURU ZOKU

Scandent monoecious herbs sometimes woody at base; leaves petiolate, hastate, cordate, coarsely toothed; tendrils simple or bifid; flowers unisexual, small, in axillary panicles or racemes, the pedicels jointed in the middle; calyx rotate, 5-parted, the segments slender, glandular on margin; corolla rotate, 5-parted, the segments narrow, caudate; stamens 5, free, the anther-locules oblong; pistillate flowers on lower portion of inflorescence, the staminate on the upper portion; ovary 1-locular; style short, the stigmas 2, reniform; ovules 2 to 4, pendulous; fruit small, asperous, circumscissile; seeds 2-4, flat, scabrous.—About 6 species, in e. Asia and India.

1. *Actinostemma lobatum* (Maxim.) Maxim. *Mitrosicyos lobatus* Maxim.; *M. racemosus* Maxim.; *Karivia* (?) *longicirra* Miq.; *A. racemosum* (Maxim.) Cogn.; *A. japonicum* Miq.—GOKIZURU. Slender annual, loosely short-pubescent on stems, leaves, and inflorescence; leaves thinly membranous, petiolate, narrowly hastate, or deltoid-cordate, 5-10 cm. long, 2.5-7 cm. wide, acuminate, sometimes with an obtuse tip, sparsely short-toothed, sometimes shallowly 3- to 5-lobed; panicles racemiform, to 12 cm. long; flowers small, greenish yellow; calyx-segments linear-lanceolate, slightly shorter than the corolla-lobes, caudate; corolla-lobes narrowly

ovate-oblong, 5-6 mm. long, caudate; pistillate flowers solitary, near the base of staminate inflorescence, the peduncles about 1 cm. long; fruit ovoid, soft-spiny, about 1 cm. in diameter, circumscissile; seeds 2, large.—Aug.-Dec. Thickets along rivers in lowlands; Honshu, Shikoku, Kyushu; common.

Actinostemma palmatum (Makino) Makino. *A. lobatum* var. *palmatum* Makino.—TSUTABA-GOKIZURU. Obscurely known plant. Leaves orbicular to reniform, deeply 3-cleft, the lobes again 2- or 3-lobed.—Once collected near Chiba in Honshu.

4. *MELOTHRIA* L. SUZUME-URI ZOKU

Slender scandent monoecious or rarely dioecious herbs; leaves lobed or undivided; tendrils simple; flowers unisexual, small, yellowish or white, the staminate in racemes or corymbs, rarely solitary; calyx campanulate, shortly 5-toothed; corolla 5-parted nearly to the base; stamens 3, the anthers free or slightly connate, the locules straight; pistillate flowers solitary, usually on very slender peduncles; placentae 3; style short, the stigma linear or capitate, bifid; fruit juicy, small; seeds flat, horizontal, many.—About 85 species, of wide distribution in all warmer regions.

- 1A. Staminate flowers solitary or sometimes in terminal racemes; anthers nearly sessile; seeds without thickened margins; leaves deltoid-ovate to ovate-cordate; fruiting peduncles 1-2 cm. long. 1. *M. japonica*
 1B. Staminate flowers few, umbellate; anthers with pilose filaments; seeds with somewhat thickened margins; leaves deltoid; fruiting peduncles 6-8 mm. long. 2. *M. perpusilla*

1. *Melothria japonica* (Thunb.) Maxim. *Bryonia japonica* Thunb.; *M. regelii* Naud.; *M. japonica* var. *major* Cogn.—SUZUME-URI. Slender annual, sparingly pubescent when young; stems very slender; leaves thinly membranous, deltoid-ovate to ovate-cordate, 3-6 cm. long, 4-8 cm. wide, acute with an obtuse tip, cordate, coarsely short mucronate-toothed, often obsoletely 3-lobed, scabrous above; staminate flowers usually solitary in leaf-axils or sometimes in terminal racemes, white, 6-7 mm. across, on slender pedicels; calyx-segments linear, short; corolla-lobes deltoid-ovate, subobtusely; anthers nearly sessile; fruit globose, about 1 cm. across, green, grayish white at maturity, smooth, the peduncles 1-2 cm. long; seeds grayish, 5-6 mm. long.—Aug.-Sept. Wet places along rivers and ditches in lowlands; Honshu, Shikoku, Kyushu; common.—Korea (Quelpaert Isl.).

2. *Melothria perpusilla* (Bl.) Cogn. var. *perpusilla*. HOSOGATA-SUZUME-URI. Leaves ovate-cordate, the basal sinus 5-15 mm. long; calyx-lobes reflexed.—Reported from Kyushu (Oosumi Prov.).—se. Asia and Malaysia.

Var. *deltifrons* Ohwi. SATSUMA-SUZUME-URI. Monoecious slender herb; stems loosely short-pubescent while young; leaves thinly membranous, deltoid, 4-7 cm. long and as wide, acuminate, mucronate, truncate at base, mucronate-dentate, nearly glabrous beneath, petiolate; staminate inflorescence few-flowered, umbellate, the long peduncles capillary, 2-3 cm. long, the flowers 4-5 mm. across, the pedicels 4-5 mm. long; pistillate flowers solitary; calyx-lobes minute, not reflexed; filaments pilose; fruit globose, 8-10 mm. across, the peduncles 6-8 mm. long; seeds pallid with somewhat thickened margins.—Sept. Kyushu (Satsuma Prov.).

5. SCHIZOPEPON Maxim. MIYAMA-NIGA-URI ZOKU

Slender scandent polygamodioecious annual herbs; leaves thinly membranous, green, petiolate, ovate- to orbicular-cordate, toothed; tendrils bifid; flowers small, white, the staminate in racemes; calyx rotate; corolla rotate, 5-parted; stamens 3, free, the anthers straight, on short filaments; perfect flowers solitary in axils, long-pedicelled; ovary 3-locular; style 3-lobed, the stigmas again 2-lobed; ovules solitary in each locule; fruit berrylike, ovoid, dehiscent with the 3 valves involute on margin; seeds ovate, flat, perpendicular, with rather thicker slightly undulate margins.—Few species, in e. Asia.

1. *Schizopepon bryoniaefolius* Maxim. *S. bryoniaefolius* var. *japonica* Cogn.; *S. bryoniaefolius* var. *paniculatus* Komar.—MIYAMA-NIGA-URI. Slender annual herb slightly short-pubescent or nearly glabrous, with slender, elongate branches; leaves ovate- to orbicular-cordate, 5-12 cm. long and as wide, acuminate, mucronate-dentate, often loosely pilose above, puberulent on the nerves beneath, shallowly 5- to 7-lobed; flowers about 5 mm. across; calyx-segments lanceolate;

corolla-lobes narrowly ovate, subobtusely; fruit obliquely ovoid, about 1 cm. long, smooth, the peduncles slender, capillary, 1-10 cm. long; seeds 1-3, about 1 cm. long, brown, flat, roughened on both surfaces, truncate on margin.—Aug.-Sept. Damp coniferous woods in mountains; Hokkaido, Honshu, Kyushu.—s. Kuriles, Sakhalin, Korea, and e. Siberia.

6. GYNOSTEMMA Bl. AMACHAZURU ZOKU

Scandent herbs sometimes slightly woody at base; leaves membranous, petiolate, narrowly ovate, palmately compound, (3-) 5-foliolate, toothed; tendrils once or twice branched; flowers small, unisexual, in axillary panicles, greenish or white; staminate calyx small, 5-lobed, the corolla rotate, 5-cleft, the segments lanceolate, involute in bud; stamens 5, the filaments connate, forming a column; ovary in pistillate flowers 2- or 3-locular; styles 2 or 3, connate at base, the stigma retuse or bifid; ovules 2 in each locule; berry small, black, globose, 1- to 3-seeded; seeds flat, with irregular warty tubercles.—Few species, in India, Malaysia, and e. Asia.

1. *Gynostemma pentaphyllum* (Thunb.) Makino. *Vitis pentaphylla* Thunb.; *Cissus pentaphylla* (Thunb.) Willd.; *G. pedata* Bl.—AMACHAZURU. Slender nearly glabrous perennial herb; rhizomes creeping; stems slender, loosely white-pubescent on the nodes; leaves membranous, palmately compound, petiolate; leaflets 5 (3 or 7), narrowly ovate-elliptic to narrowly ovate, the terminal one 4-8 cm. long, 2-3 cm. wide, acuminate or obtuse, puberulent on the nerves above,

penninerved, the veins parallel; inflorescence a panicle often racemiform, 8-15 cm. long; flowers yellowish green; calyx-lobes small; corolla-segments lanceolate, caudate, about 2 mm. long; fruit blackish green, globose, 6-8 mm. across, with a transverse line on upper half; seeds about 4 mm. long.—Aug.-Sept. Thickets in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, China, India, and Malaysia.

Fam. 192. CAMPANULACEAE KIKYŌ KA Campanula Family

Herbs, rarely woody plants, usually with milky juice; leaves usually alternate, simple, exstipulate; flowers often large and showy, perfect, actinomorphic or zygomorphic; calyx adnate to the ovary, the lobes 5(3-10); corolla superior, gamopetalous, tubular or campanulate, often 1- or 2-labiate, the lobes valvate in bud; stamens as many as and alternate with the corolla-lobes, inserted on the base of corolla-tube or free, the anthers free or connate; ovary usually inferior, 2- to 10-locular, with axile placentae, the ovules usually many; fruit a capsule or berry, the seeds usually small, many, the embryo straight, the endosperm fleshy.—About 60 genera, with about 1,500 species. Cosmopolitan.

- 1A. Flowers actinomorphic; anthers free.
- 2A. Capsule dehiscent laterally, or, if indehiscent, inferior to the calyx.
- 3A. Disc tubular or cup-shaped, surrounding the base of style. 1. *Adenophora*
- 3B. Disc flat or absent.
- 4A. Corolla campanulate, rarely infundibuliform.
- 5A. Capsules dehiscent, 3- to 5-valved. 2. *Campanula*
- 5B. Capsules scarcely dehiscent. 3. *Peracarpa*
- 4B. Corolla divided nearly to the base into narrow segments. 4. *Phyteuma*
- 2B. Capsule dehiscent apically, or, if indehiscent, superior to the calyx.
- 6A. Calyx inferior; fruit a berry. 5. *Campanumoca*
- 6B. Calyx superior; fruit a capsule.
- 7A. Erect herbs; stigma-lobes narrow.
- 8A. Plants 20-40 cm. high; flowers about 2.5 cm. across; carpels alternate with the calyx-lobes and stamens. 6. *Wahlenbergia*
- 8B. Plants 40-100 cm. high; flowers 4-5 cm. across; carpels opposite the calyx-lobes and stamens. 7. *Platycodon*
- 7B. Vinelike herbs; stigma-lobes broad. 8. *Codonopsis*
- 1B. Flowers zygomorphic; anthers united into a tube or ring around the style; capsule dehiscent apically. 9. *Lobelia*

1. ADENOPHORA Fisch. TSURIGANE-NINJIN ZOKU

Perennial herbs; stems from a thick caudex; leaves alternate or verticillate, entire or toothed; flowers pendulous, in loose terminal racemes or panicles; calyx-limb 5-parted; corolla campanulate, blue, 5-lobed; stamens free from the corolla, the filaments broadened and pilose at base; disc thick, surrounding the base of the style; ovary inferior, 3-locular; stigma lobes 3, linear; capsules inferior, with a rather broad top, crowned with the persistent calyx-segments, dehiscent between the ribs; seeds ovate, flat.—More than 50 species, in Eurasia.

- 1A. Stems weak, declined or nodding above; pedicels capillary, mostly longer than the flowers.
- 2A. Disc tubular, about 2 mm. long, longer than wide. 1. *A. maximowicziana*
- 2B. Disc cup-shaped, wider than long.
- 3A. Leaves narrowly ovate to broadly lanceolate; corolla 15-25 mm. long; style not exerted. 2. *A. takedae*
- 3B. Leaves ovate-cordate in the lower ones, lanceolate in the upper ones; corolla about 10 mm. long; style long-exserted. 3. *A. hatsushimae*
- 1B. Stems erect or ascending; pedicels stouter, mostly shorter than the flowers.
- 4A. Corolla campanulate; pedicels usually as long as or longer than the calyx.
- 5A. Disc cup-shaped, 1-2 mm. long, wider than long.
- 6A. Leaves alternate. 5. *A. nikoensis*
- 6B. Leaves usually verticillate. 6. *A. pereskiaefolia* var. *heterotricha*
- 5B. Disc tubular, longer than wide.
- 7A. Calyx-segments linear, usually toothed. 4. *A. triphylla*
- 7B. Calyx-segments lanceolate, entire.
- 8A. Leaves usually verticillate, subsessile; stems erect, 60-100 cm. long; inflorescence paniculate with long spreading branches. 7. *A. divaricata*
- 8B. Leaves usually alternate, petiolelike at base; stems decumbent, 10-30 cm. long; inflorescence in racemes with short branches. 8. *A. tashiroi*
- 4B. Corolla infundibular-campanulate; pedicels usually as long as to shorter than the ovary.
- 9A. Leaves sessile; lower half of filaments ovate-oblong or elliptic, abruptly narrowed at tip.
- 10A. Plant with white spreading hairs; calyx-segments and bracts lanceolate, acuminate. 9. *A. stricta*
- 10B. Plant nearly glabrous; calyx-segments and bracts ovate, obtuse. 10. *A. palustris*
- 9B. Leaves petiolate, usually more or less cordate at base; lower half of filaments lanceolate, gradually narrowed at tip. 11. *A. remotiflora*

1. *Adenophora maximowicziana* Makino. *A. verticillata* var. *maruspiflora* sensu auct. Japon., non Trautv.—HINA-SHAJIN. Plant glabrous, the main roots rather short, slender; stems slender, 40-60 cm. long, declined; radical leaves ovate or ovate-cordate, long-petiole, the median leaves membranous, linear-lanceolate, 8-20 cm. long, 5-10 mm. wide, gradually acuminate, gradually narrowed to a short petiolelike base, with appressed teeth; upper leaves small, rarely lanceolate; inflorescence terminal, corymbose or subpaniculate, loosely few- to about 10-flowered, the bracteoles absent or minute, the pedicels (2-) 3-6 cm. long; calyx-segments filiform-linear, 4-6 mm. long, entire; corolla campanulate, about 1 cm. long; style 18-20 mm. long; disc tubular, about 2 mm. long.—Aug.-Oct. Calcareous mountains; Shikoku.

2. *Adenophora takedae* Makino. *Campanula rotundifolia* sensu auct. Japon., non L.—IWA-SHAJIN. Plant glabrous, with rather thick main roots; stems slender, declined,

30-70 cm. long; leaves membranous, narrowly ovate, lanceolate to linear, 7-15 cm. long, 1-3 cm. wide, incurved to appressed-toothed, sometimes with scattered appressed hairs above; inflorescence a terminal open leafy raceme, few- to more than 10-flowered, the pedicels 2-5 cm. long, the bracteoles small, filiform-linear; calyx-segments slightly curved, spreading, filiform-linear, 5-8 mm. long, loosely glandular-toothed; corolla campanulate, 15-25 mm. long; style not exerted; disc cup-shaped, about 1 mm. long.—Sept.-Oct. Rocks along valleys and ravines in mountains; Honshu (Sagami, Suruga, Kai, and s. Shinano Prov.).

Var. *howozana* (Takeda) Sugimoto. *A. howozana* Takeda.—H66-SHAJIN. Stems 5-15 cm. long; leaves slightly thicker, obsoletely toothed; flowers smaller.—High mountains; Honshu (Kai and s. Shinano Prov.).

3. *Adenophora hatsushimae* Kitam. TSUKUSHI-IWA-SHAJIN. Glabrous slender plant, 20-40 cm. high; radical

and lower cauline leaves membranous, ovate-cordate, 3-4 cm. long, 1.8-2.8 mm. wide, acuminate, long-petiolate, incised-toothed, short-pilose above, glabrous beneath; median leaves smaller, elongate-ovate, about 2.5 cm. long, the petioles 1-2 cm. long; upper leaves small, lanceolate, bractlike; flowers in a terminal raceme, the pedicels filiform; calyx-segments linear, 3-5 mm. long, loosely toothed; corolla about 1 cm. long; style long-exserted, nearly 2 cm. long; disc about 0.8 mm. long.—Oct. Rocks in mountains; Kyushu (Shiiba in Hyuga Prov.).

4. *Adenophora triphylla* (Thunb.) A. DC. *Campanula triphylla* Thunb.; *C. tetraphylla* Thunb.; *A. tetraphylla* Fisch. ex Jacks.; *A. verticillata* var. *latifolia* Miq.; *A. verticillata* var. *angustifolia* Miq.; *A. verticillata* var. *triphylla* Miq. —SAIYŌ-SHAJIN. Plant nearly glabrous to white-pilose; main roots thick; stem terete, erect, 40-100 cm. long, sometimes branched; leaves usually verticillate in 4's, rarely alternate, usually oblong or ovate-elliptic, sometimes lanceolate or broadly linear, 4-8 cm. long, 5-40 mm. wide, obtuse to sub-acuminate at both ends, toothed; inflorescence usually a rather loose many-flowered erect panicle with elongate branches, the pedicels usually shorter than the flowers; calyx-segments 3-5 mm. long, filiform-linear, subentire, similar to the bracteoles; corolla urceolate-campanulate, slightly constricted above, 8-11 mm. long; style long-exserted; disc tubular, 2-3 mm. long.—Sept.-Oct. Kyushu.—Ryukyus, Formosa, and China. Extremely variable.

Var. *japonica* (Regel) Hara. *A. pereskiaefolia* var. *japonica* Regel; *A. verticillata* sensu auct. Japon., pro parte; *A. thunbergiana* Kudo; *A. triphylla* subsp. *aperitacampanulata* Kitam.—TSURIGANE-NINJIN. Corolla campanulate, not constricted above, 13-22 mm. long; style slightly exserted.—Grassy places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.

Var. *hakusanensis* (Nakai) Kitam. *A. hakusanensis* Nakai; *A. thunbergiana* var. *hakusanensis* (Nakai) Hara.—HAKUSAN-SHAJIN. Stems 30-50 cm. long; panicle-branches short; flowers densely arranged.—Alpine regions; Hokkaido, Honshu.

Var. *puellaris* (Honda) Hara. *A. puellaris* Honda.—OTOME-SHAJIN. Stems low; leaves linear, alternate, 1-3 mm. wide; flowers in racemes; corolla 1 cm. long, campanulate; style exserted.—Shikoku (Mount Higashi-akaishi in Iyo).

5. *Adenophora nikoensis* Fr. & Sav. *A. polymorpha* sensu auct. Japon., non Ledeb.; *A. coronopifolia* sensu auct. Japon., non Fisch.; *A. polymorpha* var. *coronopifolia* sensu auct. Japon., non Trautv.—HIME-SHAJIN. Plant glabrescent; main roots rather thick; stems erect, 20-40 cm. long; leaves usually alternate, linear-lanceolate to broadly lanceolate, rarely narrowly oblong, 3-7(-10) cm. long, 5-20 mm. wide, acute to long-acuminate, acute at base, toothed, sessile or subsessile; inflorescence a loose few-flowered raceme, rarely subpaniculate, the bracteoles absent or short, linear, the pedicels 5-10(-20) mm. long, rather slender; calyx-segments linear, 4-8 mm. long, usually toothed; corolla campanulate, 1.5-2.5 (-3) cm. long; style as long as to slightly longer than the corolla; disc cup-shaped, 1-2 mm. long.—Aug.-Sept. Alpine regions; Honshu (centr. and n. distr.); extremely variable.

Var. *petrophila* (Hara) Hara. *A. petrophila* Hara.—MYŌGI-SHAJIN. Stems elongate, rather slender; leaves lance-

olate, much-elongate, falcate.—Honshu (Kozuke and Musashi Prov.).

Var. *stenophylla* (Kitam.) Ohwi. *A. lamarchii* forma *multiloba* Takeda; *A. polymorpha* var. *lamarchii* forma *multiloba* (Takeda) Makino & Nemoto; *A. nikoensis* forma *nipponica* (Kitam.) Hara; *A. nikoensis* forma *stenophylla* (Kitam.) Hara; *A. nipponica* forma *multiloba* (Takeda) Kitam.; *A. nipponica* var. *stenophylla* Kitam.; *A. nipponica* Kitam.; *A. nikoensis* var. *multiloba* (Takeda) Ohwi, non Honda; *A. nikoensis* forma *multifida* Hara.—MIYAMA-SHAJIN. With the habit of the typical phase; calyx-segments lanceolate, entire.—High mountains of centr. and n. Honshu, inclusive of Yamato Prov.

6. *Adenophora pereskiaefolia* (Fisch.) Fisch. var. *heterotricha* (Nakai) Hara. *A. moiwana* var. *heterotricha* Nakai; *A. moiwana* Nakai; *A. onoi* Kitam.; *A. ishiyamae* Miyabe & Tatew.; *A. latifolia* sensu auct. Japon., non Fisch.—MOIWA-SHAJIN. Pilose or nearly glabrous; main roots thick; stems usually simple and erect, 30-50 cm. long; radical leaves reniform or cordate-ovate, long-petiolate; cauline leaves in 3's or 4's, rarely alternate or opposite, lanceolate to ovate, 2-8 cm. long, 1.5-4 cm. wide, acute to short-acuminate, sessile or subsessile, toothed; inflorescence a rather densely flowered raceme, the branches usually not elongate, the pedicels rather short; calyx-segments lanceolate, entire, 3-6 mm. long; corolla campanulate, 15-20 mm. long; style slightly exserted; disc cup-shaped, 1-1.5 mm. long.—Aug.-Sept. Hokkaido, Honshu (alpine regions of n. distr.).—s. Kuriles.

7. *Adenophora divaricata* Fr. & Sav. *A. polymorpha* var. *divaricata* (Fr. & Sav.) Makino.—FUKUSHIMA-SHAJIN. Plant nearly glabrous to slightly spreading-pilose; stems 60-100 cm. long, erect; cauline leaves 3-5, verticillate, alternate or opposite, ovate-elliptic or narrowly ovate, 5-10 cm. long, 2-4 cm. wide, acute to short-acuminate, toothed, subsessile; inflorescence a rather large terminal loose panicle with long spreading branches, the pedicels rather long, the bracteoles linear; calyx-segments lanceolate, 4-8 mm. long, entire; corolla campanulate, 15-20 mm. long; style as long as to slightly longer than the corolla; disc tubular, 2-3 mm. long.—Aug.-Sept. Mountains; Honshu (centr. and n. distr.).—Korea and Manchuria.

8. *Adenophora tashiroi* (Makino & Nakai) Makino & Nakai. *A. polymorpha* var. *tashiroi* Makino & Nakai.—SHIMA-SHAJIN. Plant nearly glabrous; main roots thick; stems 10-30 cm. long, often decumbent; leaves rather thick, usually alternate, ovate or broadly so, 1.5-3 cm. long, 1-2 cm. wide, coarsely toothed, the lower and median leaves acute, gradually or abruptly narrowed to a petiolelike base, the upper leaves small, narrow, sessile; inflorescence a terminal few-flowered raceme, sometimes 1-flowered, the pedicels rather elongate; calyx-segments lanceolate, 4-6 mm. long, entire; corolla campanulate, 16-20 mm. long; style not exserted; disc tubular, about 2.5 mm. long.—Kyushu (Fukue Isl. in Hizen Prov.).—s. Korea (Quelpaert Isl.).

9. *Adenophora stricta* Miq. *A. polymorpha* var. *stricta* (Miq.) Makino.—MARUBA-NO-NINJIN, TŌ-SHAJIN. Plant sparsely white spreading-pilose; main roots stout; stems erect, 60-100 cm. long; radical leaves reniform-cordate, long-petiolate; cauline leaves alternate, ovate or oblong, 3-7 cm. long, 1-3 cm. wide, acute, acute to obtuse at base, coarsely toothed, sessile; inflorescence rather densely racemose, often branched at base, the bracts and bracteoles lanceolate, acuminate, the

pedicels 2-4 mm. long; calyx-segments lanceolate, 7-10 mm. long, the tube densely white-pilose; corolla campanulate, 1.5-2 cm. long; style not exerted.—Aug.-Sept. Honshu (n. distr.).

Var. *lancifolia* Honda. NAGABA-NO-NINJIN. Leaves narrower; inflorescence glabrescent.—Honshu (Mutsu Prov.).

10. *Adenophora palustris* Komar. YACHI-SHAJIN. Main roots thick; stems strict, purplish, 60-100 cm. long, glabrous; leaves rather thick, elliptic or oblong, 3-6 cm. long, 1.5-2.5 cm. wide, subacute at both ends, toothed, scattered-pilose on the nerves beneath, sessile, the upper leaves gradually smaller; inflorescence narrowly racemose, the pedicels 1-4 mm. long, the subtending bracteoles broadly ovate to broadly lanceolate, 3-4 mm. long, often toothed; calyx-segments ovate, 3-4 mm. long, obtuse, sometimes toothed, erect; corolla cam-

panulate, 1-1.5 cm. long; style scarcely exerted; disc tubular, about 2 mm. long.—Aug. Wet places; Honshu (Mikawa Prov. and Chūgoku Distr.); rare.

11. *Adenophora remotiflora* (Sieb. & Zucc.) Miq. *Campanula remotiflora* Sieb. & Zucc.—SOBA-NA. Glabrous or rarely papillose-pilose; stems 40-100 cm. long, sometimes branched above; leaves ovate-cordate to broadly lanceolate, 5-20 cm. long, 3-8 cm. wide, acuminate, acute to cordate at base, acutely toothed, petiolate, the upper leaves small and sessile; inflorescence a large loose panicle, the pedicels short, the bracteoles minute; calyx-segments lanceolate, 5-8 mm. long; corolla campanulate, bluish, 2-3 cm. long; style usually not exerted.—Aug. Woods in mountains; Honshu, Shikoku, Kyushu.—Korea and Manchuria.

2. CAMPANULA L. HOTARU-BUKURO ZOKU

Perennials or rarely annuals; leaves simple, usually alternate, entire or toothed; flowers solitary, axillary or terminal, sometimes forming a terminal panicle, usually blue, sometimes purple or white; calyx-tube adnate to the ovary, the segments 5, often with an appendage on the sinus; corolla campanulate, rarely infundibuliform or rotate, 5-lobed; stamens free from the corolla, the filaments broadened at base; disc indistinct; ovary inferior, 3- or 5-locular, with many ovules in each locule; stigma lobes 3 or 5, narrow; capsules usually flat at the top, crowned with the persistent calyx-segments, the valves dehiscent between the lateral ribs; seeds small.—About 250 species, in the N. Hemisphere, mostly in the Mediterranean region and w. Asia.

1A. Stems 40-80 cm. long, relatively stout and thick, many leaved; radical leaves not prominent at anthesis.

2A. Flowers pendulous, tubular-campanulate, on short pedicels; bracts not clasping the base of the flowers. 1. *C. punctata*

2B. Flowers erect, narrowly campanulate, gradually broadened, sessile; bracts clasping the base of the flowers.

2. *C. glomerata* var. *dahurica*

1B. Stems 5-15 cm. long, slender, few-leaved; radical leaves prominent at anthesis.

3A. Leaves with minute undulate teeth; calyx-segments broadly deltoid-lanceolate, entire or obsoletely toothed. 3. *C. chamissonis*

3B. Leaves with spreading mucronate teeth; calyx-segments broadly linear or linear-lanceolate, with few mucronate teeth.

4. *C. lasiocarpa*

1. *Campanula punctata* Lam. HOTARU-BUKURO.

Coarsely hirsute perennial, short-rhizomatous, sometimes stoloniferous; stems erect, usually simple, 40-80 cm. long; radical leaves ovate-cordate, long-petiolate; cauline leaves deltoid-ovate to broadly lanceolate, acuminate, usually with an obtuse tip, rounded to cuneate at base, irregularly obtuse-toothed, winged-petiolate or sessile; calyx-segments linear-lanceolate to deltoid-lanceolate, with a reflexed appendage in the sinus; corolla rose-purple, with dark spots, the lobes rather short, long-ciliate.—June. Grassy slopes in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.

Var. *hondoensis* (Kitam.) Ohwi. *C. hondoensis* Kitam.; *C. punctata* subsp. *hondoensis* (Kitam.) Kitam.—HONDO-HOTARU-BUKURO. Calyx-segments without a reflexed appendage in the sinuses; corolla deeper colored, slightly spotted; seeds narrowly winged.—Mountains; Honshu.

Var. *microdonta* (Koidz.) Ohwi. *C. microdonta* Koidz.; *C. punctata* subsp. *microdonta* (Koidz.) Kitam.—SHIMA-HOTARU-BUKURO. Less prominently hairy on all parts; flowers smaller, paler in color; calyx-segments with or without a reflexed appendage in the sinuses; seeds nearly wingless.—Near seashores; Honshu (n. and centr. distr. on the Pacific side).

2. *Campanula glomerata* L. var. *dahurica* Fisch. *C. cephalotes* Fisch. ex Nakai; *C. glomerata* var. *speciosa* (Hornem.) A. DC.; *C. speciosa* Hornem., non Gilib.; *C. glomerata* sensu auct. Japon., non L.—YATSUSHIRO-SŌ. Perennial, short-hairy; rhizomes short-creeping; stems erect, 40-80 cm. long, simple; lower cauline leaves broadly lanceolate to narrowly ovate, 5-10 cm. long, 1-3 cm. wide, gradually acute,

rounded to cuneate at base, irregularly serrulate, winged-petiolate, the upper sessile and semiclasping; flowers about 10, erect, sessile, in a subcapitate terminal panicle; calyx-lobes linear or linear-lanceolate; corolla blue-purple, 2-2.5 (-3) cm. long, 5-lobed.—Aug.-Sept. Mountains; Kyushu.—Korea, Manchuria, and e. Siberia. The typical phase occurs in Eurasia.

3. *Campanula chamissonis* Fed. *C. pilosa* var. *dasyantha* (Bieb.) Herd.; *C. dasyantha* Bieb.—CHISHIMA-GIKYŌ. Rhizomes slender, slightly thickened; stems 5-15 cm. long, few-leaved; radical leaves somewhat rosulate, oblanceolate to narrowly oblong, 2-4 cm. long, 0.6-1 cm. wide, obtuse, gradually narrowed at base to a long petiole, minutely undulate-toothed, lustrous above, glabrous or with scattered long hairs on margin and on midrib beneath; flowers solitary, terminal; calyx long-pubescent, the segments erect, broadly deltoid-lanceolate, 8-15 cm. long, acute; corolla blue, campanulate, 3-4 cm. long with long soft white hairs on margin and inside.—Aug. Gravelly and sandy alpine slopes; Hokkaido, Honshu (centr. and n. distr.).—Kuriles, Sakhalin, Aleutians, and Alaska.

4. *Campanula lasiocarpa* Cham. *C. algida* Fisch.—IWAGIKYŌ. Rhizomes elongate, branched, slender; stems 5-12 cm. long, loosely long-pilose in upper part; radical leaves few, rosulate, oblanceolate or narrowly ovate, 1.5-3 cm. long, 4-7 mm. wide, rounded to subacute, petiolate, with a few scattered mucronate teeth, loosely long-pilose on margin of petiole; cauline leaves few, sessile, small; flowers solitary; calyx prominently spreading-pilose, the segments ascending, broadly linear, 8-10 mm. long, few-toothed; corolla blue, 2-2.5 cm. long, glabrous; capsules erect.—Aug. Gravelly and sandy alpine slopes; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin, Kuriles, Kamchatka, Aleutians, and Alaska.

3. PERACARPA Hook. f. & Thoms. TANIGIKYŌ ZOKU

Delicate rather fleshy perennial herb with slender rhizomes; leaves alternate; flowers solitary, pedicellate, axillary or terminal, erect; calyx-tube adnate to the ovary, obconical, the limb 5-parted, the segments deltoid; corolla campanulate, 5-lobed; stamens free from the corolla, the filaments narrow, the anthers free, linear; ovary inferior, 3-locular, with many ovules in each locule; stigma lobes 3, narrow; fruit nodding, indehiscent, crowned with the calyx-segments, the pericarp membranous.—A single species, in e. Asia and the Himalayas.

1. *Peracarpa carnea* (Wall.) Hook. f. & Thoms. var. *carneoides* (F. Schmidt) Makino. *Campanula carneoides* F. Schmidt; *P. carneoides* (F. Schmidt) Feer; *P. carnea* sensu auct. Japon., non Hook. f. & Thoms.—TANIGIKYŌ. Plant nearly glabrous; rhizomes slender, creeping, much branched; stems erect, soft, 5–15 cm. long, glabrous, few-leaved at top; leaves ovate-orbicular to broadly ovate, 8–25 mm. long, 6–20 mm. wide, obtuse, rounded at base, obtusely toothed, scattered short-hairy, the petioles 5–15 mm. long; corolla white or purplish, 4–8 mm. long, 5-parted, the segments broadly lanceolate;

fruit ellipsoidal, 5–6 mm. long; seeds lustrous, fusiform, about 1.5 mm. long.—May–Aug. Damp woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—s. Kuriles, Sakhalin, Kamchatka, and Korea (Quelpaert Isl.).

Var. *pumila* Hara. TSUKUSHI-TANIGIKYŌ. Plant smaller; leaves orbicular; seeds 2–2.5 mm. long.

Var. *kiusiana* Hara. EDAUCHI-TANIGIKYŌ. Plant larger; leaves acute to subacute, short-toothed.—At lower elevations; Kyushu.—The typical phase occurs in northern India.

4. PHYTEUMA L. SHIDE-SHAJIN ZOKU

Perennial herbs; leaves alternate, the radical prominent, the cauline sometimes few and small; flowers usually sessile, in terminal spikes or heads, sometimes short-pedicelled, the bracts small or involucrelike; calyx-tube adnate to the ovary, the limb 5-parted; corolla 5-parted nearly to the base, the segments linear, spreading or revolute, sometimes connate also at the tip; stamens free from the corolla, the filaments broadened at base, the anthers free; ovary inferior, 2- or 3-locular, many-ovuled, the stigma 2- or 3-lobed; capsules laterally dehiscent.—About 40 species, in Europe, Asia, and N. America, abundant in the Mediterranean region.

1. *Phyteuma japonicum* Miq. *Campanula japonica* (Miq.) Vathek; *Asyneuma japonicum* (Miq.) Briq. SHIDE-SHAJIN. Rhizomes creeping; stems erect, 50–100 cm. long, longitudinally striate, sparingly pilose; leaves membranous, ovate to narrowly so or oblong, 5–12 cm. long, 2.5–4 cm. wide, irregularly toothed, the lower petiolate, the median with a short winged petiolelike base, the upper gradually smaller and sessile; inflorescence spicate, terminal, often branched at base,

glabrous, the bracts linear, the pedicels 1–3 mm. long; calyx-segments linear, 4–6 mm. long, entire; corolla bluish-purple, the segments spreading and slightly recurved, linear, 1–1.2 cm. long, about 1 mm. wide; filaments as long as the linear anthers, ciliate on lower part; style 1–1.2 cm. long; stigma 3-lobed; capsules depressed-globose, 5–6 mm. across.—Aug. Mountains; Honshu, Kyushu.—Korea, Manchuria, Amur, and Ussuri.

5. CAMPANUMOEIA Bl. TSURUGIKYŌ ZOKU

Usually scandent perennial herbs with stout rhizomes; leaves axillary, or on short leafless branches, solitary; calyx-tube short, broad, adnate to the middle or to the upper portion of the ovary, the limb 4- to 6-parted; corolla broadly campanulate, inserted on the upper portion of the calyx-tube, the limb 4- to 6-lobed; stamens free from the corolla; ovary inferior, 4- to 6-locular, many-ovuled; stigma 4- to 6-lobed; berry subglobose, indehiscent; seeds small.—Few species, in India, Malaysia, and e. Asia.

- 1A. Ascending; leaves narrowly ovate to broadly lanceolate, acuminate, rounded to very obtuse at base; calyx-segments linear, remotely pinnately lobed, 1–2 mm. wide; free portion of corolla 6–8 mm. long; seeds flattened, smooth. 1. *C. lancifolia*
 1B. Scandent; leaves ovate-cordate to cordate, obtuse to subobtusely; calyx-segments broadly lanceolate, 3–4 mm. wide; free portion of corolla about 12 mm. long; seeds scarcely flattened, minutely reticulate. 2. *C. maximowiczii*

1. *Campanumoeia lancifolia* (Roxb.) Merr. *Campanula lancifolia* Roxb.; *Codonopsis truncata* Wall. ex A. DC.; *Campanumoeia axillaris* Oliv.; *C. truncata* (Wall.) Diels.—TANGSU, TAIWAN-TSURUGIKYŌ, SHIMAGIKYŌ. Glaucescens ascending herb with elongate 4-angled spreading branches; leaves opposite, narrowly ovate to broadly lanceolate, 7–15 cm. long, 2–6 cm. wide, acuminate, rounded to very obtuse at base, mucronate-toothed, the petioles 7–10 mm. long, the upper leaves smaller; flowers terminal and solitary in upper leaf axils, the pedicels 7–20 mm. long, the bracts 2, subtending the flower; calyx-tube wholly adnate to the ovary, flat, 3–4 mm. across at anthesis, to 1 cm. long in fruit, the segments 5–6, linear, spreading, 6–10 mm. long, remotely pinnately lobed; corolla-tube adnate to the ovary in lower half, the free portion 6–8 mm. long,

the lobes 5–6, narrowly deltoid, about 4 mm. long; anthers linear, about 2 mm. long; style short-pilose; berry subglobose, nearly 1 cm. across, with the remains of the corolla-tube at the top; seeds flattened, smooth.—Autumn. Kyushu (Tanegashima, according to S. Hatusima).—Ryukyus, Formosa, se. Asia, and Malaysia.

2. *Campanumoeia maximowiczii* Honda. *C. japonica* Maxim., non Sieb. & Morr.; *C. javanica* var. *japonica* (Maxim.) Makino.—TSURUGIKYŌ. Glaucescens scandent perennial; stems slender, elongate, terete; leaves thinly membranous, opposite and alternate, cordate or ovate-cordate, 3–5 cm. long, 2.5–5 cm. wide, subobtusely, obsolete undulate-toothed, glaucous, long-petiolate; flowers solitary, pendulous, adjacent to a leaf, the pedicels 1–2 cm. long; calyx adnate to the ovary

at base, the segments broadly lanceolate, 8-10 mm. long, 3-4 mm. wide, entire, subacute; corolla adnate at base to the ovary, the free portion about 12 mm. long, purplish inside, the lobes 5, acute, narrowly ovate, recurved at tip; fruit depressed-

globose, 1-1.2 cm. across, 5-locular; seeds scarcely flattened, minutely reticulate.—Aug.-Sept. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Formosa.

6. WAHLENBERGIA Schrad. HINAGIKYŌ ZOKU

Annuals or perennials; leaves alternate, rarely opposite; inflorescence a centrifugal panicle or sometimes 1-flowered; flowers usually bluish purple, nodding; calyx-tube adnate to the ovary, the segments 5; corolla campanulate, infundibuliform, tubular or rotate, 5-lobed; stamens free from the corolla, the filaments often broader at base; ovary inferior or subsuperior, 2- to 5-locular, many-ovuled; stigma-lobes 2-5, narrow; capsules loculicidally dehiscent, the valves alternate with the calyx-segments; seeds small.—About 100 species, chiefly in the S. Hemisphere, few in tropical America and Eurasia.

1. *Wahlenbergia marginata* (Thunb.) A. DC. *Campanula marginata* Thunb.; *Lobelia campanuloides* Thunb.; *W. gracilis* sensu auct. Japon., non Schrad.—HINAGIKYŌ. Slender perennial herb; stems erect, slender, 20-40 cm. long, striate, often branched and loosely spreading-pilose at base; radical and lower cauline leaves broadly spatulate or oblanceolate, 2-4 cm. long, 3-8 mm. wide, often undulate on the margin; upper leaves small, few; flowers few, terminal and in

upper axils, long-pedicelled; calyx-segments erect, persistent, lanceolate, 2-3 mm. long; corolla blue, infundibular-campanulate, 5-8 mm. long, 5-cleft; capsules erect, obconical, 6-8 mm. long.—May-Aug. Grassy sunny places in lowlands and low mountains; Honshu (s. Kantō Distr., Etchū Prov. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and Korea.

7. PLATYCODON A. DC. KIKYŌ ZOKU

Erect perennial herbs with thickened roots; leaves alternate, sometimes opposite or verticillate, simple, toothed; flowers large, mostly toward the top, the upper ones opening first; calyx-tube adnate to the ovary, the lobes 5; corolla blue, sometimes lilac or white, broadly campanulate, 5-lobed; stamens free from the corolla, the filaments broadened at base; ovary inferior, many-ovuled; stigma-lobes 5, linear; capsules obovate, erect, conical at top, loculicidally dehiscent, the valves opposite the calyx-lobes; seeds oblong, flat.—A single species in e. Asia.

1. *Platycodon grandiflorum* (Jacq.) A. DC. *Campanula grandiflora* Jacq.; *C. glauca* Thunb.; *C. gentianoides* Lam.; *P. grandiflorum* var. *glauca* (Thunb.) Sieb. & Zucc.; *P. chinense* Lindl. & Paxt.; *P. glaucum* (Thunb.) Nakai—KIKYŌ. Glabrous or short-pilose on leaves beneath; stems 40-100 cm. long, sometimes branched at top; leaves narrowly to broadly ovate, 4-7 cm. long, 1.5-4 cm. wide, acute, broadly cuneate to acute at base, glaucescent especially beneath, sessile

or subsessile; flowers mostly terminal, pedicelled, slightly nodding; calyx-lobes 0.5-5 mm. long, deltoid-lanceolate; corolla 4-5 cm. across; capsules 5-lobed, the valves subcoriaceous, attenuate; seeds about 2 mm. long.—Aug.-Sept. Grassy slopes in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, N. China, Manchuria, and Ussuri. Frequently planted as an ornamental and for medicine.

8. CODONOPSIS Wall. ex Roxb. TSURU-NINJIN ZOKU

Perennial scandent herbs with thick tuberous or fusiform roots; leaves opposite, alternate, or in false verticils of 4's, petiole; flowers nodding, terminal on short branches, rather large, usually greenish to purplish, sometimes white or blue; calyx-tube adnate to the ovary, the lobes 5, rather broad; corolla campanulate or broadly tubular, slightly adnate to the ovary at base, 5-lobed; stamens free from the corolla; ovary inferior or subinferior, truncate to short-conical at the broad top, depressed, 3- to 5-locular, many-ovuled, the stigma-lobes 3-5; capsules loculicidally dehiscent at the top; seeds oblong, sometimes winged.—About 40 species, in India and e. Asia.

1A. Tubers narrowed toward the end; calyx-segments 2-2.5 cm. long, 6-10 mm. wide; corolla 2.7-3.5 cm. long, purple-spotted inside; fruit 2-2.5 cm. across; seeds dull, winged on one side. 1. *C. lanceolata*

1B. Tubers not narrowed toward the end; calyx-segments 1-1.5 cm. long, 4-6 mm. wide; corolla 2-2.5 cm. long, deep-purple inside on upper half, spotted on lower half; fruit 1-1.3 cm. across; seeds lustrous, wingless. 2. *C. ussuriensis*

1. *Codonopsis lanceolata* (Sieb. & Zucc.) Trautv. *Campanumoea lanceolata* Sieb. & Zucc.; *Glossocomia hortensis* Rupr.; *Campanumoea japonica* Sieb. & Morr.—TSURU-NINJIN. Plant usually glabrous, often pilose while very young; tubers obovoid-fusiform; main stems much elongate, branched, with remote alternate scalelike leaves; lateral branches short, with a whorl of leaves at the end; leaves thinly membranous, narrowly oblong to ovate, 3-10 cm. long, 1.5-4 cm. wide, acute at both ends, glabrous or nearly so, glaucescent especially beneath, with obsolete undulate teeth or nearly entire; flowers solitary, pedicelled, terminal on the short lateral branches,

pendulous; calyx-segments narrowly ovate or narrowly ovate-oblong, subacute, green, 2-2.5 cm. long, 6-10 mm. wide; corolla pale green outside, purple-spotted inside, 2.7-3.5 cm. long; fruit 2-2.5 cm. across; seeds dull, winged on one side.—Aug.-Oct. Woods in low mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu.—Forma *emaculata* (Honda) Hara. *C. lanceolata* var. *emaculata* Honda—MIDORI-TSURU-NINJIN. Corolla without spots inside.—Korea, Manchuria, China, and Ussuri.

2. *Codonopsis ussuriensis* (Rupr. & Maxim.) Hemsl. *Glossocomia ussuriensis* Rupr. & Maxim.; *G. lanceolata* var.

obtus Regel; *G. lanceolata* var. *ussuriensis* (Rupr. & Maxim.) Regel; *G. lanceolata* var. *ussuriensis* (Rupr. & Maxim.) Trautv. —BAA-SOBU. Closely allied to the preceding species but the plant smaller; tubers shorter, not narrowed at the end; stems more slender, often spreading-pilose at base; leaves usually ovate, sometimes ovate-elliptic, 2-4.5 cm. long, 1.2-2.5 cm. wide, obtuse or subacute, usually prominently white-pilose

especially on the glaucescent lower surface, rarely nearly glabrous; calyx-segments 1-1.5 cm. long, 4-6 mm. wide; corolla 2-2.5 cm. long, deep purple inside on upper half, spotted on lower half; fruit 1-1.3 cm. across; seeds lustrous, wingless.—Aug. Woods in mountains and lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, Ussuri, and Amur.

9. LOBELIA L. MIZO-KAKUSHI ZOKU

Shrubs or herbs; leaves alternate; flowers axillary, sometimes forming a terminal raceme, pedicelled, usually without bracteoles; calyx-tube adnate to the ovary, the segments 5, sometimes unequal; corolla oblique or incurved, the tube dorsally split to the base, the limb bilabiate or 1-labiate, the 2 upper lobes smaller, erect or spreading; stamens usually free from the corolla, forming a tube around the style, the anthers at least partially united with a tuft of hairs at the apex; ovary inferior or sub-superior, 2-locular, many-ovuled; stigma shallowly 2-lobed; capsules loculicidal, apically dehiscent, 2-valved.—About 200 species, nearly cosmopolitan.

1A. Stems rather stout, 50-100 cm. long, densely many-leaved; flowers 3-3.5 cm. long, in dense narrow terminal racemes.

1. *L. sessilifolia*

1B. Stems slender, 30-40 cm. long, rather loosely few-leaved; flowers 5-12 mm. long, axillary or in loose racemes.

2A. Stems long-creeping, branched at base, ascending; flowers solitary in leaf-axils, the pedicels 1.5-3 cm. long, the corolla 1-1.2 cm. long; capsules obconical-clavate, 5-7 mm. long, deflexed after anthesis. 2. *L. chinensis*

2B. Stems erect, rarely creeping; flowers in loose terminal racemes, the pedicels 1-1.5 cm. long, the corolla 5-6 mm. long; capsules obovoid-globose, 2.5-3 mm. long, not deflexed after anthesis. 3. *L. hancei*

1. *Lobelia sessilifolia* Lamb. *L. camtschatica* Pall. ex Spreng.; *Rapuntium kamtschaticum* Presl—SAWAGIKYŌ. Glabrous perennial; rhizomes short, thick, creeping; stems stout, terete, erect, simple, 50-100 cm. long, densely many-leaved; median leaves lanceolate, 4-7 cm. long, 5-15 mm. wide, gradually attenuate to a minute obtuse point, shallow-toothed, sessile, the upper leaves gradually smaller, becoming bracteate; flower spikes terminal, densely many-flowered, the pedicels 5-12 mm. long; corolla bilabiate, lobed to the middle, the lower lip 3-lobed, the lobes loosely long-pubescent on margin; capsules 8-10 mm. long; seeds flat, ovate, smooth, lustrous, about 1.5 mm. long.—Aug.-Sept. Wet places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Kuriles, Sakhalin, Formosa, Korea, Manchuria, and e. Siberia.

2. *Lobelia chinensis* Lour. *L. radicans* Thunb.; *Rapuntium chinense* (Lour.) Presl—MIZO-KAKUSHI, AZE-MUSHIRO. Glabrous perennial; stems slender, long-creeping, branched at base, the branches usually simple, ascending, 3-15 cm. long; leaves in 2 series, subsessile, lanceolate, 1-2(-2.5) cm. long, 2-4(-7) mm. wide, obtuse, with a few obsolete teeth on each side; flowers solitary or paired, axillary, erect, white to rose-purple, deflexed after anthesis, the pedicels 1.5-3 cm. long; corolla glabrous, 1-1.2 cm. long, 5-lobed, 2 upper and 3 lower; capsules obconical-clavate, 5-7 mm. long; seeds broadly ovate,

about 0.2 mm. long, smooth, punctulate, reddish brown.—June-Oct. Wet places especially around paddy fields in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, China, Korea, India, and Malaysia.

3. *Lobelia hancei* Hara. *L. chinensis* sensu auct. Japon., non Lour.; *L. trigona* sensu auct. Japon., non Roxb.; *L. chinensis* var. *cantonensis* E. Wimm. ex Danguy—TACHI-MIZO-KAKUSHI. Glabrous (annual?) herb; stems erect, soft, rather slender, slightly branched or simple; leaves scattered, broadly lanceolate to narrowly ovate, 1-2 cm. long, 3-6 mm. wide, obtuse to acute, obsolete mucronate-toothed, sessile; flowers few on upper part of stem, forming a loose terminal raceme, the bracts leaflike, the pedicels 1-1.5 cm. long, bracteolate; corolla 5-6 mm. long, bluish purple, 5-lobed; capsules obovoid-globose, 2.5-3 mm. long, rounded at base; seeds light brown, smooth, ellipsoidal, obtusely 3-angled, about 0.4 mm. long.—Aug.-Oct. Kyushu.—Ryukyus, Formosa, China, and Indochina.

Lobelia inflata L. Plant spreading-pubescent; leaves oblong, 3-6 cm. long, obtusely toothed; racemes about 10-flowered, the pedicels 3-6 mm. long; calyx inflated after anthesis; corolla 7-10 mm. long, blue-purple or pinkish. Cultivated and often naturalized in our area.—Introduced from N. America.

Fam. 193. GOODENIACEAE KUSA-TOBERA KA Goodenia Family

Herbs or subshrubs, rarely prickly; leaves alternate or opposite; stipules absent; flowers solitary or in panicles, bisexual, zygomorphic; calyx tubular, adnate to or rarely free from the ovary, 5-lobed; corolla gamopetalous, 2- or rarely 1-labiate, 5-lobed, the lobes valvate or often induplicate-valvate; stamens 5, free or barely inserted on the corolla-tube, alternate with the lobes, the anthers 2-locular, sometimes adherent around the style, the stigma covered with a cup-shaped or bilabiate indusium; ovary inferior, 1- or 2(-4)-locular; ovules solitary or few in each locule; seeds small, flat, the endosperm copious.—About 12 genera, with about 300 species, chiefly Australian, few widely distributed in the Tropics.

1. SCAEVOLA L. KUSA-TOBERA ZOKU

Shrubs or subshrubs; leaves alternate or rarely opposite, entire or toothed; flowers axillary, sometimes with a subtending pair of bracts, sometimes on dichotomous peduncles, the pedicels sometimes absent; calyx adnate to the ovary, the limb short, annular or 5-lobed; corolla oblique, the tube split to the base on back, the 5-lobes nearly equal or the 2 dorsal shorter; anthers free, distinct; ovary inferior or nearly so, 2-locular, with a single ovule in each locule, or 1-locular with 1 or 2 ovules; indusium of the stigma cup-shaped, the stigma truncate or bifid; fruit indehiscent, the exocarp fleshy or thinly membranous, the endocarp hard or crustaceous; seeds solitary.—About 100 species, mainly in Australia, few in the Pacific Islands, e. Asia, Africa, and tropical America.

1. *Scaevola sericea* Vahl. *S. frutescens* (Mill.) Krause; *Lobelia frutescens* Mill. pro parte; *S. koenigii* Vahl; *S. koenigii* var. *glabra* Matsum.; *S. frutescens* var. *glabra* (Matsum.) Masam.—KUSA-TOBERA. Shrub, glabrous or nearly so, with tufts of long hairs in the leaf-axils; branches thick, becoming slightly woody, densely leafy toward the top; leaves alternate, fleshy, narrowly obovate, 10–18 cm. long, 4–8 cm. wide, rounded, obsoletely toothed on upper margin, sessile or subsessile; inflorescence an axillary pedunculate cyme, about

10-flowered, the bracts narrowly lanceolate, opposite, with a tuft of long hairs at base, the pedicels 1–1.5 cm. long; corolla about 2–2.5 cm. long, white, soon becoming sordid yellow, densely long-pubescent on the tube inside; indusium of the stigma white-ciliate; drupe ellipsoidal, pale green, 7–8 mm. long.—June–Oct. Near seashores; Kyushu (Yakushima and Tanegashima).—Ryukyus, Formosa, Pacific Islands, Australia, and Madagascar.

Fam. 194. COMPOSITAE KIKU KA Composite Family

(Contributed by Siro Kitamura.)

Herbs or shrubs, rarely trees; leaves alternate or opposite; stipules absent; heads subtended by involucre bracts, terminal, solitary or variously arranged, composed of 1 to many flowers; receptacle glabrous, setose, or paleaceous; flowers inserted on the receptacle, bisexual or unisexual (plants sometimes dioecious or monoecious); corollas tubular, actinomorphic, 4- or 5-lobed or ligulate and zygomorphic, 2- to 5-toothed; stamens 5, rarely 4, the filaments on the corolla-tube and alternate with the lobes, the anthers basifixed, connate and forming a tube around the style, usually appendaged at the apex, often caudate or sagittate at base; ovary inferior, 1-locular; style slender, usually bifid; ovule solitary, erect, anatropous; achenes 1-seeded, often crowned with a setose, chaffy, or plumose pappus (modified calyx-limb); endosperm absent.—About 1,000 genera, with about 20,000 species, cosmopolitan.

- 1A. Disc-corollas tubular; ligulate florets marginal or absent, pistillate or neutral; sap not milky. (TUBULIFLORAE).
- 2A. Styles below the branches, slender, sometimes filiform, often flattened, entire or bifid, rarely capitate or rounded, mammillate to papillose, not hispid, not nodosely thickened (rarely penicillate in *Cacalia*, *Syneilesis*, and *Achillea*).
- 3A. Anthers sagittate, often caudate.
 - 4A. Style-branches linear, subacute, puberulent; heads all discoid, the florets bisexual. 1. *Vernonia*
 - 4B. Style-branches obtuse.
 - 5A. Corolla of tubular florets shallowly 4- or 5-toothed.
 - 6A. Involucral bracts translucent or white, scarious, petallike.
 - 7A. Bisexual florets fertile. 2. *Gnaphalium*
 - 7B. Bisexual florets sterile.
 - 8A. Pappus-bristles of bisexual florets thickened and flat at apex; plants dioecious. 3. *Antennaria*
 - 8B. Pappus-bristles of bisexual florets not flattened; plants not dioecious.
 - 9A. Pappus-bristles connate into a ring at base. 4. *Leontopodium*
 - 9B. Pappus-bristles free at base. 5. *Anaphalis*
 - 6B. Involucral bracts green, herbaceous, coriaceous, or membranous, not scarious.
 - 10A. Bisexual florets fewer than the pistillate florets. 6. *Blumea*
 - 10B. Bisexual florets usually more than the pistillate florets.
 - 11A. Heads with ligulate florets. 7. *Inula*
 - 11B. Heads all discoid, without ligulate florets. 8. *Carpesium*
 - 5B. Corolla bilabiate or deeply 5-lobed.
 - 12A. Ligulate florets present in vernal heads; corollas distinctly bilabiate. 9. *Leibnitzia*
 - 12B. Ligulate florets none, heads all tubular; corollas of tubular florets deeply 5-cleft.
 - 13A. Pappus-bristles scarious. 10. *Pertya*
 - 13B. Pappus-bristles plumose.
 - 14A. Heads few-flowered. 11. *Ainsliaea*
 - 14B. Heads 1-flowered. 12. *Diaspananthus*
 - 3B. Anthers not or very shortly caudate at base.
 - 15A. Heads unisexual.
 - 16A. Involucral bracts of staminate heads connate; pistillate heads with a single achene. 13. *Ambrosia*
 - 16B. Involucral bracts of staminate heads not connate; pistillate heads with 2 achenes. 14. *Xanthium*
 - 15B. Heads bisexual and fertile.

- 17A. Style-branches nearly terete, obtuse, short-papillose; leaves opposite or verticillate.
 18A. Anthers appendaged at apex; pappus-bristles setose. 15. *Eupatorium*
 18B. Anthers without appendage at apex; pappus-bristles clavate. 16. *Adenostemma*
 17B. Style-branches flat, smooth, truncate or appendaged at apex.
 19A. Style-branches with a lanceolate or deltoid hairy appendage at apex; leaves alternate.
 20A. Ligulate corollas broad, petallike, spreading. 17. *Solidago*
 21A. Ligulate corollas yellow.
 21B. Ligulate corollas white or reddish.
 22A. Ligulate florets fewer than the tubular florets; heads more than 1 cm. wide.
 23A. Pappus absent. 18. *Gymnaster*
 23B. Pappus present.
 24A. Pappus bristles less than 1 mm. long, lacerate. 19. *Kalimeris*
 24B. Pappus more than 2 mm. long, at least of the tubular florets.
 25A. Pappus dimorphic, of the tubular florets setose, of the ligulate florets very short and lacerate. 20. *Heteropappus*
 25B. Pappus all bristlelike.
 26A. Involucral bracts narrow, in a few series, not definitely imbricate; ligulate florets in 2 or more series, narrow. 21. *Erigeron*
 26B. Involucral bracts broadly imbricate; heads less than 1 cm. wide; ligulate florets in 1 or 2 series. 22. *Aster*
 22B. Ligulate florets more numerous than the tubular florets.
 27A. Achenes not beaked. 23. *Myriactis*
 27B. Achenes beaked.
 28A. Stems erect, branched, many-leaved. 24. *Rhynchospermum*
 28B. Stems scapiform, few-leaved. 25. *Lagenophora*
 20B. Ligulate corollas filiform, long or short, erect.
 29A. Pappus well-developed. 26. *Conyza*
 29B. Pappus wanting. 27. *Dichrocephala*
 19B. Style-branches truncate or rarely with very short or narrow appendages.
 30A. Pappus-bristles elongate, well developed.
 31A. Plants usually dioecious; bisexual florets with a short bifid style; leaves all radical, those of the inflorescence scalelike. 28. *Petasites*
 31B. Plants hermaphroditic; leaves radical and cauline.
 32A. Annuals; leaves alternate; corollas all tubular and fertile. 29. *Erechtites*
 32B. Perennials; leaves opposite.
 33A. Heads usually with ligulate florets. 30. *Arnica*
 33B. Heads all discoid; leaves alternate.
 34A. Style-branches appendaged, short-stigose at apex. 31. *Emilia*
 34B. Style-branches truncate, penicillate, or obtuse at apex.
 35A. Leaves very thick, involute in the early stages, the lower and radical with a short sheath at base; achenes densely hairy. 32. *Farugium*
 35B. Leaves membranous, revolute in the early stages.
 36A. Radical and cauline leaves with a short sheath at base.
 37A. Style-branches obtuse; heads with ligulate florets; involucral bracts 1-seriate but of two forms. 33. *Ligularia*
 37B. Style-branches truncate; heads without ligulate florets.
 38A. Achenes beaked; involucre with caliculus at base; corollas yellow. 34. *Miricacalia*
 38B. Achenes not beaked; involucre without caliculus (rarely caliculate); corollas whitish. 35. *Cacalia*
 36B. Leaves not sheathed at base.
 39A. Corollas yellow; ligulate corollas present or rarely absent. 36. *Senecio*
 39B. Corollas whitish or reddish; ligulate corollas absent. 37. *Syneilesis*
 30B. Pappus absent or very short, crownlike, scalelike, or awnlike.
 40A. Involucral bracts scarious on margin.
 41A. Receptacles chaffy; leaves toothed or bipinnate. 38. *Achillea*
 41B. Receptacles naked.
 42A. Ligulate florets more numerous than the disc florets; annuals with small axillary heads. 39. *Centipeda*
 42B. Ligulate florets fewer than the disc florets.
 43A. Heads erect; appendage of anthers oblong.
 44A. Receptacle conical; achenes ribless on back, 3-ribbed in front. 40. *Matricaria*
 44B. Receptacle convex, hemispheric, sometimes flat; achenes striate. 41. *Chrysanthemum*
 43B. Heads nodding; appendage of anthers lanceolate; pistillate corollas tubular. 42. *Artemisia*
 40B. Involucral bracts herbaceous, green.
 45A. Tubular florets sterile; receptacle not chaffy. 43. *Adenocaulon*
 45B. Tubular florets fertile; receptacle chaffy.
 46A. Achenes of the ligulate florets 3-angled, or of the tubular florets laterally flattened.
 47A. Involucral bracts spreading, glandular-pubescent; scales of receptacle enveloping or surrounding the achene. 44. *Siegesbeckia*
 47B. Involucral bracts appressed; scales of receptacle folded.
 48A. Involucral bracts 2-seriate; scales of receptacle very narrow; annuals. 45. *Eclipta*
 48B. Involucral bracts 1-seriate; scales on receptacle convex or folded; perennials. 46. *Wedelia*
 46B. Achenes more or less dorsally flattened.

- 49A. Outer scales of receptacle longer than the inner; achenes without hooked awns. 47. *Synedrella*
 49B. Outer scales of receptacle shorter than the inner; achenes with retrorsely hooked awns.
 50A. Ligulate florets sterile; style-branches with acute-deltoid hairy appendages; leaves opposite (at least in the lower) 48. *Bidens*
 50B. Ligulate florets, if present, pistillate and fertile; style-branches with obtuse hairy appendages; leaves alternate. 49. *Glossogyne*
- 2B. Styles below the branches nodosely thickened, often hispid.
 51A. Heads many-flowered, not densely aggregated.
 52A. Achenes villous, heads with finely dissected subtending bristlelike bracteal leaves. 50. *Atractylodes*
 52B. Achenes glabrous.
 53A. Achenes basally attached.
 54A. Filaments papillose-hairy; style-branches connate.
 55A. Pappus-bristles scabrous; stems winged (in ours). 51. *Carduus*
 55B. Pappus-bristles plumose.
 56A. Plants polygamous; rhizomes not creeping. 52. *Cirsium*
 56B. Plants dioecious; rhizomes long-creeping. 53. *Breca*
 57A. Filaments glabrous; style-branches free, reflexed afterward.
 57A. Achenes 15-ribbed; involucre bracts with a keeled appendage on back. 54. *Hemistepta*
 57B. Achenes obsoletely 4-angled or striate; involucre bracts without a keeled appendage on back. 55. *Saussurea*
 53B. Achenes obliquely attached.
 58A. Anthers caudate, the tails free. 56. *Serratula*
 58B. Anther-tails connate into a tube around the filaments. 57. *Synurus*
 51B. Heads 1-flowered, densely aggregated in globose compound heads. 58. *Echinops*
- 1B. Corollas all ligulate; sap milky. (LIGULIFLORAE).
 59A. Pappus absent. 59. *Lapsana*
 59B. Pappus bristlelike or plumose.
 60A. Pappus-bristles plumose.
 61A. Receptacle scaly (paleaceous). 60. *Hypochoeris*
 61B. Receptacle not scaly.
 62A. Pappus-bristles with intricate soft hairs. 61. *Scorzonera*
 62B. Pappus-bristles with distinct hairs not intricate. 62. *Picris*
 60B. Pappus bristlelike.
 63A. Achenes beaked, warty-tuberculate near base of beak; leaves radical. 63. *Taraxacum*
 63B. Achenes not beaked, or, if beaked, then not tuberculate.
 64A. Achenes truncate.
 65A. Achenes cylindric, not flattened; corolla-tube slightly shorter to as long as the limb. 64. *Hieracium*
 65B. Achenes slightly flattened.
 66A. Pappus-bristles few, 1-seriate; corolla-tube much shorter than the limb; heads erect in anthesis. 65. *Hololeion*
 66B. Pappus-bristles 2- or 3-seriate, firm; corolla-tube as long as to slightly shorter than the limb; heads nodding in anthesis. 66. *Prenanthes*
 64B. Achenes narrowed or beaked at tip.
 67A. Subshrubs with the main axis bearing only radical leaves; scapes always lateral; achenes slightly flattened, shortly narrowed at tip. 67. *Crepidium*
 67B. Herbs with the main axis bearing only the inflorescence.
 68A. Achenes terete, scarcely flattened, ribbed; corolla-tube $\frac{3}{4}$ - $\frac{1}{2}$ as long as the limb. 68. *Crepis*
 68B. Achenes more or less distinctly flattened.
 69A. Achenes long-beaked, with 10 equal wings or ribs. 69. *Ixeris*
 69B. Achenes unequally ribbed.
 70A. Achenes distinctly flattened, with a prominent beak; corolla-tube as long as to half as long as the limb. 70. *Lactuca*
 70B. Achenes slightly flattened, narrowed at tip, not beaked.
 71A. Pappus deciduous as a whole. 71. *Sonchus*
 71B. Pappus persistent or the bristles separately deciduous. 72. *Youngia*

1. VERNONIA Schreb. YAMBARU-HIGOTAI ZOKU

Subshrubs or herbs, erect, rarely scandent; leaves alternate, hairy or glabrous; heads in corymbs, sometimes paniculate; involucre campanulate or subglobose, the bracts many-seriate, the outer series becoming smaller, sometimes spreading, acute, acuminate, awn-tipped, or obtuse; receptacles alveolate, denticulate or rarely with crisped hairs; florets all tubular, fertile; corollas purplish, 5-lobed; anthers obtuse or sagittate at base, the auricles connate; style-branches linear, subacute, puberulent; achenes angled or striate, callose at base, glabrous or hairy; pappus-bristles 1- or 2-seriate, the outer row short, the inner scaberulous, deciduous or persistent.—About 650 species, in warmer regions of America, Asia, and Africa.

1. *Veronia cinerea* Less. YAMBARU-HIGOTAI, MURASAKI-MUKASHI-YOMOGI. Perennial; stems 40–100 cm. long, gray-pubescent, branched above; cauline leaves rhombic-ovate or ovate, 3.5–6.5 cm. long, 1.5–3 cm. wide, acute, cuneate at

base, mucronate- or undulate-toothed, puberulent above, soft grayish pubescent beneath especially on nerves, the petioles 10–25 mm. long, the upper leaves gradually smaller, narrower, broadly lanceolate to linear; inflorescence corymbose-panicu-

late; heads many, rose-purple, short-pedunculate; florets about 20; involucre campanulate, 4-5 mm. long, pubescent, glandular-dotted; bracts 4-seriate, the outer linear, 1.5-2 mm. long, acuminate, the median linear, the inner linear-lanceolate, awn-

tipped; achenes terete, about 2 mm. long, densely short-hispid, glandular-dotted; pappus-bristles whitish, 4-5 mm. long, 2-seriate.—Oct.—Nov. Kyushu.—Ryukyus, Formosa, and tropical regions of Asia.

2. GNAPHALIUM L. HAHAKOGUSA ZOKU

Densely woolly herbs sometimes woody at base; leaves alternate, linear or lanceolate, entire, usually sessile, sometimes decurrent; heads small, many, usually densely arranged, unisexual; pistillate florets marginal, the corollas filiform, denticulate or shallowly 3- or 4-lobed; bisexual fertile florets central, the corollas tubular, 5-toothed; involucre subglobose or campanulate-globose, the bracts more or less scarious; receptacle flat, alveolate; anthers sagittate, caudate; style of bisexual florets with terete or slightly flattened branches; achenes oblong, small, not ribbed, papillose; pappus-bristles slender, usually scabrous, 1-seriate. —Widely distributed, especially in temperate regions of both hemispheres and in mountains of the Tropics.

1A. Involucres pale yellow.

2A. Leaves white-woolly on upper surface; style shorter than the corollas; biennial. 1. *G. affine*
2B. Leaves green on upper surface; style longer than the corollas; annual. 2. *G. hypoleucum*

1B. Involucres dark brownish.

3A. Perennial, often stoloniferous; involucre campanulate, about 5 mm. long; cauline leaves 2-2.5 cm. long. 3. *G. japonicum*
3B. Annual; involucre subglobose, about 2 mm. long; cauline leaves 4-5 cm. long. 4. *G. uliginosum*

1. *Gnaphalium affine* D. Don. *G. multiceps* Wall. ex DC.; *G. luteo-album* var. *multiceps* (Wall.) Hook. f.; *G. confusum* DC.—HAHAKOGUSA. White-woolly biennial; stems 15-40 cm. long; radical leaves small; cauline leaves spatulate or oblanceolate, 2-6 cm. long, 4-12 mm. wide, rounded, sometimes mucronate, entire, white-woolly on upper surface, decurrent; heads in dense corymbs; involucre globose-campanulate, about 3 mm. long, 3.5 mm. wide; bracts pale yellow, 3-seriate, ovate to oblong, obtuse; style shorter than the corolla; achenes 0.5 mm. long; pappus-bristles pale yellowish, about 2.2 mm. long.—Apr.—June. Waste grounds and cultivated fields in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, China, Ryukyus, Formosa to Indochina, Malaysia, and India.

2. *Gnaphalium hypoleucum* DC. *G. confertum* Benth.—AKI-NO-HAHAKOGUSA. Annual; stems white-woolly, 30-60 cm. long, branched above; cauline leaves rather numerous, linear, 4-5 cm. long, 2.5-7 mm. wide, acute, auriculate, semi-clasping, green and short crisped-pilose on upper surface, densely white-woolly beneath; heads in corymbs; involucre globose-campanulate, about 4 mm. long, 6-7 mm. wide; bracts 5-seriate, scarious, yellowish, the outer short, white-pubescent on back; style longer than the corolla; achenes punctulate; pappus sordid-white.—Sept.—Oct. Honshu, Shikoku, Kyushu.—Korea, China, Formosa, Philippines to India.

3. *Gnaphalium japonicum* Thunb. CHICHIKOGUSA.

Perennial; flowering stems tufted, 8-25 cm. long, simple, white-woolly, often stoloniferous; radical leaves rosulate, linear-oblanceolate, 2.5-10 cm. long, 4-7 mm. wide, green and thinly woolly above, densely white-woolly beneath, the cauline few, linear, 2-2.5 cm. long, 2-4 mm. wide, the uppermost subtending the inflorescence, lanceolate; involucre campanulate, about 5 mm. long, 4-5 mm. wide; bracts 3-seriate, obtuse, red-brown, the outer broadly elliptic, the inner narrowly oblong; achenes about 1 mm. long; pappus white, about 3 mm. long.—May-Oct. Sunny places in lowlands and mountains; Honshu, Shikoku, Kyushu; common.—Korea, China, Ryukyus, and Formosa.

4. *Gnaphalium uliginosum* L. HIME-CHICHIKOGUSA, 4. NO-HAHAKOGUSA.

Annual; stems often tufted, 15-35 cm. long, usually more or less branched, white-woolly, leafy to the top; radical leaves small, the lower cauline oblanceolate-linear, 4-5 cm. long, 3-5 mm. wide, white woolly-tomentose on both surfaces; involucre subglobose, about 2 mm. long, 5 mm. wide; bracts 3-seriate, dark brownish, the outer short, broadly ovate, obtuse, the inner oblong to lanceolate, acute; achenes about 0.1 mm. long, punctulate; pappus whitish, about 1.5 mm. long.—Aug.—Oct. Wet cultivated fields; Hokkaido, Honshu (n. distr.).—n. China, Korea, Kamchatka, Siberia to Europe, and N. America.

3. ANTENNARIA Gaertn. EZO-NO-CHICHIKOGUSA ZOKU

White-woolly dioecious perennials; radical leaves rosulate, the cauline alternate; heads in corymbs, unisexual; pistillate involucre campanulate, the bracts many-seriate, whitish and petallike above, the outer woolly on back; receptacle glabrous; pistillate florets filiform; staminate corollas tubular, 5-toothed, obtuse; style of staminate florets capitate; anthers sagittate, the tails connate, acuminate; achenes oblong; pappus bristles many, connate at the base, falling together in a ring.—About 55 species, in the N. Hemisphere, abundant in N. America.

1. *Antennaria dioica* (L.) Gaertn. *Gnaphalium dioicum* L.—EZO-NO-CHICHIKOGUSA. Rhizomes slender, creeping; leaves of the sterile innovation shoots rosulate, spatulate, 15-25 mm. long, 5-6 mm. wide; stems 6-25 cm. long, simple, white-woolly; radical leaves rosulate, spatulate, 18-25 mm. long, 5-8 mm. wide, rounded, mucronate, green or slightly white-woolly above, densely white-woolly beneath, the

median leaves linear, erect, small, acute, 1-1.5 cm. long, about 3 mm. wide; heads few, densely arranged; involucre 7 mm. long in the staminate, 10-14 mm. long in the pistillate; bracts linear to broadly so, whitish on upper half, rounded; pappus white, about 4 mm. long.—June-Aug. Hokkaido (Kitami Prov.).—Kuriles, Kamchatka, Sakhalin, Mongolia, Siberia to Europe.

4. LEONTOPODIUM R. Br. USU-YUKI-SŌ ZOKU

Low tufted white-woolly perennial herbs, rarely woody at the base; leaves entire, alternate, lingulate to linear; heads heterogamous, often unisexual, in a dense headlike corymb surrounded by many spreading bracteate leaves; involucre subglobose or campanulate-globose, the bracts 3-seriate, nearly equal, erect, oblong, scarious and brown on margin, usually woolly on back; pistillate florets marginal, filiform, the corollas broadened at tip, 5-toothed; staminate florets central, tubular, the corollas slightly broadened at tip; styles entire; anthers sagittate, caudate; achenes oblong, flattened; pappus-bristles slender, 1-seriate, short-setulose or scabrous, slightly connate at base.—More than 30 species, in Eurasia and S. America.

- 1A. Cauline leaves lanceolate to narrowly oblong; stems rather many-leaved. 1. *L. japonicum*
 2A. Cauline leaves linear to narrowly oblongate; stems few-leaved.
 1B. Cauline leaves or some of them sheathing at base.
 3A. Leaves of innovation shoots linear-lanceolate, 3–8 cm. long. 2. *L. hayachinense*
 3B. Leaves of innovation shoots linear to oblanceolate.
 4A. Flowering stems 6–15 cm. long; heads 4–10; achenes about 1.2 mm. long, pilose. 3. *L. fauriei*
 4B. Flowering stems 4–7 cm. long; heads 2–3; achenes about 1.5 mm. long, glabrous. 4. *L. shinanense*
 2B. Cauline leaves long-petiolate, not sheathing at base. 5. *L. discolor*

1. *Leontopodium japonicum* Miq. *Gnaphalium sieboldianum* Fr. & Sav.—USU-YUKI-SŌ. Rhizomes tufted; stems 25–55 cm. long, leafy to the top; median cauline leaves lanceolate to narrowly oblong, 4–6.5 cm. long, 5–15 mm. wide, acute to acuminate, abruptly narrowed at base, sessile, green and glabrous or thinly woolly above, whitish woolly beneath; bracteal leaves loosely arranged, smaller than the upper leaves, sordid-yellow tomentose on upper surface; involucre 4–5 mm. long, about 5 mm. across; bracts acute or acuminate; achenes about 1 mm. long, more or less papillose.—July–Oct. Hokkaido, Honshu.—China.—Forma *orogenes* (Hand-Mazz.) Ohwi. *L. japonicum* var. *orogenes* Hand-Mazz.—YAMA-USA-YUKI-SŌ. Stems 20–40 cm. long; leaves about 3 cm. long, 6–9 mm. wide; inflorescence branched; heads many.—Kyushu, Honshu.—Forma *perneuveum* (Honda) Ohwi. *L. perneuveum* Honda.—KAWARA-USA-YUKI-SŌ. Leaves about 2 cm. long, densely tomentose.—Mountains; Honshu (Shinano Prov.).

Var. *shiroumense* Nakai ex Kitam. *L. japonicum* forma *shiroumense* (Nakai) Ohwi.—TAKANE-USA-YUKI-SŌ. Plants to 10 cm. high, with smaller leaves and fewer heads.—Alpine regions; Honshu.

Var. *spathulatum* (Kitam.) Murata. *L. spatulatum* Kitam.; *L. japonicum* forma *spathulatum* (Kitam.) Ohwi.—KO-USA-YUKI-SŌ. Plants quite low, tufted and with smaller spatulate leaves.—Alpine regions; Honshu (Yamato Prov.) and Shikoku.

2. *Leontopodium hayachinense* (Takeda) Hara & Kitam. *L. alpinum* subsp. *campestre* var. *hayachinense* Takeda; *L. discolor* var. *hayachinense* (Takeda) Takeda & Beauverd.—HAYACHINE-USA-YUKI-SŌ. Stems 10–20 cm. long, loosely leaved; leaves of innovation shoots linear-lanceolate, 3–8 cm. long, 3–5 mm. wide, usually acute, green and woolly on upper surface, gray-woolly beneath; radical leaves of flowering stems and lower cauline leaves small, the median leaves erect, lanceolate, 3–5 cm. long, 4–6 mm. wide; bracteal leaves 5–15, linear-lanceolate to narrowly oblong, 7–30 mm. long, 1–6 mm. wide, acute to acuminate; heads 4–8; involucre globose, about 5 mm. long; bracts obtuse, woolly; achenes about 1.6 mm. long, papillose.—July–Aug. Alpine regions; Honshu (Mount Hayachine in Rikichu).

3. *Leontopodium fauriei* (Beauverd) Hand-Mazz. *L. alpinum* sensu auct. Japon., pro parte, non Cass.; *L. alpinum* subsp. *fauriei* Beauverd; *L. alpinum* var. *fauriei* (Beauverd)

Beauverd.—MIYAMA-USA-YUKI-SŌ, HINA-USA-YUKI-SŌ. Flowering stems 6–15 cm. long, woolly; leaves of innovation shoots linear-oblanceolate, 2.5–6 cm. long, acute, long-petiolate, slightly woolly on upper surface, densely so beneath; lower cauline leaves linear, 1.5–3 cm. long, 2–3 mm. wide, gradually narrowed at base, sheathing the stems, densely yellowish gray woolly; bracteal leaves 8–13, linear, to 22 mm. long, 2–(4) mm. wide; heads densely arranged, 4–10; involucre globose, about 4 mm. long; bracts acute, long-hairy on back, with brown scarious margins; achenes about 1.2 mm. long, 4-angled, pilose.—July–Aug. Alpine regions; Honshu (n. distr.).

Var. *angustifolium* Hara & Kitam. *HOSOBANA-USA-YUKI-SŌ*. Plant more slender, with narrower leaves 1–1.5 mm. wide.—Honshu (Mount Shibutsu and Tanigawa in n. Kantō Distr.).

4. *Leontopodium shinanense* Kitam. *L. alpinum* sensu auct. Japon., non Cass.—HIME-USA-YUKI-SŌ, KOMA-USA-YUKI-SŌ. Flowering stems slender, 4–7 cm. long, woolly; leaves of innovation shoots oblanceolate, 8–20 mm. long, 2–4 mm. wide, usually acute, long-petiolate, loosely gray-woolly on upper surface, densely so beneath; radical and lower cauline leaves spatulate or oblanceolate, the median narrowly lingulate, 14–20 mm. long, 2.5–3 mm. wide, obtuse, sheathing the stems, densely gray-woolly on both sides; bracteal leaves 6–9, lanceolate, 7–14 mm. long, 1–3.5 mm. wide, acute; heads 2 or 3; involucre about 4 mm. long; bracts acute or acuminate, with brownish scarious margins; achenes about 1.5 mm. long, glabrous.—July–Aug. Alpine regions; Honshu (Mount Nishi-koma in Shinano).

5. *Leontopodium discolor* Beauverd. *L. japonicum* subsp. *sachalinense* Takeda; *L. sachalinense* (Takeda) Miyabe & Kudo.—EZO-USA-YUKI-SŌ. Flowering stems 13–33 cm. long, woolly; leaves of the innovation shoots linear-lingulate, 3.5–8 cm. long, 5–7 mm. wide, acute, mucronate, long-petiolate, glabrous or thinly woolly and green above, whitish woolly beneath; median cauline leaves lanceolate-lingulate, 3–5.5 mm. long, (1.5–)5–8 mm. wide, long-narrowed and petiolelike at base, glabrous to loosely white-woolly on upper surface, densely whitish woolly beneath; bracteal leaves lanceolate to narrowly oblong, acute to acuminate at both ends; heads 5–22, densely arranged; involucre 3–4 mm. long; bracts acute to obtuse, brown, scarious on the margins, densely woolly on back; achenes about 1 mm. long, 4-angled, glabrous.—July–Sept. Hokkaido.—Sakhalin.

5. ANAPHALIS DC. YAMA-HAHA-KO ZOKU

Grayish woolly or villous, often stoloniferous, dioecious or polygamodioecious perennial herbs; leaves alternate, entire, linear to lanceolate, sometimes oblong, often decurrent; heads in dense or loose corymbs, rarely solitary, heterogamous or homogamous, unisexual or sometimes the pistillate with a few staminate flowers in the center; involucre globose-campanulate, the bracts 5- to 8-seriate, imbricate, often whitish on upper half, brownish on lower half, the outer short, woolly on back; receptacle alveolate or pilose; pistillate florets marginal, fertile, the bisexual central, few, sterile; staminate corollas filiform, 2- to 4-toothed; corollas of bisexual flowers tubular, 5-toothed; style of the bisexual florets bifid; achenes oblong; pappus-bristles 1-seriate, slender, scaberrulous, deciduous.—About 35 species, in temperate regions of the N. Hemisphere.

1A. Leaves distinctly decurrent.

2A. Involucres 5-7 mm. long, the bracts 5-seriate; cauline leaves 4-6 cm. long. 1. *A. sinica*
2B. Involucres 9-10 mm. long, the bracts 6- to 7-seriate; cauline leaves 6-10 cm. long. 2. *A. alpicola*

1B. Leaves not decurrent. 3. *A. margaritacea*

1. *Anaphalis sinica* Hance. *A. pterocaulon* (Fr. & Sav.) Maxim.; *Gnaphalium pterocaulon* Fr. & Sav.; *A. todaensis* Honda—YAHAZU-HAHA-KO. Stems 20-35 cm. long, usually simple, densely grayish tomentose; cauline leaves oblanceolate, 4-6 cm. long, 1-1.5 cm. wide, obtuse, mucronate, sessile, decurrent on the winged stems, green and often viscid above, sparsely grayish tomentose while young above, densely so and persistent beneath; inflorescence a globose corymb, 3-7 cm. across; involucre campanulate to globose, 5-7 mm. long; bracts 5-seriate, those of the pistillate snow-white on upper half, brownish and pubescent on lower half, the inner bracts acute.—Aug.-Sept. Sunny places in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *viscosissima* (Honda) Kitam. *A. viscosissima* Honda—KURIYAMA-HAHA-KO. Hairs dense, glandular.—Honshu (Kuriyama in Shimotsuke Prov.).

Var. *morii* (Nakai) Ohwi. *A. sinica* subsp. *morii* (Nakai) Kitam.; *A. morii* Nakai; *A. yakushimensis* Masam.—TANNA-YAHAZU-HAHA-KO. Stems tufted, densely leafy, 5-20 cm. long; cauline leaves thicker, 1.5-2 cm. long, 3-7 mm. wide; heads fewer, sometimes solitary.—High mountains in Kyushu (Higo Prov. and Yakushima).—Quelpaert Isl., Korea, and China.

2. *Anaphalis alpicola* Makino. *A. apoiensis* Nakai—TAKANE-YAHAZU-HAHA-KO. Stems tufted, 10-20 cm. long, grayish tomentose; leaves of sterile innovation shoots oblanceolate, 6-10 cm. long, 1-1.8 cm. wide, acute, gradually narrowed at base, grayish woolly tomentose on both sides; radical leaves smaller, the median lanceolate, 4-6 cm. long, 9-12 mm. wide, acuminate to obtuse, sessile, decurrent; inflorescence a dense corymb; involucre globose-campanulate, 9-10 mm. long; bracts 6- or 7-seriate, the outer short, broadly ovate, obtuse, white, brown-red on lower half.—Aug. Alpine slopes; Hokkaido, Honshu (centr. and n. distr.).

3. *Anaphalis margaritacea* (L.) Benth. & Hook. f. var. *margaritacea*. *Gnaphalium margaritaceum* L.; *Antennaria*

margaritacea (L.) R. Br.; *Antennaria cinnamomea* DC.; *Anaphalis margaritacea* forma *latifolia* Kudo—HIRO-HA-YAMA-HAHA-KO. Leaves 1.5-3 cm. wide.—Hokkaido.—Northern E. Asia and N. America.

Var. *angustior* (Miq.) Nakai. *Antennaria cinnamomea* var. *angustior* Miq.; *Anaphalis margaritacea* subsp. *angustior* (Miq.) Kitam.—YAMA-HAHA-KO. Rhizomes elongate; stems rather firm, 30-70 cm. long, grayish white woolly, many-leaved; median and upper leaves thick, linear-lanceolate to lanceolate or narrowly oblong, 6-9 cm. long, 1-1.5 cm. wide, acuminate to obtuse, semiclasping, recurved on margin, 3-nerved, green and woolly above when young, long grayish to brownish villous beneath; inflorescence a corymb; heads many; involucre globose, about 5 mm. long; bracts 6-seriate, the outer ovate or oblong, brownish scarious, the median oblong, obtuse, white at tip, brown at base, the inner lanceolate.—Aug.-Sept. Sunny slopes in mountains, rarely alpine; Hokkaido, Honshu (centr. and n. distr.); rather common.—China.

Var. *angustifolia* (Fr. & Sav.) Hayata. *Antennaria japonica* Schultz-Bip.; *Gnaphalium margaritaceum* var. *angustifolium* Fr. & Sav.; *Anaphalis japonica* Maxim.; *A. margaritacea* var. *japonica* (Maxim.) Makino; *A. margaritacea* subsp. *japonica* (Schultz-Bip.) Kitam.—HOSOGA-NO-YAMA-HAHA-KO. Median leaves linear, 3-6 cm. long, 3(2-6) mm. wide, green and woolly above; involucre globose.—Aug.-Oct. Mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Var. *yedoensis* (Fr. & Sav.) Ohwi. *A. margaritacea* subsp. *yedoensis* (Fr. & Sav.) Kitam.; *Gnaphalium yedoense* Fr. & Sav.; *A. yedoensis* (Fr. & Sav.) Maxim.—KAWARA-HAHA-KO. Stems branched in upper part, many-leaved; leaves linear, 3-6 cm. long, about 1.5 mm. wide, 1-nerved, green and woolly above, densely woolly beneath; involucre bracts 3-seriate, yellowish brown on lower half, the outer very short.—Sunny places along rivers; Hokkaido, Honshu, Shikoku, Kyushu; rather common.

6. BLUMEA DC. TSURU-HAGUMA ZOKU

Annual or perennial herbs often woody at base, villous or woolly throughout; leaves alternate, sessile or petiolate, mucronate-toothed to laciniate; inflorescence panicle or in spike-like panicles; heads heterogamous; involucre campanulate-globose, the bracts imbricate or reflexed, 4- or 5-seriate; corolla of pistillate florets filiform, minutely 2- or 3-toothed; perfect florets tubular, 5-toothed; anthers sagittate, tails connate, caudate-acuminate; style-branches narrow, compressed or filiform, papillose on back; achenes cylindric, hirsute, 5- to 10-ribbed; pappus-bristles capillary, 1-seriate, often caducous, whitish or rubescent.—More than 100 species, in the Tropics of Asia, Africa, and Australia.

1. *Blumea conspicua* Hayata. *B. fruticosa* Koidz.—TSURU-YABU-TABIRA-KO, Ō-KIBANA-MUKASHI-YOMOGI. Stems stout, 1-2 m. long, erect, striate, puberulent, branched in up-

per part; lower cauline leaves chartaceous, many, large, obovate-oblong, 25-35 cm. long, 8-11 cm. wide, abruptly acute, gradually narrowed at base, winged-petiolate, mucronate-

toothed, villous while young; upper leaves distant, smaller; heads many, in large panicles, the pedicels 1-3 cm. long; involucre subglobose, about 9 mm. long, 18-20 mm. wide; bracts 5-seriate, acute, gray-hirsute on back, the outer corolla

6 mm. long; achenes cylindric, 1.5 mm. long, hirsute, 10-ribbed; pappus sordid-rubrescent, 6 mm. long.—Kyushu (Yakushima and Tanegashima).—Ryukyus.

7. INULA L. OGURUMA ZOKU

Perennial glabrous or villous sometimes glandular-pilose herbs often woody at base; inflorescence a corymb or panicle; heads sometimes solitary; leaves alternate, entire; heads heterogamous; involucre globose to campanulate, the bracts many-seriate, often nearly equal; receptacle glabrous, alveolate; pistillate flowers marginal, 1- to many-seriate, fertile, the corollas ligulate, yellow, 3-toothed; perfect florets many, the corollas 5-toothed; anthers sagittate, tails setiform; style branches in perfect florets linear, rounded at apex, minutely papillose on back; achenes pilose or glabrous, many-ribbed; pappus-bristles many, mostly equal, setulose.—About 100 species, in Eurasia and Africa.

- 1A. Radical leaves rosulate. 1. *I. ciliaris*
 1B. Radical leaves not rosulate.
 2A. Achenes glabrous; veinlets of leaves raised beneath. 2. *I. salicina* var. *asiatica*
 2B. Achenes pilose; veinlets of leaves not raised beneath. 3. *I. britannica*

1. *Inula ciliaris* (Miq.) Maxim. *Erigeron ciliaris* Miq.—MIZUGIKU. Stems 25-50 cm. long, subscapose, densely hairy or glabrescent at base, rarely slightly branched; radical leaves rosulate, spreading, spatulate, 4-10 cm. long, 8-15 mm. wide, obtuse or subacute, entire, hairy at first, becoming glabrate; cauline leaves becoming gradually smaller in upper part, few, obsoletely clasping at base; upper leaves ovate-lanceolate, obtuse, broadly clasping at base; uppermost leaf 8-10 mm. long; heads solitary or few; involucre subglobose, 8-10 mm. long, with many subtending bracteal leaves; bracts 4- or 5-seriate, equal, sparsely glandular, the outer narrowly oblong, densely hairy; ligulate florets yellow, glandular-dotted, 14-15 mm. long; achenes about 1.5 mm. long, 10-ribbed, loosely pilose; pappus whitish, about 4.5 mm. long, the bristles scaberrulous.—June-Oct. Wet places; Honshu (Kinki Distr. and eastw.).

Var. *glandulosa* Kitam. OZE-MIZUGIKU. Leaves beneath densely glandular-dotted.—Honshu (Ose in Kotzuke).

2. *Inula salicina* L. var. *asiatica* Kitam. *I. involucrata* Miq., non Kalenic.; *I. kitanurana* Tatew. ex Kitam., in syn.—KASEN-SŌ. Stems slender, 60-80 cm. long, densely leaved, pilose, branched at the tip; radical leaves scalelike, becoming larger in the upper ones; median leaves chartaceous, lanceolate, 5-8 cm. long, 1-2 cm. wide, gradually narrowed at tip, acute, broadly clasping at base, loosely mucronate-toothed, ciliate, scabrous on upper surface, scattered pilose on the veinlets beneath; upper leaves becoming smaller and reduced to bracts below the involucre; involucre subglobose, about 1 cm. long, about 2 cm. wide; bracts about 4-seriate, the outer broadly lanceolate, acute, ciliate, spreading or ascending, the inner linear, gradually narrowed at tip; ligulate corollas about 9 mm. long, 2 mm. wide, 3-toothed; achenes about 1.5 mm. long, glabrous, 10-ribbed; pappus about 8 mm. long.—July-Sept. Wet places; Hokkaido, Honshu, Shi-

koku, Kyushu.—Korea, Manchuria, and Siberia. The typical phase occurs in Europe and w. Siberia.

3. *Inula britannica* L. var. *chinensis* (Rupr.) Regel. *I. japonica* Thunb.; *I. britannica* var. *japonica* (Thunb.) Fr. & Sav.; *I. britannica* sensu auct. Japon., non L.; *I. chinensis* Rupr. ex Maxim.—OGURUMA. Stems 20-60 cm. long, appressed-pilose, sometimes glabrescent; radical and lower leaves smaller than the median; median leaves lanceolate to oblong, 5-10 cm. long, 1-3 cm. wide, subacute, abruptly narrowed at base, sessile or semiclasping, loosely mucronate-serrulate, appressed-pilose or nearly glabrous on both surfaces; upper leaves gradually smaller; heads few or solitary, sometimes with subtending bracteal leaves; involucre subglobose, 7-8 mm. long, 15-17 mm. across; bracts 5-seriate, nearly equal, the outer lanceolate, the inner narrow, scarious, ciliate; ligulate florets 1-seriate, the corollas yellow, 16-19 mm. long; achenes about 1 mm. long, 10-ribbed, pilose; pappus about 5 mm. long, the bristles minutely scabrous.—June-Oct. Wet places in lowlands, especially along rivers; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and China.—Cv. *Plena*. YAE-OGURUMA. A double-flowered cultivar.

Var. *ramosa* Komar. ENA-UCHI-OGURUMA. Stems to 1 m. long, branched in upper part; heads many, small; leaves lanceolate or linear-lanceolate; involucre bracts nearly all alike.—Kyushu, Shikoku.—Korea, Manchuria, and China.

Var. *linariaefolia* (Turcz.) Regel. *I. linariaefolia* Turcz.; *I. britannica* subsp. *linariaefolia* (Turcz.) Kitam.; *I. britannica* var. *maximowiczii* Regel.—HOSŌ-OGURUMA. Stems 30-70 cm. long; median leaves linear to linear-lanceolate, 4-9 cm. long, 6-10 mm. wide, recurved on margin, glandular-dotted beneath; involucre 4-6 mm. long, 8-14 mm. across; bracts 4-seriate, glandular-dotted; ligulate corollas 8-10 mm. long, glandular-dotted on back; pappus about 3 mm. long.—Honshu, Kyushu.—Korea, Manchuria, China, and Siberia.

8. CARPESIUM L. YABU-TABAKO ZOKU

Branched perennials; leaves alternate, entire or toothed; heads all discoid, heterogamous; involucre subglobose or depressed-globose; bracts 3- or 4-seriate, the outer herbaceous or with herbaceous appendages, the inner scarious, oblong, obtuse, sometimes acute; receptacle flat; pistillate florets marginal, many-seriate, the corollas 3- to 5-toothed; the bisexual florets fertile, many, the corollas 4- or 5-toothed, yellowish; anthers sagittate with setiform appendages; style of bisexual florets linear, rather flat, rounded at apex; achenes glabrous, many-grooved, with a short glandular beak, crowned by a cartilaginous ring; pappus absent.—Ten species or more, Eurasia.

- 1A. Heads sessile. 1. *C. abrotanoides*
 1B. Heads pedunculate.
 2A. Radical leaves rosulate, lingulate, persistent at flowering time, the cauline oblong-lanceolate to oblanceolate.
 3A. Heads subglobose, 8–15 mm. across; involucre bracts 5-seriate. 2. *C. glossophyllum*
 3B. Heads depressed-globose, about 5 mm. across; involucre bracts 3-seriate. 3. *C. rosulatum*
 2B. Leaves not rosulate at flowering time, the cauline ovate or ovate-oblong.
 4A. Heads 25–35 mm. across. 4. *C. macrocephalum*
 4B. Heads 5–18 mm. across.
 5A. Leaves short-cuneate at base, abruptly narrowed on a long wingless petiole.
 6A. Heads 4–5 mm. across; leaves ovate-lanceolate to oblong, 2.5–3.5 cm. wide. 6. *C. hosokawae*
 6B. Heads 6–11 mm. across; leaves usually wider.
 7A. Heads subglobose; involucre bracts equal in length. 8. *C. matsuii*
 7B. Heads depressed-globose; involucre bracts of unequal length.
 8A. Lower cauline leaves oblong, acute at base; heads 5–6 mm. across. 5. *C. koidzumii*
 8B. Lower cauline leaves ovate to ovate-oblong, rounded to slightly cordate at base; heads 6–8 mm. across. 7. *C. divaricatum*
 5B. Leaves long-decurrent on a winged petiole.
 9A. Leaves abruptly narrowed at base. 9. *C. cernuum*
 9B. Leaves gradually long-petiolate. 10. *C. triste*

1. *Carpesium abrotanoides* L. *C. thunbergianum* Sieb. & Zucc.; *C. abrotanoides* var. *thunbergianum* (Sieb. & Zucc.) Makino.—YABU-TABAKO. Roots fusiform, woody; stems 50–100 cm. long, stout, terete, leafy, pubescent toward the top, dichotomously forked; lower cauline leaves broadly elliptic to oblong, 20–28 cm. long, 8.5–15 cm. wide, obtuse to acute, narrowed at base to a broadly winged petiole, irregularly mucronate-toothed, glandular-dotted beneath, short-pubescent on both sides; upper leaves oblong, sessile, gradually smaller, acute; heads many, sessile, axillary, usually bractless, deflexed in anthesis; involucre campanulate-globose; bracts in 3 series, the outer shortest, ovate, acuminate, short-pubescent, the median and inner oblong, rounded at apex; achenes about 3.5 mm. long, with a beak about 0.7 mm. long.—Sept.–Nov. Woods; Hokkaido, Honshu, Shikoku, Kyushu.—Korea and China.

2. *Carpesium glossophyllum* Maxim. *C. hieracioides* Lévl.—SAJI-GANKUBI-SŌ. Rhizomes short, creeping; stems 25–50 cm. long, subscapose, densely spreading-pubescent, slightly branched in upper part; radical leaves rosulate, oblanceolate-lingulate, densely pubescent on both sides; cauline leaves few, scattered, smaller, oblong-lanceolate, obtuse, sometimes acute; upper leaves linear-lanceolate, few, very small; heads subglobose, terminal, nodding, long-pedunculate, with many usually linear subtending bracteal leaves; involucre cupuliform, 6–8 mm. long, 8–15 mm. wide; bracts 5-seriate, the outer shortest, reflexed, pubescent on back, the median and inner oblong, obtuse, ciliate; achenes 3.5–4 mm. long.—Aug.–Oct. Woods; Honshu, Shikoku, Kyushu.—Ryukyus and Korea (Quelpaert Isl.).

3. *Carpesium rosulatum* Miq. HIME-GANKUBI-SŌ. Rhizomes short; stems erect, slender, subscapose, 15–45 cm. long, densely pubescent, branched; radical leaves rosulate, spatulate-lanceolate, 6–15 cm. long, 1.2–3 cm. wide, obtuse to rounded, narrowed at base, sessile, sparsely mucronate-toothed, densely pubescent; cauline leaves smaller, narrowly oblanceolate, sessile, obtuse; heads depressed-globose, 1–30, terminal, on slender peduncles, nodding; involucre tubular-campanulate, about 6.5 mm. long, 5 mm. across, bractless or with few small obovate subtending bracteal leaves; bracts 3-seriate, the outer ovate, shortest, reflexed, the median narrowly oblong, obtuse, ciliate, the inner linear; achenes about 3.5 mm. long.

—Aug.–Oct. Woods; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Korea (Quelpaert Isl.).

4. *Carpesium macrocephalum* Fr. & Sav. *C. eximium* C. Winkl.—Ō-GANKUBI-SŌ. Stems crisped-pubescent, with thickened branches below the heads; lower leaves large, broadly ovate, 30–40 cm. long, 10–13 cm. wide, acute, winged-petiolate, with irregular, coarse, double teeth, short-pubescent on both sides especially on nerves; median cauline leaves gradually smaller, obovate-oblong, acute, abruptly narrowed on lower half; upper leaves small, narrow, acuminate; heads 25–35 mm. across; involucre cupuliform, 8–10 mm. long, 23–30 mm. across; outer bracts similar to the bracteal leaves, the median oblong-linear, acute, densely pubescent, the inner linear-spathulate, 5.5–6 mm. long.—Aug.–Oct. Honshu (centr. distr. and northw.).—Korea and Manchuria.

5. *Carpesium koidzumii* Makino. *C. triste* var. *abrotanoides* Matsum. & Koidz.; *C. divaricatum* var. *abrotanoides* (Matsum. & Koidz.) Kitam., in syn.—HOSABA-GANKUBI-SŌ. Rhizomes thickened; stems erect, 70–100 cm. long, often reddish, pubescent, branched in upper half; radical and lower leaves ovate-oblong, about 18 cm. long, 3–5 cm. wide, acuminate, rounded at base, long winged-petiolate; median leaves narrowly oblong, 12–15 cm. long, 3–5 cm. wide, acute at base, short-petiolate, loosely mucronate-toothed, sparsely pubescent on both sides; upper leaves lanceolate, gradually smaller; leaves on branches lanceolate, 2–5 cm. long, acuminate at both ends; heads in racemes, short-pedunculate, nodding; involucre obovoid, about 4.5 mm. long, 5–6 mm. across; bracts 4-seriate, the outermost often caudate, the median and inner oblong, obtuse, ciliate; achenes about 3 mm. long, glandular-tuberculate.—Aug.–Oct. Woods; Honshu, Shikoku, Kyushu.

6. *Carpesium hosokawae* Kitam. BANJIN-GANKUBI-SŌ. Rhizomes short; stems 50–70 cm. long, densely pubescent, often purplish, branched in upper half; lower cauline leaves ovate-oblong, long-petiolate, 10–14 cm. long, 2.5–3.5 cm. wide, obtuse to acuminate, cuneate at base, on long wingless petioles; median leaves lanceolate, acuminate, cuneate at base; upper leaves linear-lanceolate, gradually smaller; heads 4–5 mm. across, solitary on the branches, nodding at anthesis, subtended by many involucre bracts longer than the heads; involucre campanulate-globose, about 4 mm. long, 4–5 mm. across; bracts 4-seriate, the outermost shortest, ovate, mucro-

nate, pubescent, the median narrowly oblong, rounded at apex, denticulate, the inner narrow; achenes about 2.5 mm. long. —Aug.-Oct. Woods; Honshu (Kinki Distr. and westw.), Kyushu.—Formosa.

7. *Carpesium divaricatum* Sieb. & Zucc. *C. divaricatum* var. *pygmaea* Miq.; *C. erythrolepis* Lévl.—GANKUBI-SŌ. Rhizomes short-creeping; stems erect, 25–150 cm. long, densely pubescent; lower leaves ovate to ovate-oblong, 7–23 cm. long, obtuse to acute, rounded or sometimes shallowly cordate or truncate, rarely short-cuneate at base, irregularly mucronate-toothed, glandular-dotted beneath, the petioles shorter or as long as the blades, short-winged; median leaves oblong, acuminate, cuneate at base; upper leaves smaller, sessile; heads 6–8 mm. across, terminal and solitary on the branches or subracemose, nodding in anthesis, the subtending bracteal leaves 2–4, lanceolate, reflexed, 2–5 times as long as the head; involucre ovoid-globose, 5–6 mm. long; bracts 4-seriate, the outer broadly ovate, mucronate, the median oblong, rounded, the inner linear; achenes about 3.5 mm. long.—Aug.-Oct. Honshu, Shikoku, Kyushu.—Korea, Manchuria, China, Ryukyus, and Formosa.

8. *Carpesium matsuei* Tatew. & Kitam. *C. koidzumii* var. *matsuei* (Tatew. & Kitam.) Hara.—NOPPORO-GANKUBI-SŌ. Rhizomes thick; stems 40–100 cm. long, pubescent, branched at the top; lower and median leaves membranous, ovate or broadly so, the blades 7.5–14 cm. long, 5–11 cm. wide, acute or short-acuminate, shallowly cordate-rounded to cuneate at base, entire or loosely mucronate-toothed, loosely pubescent on both sides, the petioles 2.5–11 cm. long; upper leaves gradually smaller, lanceolate to broadly so, cuneate at base; heads terminal on the branches, nodding in anthesis, pedunculate, the subtending bracteal leaves 3–5, lanceolate, longer than the head; involucre subglobose, about 5 mm. long, 11 mm.

across; bracts 3-seriate, equal in length, the outer ovate-oblong, acute, the inner obtuse; achenes about 3.5 mm. long, slightly viscid.—Aug.-Oct. Hokkaido, Honshu (centr. and n. distr.).

9. *Carpesium cernuum* L. *C. glossophylloides* Nakai; *C. taquetii* Lévl.—KO-YABU-TABAKO. Stems 50–100 cm. long, thickened, densely white-pubescent and crisped-puberulent at base, much branched; lower cauline leaves spatulate-oblong, 8–25 cm. long, 4–6 cm. wide, acute or obtuse, abruptly narrowed at base, winged-petiolate, doubly mucronate-toothed or undulate mucronate-toothed, rather densely white-pubescent on both sides; median leaves slightly smaller, oblong, obtuse, or sometimes acuminate; heads nodding in anthesis, the subtending bracteal leaves many, linear-lanceolate, 2–5 cm. long; involucre cupuliform, 7–8 mm. long; bracts scarious, the outer leaflike, broad, white-pubescent, the inner narrowly oblong, obtuse; achenes linear, 4.5–5 mm. long.—July-Sept. Hokkaido, Honshu, Shikoku, Kyushu.—Temperate regions, Europe to China, Ryukyu, Formosa, and Korea.

10. *Carpesium triste* Maxim. MIYAMA-YABU-TABAKO, GANKUBI-YABU-TABAKO. Stems 40–100 cm. long, densely spreading-pubescent especially at base, branched in upper part; lower cauline leaves ovate-oblong, 13–20 cm. long, 3–5 cm. wide, rounded at base, irregularly mucronate-toothed, densely pubescent on both sides, long winged-petiolate; median leaves narrower, long-acuminate; upper leaves gradually smaller, lanceolate or linear-lanceolate, acuminate at both ends; heads pedunculate, the subtending bracteal leaves many, linear-lanceolate, as long as or longer than the heads, reflexed; involucre campanulate; bracts mostly all alike, the outer oblong-lanceolate, acute, green, ciliate, the inner lanceolate, scarious; achenes about 3.5 mm. long.—Aug.-Oct. Hokkaido, Honshu, Shikoku, Kyushu.—China (?).

9. LEIBNITZIA Cass. SEMBON-YARI ZOKU

Perennials; stems scapiform, scaly-leaved; radical leaves many, pinnately lobed; heads dimorphic, the vernal ones ligulate, the autumnal cleistogamous and tubular; involucre tubular; bracts imbricate, few-seriate, linear; receptacle flat, alveolate; ligulate florets fertile or sterile; ligulate corollas bilabiate, the outer lip elongate, 3-toothed; tubular corollas slightly bilabiate; autumnal florets fertile; anthers sagittate, the tails connate, acuminate; achenes fusiform, more or less flattened, hairy; pappus-bristles many, smooth or scaberulous, persistent.—Five species, in Asia.

1. *Leibnitzia anandria* (L.) Nakai. *Tussilago anandria* L.; *Perdicium tomentosum* Thunb.; *Tussilago lyrata* Willd.; *Gerbera anandria* (L.) Schultz-Bip.—SEMBON-YARI, MURASAKI-TAMPOPO. Rhizomes short; stems 10–20 cm. long, simple, cobwebby-lanate while young, loosely scaly; radical leaves broadly oblanceolate, 5–16 cm. long, 13–45 mm. wide, pinnately cleft or lobed, sometimes ovate-cordate or deltoid-ovate by reduction of the lateral lobes, cobwebby-lanate especially beneath; heads about 15 mm. across; involucre 8–10 mm.

long; bracts broadly linear, obtuse; ligulate corollas 10–12 mm. long, white, red-purple outside; achenes 4.5–6 mm. long; pappus-bristles about as long as the achene, scaberulous.—Vernal phase, Apr.-June.—Autumnal phase with taller stems to 60 cm. high; involucre about 15 mm. long; achenes about 6 mm. long, more or less hairy; pappus brown, 11 mm. long, the bristles nearly smooth.—Oct.-Nov.—Grassy hills and low mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin, s. Kuriles, Manchuria, Siberia, China, and Formosa.

10. PERTYA Schultz-Bip. KŌYA-BŌKI ZOKU

Herbs or subshrubs; leaves alternate, toothed, sometimes divided, sessile or petiolate; heads solitary or sometimes racemose or paniculate; florets all tubular, bisexual, fertile; involucre campanulate; bracts many-seriate, imbricate, firmly membranous or rather coriaceous, rounded to acute; receptacle flat, rarely villous; corollas tubular, deeply 5-lobed; anthers sagittate, the tails connate, often lacinate; style shortly 2-fid, with obtuse reflexed lobes; achenes obovoid-oblong, narrowed at base, many-ribbed, glabrous or hairy; pappus-bristles many, unequal, scabrous.—About 16 species, in e. Asia and India.

- 1A. Stems woody and branched; rhizomes indistinct; heads solitary and terminal on the branchlets.
 2A. Leaves ovate, appressed-pilose; heads on elongate branchlets. 1. *P. scandens*
 2B. Leaves oblong, nearly glabrous; heads on abbreviated branchlets. 2. *P. glabrescens*
 1B. Stems herbaceous, simple; rhizomes elongate; heads in racemes, spikes, or panicles.
 3A. Leaves long-petiolate.
 4A. Leaves 3-lobed; heads 1-flowered, in panicles; achenes short-pilose; receptacle glabrous. 3. *P. triloba*
 4B. Leaves dentate or irregularly incised; heads few-flowered, in spikes; achenes glabrous; receptacle setose. 4. *P. robusta*
 3B. Leaves sessile, obovate-oblong, 10-30 cm. long, cuneate at base. 5. *P. rigidula*

1. *Pertya scandens* (Thunb.) Schultz-Bip. *Erigeron scandens* Thunb.; *P. ovata* Maxim.—KŌYA-BŌKI. Stems slender, woody, short-pilose, gray-brown, much branched; leaves on previous season's branches many, loosely arranged, ovate, 2-5 cm. long, 1.5-4.5 cm. wide, obtuse to acute, rounded at base, subsessile, loosely mucronate-toothed, 3-nerved, appressed-pilose; leaves of current season 3 or 4, fasciculate, deciduous; heads solitary, terminal; involucre 13-14 mm. long; bracts distinctly imbricate, acute, the outer ovate, the median ovate-oblong, the inner narrowly oblong; florets about 13, about 15 mm. long; achenes densely pilose, about 5.5 mm. long.—Sept.-Nov. Thin woods in hills and low mountains; Honshu, Shikoku, Kyushu.—China.

2. *Pertya glabrescens* Schultz-Bip. *P. scandens* sensu auct. Japon., non Schultz-Bip.; *P. glabrescens* var. *viridis* Nakai; *P. scandens* var. *schultzeana* Franch.—NAGABA-KŌYA-BŌKI. Rhizomes thickened; stems slender, to 120 cm. long, nearly glabrous, much branched; leaves on previous season's branches ovate, 25-35 mm. long, 15-25 mm. wide, obtuse to acute, rounded at base, very short-petiolate, mucronate-toothed, glabrous on both sides, 3-nerved; leaves of current season 3-5, fasciculate on the nodes of the last year's branches, oblong, 3-6.5 cm. long, 1-1.7 cm. wide, acute at both ends, serrulate, lustrous, sparsely pilose; heads terminal on short spurs; florets 15-18 mm. long; achenes 6.5-7 mm. long, 10-ribbed, appressed-pubescent.—Aug.-Nov. Thin woods in hills and low mountains; Honshu, Shikoku, Kyushu.

3. *Pertya triloba* (Makino) Makino. *Macroclinidium trilobum* Makino; *P. fauriei* Franch.—OYARI-HAGUMA. Stems erect, 45-85 cm. long, nearly glabrous; radical and lower cauline leaves scalelike; median leaves alternate, chartaceous, oblong, 10-13 cm. long, 7-13 cm. wide, mucronate, 3-lobed, long-petiolate, coarsely mucronate-toothed, glabrescent above, crisped-puberulent on nerves and veinlets beneath and on margin; upper leaves gradually smaller, becoming bractlike; heads many, paniculate, 1-flowered, subsessile; receptacles glabrous; involucre 14-17 mm. long, narrowly tubular; bracts ovate, the median oblong, the inner linear-oblong; achenes 8.5-9 mm. long, short-pilose.—Sept.-Oct. Woods; Honshu (n. distr. and n. Kantō Distr.).

4. *Pertya robusta* (Maxim.) Beauverd. *Macroclinidium robustum* Maxim.; *P. macroclinidium* Makino.—KASHIWABA-HAGUMA. Rhizomes creeping, knotty; stems erect, simple, 30-70 cm. long, thinly puberulent at top; leaves mostly near the median portion of the stem, ovate to ovate-oblong, 10-20 cm. long, 7-12 cm. wide, acute, rounded to cuneate at base, dentate or irregularly incised, puberulent on both sides, ciliate,

the petioles to 12 cm. long; leaves of the inflorescence sessile, small, ovate; heads in spikes, few-flowered, sometimes geminate; receptacles setose, the hairs 0.5-1 mm. long; involucre 17-27 mm. long, 8-18 mm. across; bracts many-seriate, rather coriaceous, the outer depressed-ovate, rounded at apex, the median ovate, purplish brown, the inner narrowly oblong; achenes 10-11 mm. long, glabrous; pappus 13-15 mm. long, the bristles minutely scabrous, unequal.—Sept.-Nov. Woods in mountains; Honshu, Shikoku, Kyushu.

Var. *kiushiana* Kitam. *Macroclinidium robustum* var. *kiushianum* (Kitam.) Honda.—TSUKUSHI-KASHIWABA-HAGUMA. Heads short-pedunculate; leaves often broader; involucre bracts furfuraceous-puberulent on back.—Kyushu.

5. *Pertya rigidula* (Miq.) Makino. *Eupatorium rigidulum* Miq.; *Macroclinidium rigidulum* (Miq.) Makino; *M. verticillatum* Fr. & Sav.—KURUMABA-HAGUMA. Rhizomes creeping, knotty; stems 60-90 cm. long, nearly glabrous; leaves coriaceous, mostly 7 or 8 in false verticils near the median portion of the stems, obovate-oblong, 10-30 cm. long, 3.5-11.5 cm. wide, mucronate, cuneate at base, mucronate-toothed, subtrinnerved, sessile; leaves of the inflorescence small, broadly lanceolate; heads on slender peduncles, in panicles, bracteate; florets 7-9; involucre 18-20 mm. long, about 1 cm. across; bracts rounded at apex, the outer 1.5-2 mm. long, depressed-ovate; achenes 6-8 mm. long, coarsely pilose.—Oct.-Nov. Woods in mountains; Honshu (Kinki Distr. and eastw.).

The following interspecific hybrids are reported:

Pertya × *hybrida* Makino. *Macroclinidium hybridum* (Makino) Matsum.; *P. macrophylla* Nakai; *Macropertya hybrida* (Makino) Honda.—KAKOMABA-HAGUMA, ŌBA-KŌYA-BŌKI. Annual; median leaves about 8 cm. long, 6 cm. wide, 3-nerved, the petioles about 1 cm. long; upper leaves small; heads solitary in axils of upper leaves, forming a terminal spike; involucre 17-19 mm. long.—Hybrid of *P. robusta* × *P. scandens*.

Pertya × *suzukii* Kitam. *Macroclinidium suzukii* Kitam., in syn.—IWAKI-HAGUMA. Median leaves chartaceous, approximate, irregularly dentate; florets 3 or 4.—Honshu (Iwaki Prov.).—Hybrid of *P. triloba* × *P. rigidula*.

Pertya × *koribana* (Nakai) Makino & Nemoto. *Macroclinidium koribanum* Nakai; *P. triloba* var. *koribana* (Nakai) Makino.—SENDAI-HAGUMA. Median leaves petiolate, alternate, elliptic, about 12 cm. long, about 6 cm. wide, acute, cuneate at base, loosely mucronate-toothed, the petioles 2-2.5 cm. long; heads 1-flowered, in panicles.—Honshu (near Sendai).—Hybrid of *P. triloba* × *P. robusta*.

11. AINSLIAEA DC.

MOIMIJI-HAGUMA ZOKU

Perennial herbs; leaves petiolate, radical or on the median part of stems, entire to lobed; heads in racemes, spikes, or panicles, often nodding; involucre narrowly tubular; bracts imbricate; receptacles glabrous; florets few, bisexual, fertile or rarely sterile, rarely cleistogamous, the corolla lobes 5, linear, reflexed, the anthers sagittate, the tails connate, usually acuminate;

style-branches short, flat, rounded to truncate at apex, divergent; achenes oblanceolate, rather flattened, many-nerved, truncate at apex, narrowed at base, glabrous or coarsely pilose; pappus-bristles 1-seriate, plumose, sometimes absent.—About 20 species, in e. Asia, Philippines, and India.

- 1A. Leaves linear, 4.5–7 mm. wide. 1. *A. linearis*
 1B. Leaves more than 1 cm. wide, sometimes lobed.
 2A. Leaves entire, ovate, rounded at apex, cordate at base, the petioles densely brown-lanate. 2. *A. fragrans* var. *integrifolia*
 2B. Leaves dentate or divided, the petioles not brown-lanate.
 3A. Leaves dentate or lobed.
 4A. Leaves 1–3 cm. long, 5-angled or shallowly 5-lobed. 3. *A. apiculata*
 4B. Leaves 6–16 cm. long.
 5A. Leaves reniform-cordate or orbicular, palmately 7- to 11-lobed, shorter than to as long as wide. 4. *A. acerifolia*
 5B. Leaves oblong, sagittate, hastate or ovate, longer than broad, irregularly dentate and shallowly incised. 5. *A. cordifolia*
 3B. Leaves palmately 2- to 5-parted, the segments 2- or 3-lobed. 6. *A. dissecta*

1. *Ainsliaea linearis* Makino. *A. fauricana* Beauverd —HOSOGA-HAGUMA. Rhizomes short; stems tufted or solitary, 17–40 cm. long, purplish; leaves densely aggregated near the median part of stems, linear, 4–8 cm. long, 4.5–7 mm. wide, obtuse, mucronate-tipped, entire or undulate and mucronate-toothed, slightly recurved on margin, nearly glabrous, 1- or sometimes obscurely 3-nerved, gradually narrowed below to a winged petiole; inflorescence a bracteate raceme; heads rose-purple, 3-flowered, the peduncles 3–15 mm. long; involucre 7–9 mm. long; bracts obtuse, the outer ovate, the inner linear, about 0.5 mm. wide; achenes 3–4 mm. long, densely coarse-pilose; pappus brownish.—July–Nov. Rocks along rivers in mountains; Kyushu (Yakushima).

2. *Ainsliaea fragrans* Champ. var. *integrifolia* (Maxim.) Kitam. *A. integrifolia* (Maxim.) Makino; *A. cordifolia* var. *integrifolia* Maxim.—MARUBA-TEISHO-SO. Rhizomes short-creeping, slender; stems 45–60 cm. long, densely brown-pubescent, usually simple; leaves 4–5, in a false verticil on lower part of stems, ovate, 6–10 cm. long, 3.5–6 cm. wide, mucronate, deeply cordate, mucronate-toothed, densely brown-lanate on both sides, long-petiolate; heads spicate, nodding in anthesis, subsessile; involucre narrowly tubular, 12–17 mm. long; bracts glabrous, the outer obtuse, ovate, the inner lanceolate and acuminate, about 1 mm. wide; achenes about 5 mm. long, 1 mm. wide, appressed brown-pilose; pappus about 10 mm. long, brownish.—Nov.–Dec. Kyushu (s. distr.).—s. China.

3. *Ainsliaea apiculata* Schultz-Bip. *A. apiculata* var. *typica* Masam.; *A. apiculata* var. *rotundifolia* Masam.—KIKKO-HAGUMA. Rhizomes slender, creeping; stems 8–30 cm. long, rather prominently pubescent, simple or branched; leaves chartaceous, crowded on lower portion of stems, ovate, cordate, or reniform, 1–3 cm. long and as wide, long-pubescent on both sides, 5-angled or shallowly 5-lobed, the lobes obtuse, mucronulate, the terminal lobe often elongate, the petiole about twice as long as the blade; heads in racemes, short-pedunculate; florets often cleistogamous; involucre 10–15 mm. long; bracts 5-seriate, the outer about 1 mm. long, ovate, the inner linear; achenes about 4.5 mm. long, densely short-pilose; pappus about 7 mm. long.—Sept.–Nov. Woods in mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

Var. *acerifolia* Masam. *A. apiculata* var. *multiscapa* Masam.; *A. apiculata* var. *ovatifolia* Masam. and var. *scapifolia* Masam.; *A. liukiuensis* Beauverd.—RŪKYŪ-HAGUMA. Leaves rather deeply lobed or oblong with an elongate apical lobe.—Kyushu (Yakushima).

4. *Ainsliaea acerifolia* Schultz-Bip. MOMIJI-HAGUMA. Stems 35–80 cm. long, loosely long-pubescent, simple; leaves mostly near the median part of the stem, in a false whorl of 4–7, reniform-cordate or orbicular, 6–12 cm. long, 6.5–19 cm. wide, palmately 7- to 11-lobed or lobulate, acuminate, mucronate-toothed, loosely pubescent on both sides, the petioles 5–13 cm. long, wingless, pubescent; heads spicate, many, nodding in anthesis, the peduncles about 2 mm. long, minutely bracteolate; involucre 12–15 mm. long, tubular; bracts many-seriate, scarious, the outer broadly ovate, very short, the inner oblong, 2–3 mm. wide, obtuse; achenes about 9 mm. long, 2 mm. wide; pappus 10–11 mm. long, brownish to purplish.—Woods in mountains and hills; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Var. *subapoda* Nakai. *A. affinis* Miq.; *A. acerifolia* var. *affinis* (Miq.) Kitam.—OKU-MOMIJI-HAGUMA. Leaves shallowly lobed.—Aug.–Oct. Honshu.—Korea, Manchuria, and China.

5. *Ainsliaea cordifolia* Fr. & Sav. *A. maruoi* Makino —TEISHO-SO. Rhizomes creeping, slender, knotty; stems 20–70 cm. long, pubescent, simple or rarely branched, with oblong buds at base; leaves 4–7 on lower part of stems, falsely verticillate, oblong, sagittate, hastate, or ovate, to 16 cm. long, 12.5 cm. wide, obtuse to acute, cordate, irregularly dentate and shallowly incised, often purple-maculate beneath, long-appressed-pubescent on both sides, the petioles to 12 cm. long; upper leaves 1.5–3 cm. long, deltoid, bractlike; heads in racemes, the peduncles 2–3 mm. long, prominently bracteolate; involucre 11–14 mm. long, the median and outer bracts narrowly oblong, obtuse; achenes glabrous; pappus 9–11 mm. long, brownish or purplish.—Sept.–Nov. Woods in mountains; Honshu (s. Kantō, Tōkaidō, s. Kinki Distr.), Shikoku.

6. *Ainsliaea dissecta* Fr. & Sav. ENSHŪ-HAGUMA. Rhizomes slender, creeping; stems 10–33 cm. long, glabrous, usually simple; leaves densely arranged on lower half of stems, often falsely verticillate, rounded, 2.3–6.5 cm. long, cordate, long-petiolate, palmately 2- to 5-parted to divided, the segments 2- or 3-lobed, coarsely toothed, nearly glabrous to loosely puberulent on both sides, the petioles wingless, about twice as long as the blades; heads in racemes, the pedicels 3–4 mm. long, with many minute bracteoles; involucre about 10 mm. long; bracts many-seriate, obtuse, the outer ovate, the inner linear, about 1 mm. across, acute; achenes glabrous.—Sept.–Oct. Woods in mountains; Honshu (Tōkaidō Distr.).

12. DIASPANANTHUS Miq. KUSA-YATSUDE ZOKU

Perennial herb; leaves long-petiolate, radical, rosulate, palmately cleft; inflorescence paniculate; heads many, 1-flowered, the florets bisexual, fertile, the involucre narrow, tubular, the bracts many-seriate, imbricate, scarious; corolla equally 5-cleft, actinomorphic, dark purple or white, the lobes reflexed; anthers sagittate, the auricles contiguous, connate, acuminate; style shortly bifid, the branches rounded at apex, papillose on back; achenes narrowly oblong, somewhat flattened, truncate at apex, contracted at base, densely hirsute; pappus bristles setose, pinnate, in 1 series.—One species, in Japan.

1. *Diaspananthus palmatus* Miq. *D. uniflorus* (Schultz-Bip.) Kitam.; *Ainsliaea uniflora* Schultz-Bip.—

KUSA-YATSUDE. Rhizomes short-creeping, with persistent bases of previous year's stems; stems 40–100 cm. long, with short brown pubescence on lower part; leaves approximate near base of stems, long-petiolate, spreading, orbicular, 6–14 cm. long, cordate, palmately cleft, the lobes usually 7, 2- or 3-lobulate, acute, mucronately toothed, loosely pubescent on

both sides or only on under surface, the petioles as long as to longer than the blades; heads nodding, pedicelled; involucre narrowly tubular, about 11 mm. long, 2 mm. across; bracts obtuse, the outer ovate, about 0.5 mm. long, the inner linear, about 1 mm. wide; corolla dark purple; achenes about 7 mm. long, 1.5 mm. wide, densely hirsute.—Sept.–Nov. Woods in mountains; Honshu (Tōkaidō and s. Kinki Distr.), Shikoku, Kyushu.

13. AMBROSIA L. BUTA-KUSA ZOKU

Annuals or perennials; leaves opposite or alternate, usually dissected or compound; heads unisexual, the pistillate heads 1 or few together, below the staminate heads; involucre of staminate heads obconical, the bracts 7–12, connate; pistillate heads 1-flowered, ellipsoidal to obovoid, with 4–8 small tubercles at apex; staminate florets 5–20; anthers nearly free; achenes ovoid; pappus absent.—More than 20 species, in America and the Mediterranean region.

1. *Ambrosia artemisiifolia* L. var. *elator* (L.) Descourt. *A. elator* L.; *A. artemisiifolia* subsp. *diversifolia* Piper; *A. diversifolia* (Piper) Rydb.—BUTA-KUSA. Erect annual; stems 30–100 cm. long, branched, soft-pubescent; leaves opposite or alternate, 2 or 3 times pinnately dissected, green,

loosely pubescent above, gray-green and soft-pubescent beneath, 3–11 cm. long; staminate heads in racemes, nodding, short-pedicelled; involucre bracts connate, pubescent and glandular; pistillate heads few, 4–5 mm. long in fruit.—Aug.–Sept. Widely naturalized in our area.—N. America.

14. XANTHIUM L. ONA-MOMI ZOKU

Large branched annuals; leaves alternate, coarsely dentate, petiolate; heads unisexual, the staminate densely aggregated, terminal, globose; involucre bracts spreading, 1-seriate, oblong-lanceolate; receptacle cylindric, scaly; corollas tubular, 5-toothed, the filaments and anthers free, obtuse at base; style clavate at apex; pistillate heads fasciculate in leaf-axils; outer series of involucre bracts oblong-lanceolate, spreading, small, the inner forming an ellipsoidal or ovoid, sharply prickly, 2-beaked utricle enclosing 2 florets; corollas absent; style-branches filiform, exserted; achenes 2 in each head, oblong, enclosed within the utricle.—More than 20 species, chiefly in America.

1. *Xanthium strumarium* L. *X. sibiricum* Patr. ex Widder; *X. japonicum* Widder; *X. strumarium* var. *japonicum* (Widder) Hara.—ONA-MOMI. Short-pubescent; stems 20–100 cm. long, rather stout; leaves ovate-deltoid, 5–15 cm. long, acute, shallowly cordate to broadly cuneate at base, irregularly acute-toothed, often obsoletely 3-lobed, slightly scabrous on

both sides, long-petiolate; utricles sessile, oblong, elliptic, or ovoid, 10–18 mm. long, 6–12 mm. wide, densely puberulent, 2-beaked, the beak 1.5–2 mm. long, the prickles 1.5–2 mm. long.—Aug.–Oct. Waste grounds; Hokkaido, Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, China, Korea to Europe; naturalized in N. America.

15. EUPATORIUM L. FUJIBAKAMA ZOKU

Perennials or subshrubs; leaves opposite or verticillate, dentate or variously parted; heads many, small, short-pedicelled, in dense corymbs, homogamous; involucre tubular, the bracts loosely imbricate, few-seriate; receptacle flat, alveolate, glabrous; florets 5–15, tubular; corollas regular, 5-toothed; anthers obtuse, entire at base; style-branches elongate, obtuse or flat; achenes cylindric, truncate at apex, 5-angled, often glandular or pilose.—More than 600 species, mainly in N. and S. America, a few in e. Asia and Europe.

1A. Leaves obtuse to acuminate.

2A. Leaves sessile, abruptly acute with an obtuse tip, 3-nerved, sometimes deeply 3-lobed. 1. *E. lindleyanum*

2B. Leaves acute to acuminate.

3A. Leaves short-petiolate, cuneate at base.

4A. Leaves usually glandular-dotted beneath; stems slightly scabrous. 2. *E. chinense*

4B. Leaves not glandular-dotted beneath; stems glabrous except near tip. 3. *E. fortunei*

3B. Leaves rounded or subtruncate at base. 4. *E. variabile*

1B. Leaves 3-cleft, the segments incised and pinnately cleft, caudately long-acuminate. 5. *E. yakushimense*

1. *Eupatorium lindleyanum* DC. *E. kirilowii* Turcz.; *E. lindleyanum* var. *trifoliolatum* Makino—SAWA-HIYODORI. Rhizomes short; stems 40–70 cm. long, usually simple, densely crisped-puberulent especially toward the top; leaves opposite, the lower cauline small, the median rather thick, lanceolate or linear-lanceolate, 6–12 cm. long, 1–2 cm. wide, mucronulate, abruptly cuneate at base, subsessile, sometimes deeply 3-cleft, usually distinctly 3-nerved, with resinous glandular dots beneath, prominently crisped-pubescent on both sides, sparsely toothed; heads 4–5 mm. long, 5-flowered; involucre bracts about 10, 2-seriate; achenes about 2.5 mm. long; pappus white. —Aug.–Oct. Wet grassy places in lowlands and low mountains; Hokkaido, Honshu, Kyushu.—Ryukyu, Formosa, Korea, Manchuria, China, and Philippines.

Var. *eglandulosum* Kitam. HOSHI-NASHI-SAWA-HIYODORI. Leaves pubescent or nearly glabrous, without glandular-dots beneath.—Honshu (centr. and w. distr.), Kyushu.

2. *Eupatorium chinense* L. var. *simplicifolium* (Makino) Kitam. *E. japonicum* Thunb.; *E. japonicum* var. *simplicifolium* Makino; *E. fortunei* var. *simplicifolium* (Makino) Nakai; *E. sachalinense* var. *oppositifolium* Koidz.—HIYODORIBANA. Stems tall, to 2 m. long, crisped-pubescent; lower leaves small, the median large, opposite, ovate-oblong or elliptic, rather regularly acute-toothed, 10–18 cm. long, 3–8 cm. wide, short-acuminate, cuneate at base, glandular-dotted beneath, loosely crisped-pubescent on both sides, with 6–7 pairs of lateral nerves, the petioles 1–2 cm. long; inflorescence loosely corymbose; heads 5–6 mm. long, 5-flowered; involucre bracts 2-seriate, the outer very short, scarious, rounded at apex; achenes about 3 mm. long, glandular or pilose; pappus white. —Aug.–Oct. Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, China, and Philippines; very variable.—Forma *tripartitum* (Makino) Hara. *E. japonicum* var. *tripartitum* Makino—MITSUBA-HIYODORIBANA. Leaves not glandular-dotted beneath.—Honshu, Kyushu.

Var. *angustatum* (Makino) Hara. *E. japonicum* var. *tripartitum* forma *angustatum* Makino; *E. laciniatum* Kitam.; *E. japonicum* var. *angustatum* (Makino) Kitam.—SAKEBA-HIYODORI. Leaves 3-sected, incised or pinnately lobed, without glandular dots beneath.—Honshu (Izu Prov., Tokaido Distr. and westw.), Kyushu.

Var. *dissectum* (Makino) Hara. *E. japonicum* var. *dissectum* Makino; *E. laciniatum* var. *dissectum* (Makino) Kitam.—KIKUBA-HIYODORI. Resembles the preceding variety; leaves with glandular dots beneath.—Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Var. *sachalinense* (F. Schmidt) Kitam. *E. japonicum* var. *sachalinense* F. Schmidt; *E. glehnii* F. Schmidt ex Trautv.; *E. sachalinense* (F. Schmidt) Makino; *E. hakonense* var. *inter-*

medium Nakai; *E. japonicum* subsp. *sachalinense* (F. Schmidt) Kitam.—YOTSUBA-HIYODORI. Leaves oblong to lanceolate-oblong, acutely or doubly toothed, verticillate in 3's or 4's, with resinous glandular dots beneath.—Hokkaido, Honshu (centr. and n. distr.).—Sakhalin and s. Kuriles.

Var. *hakonense* (Nakai) Kitam. *E. hakonense* Nakai; *E. glehnii* var. *hakonense* (Nakai) Hara; *E. japonicum* subsp. *sachalinense* var. *hakonense* (Nakai) Kitam.—HOSOKA-YOTSUBA-HIYODORI. Resembles the preceding variety; leaves lanceolate to linear-lanceolate; inflorescence often looser.—Mountains; Honshu (centr. and w. distr.).

3. *Eupatorium fortunei* Turcz. *E. stoehadosmum* Hance; *E. chinensis* var. *tripartitum* Miq.; *E. japonicum* var. *fortunei* (Turcz.) Pampan.—FUJIBAKAMA. Stems 1–1.5 m. long, tufted, thinly crisped-puberulent or glabrous at base; lower leaves small; median leaves opposite, usually deeply 3-cleft, rarely undivided, acutely toothed, short-petiolate, lustrous above, the terminal segments oblong or oblong-lanceolate, 8–13 cm. long, 3–4.5 cm. wide, short-acuminate to acute, cuneate to rounded at base, the lateral lobes lanceolate or oblong-lanceolate, acuminate, slightly pilose; upper leaves smaller, usually not divided, oblong; inflorescence a dense corymb; heads 7–8 mm. long, 5-flowered; involucre bracts about 10, 2- or 3-seriate, obtuse; achenes about 3 mm. long; pappus white.—Aug.–Sept. Grassy slopes and river-beds; Honshu (Kantō Distr. westw.), Shikoku, Kyushu; sometimes cultivated.—Korea and China.

4. *Eupatorium variabile* Makino. YAMA-HIYODORI. Stems 40–100 cm. long, glabrous at base, branched, crisped-puberulent at top; median leaves opposite, ovate, oblong-ovate, or oblong-lanceolate, 5–7 cm. long, 2.5–3.5 cm. wide, short-acuminate or short-acute, truncate, shallowly cordate or rounded at base, toothed, nearly glabrous on both sides, the petioles 2–3 cm. long; upper leaves slightly smaller; inflorescence dense, 3–4 cm. across; heads 4–5 mm. long, 5-flowered; involucre bracts 8–9, scarious, 2-seriate, the outer very short; achenes 2–3 mm. long, pilose at tip.—Sept.–Nov. Kyushu.—Ryukyu.

5. *Eupatorium yakushimense* Masam. & Kitam. *E. variabile* Makino pro parte.—YAKUSHIMA-HIYODORI. Stems about 1 m. long, slender, glabrous at base; median leaves opposite, 9–14 cm. long, once or twice 3-cleft, the median segments largest, lanceolate, very long-acuminate, the lateral segments smaller, acutely toothed, loosely pilose on upper side, glandular-dotted beneath, the petioles 2–2.5 cm. long; heads 4–6 mm. long, reddish, 5-flowered; involucre bracts about 10, scarious, acute to obtuse; achenes black, about 3 mm. long, 5-angled, glandular-dotted; pappus white.—July–Aug. Along rivers; Kyushu (Yakushima).

16. ADENOSTEMMA Forst. NUMA-DAIKON ZOKU

Perennial herbs with leafy stems; leaves opposite, often petiolate, toothed; heads small, in loose corymbs; involucre subglobose; bracts herbaceous, 2-seriate, equal, acute, free or connate; receptacle flat and alveolate, florets all tubular, bisexual, fertile; corollas 4- or 5-toothed; anthers obtuse, without appendage at apex, obtuse to subtruncate at base; style-branches elongate, flat, obtuse; achenes obtusely 3-angled, glandular-dotted or tuberculate, rounded at apex; pappus of 3 or 4 clavate gland-tipped bristles.—About 10 species, in warmer and tropical regions, especially in America.

1. *Adenostemma lavenia* (L.) O. Kuntze. *Verbesina lavenia* L.; *A. viscosum* Forst.—NUMA-DAIKON. Stems erect, 30–100 cm. long, puberulent at top, the branches often

spreading; lower leaves small; median leaves ovate or ovate-oblong, 4–20 cm. long, 3–12 cm. wide, rounded-cuneate at base, obtusely toothed, sparsely pilosulous, the petioles 1–6 cm.

long; heads about 4 mm. long, pedunculate; involucre bracts 2-seriate, equal, connate at base, narrowly oblong, rounded at apex, reflexed; styles long-exserted; achenes about 4 mm. long, tubercled or glandular-dotted.—Sept.—Nov. Wet places in

lowlands and mountains; Honshu, Shikoku, Kyushu; common.—Korea, Ryukyus, Formosa, China, and the temperate to tropical parts of Asia and Australia.

17. SOLIDAGO L.

AKI-NO-KIRIN-SŌ ZOKU

Perennial herbs; leaves alternate, toothed; heads small, in spikes or panicles, heterogamous; involucre campanulate; bracts scarious, imbricate, 3- or 4-seriate; receptacle flat; ligulate florets 1-seriate; pistillate florets fertile, the corollas ligulate, yellow; tubular florets fertile, yellow, 5-toothed; anthers obtuse, entire at base; style-branches flat, with a lanceolate appendage at apex; achenes cylindric, 8- to 12-ribbed, truncate at apex, gradually narrowed at base, glabrous or pilose; pappus-bristles many, nearly equal, scarious.—About 130 species, in the N. Hemisphere, especially in N. America.

- 1A. Stems densely leaved; leaves linear-lanceolate; achenes densely hirsute. 1. *S. yokusaiana*
 1B. Stems loosely leaved; leaves ovate to lanceolate; achenes glabrous to scattered-pilose. 2. *S. virga-aurea*

1. *Solidago yokusaiana* Makino. *S. virga-aurea* var. *linearifolia* Franch. ex Makino; *S. virga-aurea* var. *angustifolia* Makino, non Gaudich.—OKINAGUSA, AOYAGI-SŌ. Rhizomes rather thick; stems tufted, 16–60 cm. long, densely leaved and densely short-pubescent at top; radical leaves lanceolate, long-petiolate; median cauline leaves many, linear-lanceolate, 4–7 cm. long, 2–5 mm. wide, acute, entire or loosely incurved-toothed, narrowed to a petiolelike base; upper leaves smaller and linear; heads subracemose, subtended by linear bracteate leaves; involucre bracts 3-seriate, 1-nerved, narrowly oblong, obtuse, the outer 1.5 mm. long, the inner 5–6 mm. long; ligulate corollas about 7 mm. long, 1.5 mm. wide; achenes densely hirsute.—Aug.–Oct. Rocks along rivers in low mountains; Honshu, Shikoku, Kyushu.—Ryukyus.

2. *Solidago virga-aurea* L. var. *leiocarpa* (Benth.) Miq. *S. decurrens* Lour.; *S. amphirhapis leiocarpa* Benth.; *S. cantoniensis* Lour.; *S. virga-aurea* sensu auct. Japon., non L.; *S. virga-aurea* subsp. *leiocarpa* (Benth.) Hult.—KOGANEIKU, MIYAMA-AKI-NO-KIRIN-SŌ. Stems 15–70 cm. long, often branched at top, puberulent; cauline leaves many, on winged petioles, narrowly oblong to ovate, 4–10 cm. long, 1.5–4 cm. wide, acute, rounded to cuneate at base, acutely toothed, often puberulent on both surfaces, the petioles winged; upper leaves gradually narrower, acuminate; heads 12–15 mm. across, in panicles, bractless or with few small bracteate leaves; involucre bracts 3-seriate, 1-nerved, the outer ovate-lanceolate, 2–3 mm. long, the inner lanceolate, 6–6.5 mm. long, acute to acuminate; ligulate corollas about 8.5 mm. long, about 2 mm. wide, yellow, 1-seriate; achenes glabrous to scattered-pilose.—Aug.–Sept. Open grassy slopes or woods in mountains; Hokkaido,

Honshu, Shikoku, Kyushu; very common.—Sakhalin, Kuriles, Korea, Manchuria, China, and Philippines.—Forma *paludosa* (Honda) Kitam. *S. virga-aurea* var. *paludosa* Honda; *S. japonica* var. *paludosa* (Honda) Honda—KIRIGAMINE-AKI-NO-KIRIN-SŌ. Leaves linear-lanceolate, acuminate.—Wet boggy places; Honshu (centr. distr.).

Var. *minutissima* Makino. *S. virga-aurea* var. *yakushimensis* Nakai; *S. minutissima* (Makino) Kitam.; *S. yakushimensis* (Nakai) Masam.—ISSUN-KINKA. Stems less than 10 cm. long; lower leaves ovate or oblong-lanceolate, 15–35 mm. long; achenes glabrous.—High mountains; Kyushu (Yakushima).

Var. *praefflorens* Nakai. *S. decurrens* var. *praefflorens* (Nakai) Kitam.; *S. hachijoensis* Nakai—HACHIJO-AKI-NO-KIRIN-SŌ. Stems low, branched; leaves ovate, acutely toothed; achenes pilose at apex.—Honshu (Izu Isl.).—Bonins.

Var. *gigantea* Nakai. *S. mirabilis* Kitam.; *S. decurrens* var. *gigantea* (Nakai) Ohwi—Ō-AKI-NO-KIRIN-SŌ, ŌKU-KOGANE-GIKU. Stems 60–80 cm. long, stout; cauline leaves broadly ovate, ovate-oblong to suborbicular, 10–15 cm. long, 7–10 cm. wide, truncate-cordate at base; heads dense; achenes pilose on upper half.—Lowlands near seashore; Hokkaido (sw. distr.), Honshu (n. distr.).

Var. *asiatica* Nakai. *S. japonica* Kitam.; *S. japonica* var. *ovata* Honda; *S. virga-aurea* sensu auct. Japon., non L.—AKI-NO-KIRIN-SŌ. Resembles var. *leiocarpa*; involucre narrowly campanulate, the bracts obtuse.—Aug.–Oct. Lowlands and low mountains, Honshu, Shikoku, Kyushu.—Korea.—The typical phase occurs in Eurasia and N. America.

18. GYMNASTER Kitam.

MIYAMA-YOMENA ZOKU

Erect perennials; leaves alternate, glabrous or with short coarse hairs; heads ligulate, subglobose to campanulate; involucre bracts 2- or 3-seriate, nearly equal, imbricate; receptacle conical, alveolate; ligulate florets pistillate, 1- or 2-seriate, blue or white, fertile; tubular florets many, bisexual, fertile, yellow, the corollas 5-toothed; achenes flat, oblong, glabrous, ribbed; pappus absent.—Few species, in e. Asia.

1. *Gymnaster savatieri* (Makino) Kitam. *Boltonia savatieri* Makino; *Aster savatieri* Makino; *Asteromoea savatieri* Makino, in syn.—MIYAMA-YOMENA. Rhizomes short-creeping; stems 20–50 cm. long, branched at top, green; radical leaves oblong or ovate-oblong, 4–6 cm. long, 2.5–3 cm. wide, coarsely incised-toothed, deep green above, short-pubescent on both sides, winged-petiolate; cauline leaves scattered;

heads long-pedunculate, in loose corymbs, 3.5–4 cm. across; involucre bracts lanceolate, 2-seriate; ligulate corollas blue or white, 17–20 mm. long, 3–3.5 mm. wide; achenes 3–4 mm. long.—May–July. Woods in mountains; Honshu, Shikoku, Kyushu.

Var. *pygmaeus* (Makino) Kitam. *Aster savatieri* var. *pygmaeus* Makino; *Asteromoea pygmaea* (Makino) Kitam.;

Aster yokusaianum Kitam. ex Hara; *G. pygmaeus* (Makino) Kitam.—SHINJUGIKU. Rhizomes long-creeping; stems about 10 cm. long; leaves ovate, 2–3 cm. long; heads solitary on long peduncles, smaller; involucre about 3 mm. long, 6–7

mm. across; ligulate corollas 7–9 mm. long; achenes about 2.5 mm. long.—Woods in mountains; Honshu (Kinki and Chūgoku Distr.), Shikoku.

19. KALIMERIS Cass. YOMENA ZOKU

Erect perennial herbs; leaves alternate, ovate, elliptic to linear, toothed, sometimes pinnatifid; heads subglobose; involucre bracts equal or the outer shorter, few-seriate, herbaceous or with scarious margins; receptacle convex, alveolate; achenes flat, obovate or oblong, margined, 0- to 2-ribbed, sometimes pilose; pappus-bristles very short, 0.3–1 mm. long, connate at base in a ring; style of the bisexual florets with a deltoid or lanceolate appendage; anthers entire and obtuse at base.—Few species, in e. Asia.

1A. Involucral bracts 3-seriate, loosely imbricate; style-branches deltoid; leaves ovate or lanceolate.

2A. Leaves short-puberulent beneath; heads about 2.5 cm. across; achenes about 2.5 mm. long; pappus bristles about 0.3 mm. long, few.

2B. Leaves glabrous beneath; heads about 3–3.5 cm. across; achenes 3–3.5 mm. long; pappus bristles 0.5–1 mm. long, many, reddish.

1B. Involucral bracts 2-seriate, equal; style-branches lanceolate; radical leaves cordate, acuminate to acute, long-petiolate. . 3. *K. miqueliana*

1. *Kalimeris pinnatifida* (Maxim.) Kitam. *Aster indicus* var. *pinnatifida* Maxim.; *Asteromoea pinnatifida* (Maxim.) Koidz.; *Aster pinnatifidus* (Maxim.) Makino; *Asteromoea indica* var. *pinnatifida* (Maxim.) Matsum.; *Aster iinumae* Kitam.—YUGAGIKU. Rhizomes creeping; stems 40–150 cm. long, short-pilose; median leaves membranous, oblong to ovate-oblong, 7–8 cm. long, 3–4 cm. wide, sessile, pinnatifid, incised-toothed, green, the lobes linear, 3 or 4 pairs, obtuse, mucronate, short-puberulent on both sides especially toward the margin; leaves on branches short, linear-lanceolate; heads about 2.5 mm. across, in loose corymbs, long-pedicelled; outer involucre bracts linear, obtuse, the inner narrowly oblong, green on back, loosely short-puberulent; ligulate corollas 12–13 mm. long, 2–2.5 mm. wide, bluish or rosy; achenes about 2.5 mm. long; pappus bristles about 0.3 mm. long, few.—July–Oct. Hills and low mountains; Honshu.—Cv. *Hortensis*. *K. pinnatifida* forma *hortensis* (Makino) Ohwi; *Aster indicus* var. *pinnatifidus* forma *hortensis* Makino; *K. pinnatifida* var. *hortensis* (Makino) Kitam.; *Aster iinumae* forma *hortensis* (Makino) Hara.—CHŌSEN-GIKU. With larger tubular florets.—Cultivated.

2. *Kalimeris incisa* (Fisch.) DC. *Aster incisus* Fisch.; *Asteromoea incisa* (Fisch.) Koidz.; *K. polycephala* Cass.; *Aster pinnatifidus* forma *robustus* Makino; *A. macrodon* Lév. & Van't.—CHŌSEN-YOMENA, Ō-YUGAGIKU. Rhizomes long-creeping; stems 1–1.5 m. long, loosely short-pilose in upper part, branched in upper half; lower and median cauline leaves oblong-lanceolate to lanceolate, 8–10 cm. long, about 2.5 cm. wide, acuminate, sessile, loosely incised, lustrous above, short-

pilose on margin, glabrous beneath; upper leaves linear-lanceolate, acuminate at both ends; heads 3–3.5 cm. across, on long pedicels; involucre bracts 3-seriate, the outer slightly shorter, lanceolate, acute, the inner oblong, obtuse; ligulate corollas about 18 mm. long, 2.5 mm. wide; achenes 3–3.5 mm. long; pappus 0.5–1 mm. long, reddish.—July–Sept. Meadows and waste grounds in lowlands; Honshu (Chūgoku), Shikoku, Kyushu; common.—Korea, Manchuria, n. China, and Siberia.

Kalimeris yomena Kitam. *K. incisa* var. *yomena* Kitam.; *Aster yomena* (Kitam.) Honda; *A. indicus* sensu auct. Japon., non L.—YOMENA. Leaves dentate, lustrous; pappus about 0.5 mm. long.—Common in lowlands; Honshu, Shikoku, Kyushu.—s. Korea.

3. *Kalimeris miqueliana* (Hara) Kitam. *Biotia japonica* Miq.; *Boltonia japonica* (Miq.) Fr. & Sav.; *Aster japonicus* (Miq.) Fr. & Sav., non Less.; *Asteromoea japonica* (Miq.) Matsum.; *Aster miquelianus* Hara.—ŌBA-YOMENA. Rhizomes creeping; stems 35–90 cm. long, slender, sometimes loosely pilose; radical leaves cordate, 4–9 cm. long, 3.5–6 cm. wide, acuminate to acute, coarsely incised-serrate, more or less pilose on both sides, long-petiolate; upper leaves smaller, ovate, shallowly cordate at base, short-petiolate; uppermost leaves lanceolate, bractlike; heads 22–25 mm. across, on slender pedicels; involucre bracts 2-seriate, equal, herbaceous, lanceolate, ciliate; ligulate corollas 13–16 mm. long, about 2 mm. wide; style branches lanceolate; achenes 4–4.5 mm. long.—Aug.–Oct. Shikoku, Kyushu.

20. HETEROPAPPUS Less. HAMABE-NOGIKU ZOKU

Biennial erect or decumbent herbs; stems branched; leaves alternate, spatulate-oblong or ovate-oblong, toothed or entire, pilose or glabrous; heads in loose corymbs, ligulate; heads subglobose; involucre bracts herbaceous, 2-seriate, subequal, acuminate; receptacle slightly convex, alveolate; ligulate florets pistillate, blue-purple or white, fertile; tubular florets yellow, fertile, the corolla 5-toothed; anthers obtuse, entire at base; style-branches flat, with a deltoid-acute appendage at apex; achenes much flattened, obovate, densely pilose, rounded at apex, acute at base; pappus of the ligulate florets very short and crownlike, of the tubular florets setose, 1–4 mm. long, brownish red, scabrous.—e. Asia.

1. *Heteropappus hispidus* (Thunb.) Less. *Aster hispidus* Thunb.; *H. subseriatus* Sieb. & Zucc.; *A. hispidus* var. *mesochaeta* Fr. & Sav.; *A. hispidus* var. *heterochaeta* Fr. & Sav.; *H. decipiens* Maxim.—ARENO-NOGIKU. Stems 0.3–1 m. long, densely leafy, coarsely hirsute, branched at tip; radi-

cal leaves oblanceolate, 7–13 cm. long, 1–1.5 cm. wide, loosely pubescent on both sides; cauline leaves oblanceolate to linear, 5–7 cm. long, 4–20 mm. wide, obtuse, narrowed at base, entire or loosely toothed, slightly recurved on margin, ciliate; upper leaves smaller, linear, 8–15 mm. long, bract-

like; heads 3-5 cm. across; involucre 7-8 mm. long, the bracts nearly equal, herbaceous, linear-lanceolate or the inner row rhombic-lanceolate, acuminate, puberulent; ligulate corollas

14-24 mm. long, 2.5-4 mm. wide; achenes 2.5-3 mm. long. —Sept.-Nov. Lowlands; Honshu (centr. distr. and westw.), Shikoku, Kyushu. —Korea, Manchuria, China, and Formosa.

Key to the varieties of *H. hispidus*

- 1A. Pappus of the tubular florets 1-2 mm. long; involucre about 1 cm. across. var. *leptocladus*
 1B. Pappus of the tubular florets 3-4 mm. long; involucre 1.5 cm. across.
 2A. Plant glabrous; stems 1.5 m. long; leaves linear. var. *koidzumianus*
 2B. Plant more or less hirsute.
 3A. Stems decumbent; radical leaves rather thick, small, spatulate, petiolate; involucral bracts rather thick. var. *arenarius*
 3B. Stems erect, branched. var. *insularis*

Var. *leptocladus* (Makino) Kitam. *Aster leptocladus* Makino; *H. leptocladus* (Makino) Matsum.—YANAGI-NOGIKU. Stems slender, densely leafy, densely branched at top, nearly glabrous; median leaves linear, acute, glabrous; heads 2.5-3 cm. across; involucre about 1 cm. across; ligulate corollas about 13 mm. long; achenes obovate, about 3 mm. long, pubescent.—Oct. Lowlands; Shikoku.

Var. *koidzumianus* (Kitam.) Kitam. *H. koidzumianus* Kitam.; *Aster koidzumianus* (Kitam.) Nemoto.—BUZEN-NOGIKU. Plant glabrous; stems much branched, 1.5 m. long, with slender branches; cauline leaves linear-spatulate; upper leaves gradually smaller, linear; heads 3.5-4 cm. across; involucre 6.5-7.5 mm. long; achenes about 3 mm. long, hirsute; pappus of the tubular florets 3-4 mm. long, brownish red.—Rokys; Kyushu (Yabakei in Buzen).

Var. *arenarius* (Kitam.) Kitam. *H. arenarius* Kitam.;

Aster arenarius (Kitam.) Nemoto.—HAMABE-NOGIKU. Stems branched from the base, decumbent, ascending, glabrescent; radical leaves spatulate, nearly glabrous to loosely hirsute, prominently ciliate, petiolate; heads about 3.5 cm. across; involucre about 7 mm. long.—July-Oct. Near seashores; Honshu (Japan Sea side from Etchu Prov. and westw.), Kyushu.

Var. *insularis* (Makino) Kitam. *Aster insularis* Makino; *H. insularis* (Makino) Matsum.—SONARE-NOGIKU. Plant glabrescent; roots fusiform; stems much branched from the base; leaves glabrous, ciliate, lustrous; heads 4-4.5 cm. across; involucre 7-9 mm. long; bracts glabrous, lanceolate, acuminate; ligulate corollas about 18 mm. long, 3-3.5 mm. wide; achenes 4-5 mm. long, hirsute.—Aug.-Oct. Near seashores; Shikoku.

21. ERIGERON L. MUKASHI-YOMOGI ZOKU

Annuals or perennials with erect, sometimes branched stems; leaves alternate, narrow, entire or toothed; heads on naked peduncles or scapes, ligulate or eligulate, subglobose or tubular-campanulate; involucral bracts equal, in a single series, membranous, not definitely imbricate, linear-lanceolate, acuminate, pilose on back; receptacle slightly convex, alveolate; ligulate florets pistillate, fertile, few-seriate, equal, very narrow, blue or white; tubular florets bisexual, the corollas tubular, yellow, fertile; anthers entire at base; style-branches obtuse; achenes flat, ribbed on margin, pilose; pappus-bristles 1-seriate, simple, slender, scabrous. —About 150 species, mostly in temperate regions, a few tropical.

- 1A. Limb of ligulate corolla longer than the tubular part, exerted from the pappus, usually prominent.
 2A. Heads 3-3.5 cm. across, solitary or few on short scapes.
 3A. Radical leaves long-petiolate, elliptic. 1. *E. miyabeanus*
 3B. Radical leaves spatulate-oblong. 2. *E. thunbergii*
 2B. Heads 2 cm. or less across, many on tall stems.
 4A. Ligulate corollas involute when dry, often becoming indistinct; pistillate florets with capillary corollas present; stems often purplish red. 3. *E. acris*
 4B. Ligulate corollas prominent, flat; capillary corollas absent; stems green.
 5A. Inflorescence nodding before anthesis; leaves vivid green, the cauline oblong to broadly oblanceolate, more or less clasping at base; ligulate corollas usually pinkish; May to June. 4. *E. philadelphicus*
 5B. Inflorescence erect; leaves pale green, the cauline ovate to ovate-lanceolate, not clasping at base; ligulate corollas white or purplish rose; July to October. 5. *E. annuus*
 1B. Limb of ligulate corolla shorter than the tubular part, not exerted from the pappus, minute, in a few series, rarely absent.
 6A. Involucres 4-5 mm. long; receptacle 2-4 mm. across in fruit. 6. *E. bonariensis*
 7A. Involucres about 5 mm. long; cauline leaves linear. 7. *E. sumatrensis*
 7B. Involucres about 4 mm. long; cauline leaves narrowly oblanceolate. 8. *E. canadensis*
 6B. Involucres 2.5-4 mm. long; receptacle 1.5-2.5 mm. across in fruit. 8. *E. canadensis*

1. *Erigeron miyabeanus* Tatew. & Kitam. *Aster miyabeanus* Tatew. & Kitam.—MIYAMA-NOGIKU. Plant densely pubescent with multicellular crisped-hairs; rhizomes 6-8 mm. in diameter, covered with old petioles, the innovation-shoots many, short; scapes about 15 cm. long, solitary; radical leaves elliptic, the inner 2.5-3.5 cm. long, about 2 cm. wide,

rounded to obtuse at both ends, sometimes cuneately narrowed at base, 3-nerved, coarsely toothed on upper margin, long-petiolate; cauline leaves loosely arranged, small; heads about 3.5 cm. across, blue-purple, showy; involucre about 1 cm. long, subglobose, densely pubescent, the bracts 3-seriate, equal, broadly linear, acuminate, purplish; ligulate corollas about 13

mm. long, 2 mm. wide; achenes about 2.5 mm. long, hirsute; pappus sordid-white.—July. Hokkaido (Kitami Prov.).

2. *Erigeron thunbergii* A. Gray. *Aster dubius* (Thunb.) Onno ex Kitam.; *Inula dubia* Thunb.; *A. japonicus* Less.—AZUMAGIKU. Rhizomes short and slender; innovation shoots short; flowering scapes tufted or solitary, 10–37 cm. long, usually simple, densely pubescent; radical leaves spatulate-oblong, 4.5–8 cm. long, 1–2 cm. wide, sometimes few-toothed, ciliate, nearly glabrous on both surfaces; radical leaves at the base of scapes 1.8–3 cm. long, 5–9 mm. wide, spatulate, rounded at apex, entire, densely pubescent; cauline leaves few, loosely arranged, small, 1–3 cm. long, 2–5 mm. wide, densely pubescent; heads solitary, 3–3.5 cm. across; involucre about 8 mm. long, densely pubescent; bracts 3-seriate, equal, narrowly lanceolate, about 1 mm. wide, acuminate, 3-nerved; ligulate corollas 3-seriate, about 15 mm. long, 1.5 mm. wide, blue-purple; pappus brownish red, about 5 mm. long.—Apr.–June. Grassy slopes in lowlands and mountains; Honshu (n. and centr. distr.).

Var. *glabratus* A. Gray. *Aster consanguineus* Ledeb.; *E. dubius* var. *alpicola* Makino; *E. alpicola* (Makino) Makino; *E. dubius* var. *glabratus* (A. Gray) Makino; *E. thunbergii* subsp. *glabratus* (A. Gray) Hara—MIYAMA-AZUMAGIKU. Plant less densely shorter pubescent; pappus sordid white, 2.5–3.5 mm. long.—July–Aug. Alpine regions; Hokkaido, Honshu (centr. and n. distr.).—s. Kuriles, Sakhalin, Korea, Manchuria, Kamchatka, and Siberia.

Var. *angustifolius* (Tatew.) Hara. *E. glabratus* var. *angustifolius* Tatew.; *E. tsuneoi* Tatew.; *Aster tsuneoi* (Tatew.) Miyabe & Tatew.; *A. dubius* var. *angustifolius* (Tatew.) Hara—APOI-AZUMAGIKU. Leaves narrower, the radical 3–4 cm. long, 2–4 mm. wide; ligulate corollas often white; pappus 2–2.5 mm. long.—Alpine slopes; Hokkaido (Mount Aoi).

Var. *heterotrichus* (Hara) Hara. *E. heterotrichus* Hara; *Aster heterotrichus* (Hara) Hara ex Kitam., in syn.—JŌSHŪ-AZUMAGIKU. Leaves of the sterile rosettes linear-spatulate, glabrous; cauline leaves 4 or 5, broadly linear, narrower; ligulate corollas 10–13 mm. long; style-branches slender; pappus sordid white, about 3.5 mm. long.—Alpine slopes; Honshu (Mount Tanigawa and Mount Shibutsu in Kotsuke).

3. *Erigeron acris* L. *E. kamtschaticus* var. *hirsutus* F. Schmidt; *E. acris* var. *hirsutus* (F. Schmidt) Miyabe & Miyake—EZO-MUKASHI-YOMOGI. Perennial, sometimes biennial; rhizomes short; stems 15–55 cm. long, hirsute, often branched at top; radical leaves spatulate, long winged-petiolate; lower cauline leaves oblanceolate, 3.5–6.5 cm. long, 6–12 mm. wide, obtuse, mucronate, entire or mucronate-toothed, short-hirsute on both sides, winged-petiolate; median leaves linear-oblong, 3–6 cm. long, 4–16 mm. wide, usually entire, sessile; upper leaves linear, gradually smaller; heads long-pedunculate, about 17 mm. across, in racemes or loose corymbs; involucre tubular-campulate, 6–9 mm. long; bracts linear-lanceolate, acuminate, hirsute; ligulate corollas rose-purple, 7–7.5 mm. long, about 0.2 mm. wide; achenes 2–2.5 mm. long, pilose; pappus 4–6 mm. long, whitish or reddish.—Aug. High mountains; Hokkaido, Honshu (centr. distr.).—Manchuria, China, Kuriles, Sakhalin, Korea, Siberia to Europe, and N. America.

Var. *kamtschaticus* (DC.) Herd. *E. kamtschaticus* DC.; *E. acris* var. *drobachensis* sensu Kitam., non Blytt—MUKASHI-YOMOGI, YANAGI-YOMOGI. Stems purplish, much branched at top; lower and median leaves 5–12 cm. long, 5–13

mm. wide; heads many, in panicles or corymbs; involucre bracts puberulent.—Mountains; Hokkaido, Honshu (centr. distr.).—Kamchatka, Sakhalin, and Kuriles.

Var. *linearifolius* (Koidz.) Kitam. *E. kamtschaticus* var. *linearifolius* Koidz.; *E. koidzumii* Honda.—HOSOBAMUKASHI-YOMOGI. Stems purplish red, sometimes slightly pubescent at base; median leaves many, linear, 3–6 cm. long, about 2.5 mm. wide, usually acute, entire, glabrous or ciliate; heads many; involucre about 5 mm. long, the bracts puberulent.—Honshu (n. and centr. distr. and Mount Daisen in Hoki Prov.), Shikoku.

Var. *amplifolius* Kitam. HIRO-HAMUKASHI-YOMOGI. Stems short-hirsute; leaves larger, broadly oblanceolate in the lower ones; median leaves many, oblong-lanceolate, 6–10 cm. long, 17–27 mm. wide, usually nearly entire, short-hirsute on both sides; involucre about 6.5 mm. long, the bracts puberulent.—Hokkaido (Ishikari Prov.), Honshu (Mount Azuma in Uzen Prov.).

4. *Erigeron philadelphicus* L. HARU-JŌN. Erect pubescent biennial, 30–60 cm. high; radical leaves spatulate or oblong, about 8 cm. long, 2 cm. wide; median cauline leaves oblong to broadly oblanceolate, 5–6 cm. long, 1.5–2 cm. wide, clasping or narrowed and rounded at base; heads in dense corymbs, nodding before anthesis, erect in fruit, about 2 cm. across; involucre pubescent; ligulate florets many; corollas narrow, linear, pinkish.—May–June. Naturalized in Korea, Japan; common.—Introduced from N. America.

5. *Erigeron annuus* (L.) Pers. *Aster annuus* L.; *Stenactis annua* (L.) Cass.—HIME-JŌN. Annual; stems 30–100 cm. long, coarsely hirsute, much branched at top; leaves membranous, coarsely acute-toothed, the lower cauline ovate to ovate-lanceolate, 4–15 cm. long, 1.5–3 cm. wide, pilose on both surfaces, narrowed to a winged petiole; upper leaves narrowly ovate to lanceolate, acute at both ends, acute-toothed, coarsely pilose on margin and on midrib beneath; heads erect, in corymbs, about 2 cm. across; involucre long-pilose; ligulate corollas white or purplish rose, linear, 7–8 mm. long, about 1 mm. wide, as long as to slightly longer than the involucre.—July–Oct. Waste grounds and cultivated fields in lowlands; very common. Introduced from N. America.—*Forma discoides* Mar.-Vict. & Rouss.—BŌZU-HIME-JŌN. Heads without ligulate florets. Rare.

6. *Erigeron bonariensis* L. *E. linifolius* Willd.—ARECHI-NOGIKU. Gray-green annual, 30–50 cm. high, puberulent and sparingly long-pilose; lower leaves oblanceolate, sometimes coarsely toothed; median and upper leaves linear; heads in racemes or racemose panicles; involucre gray-hirsute, about 5 mm. long; ligulate florets many, the corollas very short, white, shorter than the pappus.—A pantropic weed rather rare in our area.

7. *Erigeron sumatrensis* Retz. *E. flahaultianus* (Sennen) Thell.; *E. musashiensis* Makino—O-ARECHI-NOGIKU. Gray-green annual, coarsely long-hirsute and short-pilose; radical leaves oblanceolate, 6–10 cm. long, 1.5–3 cm. wide, coarsely toothed; cauline leaves narrowly oblanceolate, gradually acute; upper leaves gradually smaller, narrow, entire; inflorescence many-headed; involucre about 4 mm. long, pilose; ligulate corollas very short, inconspicuous.—Aug.–Oct. Waste grounds and roadsides; very common in lowlands.—Pantropic.

8. *Erigeron canadensis* L. HIME-MUKASHI-YOMOGI.

Loosely hirsute annual, 0.5–1.5 m. high; lower leaves oblanceolate, dentate or entire, 7–10 cm. long, 1–1.5 cm. wide, the upper linear; heads many, small, in large terminal panicles; involucre loosely pilose, 2.5–4 mm. long; florets rather few; ligulate florets white, very small.—Aug.–Oct. Waste

grounds, cultivated fields, and roadsides; very common.—Introduced from N. America.

Var. *levis* Makino. KENASHI-HIME-MUKASHI-YOMOGI. Plant glabrescent.

22. ASTER L. SHION ZOKU

Perennials, rarely annuals; stems sometimes scapellike, sometimes leafy and branched; leaves alternate, entire to lobed; heads mostly on leafy branchlets, in loose corymbs or rarely solitary, ligulate; involucre tubular, campanulate, or subglobose, the receptacle slightly convex or flat, alveolate; involucre bracts imbricate; ligulate florets pistillate, fertile, 1- or 2-seriate, bluish or white; tubular florets many, bisexual, usually fertile, the corollas tubular, yellow, 5-toothed; anthers entire; style branches flat, deltoid or lanceolate; achenes more or less flat, ribbed on margin, with 0–4 ribs on the face, the pappus-bristles elongate, few or many, in 1 or 2 series, scabrous.—Many species in the N. Hemisphere, especially abundant in N. America, few in S. Africa and S. America.

1A. Perennials; pappus-bristles not elongate after anthesis.

2A. Involucre bracts of two lengths, the outer ones short; pappus-bristles many.

3A. Achenes not flattened.

4A. Leaves ovate; achenes glabrous or finely hirsute.

5A. Heads 3–4 cm. across; petioles broadly winged; style-branches lanceolate at apex. 1. *A. komonoensis*

5B. Heads about 2 cm. across.

6A. Leaves cuneate at base, gradually decurrent on the petiole. 2. *A. sekimotoi*

6B. Leaves cordate at base, petioles narrowly winged. 3. *A. scaber*

4B. Leaves lanceolate; achenes coarsely hirsute.

7A. Leaves rugulose above, usually obtuse; peduncles long, leafless; pappus-bristles many. 4. *A. rugulosus*

7B. Leaves smooth and lustrous above, acuminate; peduncles short, bracteate; pappus-bristles rather few. 5. *A. sohayakiensis*

3B. Achenes flat.

8A. Involucre bracts acuminate; pits on receptacle lacerate on margin.

9A. Leaves oblong, short-petiolate; heads many; achenes glandular-dotted. 6. *A. glehnii*

9B. Leaves cordate, long-petiolate; heads few; achenes hirsute. 7. *A. dimorphophyllus*

8B. Involucre bracts obtuse, rarely acute.

10A. Heads small, many, some of the tubular florets sterile. 8. *A. fastigiatus*

10B. Heads relatively large, the tubular florets fertile.

11A. Pits on receptacle entire; heads large, 3–4 cm. across; involucre bracts reddish.

12A. Stems 48–85 cm. long; median leaves 6–10 cm. long, 1–2 cm. wide; involucre bracts rounded at apex; achenes about 2 mm. long; heads few. 9. *A. maackii*

12B. Stems 1–2 m. long; median leaves usually 20–35 cm. long, 6–10 cm. wide; involucre bracts acuminate; achenes about 3 mm. long; heads many. 10. *A. sataricus*

11B. Pits on receptacle lacerate on margin; heads smaller, 1.5–3 cm. across; involucre bracts not reddish.

13A. Involucre bracts in 4 series; heads solitary or 3 on each branch. 11. *A. tenuipes*

13B. Involucre bracts in 2 or 3 series; heads usually more than 3 on each branch. 12. *A. ageratoides*

2B. Involucre bracts nearly equal; pappus-bristles few.

14A. Involucre bracts acuminate, scarious on margin; plant of waste grounds. 13. *A. kantoensis*

14B. Involucre bracts acute to subobtus, without scarious margins; plants of seashores.

15A. Leaves densely puberulent, the median ones broadly spatulate; achenes oblong; involucre bracts acuminate.

14. *A. spathulifolius*

15B. Leaves scattered puberulent, the median ones ovate-spatulate; achenes obovate; involucre bracts obtuse to rounded.

15. *A. pseudoasagrayi*

1B. Annual or biennial, or short-lived perennial; involucre bracts few; achenes flat, the inner ones often not fertile; pappus-bristles elongate after anthesis. 16. *A. tripolium*

1. *Aster komonoensis* Makino. KOMONOGIKU, TAMAGIKU. Rhizomes short-creeping; scapes 15–50 cm. long, glabrous at base, loosely short-hairy and loosely branched in upper part; sterile branches short; rosette leaves ovate, 2.5–7 cm. long, 2.5–4 cm. wide, long-petiolate, the lower cauline leaves usually withering before anthesis, the median ones sparsely arranged, oblong, 3.5–7 cm. long, 1.5–2 cm. wide, acute, narrowed to a winged petiole or gradually narrowed to the clasping base, coarsely toothed on upper half, the upper leaves small; heads in loose corymbs, 3–4 cm. across; involucre 6–10 mm. long, globose; bracts 3-seriate, glabrous, the outer elliptic or orbicular, shorter than the inner; ligulate corollas 11–17 mm. long, 2–2.5 mm. wide; achenes about 3 mm. long, hirsute.—July–Sept. Rocks in mountains; Honshu (s. Kinki Distr.), Shikoku.

2. *Aster sekimotoi* Makino. NAGABA-SHIRAYAMA-GIKU. Stems erect, about 1.5 m. long, branched in upper part; lower cauline leaves firmly chartaceous, ovate-oblong, 14–17 cm. long, about 5 cm. wide, gradually acuminate, cuneate at base, gradually decurrent on the long petiole, loosely mucronate-toothed, short-pilose above and on nerves beneath, the upper leaves gradually smaller, lanceolate, acuminate at both ends; heads in loose corymbs, about 2 cm. across, on short-pilose peduncles; involucre depressed-globose; bracts 3-seriate, 3-nerved, glabrous, rounded at apex, the outer short; ligulate corollas about 12.5 mm. long, 2 mm. wide.—Oct. Honshu (Oosawa in Shimotsuke Prov.). This is a hybrid, allegedly of *A. rugulosus* × *A. scaber*.

3. *Aster scaber* Thunb. *Doellingeria scabra* (Thunb.) Nees; *Biotta discolor* Maxim.; *B. corymbosa* var. *discolor*

(Maxim.) Regel—SHIRAYAMA-GIKU. Rhizomes short and thick; stems 1–1.5 m. long, stout, glabrous, branched in upper part, the branches puberulent; radical leaves usually withering before anthesis, cordate, long-petiolate, the lower cauline leaves chartaceous, cordate, long-petiolate, 9–24 cm. long, 6–18 cm. wide; short-acuminate, cordate, singly or doubly toothed, deep green above, rather prominently scabrous on both sides, the median ones narrowly winged-petiolate, gradually becoming smaller, ovate-deltoid, acute, cordate to truncate at base; heads in loose corymbs, 18–24 mm. across, pedunculate; involucre bracts 3-seriate, oblong, 1.5–5 mm. long, rounded at apex, scariosus on margin; ligulate corollas 11–15 mm. long, white, about 3 mm. wide.—Aug.–Oct. Woods and thickets in hills and low mountains; Hokkaido, Honshu, Kyushu; rather common.—Korea, Manchuria, and China.

4. *Aster rugulosus* Maxim. SAWA-SHIROGIKU. Rhizomes long-creeping; stems erect, 50–60 cm. long, simple, glabrous, slenderly branched in upper part; radical leaves withering before anthesis, the lower cauline leaves rather thick, long-petiolate, linear-lanceolate, 7–17 cm. long, about 15 mm. wide, gradually narrowed to the tip, mucronate, gradually narrowed at base, loosely toothed or subentire, rugulose above and scabrous near the slightly recurved margin, glabrous beneath, the median leaves lanceolate, 7–10 cm. long, about 1 cm. wide, sessile or short-petiolate, the upper leaves few and small; heads few, terminal, about 27 mm. across; involucre bracts 3-seriate, the outer short, broadly ovate, rounded at apex, the inner oblong, about 4.5 mm. long, rounded at apex, reddish; ligulate corollas white, 1–1.3 cm. long, 2–2.5 mm. wide, turning reddish following anthesis; achenes setulose.—Aug.–Oct. Wet places; Honshu, Shikoku, Kyushu.

5. *Aster sohayakiensis* Koidz. *A. ohtanus* Makino—HOSOGA-NOGIKU, KISHŪ-GIKU. Rhizomes creeping; stems 30–60 cm. long, glabrous, branched in upper part; radical and lower cauline leaves withering before anthesis or sometimes present at anthesis, lanceolate, 9–13.5 cm. long, about 1.5 cm. wide, acuminate, gradually narrowed at base, long-petiolate, pubescent toward the margin and sometimes also on the nerves beneath, otherwise glabrous, scattered mucronate-toothed, lustrous and with impressed veins above, with raised veins beneath, the upper leaves small, linear, sessile; heads on slender peduncles, about 18 mm. across; involucre campanulate, the outer bracts 1–2 mm. long, oblong, the inner 4–4.5 mm. long, rounded to subacute; ligulate corollas 8.5–11 mm. long, 2–2.5 mm. wide.—July–Nov. Along streams, especially on rocks in mountains; Honshu (s. Kinki Distr.).

6. *Aster glehnii* F. Schmidt. *A. horsakoviensis* Lévl. & Van't.—EZO-GOMA-NA. Rhizomes creeping, thick; stems 1–1.5 m. long, powdery-puberulent, branched in upper part; lower leaves withering before anthesis, the median ones chartaceous, many, densely arranged, oblong, remotely short-toothed, usually glandular-dotted beneath, densely puberulent on both sides, short-petiolate, the uppermost ones much-reduced, linear; heads in dense corymbs, many, about 15 mm. across; involucre tubular, 4–5 mm. long; bracts 2 or 3 seriate, green, equal, linear, the outer acute, densely puberulent, the inner acuminate; ligulate corollas white, about 1 cm. long, 1.5–2 mm. wide; achenes hairy, glandular-dotted.—Aug.–Oct. Grassy places; Hokkaido.—Sakhalin and s. Kuriles.

Var. *hondoensis* Kitam. *A. glehnii* sensu auct. Japon., non F. Schmidt.—GOMA-NA. Leaves loosely puberulent; involucre smaller, 3–3.5 mm. long.—Grassy slopes and woods in mountains; Honshu.

7. *Aster dimorphophyllus* Fr. & Sav. *A. dimorphophyllus* var. *indivisus* Makino; *A. dimorphophyllus* var. *divisus* Makino.—TATEYAMA-GIKU. Rhizomes slender, creeping; stems 30–55 cm. long, slender, glabrous, slightly branched in upper part; radical leaves withering before anthesis, the lower ones thin, long-petiolate, deltoid-ovate, 3–5.5 cm. long, 2.5–5 cm. wide, acute, cordate, undulate, incised or palmately lobed, sometimes 3-sected and again 2- or 3-lobed, sometimes puberulent on both sides; cauline leaves loosely arranged, the median ones slightly larger than the lower, deltoid-ovate, acuminate, truncate to shallowly cordate at base, petiolate, the upper leaves smaller, becoming linear in the uppermost ones; heads loosely corymbose, few, on long peduncles, 2.3–3 cm. across; involucre tubular, the bracts unequal, acute; ligulate corollas few, 9–15 mm. long, 2–3 mm. wide; achenes hirsute.—July–Oct. Woods in mountains; Honshu (Izu, Sagami, and Suruga Prov.).

8. *Aster fastigiatus* Fisch. *Turczaninowia fastigiata* (Fisch.) DC.; *A. micranthus* Lévl. & Van't.; *A. micranthus* var. *achilleiformis* Lévl.; *Calimeris japonica* Schultz-Bip.—HIME-SHION. Rhizomes short, indistinct; stems 30–100 cm. long, erect, densely puberulent and branched in the upper part; lower leaves rather thick-chartaceous, linear-lanceolate or lanceolate, 5–12 cm. long, 4–15 mm. wide, gradually narrowed at both ends, subpetiolate at base, scattered mucronate-toothed, often slightly recurved on margin, short setose-pilose near upper margin, whitish and glandular-dotted, with minute appressed hairs beneath; cauline leaves rather numerous, gradually smaller in those above, linear to linear-lanceolate, the uppermost ones 2–3 mm. long, acute, sessile; heads many, in dense corymbs, slender-pedunculate, small, 7–9 mm. across, some of the tubular florets sterile; involucre tubular, about 4 mm. long, the bracts 4-seriate, oblanceolate, obtuse, densely puberulent; ligulate corollas white, 5–6.5 mm. long, about 1 mm. wide; achenes about 1.2 mm. long, puberulent, glandular-dotted.—Aug.–Oct. Waste grounds especially along rivers in lowlands; Honshu, Shikoku, Kyushu.—Korea, Manchuria, Dahuria, and China.

9. *Aster maackii* Regel. *A. koidzumanus* Makino; *A. horridifolius* Lévl. & Van't.—HIGO-SHION. Rhizomes creeping; stems erect, 45–85 cm. long, many-leaved, branched in upper part, minutely rough-puberulent; radical and lower cauline leaves rather thick-chartaceous, withering before anthesis, the median ones lanceolate, 6–10 cm. long, 1–2 cm. wide, acute to acuminate, gradually narrowed and sessile at base, sometimes subtrinnerved, scattered mucronate-toothed, with short rough hairs on both surfaces, the upper leaves gradually smaller, narrowly oblong, 1.5–2 cm. long, obtuse, entire; heads about 4 cm. across, showy, in loose corymbs, few, the peduncles long, very densely short-setulose, with 2 or 3 bracts, 5–10 mm. long at base; involucre 8–9 mm. long, subglobose, rounded at apex, the bracts in 3 series, scariosus, purplish at tip, the outer narrowly oblong, rounded at apex; ligulate corollas 19–20 mm. long, 2–2.5 mm. wide; achenes about 2 mm. long, densely coarse-hirsute.—Aug.–Oct. Wet places in mountains; Kyushu.—Korea and Manchuria.

10. *Aster tataricus* L. f. *A. trinervius* var. *longifolia* Fr. & Sav.; *A. nakaii* Lévl. & Van't.; *A. tataricus* var. *minor* Makino; *A. tataricus* var. *nakaii* (Lévl. & Van't.) Kitam.—SHION. Rhizomes short; stems 1–2 m. long, erect, slightly branched in upper part, loosely setulose; radical leaves withering before anthesis, spatulate-oblong, obtuse, gradually narrowed to a long winged petiole, loosely setulose on both sides,

the median leaves long-petiolate, 20–35 cm. long, 6–10 cm. wide, ovate or oblong, short-acuminate, rounded or gradually narrowed to a long petiole, acutely toothed, the upper leaves gradually smaller, narrowly oblong to lanceolate, acuminate at both ends, subsessile; uppermost leaves linear, 3–5 mm. long; heads 25–33 mm. across, long-pedunculate, many, in large corymbs, the peduncles densely setulose; involucre subglobose, about 7 mm. long, the bracts 3-seriate, lanceolate, acuminate, short-pilose, scarious on margin; ligulate corollas blue-purple, 16–17 mm. long, 3–3.5 mm. wide; achenes pilose, about 3 mm. long.—Aug.–Oct. Wet places; Honshu (Chūgoku Distr.) Kyushu.—Korea, Manchuria, n. China, Mongolia, and Siberia.

11. *Aster tenuipes* Makino. KURUMAGIKU. Stems about 30 cm. long, short-pubescent, much branched; radical leaves rosulate, withering before anthesis, oblanceolate, about

7 cm. long, 2.5 mm. wide, acute, narrowed at base, coarsely toothed toward tip, puberulent above, the cauline leaves many, linear-lanceolate, about 5 cm. long, 6 mm. wide, acuminate, narrowed at base, sessile, obsolete 3-nerved, glabrous on both sides, loosely toothed; heads solitary or to 3 on each branch, about 2 cm. across, the branches slender, densely leaved, the leaves linear, 6–15 mm. long, entire, resembling involucre bracts; involucre about 7 mm. long; bracts 4-seriate, the outer ovate, the inner narrowly oblong, obtuse, 1-nerved; ligulate corollas about 9 mm. long, 1.5 mm. wide; achenes densely hairy.—Aug. Honshu (s. Kinki Distr.); sometimes cultivated in gardens.

12. *Aster ageratoides* Turcz. *A. trinervius* Roxb., non Gillib.—NOYAMA-KINGIKU. Very polymorphic species occurring from e. Asia to India.

Key to the varieties of *A. ageratoides*

- 1A. Involucres about 1 cm. across; bracts viscid at tip; leaves oblong-ovate, rounded at base, sessile.
 - 2A. Stems 35–65 cm. long; heads in loose corymbs. var. *viscidulus*
 - 2B. Stems 20–30 cm. long; heads solitary. var. *alpinus*
- 1B. Involucres smaller; bracts not viscid.
 - 3A. Leaves abruptly narrowed at base. var. *sugimotoi*
 - 3B. Leaves cuneate at base.
 - 4A. Marginal florets with large tubular corollas. var. *tubulosus*
 - 4B. Marginal florets with ligulate corollas.
 - 5A. Stems and leaves densely pubescent; cauline leaves semiclasping. var. *semialexicaulis*
 - 5B. Stems and leaves scattered-pubescent.
 - 6A. Leaves broadly auriculate-clasping at base, lanceolate, long-acuminate. var. *yoshinaganus*
 - 6B. Leaves not auriculate-clasping at base.
 - 7A. Heads about 3 cm. across, white; involucre campanulate-globose, 7–8 mm. long. var. *robustus*
 - 7B. Heads about 2.5 cm. across; involucre 4–5 mm. long.
 - 8A. Leaves abruptly narrowed on lower half; involucre tubular, about 4 mm. long; ligulate corollas white, rarely blue-purple. var. *harae*
 - 8B. Leaves gradually narrowed at base; involucre subglobose; ligulate corollas usually blue-purple.
 - 9A. Leaves oblong to ovate. var. *ovatus*
 - 9B. Leaves linear to lanceolate.
 - 10A. Leaves linear-lanceolate to lanceolate, about 10 cm. long, 15 mm. wide. var. *angustifolius*
 - 10B. Leaves linear, 3–6 cm. long, 2–5 mm. wide.
 - 11A. Stems 20–90 cm. long, short-pilose. var. *ripensis*
 - 11B. Stems 30–40 cm. long, setulose. var. *microcephalus*

Var. *viscidulus* (Makino) Kitam. *A. trinervius* var. *viscidulus* Makino; *A. viscidulus* (Makino) Makino—HAKONEGIKU, MIYAMA-KONGIKU. Rhizomes indistinct; stems tufted, 35–65 cm. long, densely pubescent; median leaves many, oblong, lanceolate, or ovate-oblong, 4–7 cm. long, 15–17 mm. wide, acute to acuminate, dilated and rounded at base, subtrinnerved, very sparsely mucronate-toothed, densely short-pilose on both sides, sometimes glandular-dotted beneath, short-petiolate or sessile; heads 23–25 mm. across, in loose corymbs, long-pedunculate; involucre tubular-globose, about 5 mm. long; bracts 4-seriate, the outer very short, the median oblong, rounded at apex, scarious on margin, viscid above; ligulate corollas blue-purple, 12–13 mm. long, about 2.5 mm. wide.—July–Oct. Woods in mountains; Honshu (Kantō and e. Tokaidō Distr.).

Var. *alpinus* Koidz. *A. viscidulus* var. *alpinus* (Koidz.) Kitam.—TAKANE-KONGIKU. Stems 20–30 cm. long; heads solitary.—Alpine; Honshu (Akaishi Mts.).

Var. *sugimotoi* (Kitam.) Kitam. *A. sugimotoi* Kitam.; *A. trinervius* var. *sugimotoi* (Kitam.) Kitam.; *A. ageratoides* subsp. *sugimotoi* (Kitam.) Kitam.—AKIHAGIKU, KYOSUMI-KIKU. Stoloniferous; stems about 50 cm. long, setulose;

median leaves approximate, ovate, 5.5–8 cm. long, 3–4 cm. wide, acuminate, setulose on both sides, with raised netted veinlets, petiolate; heads about 16 mm. across; involucre tubular, about 4 mm. long, the outer bracts small, the inner obtuse; ligulate corollas about 6 mm. long, 2 mm. wide.—Oct.–Nov. Woods in mountains; Honshu (s. Kantō and Tōkaidō Distr.).

Var. *tubulosus* (Makino) Ohwi. *A. trinervius* var. *congestus* forma *tubulosus* Makino; *A. tubulosus* (Makino) Kitam.—CHOKUZAKI-YOME-NA. Stems 40–60 cm. long; cauline leaves rather thick, oblong-lanceolate, 3-nerved, acuminate, lustrous, glabrous to loosely short-pilose; heads 2–2.3 cm. across; involucre about 7 mm. long; ligulate corollas 10–11 mm. long, tubular, bilabiate, purplish.—Cultivated in gardens.—Forma *albiflorus* Kitam. SHIROBANA-CHOKUZAKI-YOME-NA. Flowers white.

Var. *semialexicaulis* (Makino) Ohwi. *Calimeris amplexifolia* Sieb. & Zucc.; *Amphyraxis japonica* Miq.; *Aster trinervius* var. *semialexicaulis* Makino; *A. semialexicaulis* (Makino) Makino; *A. ageratoides* subsp. *amplexifolius* (Sieb. & Zucc.) Kitam.—INAKAGIKU, YAMASHIROGIKU. Densely white-pubescent; cauline leaves oblong-lanceolate, 6–12 cm.

long, 1.5–3 cm. wide, acuminate, abruptly narrowed at base, semiclasping; heads about 2 cm. across; ligulate corollas about 12 mm. long, whitish, sometimes slightly bluish.—Aug.–Oct. Woods in mountains; Honshu (Tōkaidō, Kinki Distr. and westw.), Shikoku, Kyushu.

Var. *yoshinaganus* (Kitam.) Ohwi. *A. ageratoides* subsp. *yoshinaganus* Kitam.; *A. yoshinaganus* Kitam.—SHIKOKU-KONGIKU. Stems slender, often short-pilose; median leaves linear-lanceolate, 12–13 cm. long, loosely short-hairy or glabrous; heads about 15 mm. across, on slender peduncles; involucre about 3 mm. long; ligulate corollas purpurascens.—Aug.–Oct. Shikoku.

Var. *robustus* (Koidz.) Makino & Nemoto. *A. trinervius* var. *robustus* Koidz.; *A. ageratoides* subsp. *megaloccephalus* Kitam.—ŌYAMASHIROGIKU, ŌBANA-SHIRO-YOME-NA. Stems stout, nearly glabrous; median leaves oblong, 12–15 cm. long, 3–6 cm. wide, acuminate, mucronate, gradually narrowed at base, 3-nerved, loosely mucronate-toothed; involucre 7–8 mm. long, the bracts green, broadly linear, obtuse; ligulate corollas about 13 mm. long, white.—Oct.–Nov. Honshu (n. Kantō Distr.).

Var. *harae* (Makino) Kitam. *A. trinervius* var. *harae* Makino; *A. leiophyllus* var. *purpurascens* Honda.—SAGAMI-KONGIKU. Stems about 70 cm. long, purpurascens; leaves linear-lanceolate or lanceolate, long-acuminate, short-petiolate at base, 3-nerved; ligulate corollas purpurascens or white; involucre bracts purplish brown near tip.—Sept.–Oct. Honshu (s. Kantō Distr. and Suruga Prov.).—Forma *leucanthus* Honda. *A. leiophyllus* Fr. & Sav.; *A. leiophyllus* var. *oligocephalus* Nakai.—YAMASHIROGIKU, SHIRO-YOME-NA. Stems about 1 m. long; leaves oblong-lanceolate, abruptly contracted and narrowed to the base, coarsely acute-toothed, green, lustrous, slightly scabrous above; heads many, small; ligulate corollas white; style-branches slender, oblong-lanceolate.—Commonest phase in Honshu, Shikoku, Kyushu.—Formosa.

—Forma *stenophyllus* (Kitam.) Ohwi. *A. ageratoides* var. *stenophyllus* Kitam.—HOSOBANA-SHIRO-YOME-NA. Leaves linear-lanceolate, about 15 cm. long, 1–1.3 cm. wide, long-acuminate, abruptly narrowed to the base.—Honshu (s. Kinki and Tōkaidō Distr.).—Forma *sawadanus* (Kitam.) Ohwi. *A. ageratoides* var. *sawadanus* Kitam.—KINTOKI-SHIRO-YOME-NA. Stems short, densely pubescent; leaves pubescent; heads few; involucre small; ligulate corollas white; achenes densely hirsute.—Honshu (Sagami and Kai Prov.).—Forma *ovalifolius* (Kitam.) Ohwi. *A. ageratoides* var. *ovalifolius* Kitam.—TAMABA-SHIRO-YOME-NA. Cauline leaves ovate, 10–12 cm. long, 4.5–6 cm. wide, acute, rounded-cuneate at base, coarsely incised-toothed, sessile; heads dense; ray-flowers white; style-branches deltoid, acute.—Honshu (centr. and n. distr.).—Forma *tenuifolius* (Kitam.) Ohwi. *A. ageratoides* var. *tenuifolius* Kitam.—NAGABA-SHIRO-YOME-NA. Leaves very thin, linear-lanceolate, 15–20 cm. long, 1.5–3 cm. wide, long-acuminate, sparsely incised-dentate; flowers white.—Honshu and Shikoku.

Var. *ovatus* (Fr. & Sav.) Nakai. *A. trinervius* var. *ovatus* Fr. & Sav.; *A. trinervius* var. *congesta* Fr. & Sav.; *A. ageratoides* var. *adustus* sensu auct. Japon., non Maxim.; *A. ageratoides* subsp. *ovatus* (Fr. & Sav.) Kitam.—NO-KONGIKU. Rhizomes creeping; stems 50–100 cm. long, stout, often much branched, the branches densely setulose; cauline leaves oblong or ovate, 6–12 cm. long, 3–5 cm. wide, acute to obtuse, cuneate to rounded at base, setulose on both sides, the upper leaves

oblong to lanceolate; heads blue-purple or purple, about 2.5 cm. across; involucre herbaceous; bracts 3-seriate, 4.5–5 mm. long, greenish, broadened at tip and purplish, 1-nerved, short-pilose; achenes 1.5–3 mm. long, hirsute, the pappus 4–6 mm. long, whitish to reddish.—Aug.–Oct. Mountains and hills; Honshu, Shikoku, Kyushu; very common.—Forma *humilis* (Nakai) Ohwi. *A. ageratoides* var. *humilis* Nakai.—KOMACHIGIKU. Stems much branched, 15–20 cm. long; leaves thicker, about 4.5 cm. long, obtuse, cuneate-acuminate at base, sessile; heads many in pyramidal corymbs, the peduncles stouter.—Forma *vernalis* (Honda) Ohwi. *A. ageratoides* var. *vernalis* Honda.—HARU-NO-KONGIKU. Stems short; leaves acute at both ends; spring flowering.—Honshu (Suruga Prov. and Izu Isl.).—Forma *littoricola* (Kitam.) Ohwi. *A. ageratoides* var. *littoricola* Kitam.—HAMA-KONGIKU. Leaves broader, obtuse.—Near seashores.—Forma *yezoensis* (Kitam. & Hara) Ohwi. *A. ageratoides* var. *yezoensis* Kitam. & Hara.—EZO-NO-KONGIKU. Median leaves abruptly narrowed on lower half.—Hokkaido.—Cv. *Hortensis*. *A. trinervius* forma *hortensis* Makino.—KONGIKU. Heads larger, deep blue-purple. Cultivated.

Var. *angustifolius* (Kitam.) Ohwi. *A. ageratoides* subsp. *angustifolius* (Kitam.) Kitam.; *A. mayasensis* Kitam.—HOSOBANA-KONGIKU. Stems 50–100 cm. long; median leaves linear-lanceolate, 8–10 cm. long, 1–1.5 cm. wide, narrowed at both ends; heads few, 2–2.5 cm. wide, showy; involucre subglobose, about 5.5 mm. long; bracts 2-seriate, the outer about 3 mm. long, obtuse, green, the inner purplish, the pappus whitish.—Aug.–Nov. Ravines and valleys; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Var. *ripensis* (Makino) Ohwi. *A. microcephalus* var. *ripensis* Makino; *A. ageratoides* subsp. *ripensis* (Makino) Kitam.—TANIGAWA-KONGIKU. Stems 20–90 cm. long, short-pilose, much branched in upper part; median leaves rather firm, linear-lanceolate, 3–6 cm. long, 2.5–(10) mm. wide, 1-nerved, acuminate, gradually narrowed to a sessile base; heads long-pedunculate, blue-purple; ligulate corollas 11–13 mm. long.—Aug.–Nov. Ravines in mountains; Honshu (s. Kinki Distr.), Shikoku, Kyushu.

Var. *microcephalus* (Miq.) Ohwi. *A. ageratoides* subsp. *microcephalus* (Miq.) Kitam.; *A. microcephalus* (Miq.) Fr. & Sav.; *Calimeris microcephala* Miq.; *A. trinervius* var. *microcephalus* (Miq.) Makino.—SEMBONGIKU, MISUGIKU. Rhizomes short-creeping; stems tufted, slender, erect, 30–40 cm. long, branched in upper part, setulose; median leaves many, approximate, linear, 3.5–6 cm. long, 3.5–5 mm. wide, acuminate, narrowed at base, mucronate, toothed, thinly setulose above, 1-nerved, nearly glabrous beneath; involucre subglobose, about 3.5 mm. long; bracts 3-seriate, linear, obtuse, 1-nerved, puberulent, green; ligulate corollas about 9 mm. long, about 1.2 mm. wide, pale blue.—Oct.–Nov. Ravines; Honshu.

13. *Aster kantoensis* Kitam. *A. altaicus* sensu auct. Japon., non Willd.; *A. hispidus* var. *isochaeta* Fr. & Sav., excl. syn.—KAWARA-NOGIKU. Stems about 50 cm. long, with short rigid hairs, densely leaved, much branched in upper part; radical and lower cauline leaves withering before anthesis, the median ones linear, 6–7 cm. long, 3–5 mm. wide, 1(–3)-nerved, obtuse, long-attenuate, petiolate, entire, short-setulose on margin and on underside, the upper leaves smaller, narrowly linear; heads 3.5–4 cm. across, in panicles, long-pedunculate; involucre 7–16 mm. long; bracts 2-seriate, broadly linear,

equal, acuminate, scarious on margin, short-setulose on back; ligulate corollas about 17 mm. long, 3 mm. wide; pappus brownish red.—Oct.—Nov. Waste grounds along rivers; Honshu (sw. Kantō Distr. and Suruga Prov.).

14. *Aster spatulifolius* Maxim. *A. fauriei* Lévl. & Van't.; *A. jeddei* Lévl. & Van't.; *A. oharae* Nakai; *Heteropappus oharae* (Nakai) Kitam.; *Erigeron oharae* (Nakai) Batsch; *E. jeddei* (Lévl. & Van't.) Batsch.—DARUMA-GIKU. Stems slightly woody, about 25 cm. long, branched from base, densely hirsute; lower cauline leaves thick, rosulate while young, withering before anthesis, obovate or orbicular, 3–9 cm. long, 1.5–5.5 cm. wide, rounded at apex, cuneate at base, entire or obtusely toothed, densely puberulent on both sides, winged-petiolate or sessile, the upper leaves very short on the peduncles, spatulate, 12–16 mm. long, becoming bractlike below the heads; heads 35–40 mm. across, solitary and terminal on long peduncles; involucre subglobose, 8–9 mm. long; bracts 3-seriate, linear, equal, acuminate, pilose; ligulate corollas blue-purple, 13–16 mm. long, 2.5–3 mm. wide; achenes oblong, the pappus whitish.—July–Nov. Rocks near seashores; Honshu (Chūgoku Distr.), Kyushu.—Korea.

15. *Aster pseudoasagrayi* Makino. ISO-KANGIKU, KANYOME-NA. Perennial; stems radiately much branched, slender, many-leaved, incurved-setulose, ascending above; lower leaves withering before anthesis, the median leaves rather thick, spreading, ovate-spatulate, 3–10 cm. long, 5–9 mm. wide, rounded at apex, entire, incurved short-setulose on both

sides, deep green, more or less lustrous above, petiolate, the uppermost leaves subtending the heads, very small, bractlike; heads many, showy, terminal, 3.5–4 cm. across; involucre subglobose, about 6 mm. long; bracts 3-seriate, the outer gradually smaller, rounded at apex, the median oblong, obtuse, loosely pilose; ligulate corollas purplish, about 14 mm. long, 2.5–3 mm. wide; achenes obovate, the pappus reddish purple.—Nov.—Dec. Rarely cultivated. Presumably indigenous, although it has not been found in the wild.

16. *Aster tripolium* L. *A. macrocephalus* Lévl. & Van't.; *A. tripolium* var. *integrifolium* Miyabe & Kudo.—URAGIKU, HAMA-SHION. Annual, or sometimes a short-lived perennial, without distinct rhizomes; stems 25–55 cm. long, glabrous, erect, branched in upper part, reddish at base; lower and median leaves slightly fleshy, linear-lanceolate, 6.5–10 cm. long, 6–12 mm. wide, acuminate, semiclasping, entire or with short mucronate-teeth, glabrous, the upper leaves linear, bractlike; heads loosely or densely corymbose, 16–22 mm. across; involucre tubular, about 7 mm. long and as wide; bracts 3-seriate, membranous, loose, the outer lanceolate, 2.5–3 mm. long, obtuse, loosely ciliate, the inner narrowly oblong, about 2 mm. wide, rounded at apex, purplish; ligulate corollas 12–16 mm. long, about 2 mm. wide, purplish; pappus about 5 mm. long at anthesis, 14–16 mm. long in fruit.—Aug.—Nov. Wet places near seashores; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin, Korea, n. China, Manchuria, and e. Siberia.

23. MYRIACTIS Less.

HIME-KIKU-TABIRA-KO ZOKU

Simple or branched perennials; leaves alternate, toothed or lyrate pinnate; heads small, solitary, long-pedunculate; receptacle convex, alveolate; involucre subglobose, the bracts membranous, 2-seriate, equal; ligulate florets fertile, 3- to 5-seriate, the corollas white or reddish; tubular florets campanulate, bisexual, many, fertile, yellow, the anthers obtuse and entire at base; style-branches flat, acute, mammillate; achenes oblong, flat, nerved on margin or 1-ribbed on the face, narrowed at both ends, crowned by a ring, bearing glands at apex; pappus absent. —Few species in mountains of s. Asia and Japan.

1. *Myriactis japonensis* Koidz. *Solenogyne japonensis* (Koidz.) Masam.—HIME-KIKU-TABIRA-KO. Rhizomes slender; stems scapose, 3–12 cm. long, densely white-woolly at base, puberulent above, simple or with 1 or 2 branches at base; radical leaves rosulate, oblanceolate-oblong, 2.5–4 cm. long, 7–14 mm. wide, pinnately cleft, the lateral lobes 1 to 4 pairs, spreading, unequal, obtuse, toothed, rather densely pubescent

on both surfaces, the terminal lobe orbicular, the cauline leaves 2 or 3, small, narrow, entire or toothed; heads on long peduncles, solitary; involucre about 2.5 mm. long, 5 mm. across, the bracts 2-seriate, equal, oblong, obtuse, puberulent; ligulate corollas about 1 mm. long, 0.5 mm. wide; achenes about 2 mm. long.—July–Sept. High mountains; Kyushu (Yakushima).

24. RHYNCHOSPERMUM Reinw.

SHŪBUN-SŌ ZOKU

Erect branched perennial often with spreading branches; leaves lanceolate, loosely toothed; heads very small, in racemes or spikes; involucre campanulate, the bracts unequal, obtuse, with thinly membranous margins; ligulate florets fertile, in 2 series, the corolla rather thick, whitish; disc florets bisexual, fertile, the corolla tubular, 5-cleft; anthers obtuse at base; style-branches flat, deltoid at apex; achenes flat, narrowed to both ends, nerved on margin, nerveless on the face, beaked in those of the ligulate florets, beakless in the disc florets; pappus absent or of few slender bristles.—One species, in e. Asia, Malaysia, and India.

1. *Rhynchospermum verticillatum* Reinw. ex Bl. *R. formosanum* Yamamoto; *Leptocoma racemosa* Less.; *R. verticillatum* var. *subsessilis* Oliv. ex Miq.—SHŪBUN-SŌ. Rhizomes short; stems 50–100 cm. long, mealy-puberulent, usually divaricately branching in upper part; leaves membranous, the lower oblanceolate or oblong-oblanceolate, 7–15 cm. long, 17–32 mm. wide, acute, narrowed to the petiole at base, shallowly undulate-toothed on upper half, with short setulose hairs on both sides, the middle leaves many, densely arranged,

lanceolate, acuminate at both ends, gradually smaller in the upper; heads terminal or axillary; involucre broadly campanulate, about 2.5 mm. long; bracts in 3 series, oblong; ligulate florets in 2 series, the corollas whitish, 1.2 mm. long, 0.5 mm. wide; achenes of ligulate florets beaked, flat, about 4 mm. long, those of the disc florets beakless.—Aug.—Nov. Woods in hills and low mountains; Honshu (Kantō Distr.), Shikoku, Kyushu.—s. Korea, Ryukyus, Formosa, Malaysia, and India.

25. **LAGENOPHORA** Cass. KOKE-SEMBONGIKU ZOKU

Small delicate perennials; stems scapiform; leaves obovate to oblanceolate, pinnately cleft to toothed; heads terminal, small; involucre subglobose, the bracts 2- to 4-seriate, unequal, scarious on margin; receptacles flat; ligulate florets pistillate, fertile, 2- or 3-seriate, the corolla strap-shaped or tubular, white; tubular florets few, bisexual, sterile, the anthers obtuse, entire at base; style-branches flat, acuminate, with mammillate; achenes much flattened, nervelike on margin, not ribbed on the face, glabrous, short-beaked; pappus wanting.—About 10 species, in Australia, Asia, S. America, and Pacific Islands.

1. *Lagenophora stipitata* (Labill.) Druce var. *microcephala* (Benth.) Domin. *L. billardieri* var. *microcephala* Benth.; *L. crepidioides* Koidz.; *L. billardieri* sensu auct. Japon., non Cass.—KOKE-SEMBONGIKU. Rhizomes slender; scapes 3.5–12 cm. long, simple, slender, puberulent especially toward the top; radical leaves rosulate, obovate or broadly spatulate, 12–30 mm. long, 7–13 mm. wide, rounded at apex, cuneately narrowed to the petiole, shallowly undulate, mucronate-

toothed, densely pubescent, the cauline leaves few, 1–1.5 mm. long, linear; heads scapose, solitary; involucre about 2.5 mm. long, glabrous; bracts 3- or 4-seriate, the outer lanceolate, about 1 mm. long, obtuse, the inner linear, obtuse, purplish; ligulate florets 3-seriate, the corolla about 2.5 mm. long, about 0.5 mm. wide; achenes about 2.5 mm. long, glandular-dotted.—July–Oct. Honshu (Aki Prov.), Kyushu.—Ryukyus and Formosa. The typical phase occurs in the Pacific Islands.

26. **CONYZA** L. IZU-HAHA-KO ZOKU

Herbs usually grayish hairy; leaves alternate, toothed, sometimes pinnately cleft; involucre campanulate, the bracts 3- or 4-seriate, scarious, linear-lanceolate, unequal, acuminate; receptacles subglobose, alveolate; ligulate florets pistillate, many-seriate, fertile, the corollas capillary, shorter than the style, lacerate at apex; tubular florets few, bisexual, fertile, the corollas 5-lobed; anthers obtuse, entire at base; style-branches flat, obtuse, mammillate; achenes very small, flat, narrowed toward the ends, with nervelike margins, nerveless on the face, hairy; pappus whitish or reddish, the bristles nearly equal, 1-seriate, slender, scabrous or short-pilose.—About 50 species, widely distributed in the Tropics and subtropics, few in temperate regions.

1. *Conyza japonica* (Thunb.) Less. *Erigeron japonicum* Thunb.—IZU-HAHA-KO, WATA-NA, YAMA-JŌGIKU. Annual or biennial, grayish soft-villous; stems 25–55 cm. long, often branched in upper part; lower leaves oblong, 5–13 cm. long, 1.2–4 cm. wide, rounded at both ends, or cuneately narrowed at base, obtusely toothed, the median leaves clasping, the upper ones smaller, lanceolate; heads densely arranged,

terminal; involucre about 5.5 mm. long, the bracts 3-seriate, narrow; ligulate florets many, capillary, indistinct; achenes flattened, about 1 mm. long, pale brown; pappus 4.5 mm. long, whitish to brownish red.—Apr.–June. Sunny places; Honshu (sw. Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, India, and Malaysia.

27. **DICHOCEPHALA** L'Hérit. BUKURYŌ-SAI ZOKU

Branched puberulent annuals; leaves alternate, pinnately cleft; heads small, in racemes; involucre depressed-cupuliform, the bracts 1-seriate, ovate, acuminate, scarious; receptacles convex, globose, alveolate; ligulate florets 7- or 8-seriate, fertile, the corollas tubular, white; tubular florets bisexual, fertile, 5-lobed; anthers obtuse, entire at base; style-branches flat, deltoid at apex, acute; achenes broadly oblanceolate, flat, nervelike on margin, with 2 nerves on each face, glandular-dotted; pappus wanting; disc of ovary with 2 white bristles in fruit.—About 5 species, in s. Asia and Africa.

1. *Dichrocephala bicolor* (Roth) Schldt. *Cotula bicolor* Roth; *Grangea latifolia* Lam.; *D. latifolia* (Lam.) DC.—BUKURYŌ-SAI, BUKURYŌ-SAI. Roots narrowly fusiform; stems erect, branched, 20–35 cm. long, densely puberulent; lower leaves thin, lyrate, 9–13 cm. long, 4–5 cm. wide, puberulent on both sides, pinnately cleft, the terminal lobes ovate, obtusely toothed, the lateral lobes 1 or 2 pairs, distant, obovate or oblong, spreading, the median and upper leaves gradu-

ally smaller, the uppermost narrowly oblong, 1–2 cm. long, undivided; heads in racemes, about 2.5 mm. across at anthesis, 4 mm. long in fruit, long-pedunculate; involucre bracts about 0.8 mm. long, ovate, acuminate; ligulate corollas 0.5 mm. long, glandular-dotted.—Apr.–Nov. Clay soils; Honshu (Hachijō Isl. in Izu Prov.), Shikoku, Kyushu.—Ryukyus, Formosa, s. China, Malaysia, India, and Africa.

28. **PETASITES** Hill FUKI ZOKU

Diocious white-pubescent or white-woolly perennial herbs; rhizomatous; leaves radical, large, cordate or reniform; scapiform stems with alternate parallel-nerved scalelike leaves; heads sometimes with ligulate flowers, in a raceme or in a thyrse; involucre campanulate, with small scalelike leaves at base, the bracts equal, 1-seriate; receptacle flat; ligulate corollas filiform and truncate or very small; florets of the pistillate heads fertile; tubular florets in the nonfruiting heads with sterile bisexual flowers; pappus snow-white in pistillate florets, the bristles elongate, slender, many, minutely scabrous, not developed in the bisexual florets.—About 20 species, in the N. Hemisphere.

1. *Petasites japonicus* (Sieb. & Zucc.) Maxim. *Nardosmia japonica* Sieb. & Zucc.—FUKI. Scapes 5–45 cm. long; radical leaves after anthesis long-petiolate, reniform-obovate, 15–30 cm. wide, short mucronate-toothed, with

crisp pubescence above and cobwebby tomentum beneath while young; heads in corymbs; involucre 5–6 mm. long, slightly accrescent after anthesis in the fertile ones; achenes about 3.5 mm. long, glabrous; pappus about 12 mm. long.—

Apr.-May. Moist woods and thickets along streams and ravines in hills and mountains; Honshu, Shikoku, Kyushu; frequently cultivated as a vegetable.—Korea, China, and Ryukyus.

Var. *giganteus* (F. Schmidt) Nichols. *P. giganteus* F.

Schmidt ex Trautv., non Fuss; *P. amplus* Kitam.; *P. japonicus* subsp. *giganteus* (F. Schmidt) Kitam.—AKITABUKI. Plant larger; leaves to 1.5 m. across, the petioles to 2 m. long.—Hokkaido, Honshu (n. distr.).—Sakhalin to s. and centr. Kuriles.

29. ERECHTITES Raf. TAKEDAGUSA ZOKU

Coarse erect annuals; leaves alternate, simple, often hairy; heads many-flowered, tubular, in paniculate corymbs; involucre cylindric, with subtending bractlets at base; involucre bracts 1-seriate, linear, acute; receptacle naked; florets all fertile, the marginal pistillate with a slender corolla; achenes oblong, narrowed toward the apex; pappus copious, with very fine, soft white hairlike bristles.—America and Australia.

- 1A. Stems coarsely pubescent; leaves irregularly short-toothed. 1. *E. hieracifolia*
1B. Stems nearly glabrous; leaves irregularly double-toothed. 2. *E. valerianaeifolia*

1. *Erechtites hieracifolia* (L.) Raf. *Senecio hieracifolius* L.—DANDO-BOROGIKU. Annual, 50–100 cm. high; stems soft, striate, coarsely pubescent; leaves lanceolate to oblong, acute, irregularly short-toothed; heads rather many, yellowish to brownish green, about 15 mm. long; involucre bracts linear; florets greenish, with a very slender tubular corolla 1–1.7 cm. long; pappus white, about 14 mm. long.—

Nov.–Dec. Naturalized on deforested mountain slopes.—Introduced from N. America.

2. *Erechtites valerianaeifolia* DC. TAKEDAGUSA. Allied to the preceding but differing in the nearly glabrous stems, irregularly doubly toothed leaves, purplish heads, and pale rose-purple tips of the pappus-bristles.—Naturalized; introduced from S. America.

30. ARNICA L. USAGIGIKU ZOKU

Perennial herbs with simple or branched stems; leaves opposite, toothed, the upper ones sometimes alternate; heads relatively large, usually ligulate, sometimes eligulate; involucre tubular or subglobose, without bracteate leaves or caliculus at base, the bracts herbaceous, 2-seriate, nearly equal, acute; receptacle hairy; ligulate florets yellow; tubular florets bisexual, the corolla 5-toothed; anthers obtuse at base; achenes cylindric, truncate, narrowed at base, hairy, striate; pappus-bristles 1-seriate, rather firm, short-pilose.—More than 100 species, mainly in N. America, few in the cooler regions of the Old World.

- 1A. Heads eligulate. 1. *A. mallotopus*
1B. Heads ligulate.

- 2A. Heads solitary; stems and leaves prominently pubescent; cauline leaves 3- to 5-paired. 2. *A. unalascentis*
2B. Heads to 5 in the inflorescence; stems and leaves nearly glabrous; cauline leaves 10- to 20-paired. 3. *A. sachalinensis*

1. *Arnica mallotopus* (Fr. & Sav.) Makino. *Mallotopus japonicus* Fr. & Sav.—CHŌJIGIKU, KUMAGIKU. Rhizomes creeping; stems tufted, 20–85 cm. long, nearly glabrous, densely crisped-pubescent in upper part, loosely branched; radical leaves scalelike, the lower cauline ones withering before anthesis, the median leaves thick, oblong-lanceolate, 7–12.5 cm. long, 12–28 mm. wide, acuminate, sessile and short-sheathing at base, irregularly mucronate-toothed, more or less scabrous on both sides or nearly glabrous, the upper leaves slightly smaller, lanceolate, 7–23 mm. long, the uppermost alternate, small; heads 5–20, in corymbs, 12–20 mm. across, nodding, on long slender densely white-villous peduncles; involucre tubular, about 1 cm. long, 1–1.5 cm. across, the bracts nearly glabrous, lanceolate, without ligulate florets; achenes 4–5.5 mm. long; pappus brown, 6–7 mm. long.—Aug.–Oct. Wet slopes in high mountains; Honshu, Shikoku.

2. *Arnica unalascentis* Less. EZO-USAGIGIKU. Rhizomes long-creeping; stems 12–35 cm. long, simple, leafy at base, naked on upper half, with a single flower at apex, prominently crisped-pubescent; radical leaves small, spatulate, often withering before anthesis, the lower cauline leaves chartaceous, large, usually opposite, spatulate, 6–12 cm. long, 2–3 cm. wide, obtuse, narrowed at base to a sheathless petiole, loosely toothed, puberulent, the median leaves somewhat smaller, ovate-lanceolate, obtuse, sessile; heads solitary, long-pedunculate, erect, 4–5.5 cm. across; involucre subglobose, 9–15 mm. long, the bracts 20–28, 2-seriate, lanceolate; ligulate corollas 15–24 mm. long, 5–7 mm. wide; tubular corollas glabrous;

achenes 4–4.5 mm. long; pappus brownish, 5.5–7 mm. long.—July–Aug. Alpine slopes; Hokkaido, Honshu (centr. and n. distr.).—Kuriles, Kamchatka, and Aleutians.

Var. *tschonoskyi* (Iljin) Kitam. & Hara. *A. tschonoskyi* Iljin; *A. unalascentis* sensu auct. Japon., non Less.—USAGIGIKU, KINGURUMA. Corollas slightly pilose.—Often growing with the typical phase.

3. *Arnica sachalinensis* (Regel) A. Gray. *A. chamissonis* sensu F. Schmidt non Less.; *A. chamissonis* var. *sachalinensis* Regel.—ŌUSAGIGIKU, KARAFUTO-KINGURUMA. Rhizomes long-creeping; stems 36–56 cm. long, stout, glabrous, short-branched in upper part; leaves opposite, united at base into a short sheath, the radical and lower cauline leaves withering before anthesis, the median leaves thick-chartaceous, lanceolate, 9–13 cm. long, 13–28 mm. wide, acuminate, narrowed at base to a short sheath about 5 mm. long, mucronate-toothed; setose-ciliolate, glabrous on both sides, the upper leaves rather small, ovate-lanceolate; heads of the inflorescence about 5, solitary on the branches, to 6.5 cm. across, nodding in anthesis, erect in fruit, long-pedunculate, densely brownish crisped-hairy; involucre subglobose, 17–20 mm. long, 3–4 cm. across, the bracts about 12, 2-seriate, oblong-lanceolate, glabrous, short-ciliate; ligulate florets 1-seriate, the corolla about 3 cm. long, about 6 mm. wide, densely pilose on the tube; achenes about 7 mm. long; pappus about 1 cm. long, reddish brown.—June–Sept. Reported to occur in Hokkaido (Ishikari Prov.).—Sakhalin and Ochotsk Sea region.

31. *EMILIA* Cass. USU-BENI-NIGANA ZOKU

Glaucous annuals; leaves alternate, approximate toward the base of the stems, often pinnatifid, clasping at base; heads long-pedunculate, nodding before anthesis, without ligulate florets; involucre tubular, bractless at base, the bracts 1-seriate, equal, elongate after anthesis; receptacle glabrous; flowers equal, bisexual, fertile, the corollas capillary, 5-lobed; anthers with a narrow appendage at apex, obtuse at base; style-branches appendaged, short-strigose at apex; achenes 5-angled, truncate at both ends; pappus-bristles white, many, slender, scabrous.—Tropics of Asia and Africa; naturalized in America.

1. *Emilia sonchifolia* (L.) DC. *Cacalia sonchifolia* L.; *Senecio sonchifolius* (L.) Moench—USU-BENI-NIGANA. Nearly glabrous, glaucous annual; stems 20–45 cm. long, branched in upper part; lower leaves approximate, 5–10 cm. long, 25–65 mm. wide, lyrate pinnatifid, loosely short-pubescent, usually purplish beneath, winged-petiolate, clasping at base, the median leaves loose, somewhat smaller, ovate-lanceolate, acute, sagittate at base, entire or irregularly serrulate, sessile; heads 2–5, terminal, 8 mm. long, accrescent, to 14 mm. long, in corymbs; involucre tubular, the bracts broadly linear,

acute; corolla pale rose; achenes about 3 mm. long, setulose on the ribs; pappus about 8 mm. long.—Aug.–Oct. Waste grounds; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and the Tropics of Asia and Africa.

Emilia sagittata (Vahl) DC. *E. flammea* Cass.; *Cacalia sagittata* Vahl; *C. coccinea* Sims—BENI-NIGANA. Flowers red or orange-yellow.—Often cultivated in gardens.—India.

32. *FARFUGIUM* Lindl. TSUWABUKI ZOKU

Evergreen perennial herbs; radical leaves tufted, involute in bud, long-hairy while young, cordate, reniform, or flabellate, long-petiolate, the petioles with a dilated base; cauline leaves bractlike; heads in corymbs, ligulate; involucre tubular, with subtending bracteate leaves, the bracts 1-seriate, equal, free; receptacle toothed around the pits; ligulate flowers 1-seriate; tubular flowers bisexual, many, fertile; achenes terete, slightly narrowed at the ends, densely hairy; pappus-bristles persistent, bristle-like, many, short-pilose.—Few species, in e. Asia.

- 1A. Leaves reniform, rounded at apex, mucronate-toothed or nearly entire. 1. *F. japonicum*
1B. Leaves ovate-cordate, abruptly acute to short-acuminate, doubly acute-toothed. 2. *F. hiberniflorum*

1. *Farfugium japonicum* (L.) Kitam. *Tussilago japonica* L.; *Arnica tussilaginea* Burm.; *Senecio kaempferi* DC.; *Ligularia kaempferi* (DC.) Sieb. & Zucc.; *L. tussilaginea* (Burm.) Makino—TSUWABUKI. Grayish brown-woolly or nearly glabrous perennial with thick rhizomes; radical leaves thick, long-petiolate, reniform, 4–15 cm. long, 6–30 cm. wide, semi-evergreen, lustrous above, mucronate-toothed or nearly entire; scapes 30–75 cm. long, bracteate; heads loosely corymbose, 4–6 cm. across, yellow, pedunculate; involucre 12–15 mm. long; ligulate corollas 3–4 cm. long, about 6 mm. wide; achenes 5–6.5 mm. long; pappus 8–11 mm. long, dark brown.—Oct.–Dec. Near seashores; Honshu (Iwaki and Echizen Prov. and westw.), Shikoku, Kyushu; common and frequently cultivated in gardens.

Var. *giganteum* (Sieb. & Zucc.) Kitam. *Ligularia tussilaginea* var. *gigantea* (Sieb. & Zucc.) Makino; *L. gigantea*

Sieb. & Zucc.; *Senecio sieboldii* Schultz-Bip.—Ō-TSUWABUKI. Larger spontaneous phase.—Kyushu. Sometimes cultivated in gardens.

2. *Farfugium hiberniflorum* (Makino) Kitam. *Ligularia hiberniflora* Makino; *Senecio hiberniflorus* Makino, in syn.—KAN-TSUWABUKI. Rhizomes stout; radical leaves somewhat fleshy, cordate or ovate-cordate, 5.5–20 cm. long, 7.5–20 cm. wide, abruptly acute to acuminate, cordate to subtruncate at base, irregularly double-toothed, gray-woolly beneath, long-petiolate; scapes branched in upper part, 25–42 cm. long, densely grayish white-woolly, loosely scaly-leaved; heads about 3 cm. across, in corymbs, yellow, pedunculate; involucre broadly campanulate, about 1 cm. long, the bracts purplish; ligulate corollas 17–18 mm. long; pappus snow-white, 6.5–7 mm. long.—Sept.–Dec. Thickets and woods in low mountains; Kyushu (Yakushima and Tanegashima).

33. *LIGULARIA* Cass. ME-TAKARA-KŌ ZOKU

Perennial herbs; leaves usually cordate, reniform, or ovate-oblong, petiolate, the cauline leaves few, the uppermost bractlike, alternate, sheathed at base; heads relatively large, in corymbs or racemes, the peduncles often bracteate; involucre tubular or campanulate, the bracts equal, 1-seriate, of two forms, sometimes connate; ligulate florets pistillate, the corollas yellow; tubular florets bisexual, fertile, the corolla tubular; style branches obtuse; achenes terete, striate, beakless, glabrous; pappus elongate or short, scabrous or pilose.—Many species, in Eurasia.

- 1A. Radical leaves erect, glaucous, ovate-oblong or oblong.
2A. Involucral bracts free. 1. *L. lauriei*
2B. Involucral bracts connate. 2. *L. angusta*
1B. Radical leaves spreading or ascending, green, as long as broad or broader than long.
3A. Ligulate florets absent or 1–3; involucre narrowly tubular; bracts 5. 3. *L. stenoccephala*
3B. Ligulate florets 5–10; involucre tubular-campanulate; bracts 7–13.
4A. Involucres 11–12 mm. long, 5–14 mm. across, bracteate, the pedicels bracteate.
5A. Involucres 8–10 mm. across; pappus as long as the corolla. 4. *L. sibirica*
5B. Involucres 5–14 mm. across; pappus much shorter than the corolla. 5. *L. hodgsonii*
4B. Involucres 16–25 mm. long, 16–18 mm. across, bractless, the pedicels bractless.
6A. Leaves palmately parted, strongly revolute while young; pappus 6–7.5 mm. long. 6. *L. japonica*
6B. Leaves merely toothed, revolute in bud; pappus about 12 mm. long. 7. *L. dentata*

FIG. 17.—*Ligularia stenocephala* (Maxim.) Matsum. & Koidz. 1, 2, 3, Plant showing basal leaf and scape; 4, inflorescence; 5, hairs on axis of inflorescence; 6, flower head; 7, 8, bractlets; 9, 10, 11, involucre bracts; 12, arrangement of involucre bracts; 13, 14, ligulate florets; 15, pappus-bristle; 16, stigma branches; 17, tubular floret; 18, anthers; 19, pollen; 20, longitudinal section of ovary; 21, anomalous tubular floret; 22, floral diagram; 23, head in fruiting stage; 24, achene; 25, basal part of pappus. Specimen from Umagaeshi, Nikko, Honshu.

1. *Ligularia fauriei* (Franch.) Koidz. *Senecio fauriei* Franch.; *Senecillis fauriei* (Franch.) Kitam.—ミチノコ-ユ-ヤマ-タバコ. Rhizomes short; stems erect, 60–100 cm. long, glabrous; radical leaves chartaceous, ovate-oblong or oblong, 10–25 cm. long, 7–13.5 cm. wide, rounded, truncate at base or cuneately narrowed to long winged petioles, loosely mucronate-toothed, glaucous on both sides; cauline leaves 3–4, the lower ones larger, erect, about 20 cm. long, 7 cm. wide, sessile or with a winged petiole, the petiole sheathing, the median and upper leaves narrowly oblong, sessile, the uppermost bracteate, lanceolate or broadly so; racemes to 20 cm. or more long, centripetal, the pedicels about 7 mm. long, with a minute bract near the middle; heads many, nodding in anthesis; involucre tubular, about 6 mm. long, about 3 mm. across, glabrous, the bracts free, 5; ligulate florets 2 or 3, the corollas about 16 mm. long, about 3 mm. wide; pappus about 3 mm. long, rusty brown.—June. Honshu (Shimotsuke, Iwaki and northw.).

2. *Ligularia angusta* (Nakai) Kitam. *Cyathocephalum angustum* Nakai; *L. schmidtii* sensu auct. Japon., non Max. —ヤマ-タバコ. Rhizomes short; stems slender, 1–1.3 m. long, glabrous, glaucous, usually simple; radical leaves chartaceous, erect, ovate-oblong, 17–30 cm. long, 13–19 cm. wide, rounded, truncate at base and cuneately narrowed to a partially winged petiole, undulate-toothed, glaucous on both sides; cauline leaves 3, the lower ones oblong, erect, 15–23 cm. long, about 10 cm. wide, clasping and somewhat sheathing at base, the median and uppermost ones smaller; racemes simple or rarely branched, about 30 cm. long, centripetal; heads nodding in anthesis, the pedicels 5–10 mm. long, with a small bract at the middle; involucre 6–8 mm. long, 3–3.5 mm. across, tubular, glaucous, connate on lower half, blackish at tip; ligulate florets 3(–5), the corollas about 17 mm. long, about 3 mm. wide; achenes 4.5–6 mm. long, the pappus about 2 mm. long, rusty brown.—May–June. Mountains; Honshu (Kantō and centr. distr.).

3. *Ligularia stenoccephala* (Maxim.) Matsum. & Koidz. *Senecio stenoccephalus* Maxim.; *S. calathaeifolius* var. *stenoccephalus* (Maxim.) Franch.; *S. stenoccephalus* var. *comosus* Fr. & Sav.—ME-TAKARA-KŌ. Fig. 17. Rhizomes stout; stems slender, to 1 m. long, glabrous; radical leaves thinly chartaceous, cordate- or reniform-hastate, to 24 cm. long, 20 cm. wide, abruptly acuminate, deeply cordate, acute-toothed, short-pilose on nerves beneath, long-petiolate; cauline leaves 3, the lower ones larger, the petiole sheathing at base; racemes densely many-headed, densely pubescent, the bracteate leaves broadly lanceolate, small; heads centripetal, many, the pedicels 1–3.5 cm. long; involucre narrowly tubular, 10–12 mm. long, 2.5–3 mm. across, the bracts 5; ligulate florets absent or 1–3, the corollas 2–2.5 cm. long, 3–4 mm. wide.—June–Sept. Wet places in mountains; Honshu, Shikoku, Kyushu.—China and Formosa.

4. *Ligularia sibirica* Cass. var. *speciosa* DC. *Cineraria fischeri* Ledeb.; *C. speciosa* Schrad. & Link; *Hoppea speciosa* Reichenb.; *L. speciosa* (Schrad.) Fisch. & Mey.; *L. fischeri* (Ledeb.) Turcz.; *L. sibirica* sensu auct. Japon., non Cass.; *L. euodon* Miq.; *L. fischeri* var. *euodon* (Miq.) Kitam.—Ō-TAKARA-KŌ. Rhizomes short; stems 1–2 m. long, loosely cobwebby-hairy at base, short-pubescent in upper part; radical leaves chartaceous, large, reniform-cordate, to 32 cm. long, 40 cm. wide, regularly toothed, long-petiolate; cauline leaves 3, the lower ones adjacent to the radical, short-petiolate,

sheathing at base, the upper ones short-petiolate, small; inflorescence to 75 cm. long, racemose, rarely branched; heads many, centripetal, 4–5 cm. across, the pedicels 1–9 cm. long, with 1 bract; involucre tubular-campanulate, 10–12 mm. long, 8–10 mm. across, the bracts 8–9, oblong; ligulate florets 5–9, the corollas about 25 mm. long, 3–4 mm. wide; pappus 6–10 mm. long, brownish or purplish.—July–Oct. Wet places in mountains; Honshu, Shikoku, Kyushu.—Korea, Sakhalin, Manchuria, e. Siberia, and China.

Var. *kaialpina* (Kitam.) Kitam. *L. sibirica* subsp. *kaialpina* Kitam., in syn.—KAI-TAKARA-KŌ. Stems 30–50 cm., rarely to 70 cm. long; leaves smaller; heads 4–11, in a corymb, the pedicels slender, 1–7 cm. long; involucre tubular, about 11 mm. long, about 5 mm. wide, the bracts 7–8; ligulate florets usually 5, the corollas 25–28 mm. long; pappus 6.5 mm. long, brownish, much shorter than the florets.—Wet places in high mountains; Honshu (centr. distr.).

5. *Ligularia hodgsonii* Hook. f. *L. yezoensis* Franch.; *L. calthaeifolia* sensu Matsum., non Maxim.—TŌGEBUKI, Ezo-TAKARA-KŌ, ONI-O-TAKARA-KŌ. Rhizomes stout; stems 30–80 cm. long, cobwebby-hairy only on the inflorescence; radical leaves chartaceous, long-petiolate, reniform, 4.5–13 cm. long, 7.5–27 cm. wide, rounded to short-mucronate at apex, regularly mucronate-toothed, glabrous, long-petiolate; cauline leaves usually 2, the lower one long-petioled and long-sheathing at the dilated base, the upper one smaller, the uppermost bracts oblong; inflorescence a corymb; heads 5–9, 4–5 cm. across, the pedicels 1–8 cm. long, cobwebby-hairy and crisped-puberulent; involucre campanulate, 11–12 mm. long, 8–10 mm. across, with 2 small bracteate leaves at base, the bracts 8 or 9, oblong, acute; ligulate florets 7–12, the corollas about 27 mm. long, 5–8 mm. wide; achenes 6–7 mm. long, the pappus about 1 cm. long, reddish, as long as the corolla.—July–Aug. Mountains; Hokkaido, Honshu (n. distr.).—s. Kuriles and Sakhalin.

6. *Ligularia japonica* (Thunb.) Less. *Arnica japonica* Thunb.; *Senecio japonicus* (Thunb.) Schultz-Bip.; *Erythrochaete palmatifida* Sieb. & Zucc.—HANKAI-SŌ. Rhizomes stout; stems about 1 m. long, glaucous, glabrous, purple-spotted; radical leaves chartaceous, long-petiolate, cordate-orbicular, to 30 cm. long and as wide, strongly revolute while young, the segments palmately cleft to parted, the lobes pinnately lobed or incised, densely pubescent beneath while young; cauline leaves 3, with broadly sheathing petioles, the upper leaves smaller; inflorescence a corymb, the pedicels 2.5–20 cm. long, rather stout, crisped-pubescent; heads 2–8, about 10 cm. across; involucre campanulate-tubular, 18–24 mm. long and as wide, the bracts 9–12, elliptic, acuminate; ligulate florets about 10, the corollas 5–6.5 cm. long, 8–10 mm. wide; achenes about 9 mm. long, the pappus 6–7.5 mm. long, rusty brown.—June–Aug. Mountains; Honshu (w. distr.), Shikoku, Kyushu.—Korea, China, and Formosa.

7. *Ligularia dentata* (A. Gray) Hara. *Erythrochaete dentata* A. Gray; *L. clivorum* Maxim.; *Senecio clivorum* (Maxim.) Maxim.; *L. japonica* var. *clivorum* (Maxim.) Makino.—MARUBA-DAKE-BUKI, MARUBA-NO-CHIRYŌ-SŌ. Rhizomes short; stems 40–100 cm. long, glabrous; radical leaves large, thinly chartaceous, long-petiolate, reniform-orbicular, about 30 cm. long, 38 cm. wide, deeply cordate, revolute in bud, rather regularly mucronate-toothed, loosely short-pubescent on nerves above; cauline leaves 2, the petioles dilated and clasping at base; heads few to many, in corymbs, 7–10 cm. across, the pedicels 2–9 cm. long, densely crisped-pubescent;

involucres tubular-campanulate, 16–20 mm. long, 16–28 mm. wide, densely crisped-pubescent, the bracts 9–13, free or slightly connate, oblong, short-cuspidate; ligulate florets about 10, the corollas 4–5 cm. long, 7–8 mm. wide; achenes about 9 mm. long, the pappus about 12 mm. long, reddish.—July–Aug. Meadows in mountains; Honshu.—China.

Ligularia × *yoshizoeana* (Makino) Kitam. *Senecillis*

yoshizoeana (Makino) Kitam.; *L. japonica* var. *yoshizoeana* Makino.—DAKEBUKI, CHŌRYŌ-SŌ. Hybrid of *L. japonica* × *L. dentata*; lower cauline leaves reniform, about 30 cm. long, 13 cm. wide, palmately cleft, the lobes oblong, toothed at apex; heads about 7 cm. across; involucres campanulate-globose, 17 mm. long and as much across; pappus about 1 cm. long.—Rarely cultivated in gardens.

34. *MIRICACALIA* Kitam. Ō-MOMIJIGASA ZOKU

Large perennial herbs; leaves few, alternate, lower ones large, long-petiolate, palmately cleft, short-sheathed at base; heads in racemes, nodding, homogamous; involucre bracts many, 1-seriate; receptacles glabrous; style-branches penicillate at apex; anthers long-exserted, obtuse at base; achenes cylindric, slightly flattened, striate, beaked, narrowed and stiped at base, glabrous; pappus scabrous, brown, with persistent bristles as long as the achene.—One species, in Japan.

1. *Miricacalia makineana* (Yatabe) Kitam. *Senecio makineanus* Yatabe; *Cacalia makineana* (Yatabe) Makino; *C. iinumae* Makino; *S. iinumae* Makino; *S. makinoi* C. Winkler.—Ō-MOMIJIGASA, MOMIJIGASA, TOSA-NO-MOMIJIGASA. Stems 55–80 cm. long, densely pubescent with multicellular short curled hairs; cauline leaves 3, scattered, with crisp short hairs on both sides, the lower long-petiolate, large, peltate, orbicular, 25–33 cm. wide, deeply cordate, palmately cleft, the lobes 9–12, oblong, acuminate, usually shallowly 3-lobed, mucronate-

toothed, the median leaf smaller, short-petiolate; bracteal leaves ovate-oblong, 1–1.5 cm. long; heads many, the peduncles 1–4 cm. long; involucres tubular, thinly membranous, about 15 mm. long, 12–14 mm. across, densely crisped-puberulent; bracts of caliculus 6–7, ovate-oblong, 6–8 mm. long, reflexed in anthesis; bracts lanceolate; florets about 21; corollas yellow, about 11 mm. long; achenes 7–8 mm. long, the beak about 2 mm. long; pappus about 10 mm. long.—July–Sept. Woods in mountains; Honshu, Shikoku, Kyushu.

35. *CACALIA* L. KŌMORI-SŌ ZOKU

Perennial herbs; leaves alternate, revolute in bud, the long petioles sometimes short-sheathed at base; inflorescence a corymb, raceme, or panicle; heads without ligulate florets; involucres usually narrowly tubular, sometimes with small bractlets at base, rarely caliculate, the bracts 1-seriate, free; receptacle usually flat, glabrous; tubular florets 1–20, usually few, whitish or pale yellow, bisexual, all fertile; style-branches elongate, nearly clavate and short-pilose or penicillate, reflexed in anthesis; anthers obtuse or sagittate, auricles connate, elongate or short, the filaments often globosely thickened above; achenes terete, truncate, slightly narrowed at tip, beakless, gradually narrowed at base, glabrous, many-ribbed; pappus-bristles many, snow-white, rarely reddish, minutely scabrous.—About 50 species, in Asia and America.

1A. Culine leaves many; petioles not entirely clasping the stem.

2A. Involucres not caliculate; pappus snow-white.

3A. Involucral bracts 3; corolla deeply 5-fid; leaves reniform, toothed, not clasping at base. 1. *C. adenostyloides*

3B. Involucral bracts 5–8; corolla shallowly 5-fid.

4A. Leaves palmately cleft.

5A. Leaves with raised veinlets; involucres 5–6 mm. long; pappus about 5 mm. long. 2. *C. tebakaensis*

5B. Leaves with scarcely raised veinlets; involucres 9–10 mm. long; pappus 6.5–8 mm. long. 3. *C. delphinifolia*

4B. Leaves not palmately cleft.

6A. Leaves bearing bulbils in the axils.

7A. Leaves reniform, the petioles clasping at base. 5. *C. auriculata*

7B. Leaves cordate, the petioles auriculate, not clasping at base. 4. *C. farfaraefolia*

6B. Leaves without bulbils in the axils.

8A. Involucral bracts 5.

9A. Petioles clasping at base; inflorescence paniculate. 5. *C. auriculata*

9B. Petioles not clasping at base; inflorescence corymbose.

10A. Leaves 5–18 cm. long, 9–27 cm. wide, mucronate-toothed. 6. *C. nikomontana*

10B. Leaves 3.5–4.5 cm. long, 5–6.5 cm. wide, coarsely incised. 7. *C. shikokiana*

8B. Involucral bracts more than 5.

11A. Leaves reniform, 3–9 cm. long, 5–12 cm. wide, long-caudate; stems 22–42 cm. long; heads 1–7. 8. *C. nipponica*

11B. Leaves hastate to deltoid-reniform, 25–35 cm. long, 30–40 cm. wide, short-acuminate; stems 1–2 m. long; heads numerous. 9. *C. hastata*

2B. Involucres caliculate; pappus reddish. 10. *C. kiusiana*

1B. Culine leaves few; petioles entirely clasping the stem, forming a sheath at base.

12A. Leaves reniform, toothed. 11. *C. amagiensis*

12B. Leaves orbicular, palmately cleft.

13A. Leaves peltate. 12. *C. petiifolia*

13B. Leaves basifixed. 13. *C. yatabe*

1. *Cacalia adenostyloides* (Fr. & Sav.) Matsum. *Senecio adenostyloides* Fr. & Sav.—KANIKŌMORI. Stems 60–100 cm. long, rather slender, glabrous, naked at base; larger

leaves sometimes 2 or 3, membranous, reniform, 6–11 cm. long, 10–20 cm. wide, short-cuspidate, cordate, irregularly incised-toothed, glabrous on both sides, the petioles 3–13 cm.

long, wingless, the upper leaves gradually smaller, bractlike, oblong and short-petiolate or linear-lanceolate; heads many, nodding in anthesis, in a narrow panicle, the pedicels 2-5 mm. long, with short crisped-pubescent, the bractlets 1-3, linear; involucre narrow-tubular, 8-9 mm. long, about 1.5 mm. across, without a caliculus, the bracts 3, narrowly oblong, obtuse; tubular florets 3-5, whitish, 8-8.5 mm. long; achenes about 6 mm. long, linear, the pappus snow-white, about 6 mm. long.—Aug.-Sept. Woods in mountains; Honshu (centr. and n. distr. incl. Yamato Prov.), Shikoku.

Calacia × **koidzumiana** Kitam. A hybrid of *C. adenostyloides* × *C. hastata* var. *farfaraefolia*.—Honshu (Shinano Prov.).

2. **Calacia tebakaensis** (Makino) Makino. *C. delphinifolia* var. *tebakaensis* Makino.—TEBAKO-MOMIJIGASA. Stolonerous; stems 25-85 cm. long, slender; median cauline leaves membranous, few, long-petiolate, palmately 5- to 7-cleft, 3.5-10 cm. long, 5-17 cm. wide, the segments oblong, acuminate, incised-serrate, loosely short-pubescent on both sides, with prominently raised veins, the upper leaves rather abruptly smaller, short-petiolate, 3- to 5-cleft; leaves of the inflorescence linear and small; heads many, in a panicle, the pedicels 1-5 mm. long, with 3 or 4 minute ovate bractlets; involucre tubular, about 6 mm. long, about 3 mm. across, the bracts 5, narrowly oblong, obtuse; tubular florets 5 or 6, the corollas 7-7.5 mm. long; achenes about 5 mm. long, linear, the pappus bristles many, whitish, about 5 mm. long.—Aug.-Oct. Woods in mountains; Honshu (Kantō, Tōkaidō Distr. and Yamato Prov.), Shikoku, Kyushu.

3. **Calacia delphinifolia** Sieb. & Zucc. *Senecio zuccarinii* Maxim.; *C. zuccarinii* (Maxim.) Hand-Mazz.—MOMIJIGASA, MOMIJI-SŌ. Stems about 80 cm. long, the branches with short crisped pubescence; median cauline leaves long-petiolate, 15 cm. long, to 20 cm. wide, palmately 7-cleft, the segments thin, oblong, acuminate, irregularly incised-toothed, glabrous above, densely silky-hairy beneath while young, loosely so afterward, the petioles to 14 cm. long, wingless, the upper leaves gradually smaller, short-petiolate, 3- or 5-cleft; leaves of the inflorescence linear and small; heads many, in a panicle, ascending at anthesis, the pedicels 3-12 mm. long, the bractlets 1-3, ovate-lanceolate, 1-1.5 mm. long; involucre 8-9 mm. long, 3-4 mm. across, without a caliculus, mealy-puberulent, the bracts 5, narrowly oblong, obtuse; tubular florets 5, white to purplish, about 8.5 mm. long; achenes about 5 mm. long, the pappus snow-white, 6.5-8 mm. long.—Aug.-Oct. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

× **Senecilicalcia telphusaefolia** Koidz. KANI-O-TAKARA-KŌ. A bigeneric hybrid of *Calacia delphinifolia* × *Ligularia sibirica* var. *speciosa*.—Honshu (Yamashiro Prov.).

4. **Calacia farfaraefolia** Sieb. & Zucc. *C. bulbifera* sensu auct. Japon., non Maxim.—USUGE-TAMABUKI. Stems 50-140 cm. long, cobwebby only while young, paniculately branched above and densely crisped-puberulent; median cauline leaves few, large, 11-15 cm. long, 13-21 cm. wide, acute, cordate, coarsely toothed and incised-lobulate or mucronate-toothed near base, minutely toothed toward tip, puberulent above, loosely cobwebby or glabrous beneath, the petioles 7-15 cm. long, wingless, not auriculate at base, with small globose bulbils in axils, the upper leaves abruptly smaller, ovate to broadly so, sometimes oblong, bractlike, the uppermost one linear; heads many, in a narrow panicle, the short pedicels

with few bractlets; involucre 9-10 mm. long, 2-3 mm. wide, the bracts 5; tubular florets 5-6; achenes about 6.5 mm. long, the pappus 7 mm. long, snow-white.—Aug.-Oct. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. **bulbifera** (Maxim.) Kitam. *Senecio bulbifera* Maxim.; *C. bulbifera* (Maxim.) Maxim.—TAMABUKI. Leaves densely cobwebby-hairy beneath.—Woods in mountains; Hokkaido, Honshu (Kantō Distr. and northw.).

Var. **acerina** (Makino) Kitam. *C. lobatifolia* Maxim.; *C. bulbifera* var. *acerina* Makino; *C. bulbifera* var. *lobata* Makino.—MIYAMA-KŌMORI-SŌ, MOMIJI-TAMABUKI. Stems slender, 25-60 cm. long; median cauline leaves 2-4, deltoid-cordate or deltoid-reniform, irregularly palmately cleft, the lobes entire, obtuse, mucronate.—Sept.-Oct. Mountains; Honshu (Tōkaidō, s. Kinki Distr.), Shikoku, Kyushu.

5. **Calacia auriculata** DC. var. **kamtschatica** (Maxim.) Matsum. *Senecio dahuricus* var. *kamtschaticus* Maxim.; *C. kamtschatica* (Maxim.) Kudo.—MIMI-KŌMORI. Stems erect, 60-120 cm. long, stout, short-branched in upper part, short crisped-pubescent; median cauline leaves 3 or 4, thinly chartaceous, usually reniform, 7-17 cm. long, 11-25 cm. wide, abruptly short-acute, cordate, irregularly incised-toothed, sometimes with 1 or 2 rather large acute lobes, glabrous on both sides or with short crisped hairs on the nerves beneath, the petioles 4.5-9 cm. long, auriculate at base, the upper leaves abruptly smaller, linear; heads many, in a narrow racemelike panicle, the pedicels short, with 3-4 bractlets about 2 mm. long; involucre not caliculate, glabrous, 8-10 mm. long, the bracts 5, narrowly oblong, obtuse; tubular florets 3-6, the corollas about 8.5 mm. long; achenes 4-5 mm. long, the pappus about 5 mm. long, snow-white.—July-Sept. Woods in mountains; Hokkaido, Honshu (n. distr.).—Manchuria, Ussuri, Kamchatka, Aleutians. The typical phase occurs in Manchuria, Dahuria, Ussuri, and e. Siberia.

Var. **bulbifera** Koidz. *C. bulbifera* Koidz.; *C. matsumurana* Kudo; *C. kamtschatica* var. *bulbifera* (Koidz.) Kitam.—KOMACHI-MIMI-KŌMORI. Plants with bulbils in leaf axils.—Hokkaido.

6. **Calacia nikomontana** Matsum. *C. zigzag* Honda.—Ō-KANI-KŌMORI. Stems 30-100 cm. long, more or less crisped-puberulent; median cauline leaves somewhat approximate, membranous, long-petiolate, reniform, 5-18 cm. long, 10-27 cm. wide, short-acuminate, shallowly cordate, often 5-angled, 5-nerved, mucronate-toothed, with short crisped hairs on nerves beneath, the upper leaves abruptly smaller, narrowly ovate; heads many, often in a corymb, the pedicels 5-10 mm. long, with many linear, small bractlets; involucre 8-10 mm. long, with 1-2 bractlets at base, the bracts 5, broadly linear, obtuse; tubular florets 5-6 mm. long, the corollas about 8 mm. long; achenes about 4.5 mm. long; pappus snow-white, 6-6.5 mm. long.—Aug.-Oct. Woods in mountains; Honshu.

Calacia × **cuneata** (Honda) Kitam. *C. zigzag* var. *cuneata* Honda.—HAKUSAN-KANI-KŌMORI. A hybrid of *C. hastata* var. *ramosa* × *C. nikomontana*.—Honshu (Mount Hakusan in Kaga Prov.).

7. **Calacia shikokiana** Makino. *Senecio farfaraefolius* var. *humilis* Makino.—HIME-KŌMORI-SŌ. Stems 25-35 cm. long, branched and with short crisped pubescence in upper part; median cauline leaves thinly chartaceous, long-petiolate, reniform, 3.5-4.5 cm. long, 5-6.5 cm. wide, acuminate, cordate

to truncate at base, 5-angled, coarsely incised, mucronate, loosely crisped-puberulent on both sides, the petioles wingless, not auricled, the upper leaves gradually smaller, the uppermost linear; heads rather many, dense, corymbose, the pedicels 7-11 mm. long, often bracteate; involucre 8-9 mm. long, glabrous, the bracts 5, narrowly oblong; tubular florets 7, the corollas about 7 mm. long; pappus snow-white, about 5 mm. long.—Oct. Mountains; Honshu (Kii Prov.), Shikoku.

8. *Cacalia nipponica* Miq. *Senecio farfaraefolius* var. *nipponicus* (Miq.) Maxim.; *C. farfaraefolia* var. *nipponica* (Miq.) Matsum.—TSUKUSHI-KŌMORI-SŌ. Stems 22-42 cm. long, slender, flexuous, sometimes with short crisped pubescence; median cauline leaves few, approximate, long-petiolate, depressed-reniform, 3-9 cm. long, 5-12 cm. wide, 5-cleft, abruptly caudate, truncate, rarely cordate, the terminal lobes lanceolate, large, the lateral ones of 2 pairs, spreading, deltoid-lanceolate, incised-toothed toward tip, crisped-puberulent on both sides or glabrous beneath, the petioles wingless, the upper leaves abruptly smaller; heads 1-7, on long bracteate pedicels; involucre 8-10 mm. long, glabrous, the bracts 7 or 8, broadly linear; tubular florets 12-14, the corollas 7-7.5 mm. long; achenes 4.5-6 mm. long, the pappus snow-white, 5-5.5 mm. long.—Aug.-Oct. Woods in mountains; Kyushu.

9. *Cacalia hastata* L. var. *orientalis* (Kitam.) Ohwi. *C. hastata* var. *glabra* sensu auct. Japon., non Ledeb.; *C. hastata* sensu auct. Japon., non L.; *C. hastata* subsp. *orientalis* Kitam.—YOBUSUMA-SŌ. Stems 1-2 m. long, stout, branched, with short crisped pubescence on upper portion; median cauline leaves chartaceous, hastate to deltoid-reniform, usually 25-35 cm. long, 30-40 cm. wide, short-acuminate, cordate, undivided or 2-lobed, puberulent on both sides or only on underside, the lobes acuminate, mucronate-toothed, the petioles 9-13 cm. long, usually broadly winged and auriculate-clasping, the upper leaves gradually smaller, hastate to oblong, becoming linear in the inflorescence, short-petiolate; heads numerous, 10-12 mm. long, about 5 mm. across, often in large terminal panicles, the bracts 5-8, obtuse; tubular florets 6-9, the corollas 8-9 mm. long; achenes 5-8 mm. long, the pappus about 7 mm. long.—Aug.-Oct. Woods in mountains; Hokkaido, Honshu (n. Kantō Distr. and northw.).—Korea, Sakhalin, s. Kuriles, Kamchatka, and Manchuria; variable.

Var. *tanakae* (Fr. & Sav.) Kitam. *C. aizuiensis* Koidz.; *C. aizuiensis* var. *yukii* Kitam.; *Senecio farfaraefolius* var. *tanakae* Fr. & Sav.—INU-DŌNA. Median leaves deltoid-reniform, rounded and short-acuminate, more or less cordate, irregularly toothed, the petioles broadly winged; involucre bracts 6 to 8, 7-8 mm. long; tubular florets 8 or 9; achenes about 6 mm. long.—Honshu (n. Kantō Distr. and northw.).

Var. *chokaiensis* (Kudo) Kitam. *C. chokaiensis* Kudo.—KOBANA-NŌ-KŌMORI-SŌ. Stems slender; leaves deltoid-reniform, 5-angled, the petioles not auriculate at base; involucre bracts 8-10.—Honshu (n. distr.).

Var. *nantaica* (Komatsu) Kitam. *C. nantaica* Kamatsu.—NIKKŌ-KŌMORI. Stems 50-120 cm. long; leaves hastate, the petioles not clasping at base; involucre 10-12 mm. long, the bracts 7-9; tubular florets 10-15.—Honshu (Mount Nantai in Nikko).

Var. *ramosa* (Maxim.) Kitam. *Senecio farfaraefolius* var. *ramosa* Maxim.; *C. tschonoskii* Koidz.; *C. farfaraefolia* var. *ramosa* (Maxim.) Matsum.—ŌNA-KŌMORI. Stems slender, to 1.5 m. long; leaves hastate, about 15 cm. long, about 22 cm.

wide, acuminate, truncate or shallowly cordate, sometimes 2-lobed on each side, the petioles usually not auricled at base; heads usually on pedicels 5-10 mm. long; involucre 7-8 mm. long, the bracts 5-7; tubular florets 9-10; achenes 4-6.5 mm. long.—Honshu (centr. distr. and Kinki).

Var. *farfaraefolia* (Maxim.) Ohwi. *Senecio farfaraefolius* Maxim. var. *farfaraefolius*; *C. farfaraefolia* (Maxim.) Matsum.; *C. nipponica* var. *farfaraefolia* (Maxim.) Koidz.; *C. yakushimensis* Masam.; *C. maximowicziana* Nakai & F. Maekawa.—KŌMORI-SŌ. Stems slender, 30-70 cm. long; median cauline leaves long-petiolate, shallowly 5-lobed, 8-10 cm. long, 13-15 cm. wide, cordate to subtruncate at base or depressed-hastate, the terminal lobe largest, acuminate, irregularly denticulate, the lateral lobes smaller, often entire; heads rather small, loose; involucre 7.5-10 mm. long, the bracts 6 or 7; tubular florets 6-10; achenes 4-4.5 mm. long, the pappus about 5 mm. long, snow-white.—Mountains; Honshu (Kantō to Kinki Distr.).

Var. *alata* (F. Maekawa) Kitam. *C. maximowicziana* var. *alata* F. Maekawa; *C. crucifolia* F. Maekawa, in syn.—OKUYAMA-KŌMORI. Petioles of median cauline leaves winged and auricled at base.—Mountains; Honshu (southern half of centr. distr.).

10. *Cacalia kiusiana* Makino. MOMIJI-KŌMORI. Stems 70-80 cm. long, short-branched in upper part, crisped-pubescent; median cauline leaves chartaceous, long-petiolate, reniform, 10-15 cm. long, 12.5-18 cm. wide, slightly cordate to rarely subtruncate at base, palmately 5-lobed, the lobes deltoid, acuminate, mucronate-toothed, green above, paler and densely soft-puberulent beneath, the upper leaves gradually smaller, the uppermost ones ovate; heads many in a racemelike panicle, the pedicels short, bractless or with small bracts; involucre about 9 mm. long, about 5 mm. across, the bracts 5, narrowly oblong, obtuse, glabrous, the bractlets about 7, ovate, about 1.5 mm. long at base; tubular florets 6 or 7, the corollas about 1 cm. long; achenes glabrous, the pappus about 8 mm. long, brownish red.—Aug.-Oct. Kyushu (s. distr.).

11. *Cacalia amagiensis* Kitam. *Miricacalia amagiensis* (Kitam.) Nakai.—IZU-KANI-KŌMORI. Rhizomes creeping; stems 45-60 cm. long, branched, short crisped-pubescent on the upper portion; leaves few, usually 2(-3), chartaceous-membranous, the lower one long-petiolate, reniform, 12-13 cm. long, about 22 cm. wide, rounded at apex, deeply cordate, loosely pilose above, net-veined and loosely silky along veins, lobulate, minutely mucronate-toothed, the petioles 11-12 cm. long, wingless, densely white-pubescent, short-sheathed at base, the median leaf slightly smaller, 7-8 cm. long, 10-12 cm. wide, the petioles 3-3.5 cm. long, the floral leaf ovate or narrower and bractlike; heads many, in racemelike panicles, the pedicels with 3 or 4 small bractlets; involucre 11 mm. long, 2-3 mm. wide, the bracts 5, broadly linear, acute; tubular florets 4 or 5, the corollas about 11 mm. long; pappus white, 7-9 mm. long.—Sept.-Oct. Mountains; Honshu (Izu Prov.).

12. *Cacalia peltifolia* Makino. *Miricacalia peltifolia* (Makino) Nakai.—TAIHINGASA. Rhizomes short-branched; stems 1-2 m. long, usually branched and crisped-puberulent in upper part; cauline leaves about 3, thin, the lower one largest, peltate, suborbicular, 35-55 cm. across, deeply palmately cleft, deep green, crisped-puberulent above, puberulent on nerves beneath, the lobes 9-14, the larger ones oblanceolate-oblong, 2- or 3-lobulate, irregularly toothed, the petioles 30-65 cm. long, wingless, short-sheathed at base, the median leaf

long-petiolate, slightly smaller, the uppermost very small, sometimes bractlike; heads in large panicles, densely crisped-puberulent, the pedicels with 3-4 small bractlets; involucre 9-11 mm. long, about 4 mm. across, yellow-green, crisped-puberulent, the bracts 5, narrowly oblong, obtuse, longitudinally striate; tubular florets 6, the corollas white, changing to brown, 10-11 mm. long; pappus about 8 mm. long, sordid-white.—Sept.-Oct. Woods along streams and ravines in mountains; Honshu (centr. distr. and westw.).

13. *Caecalia yatabei* Matsum. & Koidz. *C. palmata* Makino, excl. syn.; *Miricacalia yatabei* (Matsum. & Koidz.) Nakai—YAMA-TAIMINGASA, TAIMINGASA-MODOKI. Plant stoloniferous and with long-creeping rhizomes; stems 75-90 cm. long, short-branched, with short crisped-pubescent on upper portion; cauline leaves 3, thin, the lower largest, long-petiolate, 17-24 cm. long, 30-35 cm. wide, somewhat cordate,

green and glabrous above, paler and short crisped-pubescent on nerves beneath, prominently veined on both sides, palmately pinnatifid, the lobes oblong, 9 or 10 pairs, usually 2- or 3-lobulate, the lobules acuminate, loosely and irregularly mucronate-denticulate, the petioles 17-19 cm. long, wingless, short-sheathed at base, the upper leaves gradually smaller, shorter-petiolate; heads many, in terminal racemose panicles; involucre 5-10 mm. long, about 1.5 mm. across, sometimes with bractlets at base, the bracts 5, broadly linear, obtuse; tubular florets 5 or 6, the corollas 8.5-10 mm. long; achenes 5-6 mm. long; pappus about 9 mm. long, sordid-white.—Aug.-Oct. Woods in mountains; Honshu, Shikoku.

Var. *occidentalis* F. Maekawa ex Kitam. *Miricacalia maekawae* Nakai—NISHI-NO-YAMA-TAIMINGASA. Involucral bracts 3 or 4; tubular florets 2-4.—Woods in mountains; Honshu (centr. distr. and westw.), Shikoku, Kyushu.

36. *SENECIO* L. KION ZOKU

Perennials, rarely annuals or biennials; leaves revolute in bud, cauline or radical, alternate, entire to pinnately parted, not sheathing at base; heads in corymbs or falsely so, homogamous or heterogamous; involucre tubular, sometimes subglobose, sometimes bracteate at base, the bracts 1-seriate, usually free; receptacle flat or convex; ray flowers pistillate, fertile, the corollas 1-seriate (rarely absent), yellow; tubular florets bisexual, fertile; style-branches often divergent, dilated and short-pilose at tip, sometimes rounded and mammillate at apex; anthers obtuse, sagittate or bifid at base; achenes terete, truncate at apex; pappus-bristles scabrous, slender, many.—About 1,200 species. Cosmopolitan.

- 1A. Annual or biennial, without rhizomes; heads all tubular. 1. *S. vulgaris*
- 1B. Perennials with rhizomes; heads ligulate.
- 2A. Stems scandent; leaves elongate, incised, hastate or truncate at base. 2. *S. scandens*
- 2B. Stems not scandent.
- 3A. Involucres with caliculus at base.
- 4A. Heads relatively small, many, 1-2.5 cm. across; plants not fleshy.
- 5A. Leaves undivided, toothed. 3. *S. nemorensis*
- 5B. Leaves pinnately parted.
- 6A. Leaves petiolate, pinnately cleft, with 1-3 pairs of lobes, the petioles auriculate. 4. *S. cannabifolius*
- 6B. Leaves sessile, pinnately parted, with about 6 pairs of lobes. 5. *S. argunensis*
- 4B. Heads large, few, about 4 cm. across; plants rather fleshy, of seashores. 6. *S. pseudoarnica*
- 3B. Involucres not caliculate at base.
- 7A. Heads small, many, about 12 mm. across; leaves pinnately cleft or parted. 7. *S. nikoensis*
- 7B. Heads larger, rather few, 2-5 cm. across; leaves undivided.
- 8A. Ligulate corollas orange-red; involucre dark purplish.
- 9A. Peduncles bracteate; ligulate corollas short, less than 10 mm. long. 8. *S. takedanus*
- 9B. Peduncles bractless; ligulate corollas 17-22 mm. long. 9. *S. flammeus*
- 8B. Ligulate corollas yellow; involucre green.
- 10A. Radical leaves truncate at base, long-petiolate; plant of alpine regions. 10. *S. kawakamii*
- 10B. Radical leaves narrowed to an indistinct petiole; plant of mountains and lowlands.
- 11A. Achenes hairy; radical leaves 5-10 cm. long; plant of meadows. 11. *S. integrifolius* var. *spathulatus*
- 11B. Achenes glabrous; radical leaves 12-25 cm. long; plant of wet places. 12. *S. pteroti*

1. *Senecio vulgaris* L. NO-BOROGIKU. Annual or biennial, slightly fleshy, sparingly cobwebby-hairy while young; stems branched, 10-40 cm. long, somewhat purplish; leaves 3-5 cm. long, 1-2.5 cm. wide, pinnately cleft to deeply undulate-sinuate, irregularly toothed, narrowed below and semi-clasping at base, the lower ones petiolate; heads many to few; involucre cylindric, 6-8 mm. long, the caliculus very small, the bractlets lanceolate, 2-3 mm. long, blackish at the tip, the bracts linear, acute, blackish at tip; ligulate corollas absent; tubular corollas yellow; achenes terete, appressed-pilosulous.—Mar.-Oct. Sometimes flowering the whole year.—European weed, widely naturalized in our area.

2. *Senecio scandens* Hamilt. ex D. Don. *S. hibernus* Makino—TAIKIN-GIKU, MIYUKI-GIKU. Stems elongate, branched, scandent, 2-5 m. long, densely pubescent while young, glabrous; cauline leaves elongate-deltoid, usually 7-10

cm. long, 3.5-4.5 cm. wide, acuminate, truncate to hastate at base, irregularly incised-toothed or subentire, often lobed in the lower ones, pubescent on both sides, the petioles 1-2 cm. long; inflorescence paniculately corymbose, terminal, the branches much spreading, densely pubescent; heads 13-14 mm. across, the pedicels 5-10 mm. long; involucre 5-6 mm. long, about 5 mm. across, tubular, the bracts 8, lanceolate, acute; ligulate corollas yellow, about 9 mm. long, about 2 mm. across; achenes about 3 mm. long, short-pilose, the pappus 5-6 mm. long, snow-white.—Nov.-Mar. Near seashores; Honshu (Kii Prov.), Shikoku.—Formosa, China, Philippines, and India.

3. *Senecio nemorensis* L. *S. fuchsi* Gmel.; *S. nemorensis* var. *fuchsi* (Gmel.) Koch; *S. nemorensis* var. *subintegr* Hara; *S. ovatus* var. *japonicus* Nakai—KION, HIGO-OMINASHI. Rhizomes short; stems 50-100 cm. long, leafy,

branched in upper part; median leaves lanceolate to ovate-oblong, acuminate, narrowed to a short petiole or abruptly narrowed and semiclasping, irregularly serrulate, glabrous or with short crisp hairs on both sides; heads many, 17–25 mm. across, in corymbs, short-pedicellate; involucre 6–7 mm. long and as wide, caliculate at base, the bractlets linear, 2–8 mm. long, the bracts 9–12, narrowly oblong, deltoid at apex; ligulate corollas about 5, yellow, 13–19 mm. long, 1.5–3.5 mm. wide; achenes 3.5–4 mm. long, glabrous, the pappus 6–6.5 mm. long, whitish.—Aug.–Sept. High mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Formosa, China, Korea, Sakhalin, s. Kuriles, Siberia to Europe.

4. *Senecio cannabifolius* Less. *S. palmatus* Pall. ex Ledeb.; *S. palmatus* var. *genuinus* Herd.; *S. palmatus* var. *davuricus* Herd.; *S. cannabifolius* var. *davuricus* (Herd.) Kitag.—HANCON-SŌ. Rhizomes creeping; stems erect, 1–2 m. long, often reddish; lower and median cauline leaves petiolate, 10–20 cm. long, 9–15 cm. wide, pinnately divided, more or less crisped-puberulent beneath, the terminal segments lanceolate, acuminate, incurved-serrulate, the lateral segments of 1 or 2 pairs, ascending, the petioles auriculate at base, the upper leaves 3-parted to cleft, petiolate, gradually smaller, simpler, and lanceolate in the uppermost ones; heads many, about 2 cm. across, in large corymbs, the pedicels slender; involucre tubular, 5–6 mm. long and as wide, caliculate, the bractlets linear, 2–3 mm. long, few, the bracts lanceolate, acute; ligulate florets 5–7, the corollas yellow, 12–13 mm. long, 1.5–2 mm. wide; achenes about 3 mm. long, glabrous, the pappus twice as long as the achenes, yellowish white.—July–Sept. Mountains; Hokkaido, Honshu (centr. and n. distr.); rather common.—Sakhalin, Kuriles, Kamchatka, Korea, Manchuria, to e. Siberia, n. China, and Aleutians.

Var. *integrifolius* (Koidz.) Kitam. *S. palmatus* var. *integrifolius* Koidz.; *S. otophorus* Maxim.—MIMI-KION, HITSUBA-HANGON-SŌ. Leaves undivided, simple.—Hokkaido, Honshu.—Manchuria.

5. *Senecio argunensis* Turcz. *S. jacobaea* var. *grandiflorus* Turcz. ex DC.—KŌRINGIKU. Rhizomes woody; stems erect, single or tufted, 65–100 cm. long, cobwebby-hairy, branched in upper part; median leaves ovate-oblong to oblong, 8–10 cm. long, 4–6 cm. wide, pinnately parted to cleft, the lobes about 6 pairs, ascending, narrow, incised, acute to obtuse, with a broad sinus between the lobes, sessile, deep green and glabrous above, loosely cobwebby-hairy, with raised nerves beneath, the upper leaves gradually smaller, pinnately lobed; heads many, 2–2.5 cm. across, in corymbs; involucre subglobose, about 6 mm. long, 10 mm. wide, caliculate, the bractlets many, 3–5 mm. long, acuminate, the bracts oblong; ligulate corollas deep yellow, about 15 mm. long, about 3 mm. wide; achenes 2–3 mm. long, glabrous, the pappus about 5.5 mm. long, whitish.—Aug.–Oct. Mountains; Kyushu (n. distr.); rare.—Korea, China, Manchuria, and Dahuria.

6. *Senecio pseudoarnica* Less. *Arnica maritima* (L.) Koidz., non L. f.—EZO-OGURUMA. Fleshy perennial herb with thick rhizomes; stems 30–50 cm. long, stout, usually simple, cobwebby-hairy, densely leafy; radical and lower cauline leaves smaller than the median ones, the median oblong or ovate-oblong, 12–15 cm. long, 4.5–5.5 cm. wide, obtuse, slightly narrowed at base and semiclasping, mucronate-toothed, cobwebby-hairy beneath, the uppermost ones slightly smaller, obtuse to acuminate; heads 1–30, 3.5–4.5 cm. across, in pedunculate corymbs; involucre subglobose, 1–1.2 cm. long, with

many bracteal leaves 2–2.5 cm. long, the bracts narrowly oblong, acuminate; ligulate corollas yellow, 17–24 mm. long, 3–5 mm. wide; achenes grayish, about 5 mm. long, glabrous, the pappus about 1 cm. long, whitish, brownish at base.—July–Sept. Near seashores; Hokkaido, Honshu (Mutsu Prov.).—Korea, Manchuria, Amur, Ussuri, Kamchatka, and N. America.

7. *Senecio nikoensis* Miq. SAWAGIKU, BOROGIKU. Plant stoloniferous, rhizomes short; stems erect, 40–100 cm. long, white-pubescent, often branched in upper part; median and lower cauline leaves thinly membranous, ovate-oblong, 5.5–14 cm. long, 2.5–8.5 cm. wide, soft-pubescent on both surfaces, deeply pinnatifid to pinnatifid, petiolate, the segments spreading, 4–6 pairs, linear-oblong, toothed or incised; heads nearly umbellate, about 12 mm. across, on slender bractless pedicels; involucre about 5 mm. long, 7 mm. across, the bracts narrowly oblong, acute; ligulate corollas pale yellow, about 8 mm. long, 1 mm. wide; achenes about 1.5 mm. long, short-pilose; pappus snow-white, 6–7 mm. long.—June–Aug. Damp woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

8. *Senecio takenanus* Kitam. *S. flammeus* var. *alpina* Takeda.—TAKENE-KŌRIN-KA. Rhizomes short; stems simple, 20–40 cm. long, cobwebby and sometimes short-pubescent; lower and median cauline leaves spatulate-oblong, 5–10 cm. long, 1.5–3 cm. wide, obtuse, clasping at base, irregularly mucronate-toothed, cobwebby-hairy and often with short crisp hairs, the uppermost leaves gradually smaller, narrower, broadly clasping at base; heads usually 4–5, in umbels, 2–2.5 cm. across, the pedicels purplish puberulent, thickened at top, with small purplish linear bractlets; involucre cup-shaped, 7–10 mm. long, 1–1.6 cm. wide, dark purplish; ligulate corollas dark orange-red, about 1 cm. long, 2 mm. wide; achenes about 4 mm. long, hairy; pappus 6–7 mm. long, whitish.—Aug. Alpine slopes; Honshu (centr. distr.); rare.

9. *Senecio flammeus* Turcz. ex DC. *S. longiligulatus* Lév. & Van't.—TAKENE-KŌRINGIKU. Rhizomes slender, short; stems simple, 15–40 cm. long, cobwebby and puberulent; radical leaves withering before anthesis, oblong, cuneately narrowed at base, long-petiolate, the lower cauline leaves oblanceolate-oblong, 8–9 cm. long, 2.3–2.5 cm. wide, obtuse, narrowed to a winged semiclasping slightly decurrent petiole, irregularly mucronate-toothed in upper half, puberulent and cobwebby on both sides, the median leaves oblong, the upper ovate-lanceolate, gradually much reduced; heads 2–7, in false umbels, 3–3.2 cm. across, the pedicels with few bractlets; involucre cup-shaped, about 5 mm. long, 12 mm. across, dark purplish at tip, the bracts lanceolate, acute; ligulate corollas dark orange-red, incurved on margin, reflexed at anthesis, 13–22 mm. long, about 1.5 mm. wide; achenes 2.5–3 mm. long, hairy, the pappus whitish, about 5.5 mm. long.—Aug. Mountains; Kyushu (n. distr.).—Korea, Manchuria, n. China, and Dahuria.

Var. *glabrifolius* Cufodontis. *S. flammeus* sensu auct. Japon., non Turcz.; *S. flammeus* subsp. *glabrifolius* (Cufodontis) Kitam.; *S. flammeus* forma *glabrescens* Hara.—KŌRIN-KA. Stems 30–60 cm. long; heads 3–13; involucre 5–8 mm. long; achenes about 3 mm. long, densely hairy, the pappus 6.5–8 mm. long.—July–Oct. Sunny places in mountains; Honshu.—Korea.

10. *Senecio kawakamii* Makino. MIYAMA-OGURUMA. Rhizomes short-decumbent; stems 17–30 cm. long, erect, subscapose, short-pubescent and cobwebby; lower leaves rosulate,

approximate, oblong, 6–10 cm. long, about 2 cm. wide, obtuse, short-pubescent and cobwebby while young, irregularly mucronate-toothed, winged-petiolate, the upper cauline leaves gradually smaller, oblanceolate-oblong, semiclasping, the uppermost linear, bractlike; heads 3–7, in false umbels, 2–3 cm. across, the peduncles slender, minutely glandular-pubescent and cobwebby-hairy; involucre cup-shaped, about 5 mm. long, 1–1.2 cm. across, the bracts 12–15, glandular-ciliate, acute; ligulate corollas yellow, 9–12 mm. long, 3–3.5 mm. wide; achenes 3–3.5 mm. long, glabrous, the pappus accrescent, 6–7 mm. long, snow-white.—July–Aug. Alpine slopes; Hokkaido.—s. Kuriles and Sakhalin.

11. *Senecio integrifolius* (L.) Clairv. var. *spatulatus* (Miq.) Hara. *S. kirilowii* Turcz. ex DC.; *S. campestris* sensu auct. Japon., non DC.; *S. fauriei* Lévl. & Van't.; *S. integrifolius* subsp. *kirilowii* (Turcz.) Kitag.; *S. integrifolius* subsp. *fauriei* (Lévl. & Van't.) Kitam.; *S. aurantiacus* var. *spatulatus* Miq.; *S. aurantiacus* var. *elatio* Miq.; *S. aurantiacus* var. *foliosa* Miq.—OKA-OGURUMA. Rhizomes short-ascending; stems scapose, erect, 20–65 cm. long, densely cobwebby and slightly purplish in upper part; radical leaves rosulate, oblong, rarely obovate-oblong, 5–10 cm. long, 1.5–2.5 cm. wide, obtuse, minutely mucronate, gradually narrowed at base, usually sessile, rarely short-petiolate, irregularly mucronate-toothed, cobwebby on both surfaces, the cauline leaves few, the lower ones ascending, lanceolate, 7–11 cm. long, 1–1.5 cm. wide, obtuse, semiclasping at base, decurrent, the upper ones gradually smaller, narrowly lanceolate, acuminate, broadly clasping at

base; heads 3–9, in corymbs or false umbels, 3–4 cm. across, pedunculate; involucre about 8 mm. long, 11 mm. across, the bracts lanceolate, acuminate; ligulate corollas yellow, 12–16 mm. long, 2–3 mm. wide; achenes about 2.5 mm. long, densely pilose, the pappus about 11 mm. long, snow-white.—May–June. Sunny slopes in hills and low elevations in mountains; Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, China, and Formosa. The typical phase occurs from Siberia to Europe.

12. *Senecio pierotii* Miq. *S. campestris* var. *subdentatus* Maxim.; *S. subdentatus* var. *pierotii* (Miq.) Cufodontis—SAWA-OGURUMA. Rhizomes short, ascending; stems erect, 50–80 cm. long, rather stout, simple, hollow, cobwebby; radical leaves present at anthesis, rather fleshy and thick, often long-petiolate, oblong or narrowly so, sometimes lanceolate, 12–25 cm. long, 1.5–7 cm. wide, obtuse, narrowed or cuneate at base, subentire or mucronately toothed, cobwebby while young; cauline leaves rather numerous, the lower ones oblong to lanceolate, semiclasping at base, the uppermost gradually smaller, acuminate, broadly clasping at base; heads 6–30, in false umbels or corymbs, 3.5–5 cm. wide, long-pedunculate; involucre cup-shaped, without a caliculus, 7–8.5 mm. long, 1.5–2 cm. wide, the bracts broadly lanceolate, acuminate; ligulate corollas 11–16 mm. long, about 2 mm. wide, yellow; achenes glabrous, the pappus snow-white, 9–13 mm. long.—Apr.–June. Wet places at low elevations in mountains; Honshu, Shikoku, Kyushu.—Ryukyus.

37. SYNEILESIS Maxim. YABUREGASA ZOKU

Rather stout perennial herbs; radical leaves peltate, palmately parted, cobwebby while young; cauline leaves alternate, few, the petioles entirely clasping the stem; heads erect in anthesis, elongate, in corymbs or in panicles; involucre narrowly tubular, with 2–3 linear bractlets at base, the bracts usually 5, 1-seriate, free, rather thick; receptacle flat, glabrous; tubular florets bisexual, fertile, the corollas tubular, 5-lobed, whitish or reddish; style-branches elongate, obtuse to depressed-deltoid or penicillate, sometimes pilose; anthers short-sagittate, the anther-tails pollen-bearing, connate; achenes terete, striate; pappus-bristles many, nearly equal, scabrous; cotyledons 1, convolute, orbiculate, sublobed.—Few species, in e. Asia.

1A. Heads in flat-topped corymbs.

2A. Leaf-segments narrow, 4–8 mm. wide. 1. *S. aconitifolia*

2B. Leaf-segments broader, 1–1.7 cm. wide. 2. *S. tagawae*

1B. Heads in panicles; leaf-segments 2–4 cm. wide. 3. *S. palmata*

1. *Syneilesis aconitifolia* (Bunge) Maxim. *Cacalia aconitifolia* Bunge; *Senecio aconitifolius* (Bunge) Turcz. ex Forbes & Hemsl.—HOSOGA-YABUREGASA. Rhizomes short-creeping, 6–8 mm. across; stems 70–120 cm. long, brownish, glabrous, simple, with 2 main leaves; lower leaf peltate, 20–30 cm. wide, palmately parted or deeply cleft, long-petiolate, the segments 7–9, once to twice bifid, the lobes 4–8 mm. wide, acuminate, irregularly acute-toothed, revolute in bud, densely cobwebby while young, whitish beneath, the median leaf slightly smaller, petiolate, 12–24 cm. wide, 4- or 5-cleft, the upper leaves bractlike; heads many, 6–7 mm. across, in dense compound corymbs, the pedicels 6–16 mm. long, linear-bractate; involucre 9–12 mm. long, purple-brown, the bracts 5, oblong, obtuse, glabrous; tubular florets 8–10, reddish; achenes about 5 mm. long, the pappus sordid white to reddish, 8–10 mm. long.—Aug. Honshu (Tanba Prov.).

2. *Syneilesis tagawae* Kitam. *S. aconitifolia* var. *tagawae* Kitam.—YABUREGASA-MODOKI. Rhizomes short; stems about 1 m. long, glabrous; inflorescence branched; prin-

cipal cauline leaves 2, distant, the lower one thick, long-petiolate, peltate, orbicular, about 25 cm. across, glabrous above, whitish and loosely pilose beneath, palmately parted, the main segments 6, usually twice bifid, the lobes lanceolate, 10–17 mm. wide, acuminate, the median leaf short-petiolate, palmately parted, about 14 cm. across, the segments 3 or 4, bifid, the uppermost leaves very small, lanceolate or narrowly so, 2–7 mm. long; heads in corymbs, 7–10 mm. long, pedicelled, with 3 or 4 small linear bractlets at base; involucre about 1 cm. long, the bracts 5; pappus sordid-white.—Aug. Shikoku (Tosa Prov.); rare.

3. *Syneilesis palmata* (Thunb.) Maxim. *Arnica palmata* Thunb.; *Senecio palmatus* (Thunb.) Less.; *S. krameri* Fr. & Sav.; *Cacalia palmata* (Thunb.) Makino; *C. thunbergii* Nakai.—YABUREGASA. Rhizomes short; stems 70–120 cm. long, glaucous, silky while young; cauline leaves 2(–3), chartaceous, distant, the lower one long-petiolate, peltate, orbicular, 35–40(–50) cm. across, palmately 7- to 9-parted, the segments often twice bifid and the lobes 2–4 cm. wide, acuminate,

acutely toothed, pubescent while young, often whitish and at first silky beneath, the median leaves slightly smaller, short-petiolate; heads many, 8–10 mm. across, in panicles, the pedicels puberulent, with small bractlets; involucre (7–)9–10 mm.

long, the bracts 5, glabrous; achenes 4.5–6 mm. long; pappus sordid-white, minutely scabrous.—July–Oct. Woods in low mountains; Honshu, Shikoku, Kyushu.—Korea.

38. *ACHILLEA* L. NOKOGIRI-SŌ ZOKU

Perennial herbs; leaves alternate, oblong-linear, toothed to twice pinnate, sometimes woolly; heads relatively small, usually in dense corymbs, rarely solitary, ligulate; involucre subglobose or globose-campanulate, the bracts 2- or 3-seriate, the outer ones short, thickened on back, scarious on margin, dark brownish; receptacle convex or conical, chaffy; style-branches truncate and penicillate at apex; anthers bifid at base, usually acute; achenes much-flattened, oblong, truncate at apex, glabrous; pappus absent.—About 100 species, in Europe, Asia, N. America and N. Africa, especially abundant in the Mediterranean region.

1A. Leaves serrulate, not clasping, the median limb (undivided portion) 3.5–10 mm. wide; involucre bracts and chaff densely hairy.

1B. Leaves serrate, bipinnately cleft, clasping, the median limb 1–7 mm. wide; involucre bracts less densely pubescent; chaff glabrous or only sparingly hairy. 1. *A. ptarmica*
2. *A. sibirica*

1. *Achillea ptarmica* L. var. *macrocephala* (Rupr.) Masam. *A. macrocephala* Rupr.; *A. ptarmica* var. *speciosa* sensu Herd., excl. syn. and sensu auct. Japon.; *A. ptarmica* subsp. *macrocephala* (Rupr.) Heim.—EZO-NOKOGIRI-SŌ. Stems 10–85 cm. long, densely appressed-pubescent on upper portion; median cauline leaves oblong-linear or linear-lanceolate, 3–7 cm. long, 4–11 mm. wide, usually obtuse, sessile and semiclasping, regularly toothed, the leaf limb 3.5–10 mm. wide, the teeth small, incurved, acute, serrulate; heads usually many, in corymbs, rarely solitary; involucre semiglobose, about 5 mm. long, 9–11 mm. wide, densely silky-hairy; bracts 2-seriate, oblong, obtuse, the outer short; ligulate florets 2-seriate, 12–19, the corollas whitish, 6–7 mm. long, about 4 mm. wide; achenes about 2 mm. long, 1 mm. wide.—July–Oct. Hokkaido, Honshu (centr. distr. and northw.).—Kuriles, Sakhalin, Kamchatka, and e. Asia.

Var. *yezoensis* Kitam. HOSŌBA-EZO-NOKOGIRI-SŌ. Stems

to 50 cm. long, often with prominent buds in the axils; leaves linear, 5–6.5 cm. long, 3–6 mm. wide, toothed, not clasping; heads slightly smaller; involucre 3–4 mm. long, 7.5–9 mm. wide; ligulate florets 6–8.—Hokkaido (Kamuikotan in Ishikari Prov.).

2. *Achillea sibirica* Ledeb. *A. mongolica* Fisch.; *A. sibirica* var. *typica* Herd.; *A. sibirica* subsp. *mongolica* (Fisch.) Heim.—NOKOGIRI-SŌ, HAGOROMO-SŌ. Stems 50–100 cm. long, densely pubescent in upper part; cauline leaves 6–10 cm. long, 7–15 mm. wide, obtuse, sessile, the lobes semiclasping, pectinate, the lobules oblong-lanceolate, acute, acutely toothed, the median leaf limb 1–7 mm. wide, silky-hairy while young; heads many, 7–9 mm. across, in dense corymbs; involucre globose-campanulate, slightly pubescent, 5 mm. long and as wide, the bracts oblong, the outer shorter; ligulate florets 5–7, the corollas 3.5–4.5 mm. long, 2.5–3 mm. wide; achenes about 3 mm. long, about 1 mm. wide, glabrous. Very variable.

Key to the varieties of *A. sibirica*

1A. Leaves bipinnately cleft to parted.

2A. Heads less than 10 mm. across; ligulate corollas 3.5–4.5 mm. long. var. *sibirica*

2B. Heads 12–14 mm. across; ligulate corollas about 6 mm. long.

3A. Ligulate florets 8–12. var. *camtschatica*

3B. Ligulate florets 6–8. var. *angustifolia*

1B. Leaves minutely toothed or incised-toothed.

4A. Leaves minutely toothed; ligulate florets 9–11. var. *pulchra*

4B. Leaves regularly incised-toothed; ligulate florets 5–6. var. *brevidens*

Var. *sibirica*. NOKOGIRI-SŌ, HAGOROMO-SŌ. Heads less than 10 mm. across; ligulate corollas 3.5–4.5 mm. long.—July–Nov. Hokkaido, Honshu.—Sakhalin, s. Korea, Manchuria, China, e. Siberia, Kamchatka, Aleutians, and N. America.—Forma *discoidea* Regel. *A. ptarmicoides* Maxim.; *A. sibirica* var. *ptarmicoides* (Maxim.) Makino.—YAMA-NOKOGIRI-SŌ. Ligulate corollas 3 mm. long.

Var. *camtschatica* (Heim.) Ohwi. *Parmica kamtschatica* Rupr. ex Komar.; *A. sibirica* subsp. *camtschatica* Heim.—SHUMOSHU-NOKOGIRI-SŌ. Cauline leaves lanceolate or narrowly oblong, 3–9 cm. long, 5–22 mm. wide, pinnate-toothed; involucre densely pubescent; ligulate florets 8–12.—Hokkaido (Teshio and Kitami Prov.).—Sakhalin, Kuriles, and Kamchatka.

Var. *angustifolia* (Hara) Ohwi. *A. sibirica* subsp. *japonica* Heim.; *A. pulchra* var. *angustifolia* Hara.—HOROMAN-NOKOGIRI-SŌ. Stems elongate and branched; leaves bipinnately parted or cleft; involucre less densely hairy; ligulate florets

6–8, the corollas about 6 mm. long, 4–5 mm. wide.—Hokkaido, Honshu (centr. and n. distr.).—Sakhalin and Kuriles.

Var. *pulchra* (Koidz.) Ohwi. *A. pulchra* Koidz.; *A. speciosa* var. *pulchra* (Koidz.) Nakai; *A. sibirica* subsp. *pulchra* (Koidz.) Kitam.—AKABANA-NOKOGIRI-SŌ. Leaves 5–7 cm. long, 9–13 mm. wide, minutely toothed, the median leaf-limb about 7 mm. wide; involucre loosely hairy; ligulate florets 9–11, the corollas pink or white, 5–7 mm. long, 4.5–5 mm. wide.—Hokkaido.

Var. *brevidens* (Makino) Ohwi. *A. cartilaginea* Miq.; *A. ptarmicoides* forma *brevidens* Makino; *A. sibirica* var. *ptarmicoides* subvar. *brevidens* Makino; *A. sibirica* subsp. *subcartilaginea* Heim.—ASO-NOKOGIRI-SŌ. Leaves regularly incised-toothed, the median leaf limb 2–6.5 mm. wide; heads somewhat smaller; ligulate florets 5–6, the corollas 5–6 mm. long, 3.5–4 mm. wide, white or pink.—Mountains of Kyushu.

39. CENTIPEDA Lour. TOKIN-SŌ ZOKU

Small annuals; stems decumbent, much branched, leafy; leaves alternate, spatulate, toothed; heads small, axillary, pedicelled or sessile; involucre small, the bracts 2-seriate, spreading, equal, oblong, with a narrow membranous margin; pistillate florets marginal, many-seriate, fertile, the corollas tubular, about 0.2 mm. long; bisexual florets central, fertile, the corollas about 0.5 mm. long, deeply 4-lobed; style-branches in bisexual florets short, obtuse, the anthers obtuse at base, without appendages; achenes 5-angled, hairy, narrowed at base.—Few species, in Madagascar, India, e. Asia, Australia, and S. America.

1. *Centipeda minima* (L.) A. Br. & Asch. *C. orbicularis* Lour.; *Artemisia minima* L.; *Myriogyne minima* Less.; *C. minima* (Less.) C. B. Clarke.—Tokin-sō. Green, thinly cobwebby or glabrescent annual; stems slender, 5–20 cm. long, many-leaved, decumbent or procumbent, much branched and often rooting; leaves alike, nearly equal, spatulate, 7–20 mm. long, obtuse, with few teeth toward the tip, glandular-spotted

beneath, sessile; heads depressed-globose, green, 3–4 mm. across, axillary, sessile or subsessile; involucre bracts oblong, equal; ligulate florets minute, the corollas green; achenes about 1.3 mm. long, minutely hirsute, 5-angled.—July–Nov. Waste grounds and roadsides; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, e. Siberia, Korea, China, India, Malaysia, and Australia.

40. MATRICARIA L. SHIKAGIKU ZOKU

Annuals or biennials, sometimes strongly scented; leaves alternate, 2 or 3 times pinnate, the ultimate segments linear; heads small or relatively large, pedicelled, solitary, ligulate or eligulate; involucre subglobose, the bracts 4-seriate; receptacle conical; ligulate florets marginal, 1-seriate, fertile, the corollas white; tubular florets many, bisexual, the corollas yellow, 4- or 5-lobed; anthers obtuse at base; style branches truncate and mammillate at apex; achenes oblong, truncate at apex, ribless on back, 3-ribbed in front, often with 2 oil-glands, the pappus crownlike or absent.—About 50 species, in the N. Hemisphere and S. Africa.

- 1A. Ligulate florets absent. 1. *M. matricarioides*
1B. Ligulate florets present. 2. *M. tetragonosperma*

1. *Matricaria matricarioides* (Less.) Porter. *Artemisia matricarioides* Less.; *Tanacetum matricarioides* Less.; *M. discoidea* DC.; *Santolina suaveolens* Pursh; *M. suaveolens* (Pursh) Buchen., non L.—Ko-shikagiku, Oroshagiku. Slightly pubescent or nearly glabrous annual; stems 10–30 cm. long, often much branched; cauline leaves narrowly oblong or oblanceolate, 2–5 cm. long, 8–18 mm. wide, bipinnate, the pinnae many, the ultimate segments linear, acute, about 0.5 mm. wide, the basal ones clasping, the upper leaves gradually smaller; heads erect on stout pedicels; involucre 3–3.5 mm. long, 6–9 mm. across; bracts 4-seriate, oblong, the outer as long as the middle, longer than the innermost, rounded at apex; achenes glabrous, oblong, 1.5 mm. long, 3-ribbed on both sides, the pappus very short, cuplike, white.—July–Oct. Waste grounds especially near seashores; Hokkaido.—nw. America, e. Asia, and Europe.

2. *Matricaria tetragonosperma* (F. Schmidt) Hara & Kitam. *Chamaemelum tetragonospermum* F. Schmidt; *Tripleurospermum inodorum* var. *ambiguum* Reichenb. ex Herd.; *T. ambiguum* Fr. & Sav.; *M. ambigua* Miyabe.—SHIKAGIKU. Short-pubescent to nearly glabrous annual; stems 15–50 cm. long, often branched; leaves subsessile, narrowly oblong, 5.5–18 cm. long, 2–5 cm. wide, thrice pinnate, the ultimate segments 0.3–0.6 mm. wide, acute, the upper leaves clasping, smaller; heads few, 3.5–4 cm. across; involucre 7–8 mm. long, the median bracts longest, narrowly oblong; ligulate corollas 15–18 mm. long, 3–4.5 mm. wide; achenes about 3 mm. long, nearly 4-angled, with a pair of black spots on both sides below the apex.—July–Aug. Sandy places near seashores; Hokkaido.—Sakhalin, Kuriles, Manchuria, and Siberia.

41. CHRYSANTHEMUM L. KIKU ZOKU

Perennial or annual herbs, sometimes subshrubs; leaves alternate, pinnately divided or undivided; heads solitary on branchlets or in corymbs; involucre subglobose, the bracts many-seriate, imbricate, appressed, often scarious and brownish on margin; receptacle convex, hemispheric, sometimes flat; pistillate florets marginal, fertile, 1- to many-seriate, the corollas ligulate or tubular, 3-lobed; disc flowers fertile, rarely sterile, the corollas 5-lobed; anthers obtuse and entire at base, with an oblong appendage at apex; style-branches truncate at apex; achenes terete or 5- to 10-ribbed, sometimes slightly flattened, glabrous, the pappus scalelike.—About 200 species, in the N. Hemisphere, and S. Africa.

- 1A. Heads eligulate, in dense corymbs, the achenes not viscid when moistened, with a very short crownlike pappus; leaves bipinnate. 1. *C. eulgarie*
1B. Heads ligulate or, if eligulate, the achenes without a pappus.
2A. Plant shrubby; achenes with a very short crownlike pappus. 2. *C. nipponicum*
2B. Plant herbaceous; achenes without a crownlike pappus.
3A. Achenes not viscid when moistened.
4A. Achenes 5-ribbed; ligulate florets fertile; leaves or lobes of leaves not linear.
5A. Leaves pinnately lobed or cleft, or 3-cleft; achenes with the margins not raised. 3. *C. yezoense*
5B. Leaves pinnately parted and again pinnately lobed or toothed; achenes with slightly raised edges at apex. 4. *C. weyrichii*
4B. Achenes 10-ribbed; ligulate florets sterile; leaves linear or deeply 3- to 5-parted into linear segments. 5. *C. lineare*
3B. Achenes viscid when moistened.

- 6A. Leaves densely woolly beneath.
 7A. Leaves silvery-woolly beneath.
 8A. Leaves truncate at base; heads 4–5 cm. across 6. *C. ornatum*
 8B. Leaves broadly cuneate at base; heads narrower.
 9A. Leaves with shallow pinnate lobes in those of upper part; near seashores.
 10A. Involucres about 10 mm. across, the outer bracts linear. 7. *C. shiwogiku*
 10B. Involucres about 6 mm. across, the outer bracts ovate. 8. *C. pacificum*
 9B. Leaves deeply pinnately cleft into narrow lobes; involucres 3–4 mm. across; alpine. 9. *C. rupestre*
 7B. Leaves grayish white-woolly beneath.
 11A. Leaves usually cuneate at base; involucral bracts nearly equal.
 12A. Leaves obovate or oblanceolate, shallowly pinnatifid, grayish woolly on upper side. 10. *C. yoshinaganthum*
 12B. Leaves ovate or broadly so, 3-cleft, green on upper side. 11. *C. makinoi*
 11B. Leaves slightly cordate at base; outer involucral bracts shorter than the inner ones. 12. *C. japonense*
 6B. Leaves slightly pubescent beneath.
 13A. Leaves pinnately cleft, cuneate at base; involucres 13 mm. across, the outer bracts linear. 13. *C. cuneifolium*
 13B. Leaves rarely deeply cleft, truncate to cordate at base.
 14A. Heads solitary on the branches, 3–7 cm. across; outer involucral bracts linear. 14. *C. zawadskii*
 14B. Heads many, in corymbs.
 15A. Heads 12–20 mm. across, in false umbels.
 16A. Involucres about 5 mm. long, the outer bracts linear; stems erect from the base. 15. *C. boreale*
 16B. Involucres 6.5 mm. long, the outer bracts oblong or ovate; stems decumbent. 16. *C. okjense*
 15B. Heads often more than 25 mm. across, in corymbs.
 17A. Heads about 2.5 cm. across; outer involucral bracts ovate or oblong. 17. *C. indicum*
 17B. Heads 3–4.5 cm. across; outer involucral bracts oblong or linear. 18. *C. aphrodite*

1. *Chrysanthemum vulgare* (L.) Bernh. *Tanacetum vulgare* var. *boreale* (Fisch.) Makino ex Makino & Nemoto; *T. boreale* Fisch. ex DC.; *T. vulgare* var. *boreale* (Fisch.) Trautv. & Mey.; *T. vulgare* sensu auct. Japon., non L.—Ezo-yomogi-giku. Rhizomes long-creeping; stems 60–70 cm. long, slightly cobwebby-pubescent, branched in upper part; median cauline leaves oblong, 15–25 cm. long, 7–11 cm. wide, often clasping at base, slightly cobwebby-pubescent, bipinnate, the pinnae about 12-pairs, approximate, lanceolate, 12–20 mm. wide, acuminate, the pinnules 2–3 mm. wide, acute, callose-toothed, glandular-spotted on upper side, the upper leaves gradually smaller and less divided; heads in dense corymbs, short-pedicelled, about 1 cm. across; involucres depressed-globose, 4 mm. long; bracts 4-seriate, the outer ovate-oblong, obtuse, shorter than the median; ligulate florets 1-seriate, the tubular corollas about 2.5 mm. long, yellow; achenes about 2 mm. long, with a very short crownlike pappus.—July–Sept. Hokkaido.—Korea, Manchuria, Sakhalin, and e. Siberia.

2. *Chrysanthemum nipponicum* (Franch.) Matsum. *Leucanthemum nipponicum* Franch. ex Maxim.—HAMAGIKU. Stems to 1 m. long, branched, puberulent in upper part; cauline leaves approximate, spatulate, 2–9 cm. long, 1.3–2 cm. wide, obtuse, obtusely undulate-toothed, gradually narrowed and entire at base, fleshy, puberulent, lustrous, 1-nerved, sessile, the upper leaves gradually smaller, narrowly oblong; heads long-pedicelled, solitary, about 6 cm. across; involucres about 1 cm. long; bracts 4-seriate, puberulent, brownish on margin, the outer ovate-oblong, obtuse, the inner narrowly oblong; receptacle glabrous; ligulate corollas white, 22–28 mm. long, 5–6 mm. wide; achenes 3–4 mm. long.—Near seashores; Honshu (Kantō Distr. and northw.).

3. *Chrysanthemum yezoense* Maekawa. *C. arcticum* sensu auct. Japon., non L.; *C. arcticum* subsp. *maekawanum* Kitam.—Ko-HAMAGIKU. Plant stoloniferous and with long-creeping rhizomes; stems 10–50 cm. long, purplish, slightly pubescent; radical and lower cauline leaves long-petiole, ovate-cuneate or broadly so, 1–4 cm. long and as wide, pinnately cleft or lobed, the lobes oblong, obtusely toothed on upper margin, fleshy and nearly glabrous, glandular-punctate, the upper leaves spatulate, sometimes with a pair of stipule-

like appendages at base; heads solitary on branches, long-pedunculate, erect; outer involucral bracts linear, 1–1.8 mm. wide, rounded at apex, the median as long as the outer, oblong, about 3 mm. wide, with brown scarios margins, slightly reddish on upper half, the inner bracts slightly shorter; ligulate florets 1-seriate, the corollas white, about 2 cm. long, 4–6 mm. wide; achenes about 2 mm. long.—Sept.–Dec. Rocks near seashores; Hokkaido, Honshu (n. Kantō Distr. and northw.).

Chrysanthemum × *miyatojimense* Kitam. MIYATOJIMAGIKU. Hybrid of *C. morifolium* × *C. yezoense*.—Honshu (Rikuzen Prov.).

4. *Chrysanthemum weyrichii* (Maxim.) Miyabe. *Leucanthemum weyrichii* Maxim.; *C. littorale* Maekawa; *C. weyrichii* var. *littorale* (Maekawa) Kudo—PIREO-GIKU, Ezo-SONAREGIKU. Plant stoloniferous; stems 10–30 cm. long, simple or branched, purple, soft-pubescent; radical and lower cauline leaves long-petiole, fleshy, suborbicular, palmately 5-cleft or parted, the segments oblong, pinnately lobed to parted, slightly pubescent or nearly glabrous, the upper leaves smaller, pinnately cleft or linear and undivided; heads solitary, 4–4.5 cm. across, long-pedunculate; outer and median involucral bracts equal in length, the outer linear, about 1 mm. wide, the median oblong, about 3 mm. wide, the inner somewhat shorter; ligulate florets 1-seriate, the corollas pink or white, 15–16 mm. long, 4–4.5 mm. wide; achenes about 2 mm. long.—Aug.–Oct. Rocks near seashores; Hokkaido.—Sakhalin.

5. *Chrysanthemum lineare* Matsum. MIKOSHI-GIKU, HOSOBANA-SEITAKAGIKU. Plants stoloniferous; stems 30–100 cm. long, often branched, puberulent; lower leaves 4.5–9 cm. long, often withering before anthesis, sessile, subentire to 3-lobed or -cleft, or rarely pinnately cleft, the lobes 1 or 2 pairs, erect, linear, often incised to the base; heads solitary, 3–6 cm. across; involucres 5–6 mm. long, slightly woolly; bracts equal in length, the outer narrowly linear, rounded at apex, the inner oblong, with broad scarios margins; ligulate florets 1-seriate, sterile, the corollas white, about 2 cm. long, 5 mm. wide; achenes with 10 prominent ribs.—Sept.–Nov. Wet places in mountains; Honshu, Kyushu.—Korea and Manchuria.

6. *Chrysanthemum ornatum* Hemsl. *C. sinense* var. *satsumense* Yatabe; *C. decaisneanum* var. *satsumense* (Yatabe) Makino.—SATSUMA-GIKU. Rhizomes creeping, becoming woody; stems 25–50 cm. long, stout, branched, densely silvery-woolly; lower leaves thick, 4–6 cm. long, 4–5.5 cm. wide, pinnately lobed, truncate, long-petiolate, the lobes of 2 pairs, undulately toothed, green, with a white upper margin, with dorsifixed dense white-villous hairs beneath, the petioles 1.5–3.5 cm. long, the upper leaves gradually smaller; heads many, 4–5 cm. across; involucre about 6 mm. long; bracts 3-seriate, the outer linear or narrowly oblong, half as long as the inner, obtuse, the inner bracts oblong; ligulate florets 1-seriate, the corollas 18–22 mm. long, 4–5 mm. wide, white or somewhat pinkish; achenes about 1.5 mm. long.—Oct.–Dec. Near seashores; Kyushu (s. distr.).

7. *Chrysanthemum shiwogiku* Kitam. *C. decaisneanum* Matsum., excl. syn.; *C. decaisneanum* var. *discoideum* Makino; *C. ornatum* var. *discoideum* (Makino) Nakai—SHIOGOKU. Rhizomes creeping, woody; stems ascending, decumbent at base, 25–35 cm. long, densely silvery-hairy; lower leaves thick, obovate, 4–5 cm. long, 2.5–3 cm. wide, cuneate at base, the petioles 1–1.5 cm. long, pinnately lobed on upper half, the lobes broad, with 1 or 2 obtuse teeth or entire, green above, densely hairy with dorsifixed silvery hairs; heads in corymbs, on slender peduncles; involucre 5–6 mm. long; bracts 3-seriate, the outer linear or narrowly oblong, often densely hairy, the median and inner elliptic, broadly brownish scarious on margin; ligulate florets pistillate, the corollas often tubular, 3- or 4-lobed, sometimes slightly ligulate; achenes about 1.8 mm. long.—Nov.–Dec. Near seashores; Shikoku.

Var. *kinokuniense* Shimotomai & Kitam. KI-NO-KUNI-SHIOGOKU. Leaves narrower, often subspathulate, smaller, short-lobed near the top; involucre narrower.—Honshu (Kii and Shima Prov.).

Var. *ugoense* Hara & Mori. UGO-SHIOGOKU. Leaves broader, rhombic-obovate, 3–4 cm. wide, with deeper lobes; involucre slightly smaller, the outer bracts broader, ovate to ovate-oblong.—Rocky cliffs near seashores; Honshu (Ugo Prov.).

8. *Chrysanthemum pacificum* Nakai. *Pyrethrum marginatum* sensu Maxim., non Miq.; *C. marginatum* Miq. ex Matsum., non Korth.—ISOGOKU. Rhizomes long-creeping; stems arcuate-ascending, 30–40 cm. long, densely leafy at the top, densely silvery-tomentose above; cauline leaves thick, oblanceolate to obovate, 4–8 cm. long, 1.5–2.5 cm. wide, cuneate at the base, short-petiolate, pinnately lobed, green and nearly glabrous on upper side, glandular-dotted, white-margined, densely covered with silvery peltate hairs, the lobes often entire, obtuse, rarely 1- or 2-toothed; heads many, in corymbs; involucre depressed-globose, 4–5 mm. long, 5–6 mm. across; bracts 3-seriate, the outer short, ovate, white-hairy, the inner rhombic-elliptic; marginal corollas tubular, rarely ligulate, about 3 mm. long, 3- or 4-lobed, white or yellow; achenes about 1.5 mm. long.—Near seashores; Honshu (Kazusa, Sagami, Izu, and Suruga Prov. incl. Izu Is.).

9. *Chrysanthemum rupestre* Matsum. & Koidz. *C. palasiianum* var. *japonicum* (Fr. & Sav.) Matsum.; *Pyrethrum palasiianum* var. *japonicum* Fr. & Sav.—IWA-INCHIN, INCHIN-YOMOGI. Rhizomes short-creeping; stems densely tufted, 10–18 cm. long, densely white-hairy, leafy to the top; cauline leaves obovate, sessile, 2–2.5 cm. long, 1–2 cm. wide,

pinnately parted or 3-parted, the segments usually 2 pairs, narrowly linear, obtuse, green, pubescent above while young, silvery-tomentose beneath; heads 3–4 mm. across, few to rather numerous, in terminal corymbs, eligulate; involucre depressed-globose, about 2.5 mm. long; bracts 3-seriate, the outer short, oblong or ovate, the inner oblong, broadly scarious on the margins; ligulate florets few or absent, the corollas small, tubular, shorter than the disc florets.—Aug.–Sept. Rocky cliffs in high mountains; Honshu (centr. and n. distr.); rare.

Chrysanthemum × *konoanum* Makino. TOGAKUSHI-GIKU. Hybrid of *C. makinoi* × *C. rupestre*.—Reported to occur in Honshu (Mount Togakushi in Shinano Prov.).

10. *Chrysanthemum yoshinaganthum* Makino ex Kitam. NAKAGAWA-NOGIKU. Rhizomes woody; stems ascending, decumbent at base, about 60 cm. long, much branched, with dorsifixed hairs; cauline leaves rather coriaceous, densely arranged, obovate or oblanceolate-cuneate, 5–6 cm. long, 1.5–2.5 cm. wide, deeply 3-cleft to 1-lobed, the lobes oblong, obtuse, obtusely toothed, green, short-pubescent above, 3-nerved, with grayish appressed dorsifixed tomentum beneath, the petioles 5–10 mm. long, the upper leaves smaller; heads 3–4 cm. across, solitary or in loose corymbs, on long rigid peduncles; involucre 9–10 mm. long; bracts 3-seriate, the outer linear, 6–10 mm. long, about 1 mm. wide, gray-pubescent, the median and inner 7–8 mm. long, oblong, rounded at apex; ligulate florets 1- or 2-seriate, the corollas whitish or pinkish, 18–20 mm. long, about 4 mm. wide; achenes about 1.5 mm. long.—Dec. Valleys and ravines; Shikoku.

11. *Chrysanthemum makinoi* Matsum. & Nakai. *Pyrethrum sinense* var. *japonicum* Maxim.; *C. sinense* var. *japonicum* (Maxim.) Maxim. ex Matsum.; *C. japonicola* Makino; *C. makinoi* var. *japonicum* (Maxim.) Nakai; *C. makinoi* var. *laciniatum* Nakai; *C. makinoi* var. *elatum* Nakai—RYŪNGI-KU. Plants stoloniferous, becoming woody; stems ascending, 40–80 cm. long, often branched, the branches gray-tomentose; lower cauline leaves ovate or broadly so, cuneate rarely subtruncate at base, short-petiolate, green and short-pubescent on upper side, with grayish dorsifixed tomentum, 3-cleft or rarely 1-lobed, the lobes coarsely toothed, chartaceous; heads solitary, 2.5–5 cm. across, on slender peduncles; involucre about 7 mm. long; bracts equal in length, the outer narrowly linear, obtuse, gray-tomentose, the inner oblong, brownish and scarious on margin; ligulate florets white or pinkish, rarely yellow, the corollas 1–1.5 cm. long, 2–3 mm. wide, rarely tubular; achenes about 1.8 mm. long.—Oct.–Nov. Sunny hills and low mountains; Honshu, Shikoku; common.

Var. *wakasaense* (Shimotomai) Kitam. *C. wakasaense* Shimotomai—WAKASA-HAMAGIKU. Stems stouter; leaves larger, usually 5–10 cm. long, 2.5–5.5 cm. wide; heads many, about 2.5 cm. across, on slender peduncles.—Seashores; Honshu (Echizen to Tajima Prov.).

12. *Chrysanthemum japonense* (Makino) Nakai. *C. sinense* var. *spontanum* Makino; *C. sinense* var. *sinense* Makino; *C. morifolium* var. *genuinum* forma *japonense* Makino; *C. japonense* var. *debile* Kitam.—NOJIGIKU, SETO-NOJIGIKU. Stoloniferous; stems ascending, stout, decumbent at base, branched above, densely gray-tomentose; basal leaves withering before anthesis; lower cauline leaves broadly ovate, 3–5 cm. long, 2.5–4 cm. wide, usually shallowly cordate to truncate at base, the petioles 1.5–3 cm. long, pinnately cleft, the lateral lobes 2(–1)-pairs, elliptic, approximate, rounded at apex, obtusely toothed, the terminal lobes larger,

3-lobed, loosely pubescent above, with gray dorsifixed tomentum beneath, the upper leaves gradually smaller; heads rather numerous, sometimes loosely corymbose, 3–5.5 cm. across; involucre about 8 mm. long; bracts 3-seriate, the outer linear or linear-oblong, half as long as the inner or longer, rounded at apex, gray-tomentose, the inner oblong; ligulate florets 1(–2)-seriate, the corollas 1–2 cm. long, 3–5 mm. wide, white or pinkish, sometimes yellowish; achenes about 1.8 mm. long.—Oct.–Nov. Along the seacoast; Shikoku, Kyushu.

Var. *ashizuriense* Kitam. *ASHIZURI-NOJIGIKU*. Leaves thicker, smaller, more densely tomentose beneath, usually 3-lobed; heads smaller, more numerous.—Along the seacoast; Shikoku.

13. *Chrysanthemum cuneifolium* Kitam. *WAJIKI-GIKU*. Stems slender, much branched, elongate, becoming decumbent at base, with gray dorsifixed pubescence while young; median cauline leaves approximate, obovate-cuneate, about 6.5 cm. long, up to 3 cm. wide, long-tapering at base, usually 3-lobed, rarely 5-lobed, the lobes chartaceous, oblong, erect, acute to obtuse, mucronate-toothed, green and short-pubescent above, with dorsifixed short pubescence beneath, 3- to 5-nerved, the petioles about 2 cm. long; heads in loose corymbs, 23–25 mm. across, on slender peduncles, with few lanceolate bractlets; involucre about 7 mm. long; bracts nearly equal in length, rounded at apex, the outer linear, about 1 mm. wide, the median ovate-oblong, the inner elliptic; ligulate corollas 12.5–14 mm. long, about 2 mm. wide; achenes about 1.5 mm. long.—Nov. Shikoku (Wajiki in Awa).

14. *Chrysanthemum zawadskii* Herbach. *C. sibiricum* Fisch. ex Turcz.; *Leucanthemum sibiricum* var. *acutilobum* DC.; *C. sibiricum* var. *acutilobum* (DC.) Komar.; *C. zawadskii* var. *acutilobum* (DC.) Sealy; *C. zawadskii* var. *sibiricum* Sealy; *C. hakusanense* Makino—IWAGIKU. Rhizomes often long-creeping, woody, simple or branched, purplish; radical and lower cauline leaves long-petiolate, broadly ovate, 1–3.5 cm. long, 1–4 cm. wide, bipinnate, the ultimate segments 1–2 mm. wide, acute or obtuse, glandular-dotted, loosely appressed-pubescent to nearly glabrous, lustrous above, the petioles 2–4.5 cm. long; upper leaves gradually smaller and sometimes clasping at base, the uppermost ones linear; heads solitary, 3–6 cm. across; involucre 6–7 mm. long; bracts 3-seriate, nearly equal in length, the outer narrowly linear, rounded, the inner oblong; ligulate florets 1-seriate, the corollas 1.5–3 cm. long, 3–6.5 mm. wide; achenes about 2 mm. long.—Aug.–Oct. Mountains; Honshu (Echizen, Kaga, and Yamato Prov.), Shikoku, Kyushu.—Korea, n. China, Manchuria, Siberia, and the Carpathian Mountains.

Var. *latilobum* (Maxim.) Kitam. *Leucanthemum sibiricum* DC.; *L. sibiricum* var. *latilobum* Maxim.; *C. sibiricum* var. *latilobum* (Maxim.) Komar.; *C. nakdongense* Nakai; *C. erubescens* Stapf.; *C. rubellum* Sealy—CHŌSEN-NOGIKU. Stems stout, to 1 m. long; leaves long-petiolate, ovate or broadly so, truncate to shallowly cordate at base; upper leaves often cuneate at the base, pinnatifid to 3-lobed, the lateral lobes usually 4, oblong, obtuse, toothed or shallowly lobulate; heads to 8 cm. across.—Aug.–Oct. Kyushu (Tsushima, Hirado Isl., and Isomadake in Satsuma).—Korea, Manchuria, and n. China.

Var. *campanulatum* (Makino) Kitam. *C. sibiricum* var. *campanulatum* Makino—OGURAGIKU. Heads 3–5 cm.

across; ligulate florets many, the corollas broad, often connate; tubular florets few, the corollas to 2 cm. long; leaves broadly ovate, pinnately lobed.—Cultivated in our area.

15. *Chrysanthemum boreale* (Makino) Makino. *C. indicum* var. *boreale* Makino; *C. lavandulaefolium* sensu auct. Japon, non Fisch.; *Artemisia debilis* Kitam.; *C. seticuspe* var. *boreale* (Makino) Hand.-Mazz.—ABURAGIKU, AWA-KOGANE-GIKU. Rhizomes short; stems tufted, erect, 1–1.5 m. long, branched in upper part, rather prominently white-pubescent; median cauline leaves oblong-ovate, 5–7 cm. long, 4–6 cm. wide, slightly cordate or truncate and abruptly narrowed at base, pinnately parted, the segments 2 pairs, oblong, obtuse, acutely incised-toothed, with a broad sinus at base, loosely pubescent above, with dorsifixed pubescence beneath, the petioles 1–2 cm. long; heads nearly corymbose, terminal, many, about 15 mm. across, nodding after anthesis; involucre about 4 mm. long; bracts 3- or 4-seriate, the outer linear or narrowly oblong, soft-pubescent, the inner elliptic; ligulate corollas 5–7 mm. long, 1.5–2 mm. wide, yellow; achenes about 1 mm. long.—Oct.–Nov. Honshu, Kyushu (Iki and Tsushima).—Korea, Manchuria, and n. China.

Chrysanthemum × *leucanthemum* Makino. *SHIROBANA-ABURAGIKU*. Hybrid of *C. boreale* × *C. makinoi*.

16. *Chrysanthemum okiense* Kitam. *C. boreale* var. *okiense* (Kitam.) Okuyama—OKI-NO-ABURAGIKU. Rhizomes creeping; stems to 60 cm. long, often decumbent, branched above, gray-pubescent; median cauline leaves chartaceous, dense, ovate, obtuse, truncate or shallowly cordate at base, falsely stipulate, short-pubescent above, with soft dorsifixed pubescence beneath, deeply pinnatifid, petiolate, the lateral lobes 2 pairs, oblong, obtuse, irregularly incised-toothed; uppermost leaves spatulate, pinnatifid or linear and entire; heads many, in false umbels, 15–20 mm. across, the pedicels densely white-pubescent; involucre about 5 mm. long; bracts 3-seriate, the outer narrowly oblong or ovate, obtuse, loosely short-pubescent, the inner oblong; ligulate corollas about 8 mm. long, 2.5 mm. wide; achenes about 1.5 mm. long.—Nov. Honshu (Oki Isl.).

17. *Chrysanthemum indicum* L. *C. sabinii* Lindl.; *C. indicum* var. *coreanum* Lévl.—ABURAGIKU, HAMA-KANGIKU, SHIMA-KANGIKU. Plant stoloniferous and with creeping rhizomes; stems leafy, slightly decumbent with deciduous soft dorsifixed pubescence; median cauline leaves chartaceous, ovate-oblong, 3–5 cm. long, 2.5–4 cm. wide, slightly cordate to truncate and abruptly narrowed at base, falsely stipulate, the petioles 1–2 cm. long, pinnately cleft, the terminal lobe largest, obtuse, the lateral lobes 2 pairs, elliptic to oblong, toothed, with a narrow or rather broad sinus between the lobes, short-pubescent above, with soft dorsifixed pubescence beneath; heads about 2.5 cm. wide, in loose terminal corymbs, the pedicels slender; involucre 5–6 mm. long; bracts 4-seriate, the outer small, oblong or ovate, the inner shorter than the median; ligulate corollas yellow, 11–13 mm. long, 2.5–3 mm. wide; achenes about 1.8 mm. long.—Oct.–Dec. Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Var. *albescens* Makino. *C. indicum* subsp. *albescens* (Makino) Kitam.—SHIROBANA-KANGIKU. Ligulate corollas white.

Var. *ijoense* Kitam. *IYO-ABURAGIKU*. Branches prominently soft-pubescent; leaves somewhat smaller, about 4 cm. long, 2.5 cm. wide, pinnately parted, the segments 2 pairs,

oblong, pinnately cleft, green and pubescent above, rather densely pubescent with dorsifixed hairs.—Shikoku (Iyo Prov.).

Chrysanthemum × *ogawae* Kitam. HI-NO-MISAKIGIKU.
Hybrid of *C. indicum* × *C. shiwogiku* var. *kinokuniense*.

18. *Chrysanthemum aphrodite* Kitam. SANINGIKU.
Stoloniferous; stems about 1 m. long, woody at base, glabrous, decumbent, the branches white-pubescent; median and upper cauline leaves thin, broadly ovate, 5–7 cm. long, 4.5–5.5 cm. wide, cordate and long-decurrent at base, scabrous and green

above, white-pubescent beneath, pinnately cleft, the lobes of 2 pairs, oblong, rounded, mucronate-toothed; heads 3–4 cm. across, in terminal corymbs; involucre 8 mm. long; bracts 3-seriate, the outer linear or oblong, rounded, the inner ovate; ligulate florets 14–24, the corollas 17–23 mm. long, 3–4 mm. wide, yellow or white, sometimes rose-colored; achenes about 2 mm. long.—Nov.–Dec. Honshu (Japan Sea side from Etchu Prov. westw.).

Chrysanthemum × *shimotomai* Makino. NIJIGAHAMAGIKU.
Hybrid of *C. aphrodite* × *C. pacificum*.

42. ARTEMISIA L. YOMOGI ZOKU

Entomophilous herbs or subshrubs, aromatic or bitter to taste, often silky or cobwebby; leaves alternate, entire, incised, or 1 to 3 times pinnate; heads small, usually nodding at anthesis, erect in fruit, in racemes, panicles, or solitary, heterogamous; disc florets without ligulate florets; involucre subglobose to ovoid; bracts few-seriate, imbricate, the outer small or nearly as long as the inner, scarious on margin; receptacle flat or globose, often hairy; marginal florets pistillate, 1-seriate, fertile, the central ones bisexual, fertile or sterile, the heads sometimes without marginal florets and hence homogamous; pistillate corollas with slender tubes, shortly 2- or 3-lobed, the central florets with 5-lobed actinomorphic corollas; anthers with lanceolate appendages; achenes obovoid, terete, or usually with 2 obsolete wings, glabrous or hairy, rounded and with a disc at apex, without a pappus.—About 200 species, in the N. Hemisphere.

1A. Central florets sterile.

2A. Heads 4 mm. wide; cauline leaves not clasping at base; sterile shoots elongate, decumbent; radical leaves gray-woolly, pinnately parted. 1. *A. congesta*

2B. Heads 1–3 mm. wide; cauline leaves clasping at base.

3A. Heads 1–1.2 mm. across; leaf-segments filiform. 2. *A. scoparia*

3B. Heads 1.5–3 mm. across; leaf-segments of some of them broader.

4A. Subshrub; ultimate leaf-segments filiform. 3. *A. capillaris*

4B. Herb; ultimate leaf-segments broader, not filiform. 4. *A. japonica*

1B. Central florets fertile.

5A. Receptacles glabrous.

6A. Annuals.

7A. Ultimate leaf-segments acute; heads rounded at base.

8A. Leaves thrice pinnate, the rachis entire; heads about 1.5 mm. across. 5. *A. annua*

8B. Leaves bipinnate, the rachis pectinate; heads about 5–6 mm. wide. 6. *A. apiacea*

7B. Ultimate leaf-segments obtuse; heads obconical, about 4 mm. wide. 7. *A. fukudo*

6B. Perennials.

9A. Style-branches acuminate; median cauline leaves obovate or spatulate, cuneate at base. 8. *A. keiskeana*

9B. Style-branches truncate.

10A. Leaves usually rather densely silky-pubescent, rarely glabrous.

11A. Heads large, 8–14 mm. across.

12A. Leaves spatulate, simple, incised-toothed. 12. *A. pedunculosa*

12B. Leaves 1–3 times pinnate.

13A. Cauline leaves 5–9 cm. long, 2–3 times pinnate.

14A. Cauline leaves thrice pinnate, the ultimate segments about 1 mm. wide. 13. *A. sinanensis*

14B. Cauline leaves bipinnate, the ultimate segments 1.5–2 mm. wide. 14. *A. arctica*

13B. Cauline leaves 1.5–2 cm. long, palmately 3- to 5-sected. 10. *A. trijucata*

11B. Heads smaller, 4–6.5 mm. across.

15A. Stems 7–16 cm. long; leaves palmately divided.

16A. Heads in corymbose racemes, 4.5 mm. long, about 6.5 mm. wide. 10. *A. trijucata*

16B. Heads in dense corymbs, 4–4.5 mm. across. 9. *A. glomerata*

15B. Stems 25–40 cm. long; leaves bipinnate or simple.

17A. Leaves bipinnate. 11. *A. laciniata*

17B. Leaves simple. 8. *A. keiskeana*

10B. Leaves cobwebby, often densely so beneath, rarely glabrous.

18A. Heads 8–10 mm. wide; leaves pinnately cleft, densely cobwebby and grayish on both sides. 15. *A. stelleriana*

18B. Heads 1–6 mm. wide.

19A. Plants without stolons; ultimate leaf segments relatively small, 1.5–4.5 mm. wide. 16. *A. iwaiyomogi*

19B. Plants stoloniferous; ultimate leaf segments relatively large.

20A. Heads 2 mm. long, about 1 mm. across. 17. *A. feddei*

20B. Heads more than 1 mm. across.

21A. Leaves white-spotted above.

22A. Median leaves bipinnate, the ultimate segments linear. 18. *A. dubia*

22B. Median leaves 3-fid, the lateral lobes lanceolate to oblong. 19. *A. gilvoscens*

21B. Leaves not white-spotted above.

- 23A. Leaves simple, oblong-lanceolate, acuminate at both ends, acutely toothed. 20. *A. monophylla*
 23B. Leaves once to twice pinnately parted to cleft.
 24A. Leaves once to twice pinnately parted; involucre bracts equal in length. 21. *A. unalaskensis*
 24B. Leaves pinnately cleft; outer involucre bracts shorter.
 25A. Heads 3–6 mm. wide.
 26A. Heads 3–4 mm. wide, 4–4.5 mm. long, cobwebby; leaves cobwebby above, gray-woolly beneath. 22. *A. stolonifera*
 26B. Heads 4–6 mm. wide, about 5 mm. long, villous; leaves villous, the upper ones gray-cobwebby. 23. *A. koidzumii*
 25B. Heads 1.5–2.5 mm. wide.
 27A. Upper leaves and heads densely cobwebby; heads 1.5–2 mm. wide. 24. *A. momiyamae*
 27B. Upper leaves and heads not densely cobwebby.
 28A. Leaves bipinnate, the segments narrow, 5–7 mm. wide, acuminate; heads 2–2.5 mm. long, 1.5 mm. wide. 25. *A. rubripes*
 28B. Leaves pinnately parted to divided.
 29A. Stems 1.5–2 m. long; leaves 15–19 cm. long; heads 3.5 mm. long, about 3 mm. wide. 26. *A. montana*
 29B. Stems 0.5–1 m. long; leaves 5–10 cm. long.
 30A. Heads 2.5–3.5 mm. long, about 1.5 mm. wide. 27. *A. princeps*
 30B. Heads 3.5–4 mm. long, about 2.5–3 mm. wide. 28. *A. indica*
 5B. Receptacles densely hairy.
 31A. Stems branched; heads about 5 mm. across, in panicles. 29. *A. schmidtiana*
 31B. Stems simple; heads about 8 mm. across, in simple racemes. 30. *A. kitadakensis*

1. *Artemisia congesta* Kitam. ONI-OTOKO-YOMOGI. Rhizomes long-creeping, 4–7 mm. across; flowering stems 40–65 cm. long, branched above, gray-woolly while young; sterile shoots elongate, decumbent, with a tuft of rosulate leaves at apex; basal leaves rather thick, long-petiolate, densely gray-woolly while young, ovate or broadly so in outline, 5.5–8 cm. long, 6–7 cm. wide, pinnately parted, the segments oblong-cuneate, pinnately cleft or incised, the cauline leaves petiolate, 5–7 cm. long, 1–2 mm. wide, bipinnate, gray-woolly to glabrescent, the upper leaves short-petiolate, smaller, pinnate, the uppermost leaves becoming bracteate, linear, entire; heads many, in a spikelike panicle; involucre globose, 3.5 mm. long, 4 mm. wide; bracts 4-seriate, the outer smallest, ovate, obtuse, the inner elliptic; achenes 1.3 mm. long.—Sept. Near seashores; Hokkaido (Kojima in Oshima Prov.), Honshu (Benjenjima in Mutsu).

2. *Artemisia scoparia* Waldst. & Kitaib. *A. capillaris* var. *scoparia* (Waldst. & Kitaib.) Pampan. HAMA-YOMOGI. Roots fusiform, branched; flowering stems 60–90 cm. long, much branched above, sometimes with purplish sterile shoots at base provided with a tuft of rosulate leaves at the apex; cauline leaves 3–5 cm. long, 2–5 cm. wide, once to twice pinnate, broadly clasping at base, the segments filiform, elongate, the upper leaves gradually smaller; heads very many, small, 1.2–1.5 mm. long, 1–1.2 mm. wide, in large panicles, the pedicels short; involucre globose, glabrous; bracts 3-seriate, the outer shortest, broadly ovate or elliptic, obtuse, the median and inner elliptic.—Sept.–Nov. Waste grounds; Honshu. —Korea, Manchuria, n. India, China, Siberia, and Europe.

3. *Artemisia capillaris* Thunb. *A. capillaris* var. *arbuscula* Miq. —KAWARA-YOMOGI. Subshrub; stems somewhat woody, 30–100 cm. long, much branched, silky-pubescent while young; sterile shoots with a tuft of rosulate leaves at the tip; upper leaves of the sterile shoots long-petiolate, broadly clasping at base, bipinnatisect, 1.5–3.8 cm. long, the ultimate segments filiform, 0.3–1(–2) mm. wide, usually densely silky, the median cauline leaves 1.5–9 cm. long, 1–7 cm. wide, broadly clasping at base, bipinnatisect, glabrous to densely silky, the upper leaves smaller, pinnatisect; heads very numerous, globose or ovoid, glabrous, 1.5–2 mm. long and as wide, in large

panicles; involucre bracts 3- or 4-seriate; outer very small, ovate, obtuse, the inner elliptic, rounded at apex, keeled on back; achenes 0.8 mm. long.—Sept.–Oct. Along rivers and seashores; Honshu, Shikoku, Kyushu.—Korea, Manchuria, China, Formosa, and Philippines.

4. *Artemisia japonica* Thunb. *Chrysanthemum japonicum* Thunb.; *A. subintegra* Kitam.; *A. manshurica* Komar. —OTOKO-YOMOGI. Herb; nonflowering stems elongate, with a tuft of leaves at the tip; leaves of the sterile shoots spatulate, 3.5–8 cm. long, 1–3 cm. wide, rounded, pinnately lobed and toothed, loosely silky-pubescent on both sides; flowering stems 40–100 cm. long, branched above, rarely cobwebby; median leaves rather fleshy, cuneate-spatulate, 4–8 cm. long, toothed, 3-fid, pinnately parted, or pinnately divided, the bracteate leaves linear, small; heads small, many, ovoid-globose or ellipsoidal, slightly lustrous, yellow-green, glabrous, in panicles; outer involucre bracts small, ovate, obtuse, the inner elliptic, rounded at apex; achenes 0.8 mm. long.—Aug.–Nov. Sunny hills and low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, Korea, Manchuria, China, and Philippines.

Var. *macrocephala* Pampan. *A. desertorum* sensu auct. Japon., non Spreng.; *A. japonica* var. *desertorum* sensu auct. Japon., non Maxim.; *A. littorica* Kitam. —HAMA-OTOKO-YOMOGI. Heads larger, about 2 mm. wide; leaves pinnate or bipinnately cleft.—Near seashores; Hokkaido, Honshu (Ugo Prov.).—s. Kuriles and Sakhalin.

5. *Artemisia annua* L. KUSO-NINJIN. Annual; stems to 1.5 m. long, glabrous, much branched; median cauline leaves broadly clasping at base, ovate in outline, 4.5–7 cm. long, tripinnate, the pinnae oblong, spreading, the ultimate segments acute, about 0.4 mm. wide, mealy-puberulent above, glandular-dotted, the rachis entire, the upper leaves smaller; heads globose, small, about 1.5 mm. long, very numerous; involucre glabrous; bracts 2- or 3-seriate, the outer narrowly oblong, green, the median and inner elliptic, green on back; achenes 0.7 mm. long.—Aug.–Oct. Waste grounds and cultivated fields; Honshu, Shikoku.—Formosa, Korea, Manchuria, Siberia, China, India, w. Asia, and e. Europe; naturalized in w. Europe and N. America.

6. *Artemisia apiacea* Hance. *A. carvifolia* var. *apiacea* (Hance) Pampan.; *A. thunbergiana* Maxim.—KAWARA-NINJIN, NO-NINJIN. Biennial; stems 40–150 cm. long, glabrous, much branched; radical and lower cauline leaves withering before anthesis, oblong in outline, 9–15 cm. long, 3.5–5.5 cm. wide, bipinnate, the primary segments oblong, spreading, pectinate on upper part, the secondary segments 1.5–2 mm. wide, acutely incised, dentate, glabrous on both sides, the median leaves oblong, about 6 cm. long, bipinnatifid, the primary segments loose, the ultimate segments incised-dentate, usually 0.5 mm. wide; heads many, in large panicles, nodding in anthesis, subglobose, 3.5–4 mm. long, 5–6 mm. wide, on slender pedicels; involucre globose; the bracts 3-seriate, the outer narrowly oblong, slightly shorter, the median and inner oblong, equal in length, green and punctate on back, yellow-scarious on margin; achenes about 1 mm. long.—Aug.–Sept. Along rivers, cultivated fields, and waste grounds; Honshu, Shikoku, Kyushu.—Korea, China, and Manchuria.

7. *Artemisia fukudo* Makino. FUKUDO, HAMA-YOMOGI. Biennial or a short-lived perennial; stems 30–50 cm. long, purplish, cobwebby while young, much branched from the base; radical leaves thick, rosulate, withering before anthesis, 14–21 cm. long inclusive of the petiole, flagellate, palmately 2- or 3-parted, the segments linear, about 2 mm. wide, rounded at apex, cobwebby while young, the lower cauline leaves withering before anthesis, long-petiolate, 9–12 cm. long, pinnately parted, the ultimate leaf segments linear, about 2 mm. wide, obtuse, cobwebby while young, the upper leaves 3-lobed or linear and entire, 1–3 cm. long; heads obconical, 3–5 mm. long, about 4 mm. wide, in panicles; involucre bracts green, the median ovate-oblong, obtuse; achenes 1.2–2 mm. long.—Sept.–Oct. Clay soils near seashores; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Korea.

8. *Artemisia keiskeana* Miq. INU-YOMOGI. Perennial; rhizomes stout; sterile shoots decumbent, with a tuft of rosulate leaves at the tip; median cauline leaves chartaceous, obovate or spatulate, 3–10 cm. long, 1.5–4.5 cm. wide, rounded at apex, cuneate, coarsely obtuse-toothed, green, short-pubescent above, glandular-dotted, pale green and silky beneath; flowering stems 30–80 cm. long, branched and often silky above; median leaves obovate to spatulate, 4.5–8.5 cm. long, 17–40 mm. wide, obtuse, coarsely incised-dentate, cuneate at base, sometimes short-pubescent above, rather densely silky beneath, the upper leaves gradually smaller, obovate, incised or entire; heads globose, 3–3.5 mm. long and as wide, in narrow panicles, the pedicels nodding in anthesis; involucre glabrous; bracts 3- or 4-seriate, the outer smaller, about 1 mm. long, broadly ovate, obtuse, the median elliptic, green on back; style branches acuminate; achenes about 2 mm. long.—Aug.–Oct. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and n. China.

9. *Artemisia glomerata* Ledeb. *A. leontopodioides* Fisch. ex Bess.; *A. curilensis* Spreng. ex Bess.—HAHA-KO-YOMOGI. Rhizomes creeping, 1–3 mm. across; stems 7–15 cm. long, slender, densely white-silky, short-branched above; leaves of the sterile shoots radical, obovate or flabellate in outline, 1.2–4.6 cm. long, dilated and clasping at base, petioles 5–32 mm. long, bipalmately cleft, the segments linear, about 1 mm. wide, obtuse, densely silky on both sides, the median leaves spatulate or flabellate, 13–20 mm. long, 3- or 4-cleft or bipalmately cleft, densely silky, the petioles winged, the uppermost leaves often oblong, 2–2.5 mm. wide, entire; heads glo-

bosc-campanulate, about 5 mm. long, 4–4.5 mm. wide, in dense corymbs, pedicelled; involucre densely silky, the bracts 3-seriate, equal in length, elliptic to obovate-oblong; achenes about 1.5 mm. long.—Aug. Rocky cliffs in alpine regions; Honshu (Mount Nishikoma and Kotadake).—Sakhalin, Kuriles, Siberia, Kamchatka, and Alaska.

10. *Artemisia trifurcata* Steph. ex Spreng. *A. heterophylla* Bess.; *A. trifurcata* var. *heterophylla* (Bess.) Kudo.—NAGAE-HAHA-KO-YOMOGI. Rhizomes stout, slightly branched; stems tufted, 12–16 cm. long, gray-silky, branched above; rosulate leaves of the sterile shoots to 8 cm. long, densely gray-silky on both sides, bipalmately divided, long-petiolate, the median cauline leaves 1.5–2.5 cm. long, 6–12 mm. wide, palmately 3- to 5-sected, densely silky on both sides, the segments obtuse, about 1 mm. wide, the petioles 6–11 mm. long, the upper leaves linear, 2–2.5 mm. wide; heads in corymbose racemes, long-pedicellate, nodding in anthesis, about 4.5 mm. long, 6.5 mm. wide; involucre densely silky, subglobose, the bracts 2-seriate, equal in length, elliptic, rounded; achenes about 2 mm. long.—Aug. Hokkaido (Mount Daisetsu).

Var. *pedunculosa* (Koidz.) Kitam. *A. glomerata* var. *pedunculosa* Koidz.; *A. yezoensis* Tatew. & Kitam.—EZO-HAHA-KO-YOMOGI. Heads larger, about 8 mm. across, with 30 to 40 florets.—Kuriles, Kamchatka, Siberia, and N. America.

11. *Artemisia laciniata* Willd. *A. sacrorum* var. *major* forma *japonica* Pampan.; *A. laciniata* var. *glabriuscula* forma *dissecta* Pampan.—SHIKOTAN-YOMOGI. Rhizomes decumbent, stout, woody; stems 25–40 cm. long, cobwebby while young, branched above; rosulate leaves of the sterile shoots oblong in outline, 12–18 cm. long inclusive of the petioles, 5.5–6 cm. wide, bipinnate, green above, appressed-silky beneath, the primary segments about 8 pairs, elliptic, the secondary segments oblong, pinnatifid, the ultimate segments acute, 0.5–0.7 mm. wide, the median leaves similar to the radical but smaller, short-petiolate, the uppermost leaves linear and small; heads globose, 2.5–4 mm. long, 4–6 mm. wide, pedicelled, in a narrow panicle; involucre glabrous; bracts 4-seriate, the outer 2.5 mm. long, broadly ovate, the median and inner broadly elliptic; achenes about 1.2 mm. long.—Aug.–Oct. Hokkaido (Nemuro Prov. and Rebun Isl.).—s. Kuriles, Sakhalin, Korea, Manchuria, China, India, Siberia, and Europe.

12. *Artemisia pedunculosa* Miq. MIYAMA-OTOKO-YOMOGI. Rhizomes 2.5–6 mm. thick; plant stoloniferous; stems 15–35(–45) cm. long, silky-pubescent while young, usually purplish, short-branched above; rosulate leaves of the sterile shoots chartaceous, obovate-spatulate, 2.7–9 cm. long, 13–23 mm. wide, rounded at apex, incised-toothed, green above, silky-pubescent beneath, winged-petiolate, the radical leaves of flowering stems withering before anthesis, the median leaves sessile, oblanceolate-spatulate, 2.5–6 cm. long, 6–16 mm. wide, rounded at apex, gradually narrowed at base, obtusely incised-toothed; heads subglobose, about 6 mm. long, 8–10 mm. wide, nodding in anthesis, long-pedicelled, in simple or compound racemes; involucre glabrous, the bracts nearly equal in length, 3-seriate, ovate-elliptic to elliptic, yellowish; achenes about 2 mm. long, short-pilose while young.—Aug.–Sept. Alpine; Honshu (centr. distr.).

13. *Artemisia sinanensis* Yabe. TAKANE-YOMOGI. Rhizomes stout; stems 20–50 cm. long, rather stout, densely silky-pubescent while young, short-branched above; cauline leaves

of the sterile shoots similar, elliptic or obovate, 12–15 cm. long inclusive of the long petioles, silky, tripinnate, silky-pubescent, the ultimate segments linear, about 1 mm. wide, the median and upper cauline leaves smaller, short-petiolate or sessile, elliptic, bi- or tripinnate; heads 6–7 mm. long, 12–14 mm. wide, pedicelled, in narrow panicles; involucre glabrous, the bracts 3-seriate, equal in length, ovate to elliptic or oblong.—Aug. Alpine slopes; Honshu (centr. distr., Uzen and Iwashiro Prov.).

14. *Artemisia arctica* Less. *A. norvegica* sensu auct. Japon., non Fries; *A. arctica* var. *sachalinensis* F. Schmidt—SAMANI-YOMOGI. Rhizomes stout, elongate; stems 20–50 cm. long, stout, yellow-brown villous while young, short-branched above; radical leaves persistent in anthesis, long-petiolate, ovate-elliptic, in outline, 3.5–4 cm. long, bipinnately parted, the primary segments 2 or 3 pairs, irregularly palmately cleft, the ultimate segments entire, acute or toothed, brownish white villous while young, the cauline leaves gradually smaller, with false stipules at base, the upper leaves oblong, once or twice pinnate, sessile and clasping, the ultimate segments 1.5–2 mm. wide; heads subglobose, about 5 mm. long, 10 mm. wide, in simple or compound racemes, involucre dark brown, glabrous; bracts 3-seriate, the outer ovate, 2.5–3 mm. long, obtuse, the inner elliptic.—July–Sept. Alpine; Hokkaido, Honshu (n. distr.).—Sakhalin, Kuriles, Siberia, and N. America.—Forma *villosa* (Koidz.) Kitam. *A. norvegica* var. *villosa* Koidz.; *A. arctica* var. *villosa* (Koidz.) Tatew.; *A. caekranowskiana* sensu auct. Japon., non Trautv.—SHIRO-SAMANI-YOMOGI. Plants densely villous.—Hokkaido.

15. *Artemisia stelleriana* Bess. *A. stelleriana* var. *vesiculosa* Fr. & Sav.; *A. stelleriana* var. *sachalinensis* Nakai—SHIRO-YOMOGI. Plant stoloniferous; rhizomes elongate, branched, 2–5 mm. across; stems 20–65 cm. long, nodding in upper part before anthesis, densely white-villous; leaves of the sterile shoots rather thick, ovate to oblong in outline, 3–7 cm. long inclusive of the long petioles, pinnately cleft, the segments 2-cleft, oblong, obtuse, densely cobwebby and grayish on both sides, the median cauline leaves 3–9 cm. long, 2–5 cm. wide, pinnately parted, the segments 2 or 3 pairs, narrowly oblong, entire or 2-fid, obtuse, white-woolly above, densely white-tomentose beneath, the upper leaves gradually smaller, pinnately cleft or entire; heads globose, 7 mm. long, 8–10 mm. wide, in narrow panicles; involucre densely long-woolly, the bracts 4-seriate, nearly equal, oblong to narrowly so; achenes about 3 mm. long.—July–Oct. Sand dunes along the sea-coast; Hokkaido, Honshu (n. Kantō Distr. and northw.).—Korea, Sakhalin, Kuriles, Kamchatka, and Ochotsk Sea region; naturalized in Europe and N. America.

16. *Artemisia iwayomogi* Kitam. *A. sacrorum* var. *latiloba* sensu auct. Japon., non Ledeb.—IWA-YOMOGI. Rhizomes woody; stems tufted, 50–100 cm. long, slightly woody at base, branched above; median cauline leaves bipinnate, ovate in outline, acute, truncate at base, green, short-pubescent on upper surface, glandular-dotted beneath, cobwebby while young, the petioles 2–3 cm. long, the segments 6–10 pairs, spreading, approximate, oblong, obtuse, the ultimate segments pinnately lobed or incised-dentate, 1.5–4.5 mm. wide, the upper leaves gradually smaller, the uppermost oblanceolate; heads many, globose, 3–3.5 mm. long and as much across, in panicles; involucre nearly glabrous, the outer bracts 1 mm. long, oblong, the median ovate, the inner elliptic; achenes 1.5 mm.

long.—Sept.–Oct. Hokkaido.—s. Kuriles, Sakhalin, Korea and Manchuria.—Forma *laciniiformis* (Nakai) Kitam. *A. sacrorum* var. *laciniiformis* Nakai. Leaves much-dissected.

17. *Artemisia feddei* Lév. & Van't. *A. lavandulaefolia* var. *feddei* (Lév. & Van't.) Pampan.—HIME-YOMOGI. Plant stoloniferous; rhizomes elongate, creeping; stems 1–1.2 m. long, cobwebby, often purplish, branched above; median cauline leaves thin, 3–7 cm. long, 28–65 mm. wide, pinnately parted, the segments 2 or 3 pairs, linear, obtuse, thinly cobwebby above, densely white-villous beneath, the upper ones gradually smaller, the uppermost bracteate; heads numerous, small, sessile, about 2 mm. long, about 1 mm. wide; involucre loosely cobwebby; bracts 4-seriate, the outer short, broadly ovate, obtuse, the median suborbicular, the inner elliptic; achenes about 1.1 mm. long.—Grassy places; Honshu, Shikoku, Kyushu.—Korea, Manchuria, China, and Formosa.

18. *Artemisia dubia* Wall. *A. lavandulaefolia* DC. pro parte; *A. umbrosa* Turcz.; *A. vulgaris* var. *umbrosa* Bess.; *A. codonoccephala* Diels; *A. araneosa* Kitam.—KESHŌ-YOMOGI. Rhizomes elongate; plant stoloniferous; stems stout, 1.5–2 m. long, prominently cobwebby and whitish, short-branched, the branches nodding toward the top while young; median cauline leaves with false stipules at base, 11–14 cm. long, about 8 cm. wide, bipinnate, densely white-punctate and silky-cobwebby above, densely grayish tomentose beneath, the petioles 2.5–3 cm. long, the primary segments usually 2 pairs, the ultimate segments linear, 5–7 mm. wide, gradually narrowed to tip, mucronate, entire, the upper leaves gradually smaller, pinnately cleft, 3-fid, or entire, short-petiolate or sessile, the lobes linear, acuminate, silky-cobwebby; heads globose to campanulate, 3–3.5 mm. long, about 3 mm. wide, in leafy narrowly pyramidal panicles 25–30 cm. long; involucre densely cobwebby; bracts 3- or 4-seriate, the outer ovate or ovate-acuminate, 1.8–2.5 mm. long, the inner oblong; achenes about 1 mm. long.—Kyushu.—Korea, Manchuria, n. China, Dahuria to India.

19. *Artemisia gilvescens* Miq. *A. vulgaris* var. *gilvescens* (Miq.) Nakai—WATA-YOMOGI. Stems 30 cm. high or higher, densely woolly, short-branched above, the branches nodding; median cauline leaves chartaceous, 6–7 cm. long, 2.8–4.5 cm. wide, sessile, cuneate at base, 3-fid, the terminal lobe oblong, acute, entire or with 1 tooth on each side, the lateral lobes oblong-lanceolate, smaller, acuminate, green, densely white-punctate and short-pubescent above, densely woolly beneath, the upper leaves gradually smaller, oblong, acute, cuneate at base, sessile, entire, slightly recurved; panicles narrow; heads tubular, about 4 mm. long, 2 mm. wide, densely long-woolly; involucre bracts 3-seriate; outer ovate, obtuse, rather short, the median and inner oblong, rounded at the tip; achenes 0.8 mm. long.—Honshu (Nagato Prov.), Shikoku.—China.

20. *Artemisia monophylla* Kitam. *A. vulgaris* var. *integrifolia* sensu auct. Japon., non L.; *A. viridissima* var. *japonica* Pampan.—HITOTSUBA-YOMOGI, YANAGI-YOMOGI. Rhizomes creeping; stems 70–100 cm. high, tufted, densely cobwebby while young, branched above; cauline leaves many, chartaceous, approximate, oblong-lanceolate, 6.5–14 cm. long, 2–4 cm. wide, gradually acuminate at both ends, mucronate, acutely toothed, green and slightly cobwebby above, long whitish tomentose beneath, short-petiolate, the upper leaves gradually smaller, lanceolate, acuminate; heads campanulate, subsessile, 3–4 mm. long, 2–3 mm. wide, cobwebby, in narrow

panicles; achenes about 2 mm. long.—Aug.–Oct. High mountains; Honshu (centr. and n. distr. incl. high mountains of Mimasaka and Hōki Prov. in Chūgoku Distr.).

21. *Artemisia unalaskensis* Rydb. *A. vulgaris* var. *hamtschatica* Bess.; *A. vulgaris* var. *coarctata* sensu auct. Japon., non Bess.; *A. nipponica* (Nakai) Pampan.; *A. opulenta* Pampan.; *A. vulgaris* var. *nipponica* Nakai; *A. verlotorum* Hult., non Lamotte; *A. pampaninii* Kitam.—CHISHIMA-YOMOGI, Ezo-ō-YOMOGI. Plant stoloniferous; rhizomes elongate; stems 30–100 cm. long, short-pubescent toward the top; median cauline leaves thinly chartaceous, 10–15 cm. long, 7–10 cm. wide, pinnate to bipinnately parted or cleft, the petioles 13–30 mm. long, the primary segments 3 pairs, oblong, the secondary segments lanceolate, usually acuminate or acute, entire or toothed, green and thinly silky-pubescent on the upper side, densely grayish tomentose beneath, the upper leaves gradually smaller, short-petiole or sessile, pinnately cleft, the uppermost leaves linear-lanceolate; heads campanulate or globose-campanulate, 4–4.5 mm. long, 3–5 mm. wide, in a narrowly pyramidal panicle; involucre slightly cobwebby and pale yellowish; bracts membranous, 4-seriate, nearly equal in length, the outer ovate-lanceolate, acuminate, the median oblong.—Aug.–Sept. Alpine regions; Honshu (centr. distr.).—Kuriles, Sakhalin, Kamchatka, and Aleutians.

22. *Artemisia stolonifera* (Maxim.) Komar. *A. vulgaris* var. *stolonifera* Maxim.; *A. vulgaris* var. *kjusiana* Makino; *A. vulgaris* var. *stolonifera* lusitana incana Regel; *A. integrifolia* var. *stolonifera* (Maxim.) Pampan.—HIRO-HA-YAMA-YOMOGI, HIRO-HA-NO-HITOTSUBA-YOMOGI. Plants stoloniferous; rhizomes long-creeping; stems 50–100 cm. long, slender, cobwebby, glabrate, short-branched near the top; median cauline leaves chartaceous, many, ovate-oblong, rarely obovate-oblong in outline, 7–14 cm. long, 4.5–8 cm. wide, acute or sometimes obtuse, cuneate and falsely stipulate at base, winged-petiole, pinnately lobed to cleft, the lobes oblong, 2 pairs, approximate, acute, rarely obtuse, toothed, cobwebby, becoming glabrous above, densely gray-woolly beneath, the upper leaves gradually becoming smaller; heads many, globose-campanulate, 4–4.5 mm. long, 3–4 mm. wide, usually aggregated on one side of the branched panicles; involucre cobwebby; bracts 3-seriate, the outer ovate or oblong, acute, the inner rounded at apex; achenes 1.8 mm. long.—Aug.–Oct. Mountains; Honshu (Chūgoku Distr.), Kyushu.—Korea and Manchuria.

23. *Artemisia koidzumii* Nakai. *A. ursorum* Hult.; *A. koidzumii* var. *arguta* Kitam.; *A. megalobotrys* Nakai; *A. nipponica* var. *megalobotrys* (Nakai) Pampan.—Ō-WATA-YOMOGI, HIRO-HA-URAJIRO-YOMOGI. Plants stoloniferous; rhizomes creeping; stems stout, rarely slender, 35–100 cm. high, long grayish woolly; median cauline leaves rather thick, obovate, 4.5–18 cm. long, 3–11 cm. wide, cuneate, with false stipules at base, sessile or winged-petiole, pinnately cleft or lobed, the lobes 2(–3) pairs, oblong, obtuse or acute, few-toothed or entire, cobwebby on the upper surface while young, densely long grayish tomentose beneath, the upper leaves gradually smaller, oblong or lanceolate, acute; heads globose or globose-campanulate, about 5 mm. long, 4–6 mm. wide, villous; involucre densely long-pubescent; bracts 3-seriate, the outer ovate, subacute, the median broadly ovate, obtuse, the inner oblong, rounded.—Aug.–Oct. Near seashores; Hokkaido.

Var. *megalophylla* Kitam. *A. megalophylla* Kitam., no-

men provis.—ŌBA-YOMOGI. Larger and stouter in habit; leaves deeply pinnately cleft, the segments 3-lobed; heads cobwebby.—Honshu (Bentenjima in Mutsu).

Var. *tsuneoi* (Tatew. & Kitam.) Kitam. *A. tsuneoi* Tatew. & Kitam.—MASHŪ-YOMOGI. Heads smaller; leaves deeply pinnately cleft, 6.5–7 cm. long, the lobes 2 pairs, subentire.—Hokkaido (near Mashū Lake).

24. *Artemisia momiyamae* Kitam. *A. princeps* var. *momiyamae* (Kitam.) Hara—YUKI-YOMOGI. Plants stoloniferous; rhizomes creeping; stems about 1 m. long, much-branched, white-villous; lower cauline leaves rather thick, falsely stipulate, oblong, about 12 cm. long, 6 cm. wide, densely white cobwebby-tomentose on upper side, pinnately divided, the segments 3 pairs, oblong, pinnatifid, the median leaves 7–9 cm. long, 4.5–5 cm. wide, deeply pinnatifid, the segments 2 pairs, spreading or sometimes obliquely so, linear-lanceolate, entire, acute to obtuse, cobwebby above, long white-villous beneath, the upper leaves 3-parted, gradually smaller, the lobes linear-lanceolate, acute; heads numerous, tubular or oblong-campanulate, about 4 mm. long, 1.5–2 mm. wide, densely cobwebby, in panicles; involucre bracts 3-seriate, the outer broadly ovate, the inner oblong; achenes about 1.5 mm. long.—Oct.–Nov. Near seashores; Honshu (Sagami Prov. and Izu Is.).

25. *Artemisia rubripes* Nakai. *A. vulgaris* var. *parviflora* Maxim.; *A. nipponica* var. *rubripes* (Nakai) Pampan.; *A. venusta* Pampan.—YABU-YOMOGI. Plants stoloniferous; rhizomes stout, long-creeping; stems 1–2 m. long, nearly glabrous, much branched; median and lower cauline leaves chartaceous, large, 12–21 cm. long, 9–12 cm. wide, falsely stipulate, bipinnately divided, the segments many, narrow, 5–7 mm. wide, acuminate, loosely toothed, green, the midrib hairy on the upper side, densely gray-cobwebby beneath, the upper leaves gradually smaller, pinnate or bipinnately divided, the segments narrow, the uppermost leaves linear, acuminate; heads numerous, small, globose-campanulate, 2–2.5 mm. long, 1.5 mm. wide, in compound racemes or spikes; involucre bracts slightly cobwebby, 3-seriate, the outer oblong or ovate, obtuse, the inner oblong, rounded at apex.—Aug.–Sept. Kyushu.—Korea, Manchuria, and n. China.

26. *Artemisia montana* (Nakai) Pampan. *A. montana* var. *latiloba* Pampan.; *A. vulgaris* var. *indica* forma *montana* Nakai; *A. nipponica* var. *elata* Pampan.; *A. gigantea* Kitam.; *A. vulgaris* var. *yezoana* Kudo; *A. shikotanensis* Kitam.—Ō-YOMOGI, Ezo-YOMOGI, YAMA-YOMOGI. Plants stoloniferous; rhizomes creeping; stems 1.5–2 m. long, stout; median leaves chartaceous, usually 15–19 cm. long, 6–12 cm. wide, cuneate at base, winged-petiole, deeply pinnately cleft to parted, the segments oblong or oblong-lanceolate, acuminate, the lateral lobes 2 or 3 pairs, entire or often incised-dentate, loosely cobwebby or nearly glabrous above, grayish woolly beneath, the upper leaves gradually smaller, lanceolate, 3-fid or entire; panicles large, the heads many, 3.5 mm. long, 3 mm. wide; involucre cobwebby; bracts 3-seriate, the outer short, broadly ovate, the inner oblong, rounded at apex; achenes 1.5–2 mm. long.—Aug.–Oct. Woods in mountains; Hokkaido, Honshu (Kinki Distr. and eastw.).—Sakhalin, and s. Kuriles.

27. *Artemisia princeps* Pampan. *A. vulgaris* var. *maximowiczii* Nakai; *A. pleiocephala* var. *insularis* Pampan.; *A. montana* var. *nipponica* Pampan.; *A. parvula* Pampan.—YOMOGI, KAZUZAKI-YOMOGI. Plants stoloniferous; rhizomes creeping; stems 60–120 cm. long, tufted, crisped-pubescent,

cobwebby toward the top, usually branched; median cauline leaves chartaceous, falsely stipulate at base, elliptic, 6–12 cm. long, 4–8 cm. wide, pinnately parted to cleft, the segments 2 to 4 pairs, oblong-lanceolate, acuminate to obtuse, toothed or deeply incised, rarely entire, green above, white-tomentose beneath, the upper leaves gradually smaller, pinnately cleft or 3-fid, the segments lanceolate, entire or rarely toothed, the bracteate leaves linear, small; inflorescence paniculate, consisting of compound racemes; heads very many, dense, 2.5–3.5 mm. long, about 1.5 mm. wide; involucre oblong-campanulate, loosely cobwebby; bracts 4-seriate, oblong or the outer broadly ovate, the inner rounded; achenes about 1.5 mm. long.—Sept.–Oct. Waste grounds and thickets in lowlands and low elevations in the mountains; Honshu, Shikoku, Kyushu; very common.—Bonins and Korea.

28. *Artemisia indica* Willd. *A. dubia* sensu auct. Japon., non Wall.; *A. dubia* var. *grata* forma *asiatica* Pamp.; *A. vulgaris* var. *indica* Maxim.; *A. asiatica* Nakai; *A. dubia* var. *orientalis* Pamp.; *A. dubia* var. *septrionalis* Pamp.; *A. princeps* var. *orientalis* (Pamp.) Hara.—NISHIYOMOGI, Yomogi. Plant stoloniferous and with rhizomes; stems 50–120 cm. long, arachnoid or sometimes glabrous at base, branched above; median cauline leaves chartaceous, falsely stipulate, oblong or elliptic in outline, 7–12 cm. long, 3.3–10 cm. wide, pinnately parted, the segments 2 or 3 pairs, oblong or oblong-lanceolate, rarely lanceolate, obtuse, toothed or entire, pinnatifid, green, slightly cobwebby to subglabrate above, densely white-woolly beneath, the upper leaves gradually smaller, pinnatifid or 3-fid, the uppermost lanceolate, entire; panicles narrow; heads very many, dense, globose-campanulate, 3.5–4 mm. long, 2.5–3 mm. wide; involucre 3–4 mm. long, slightly cobwebby; bracts 3- or 4-seriate, the outer broadly ovate, obtuse, the inner oblong and rounded; achenes about 2 mm. long.—Sept.–Dec. Waste ground; Honshu (Chûgoku Distr.), Kyushu.—Ryukyus, Formosa, China, and India.

29. *Artemisia schmidtiana* Maxim. *A. sericea* sensu auct. Japon., non Weber; *A. sericea* var. *schmidtiana* (Maxim.) Kitam., in syn.—ASAGIRI-SÔ. Rhizomes creeping; stems tufted, 16–30 cm. long, white-villous, much branched above; median cauline leaves many, 3–4.5 cm. long, petiolate, bipalmately divided, the segments linear, about 1 mm. wide, obtuse, densely silvery-villous on both sides, the upper leaves gradually smaller, palmately or pinnately divided, the uppermost linear; heads many, 4–5 mm. wide, in panicles, the pedicels bracteate; involucre globose or depressed-globose, about 4 mm. long, 4–5 mm. wide, densely silky-pubescent; bracts 3-seriate, the outer slightly shorter, ovate or elliptic, the inner obovate, rounded at apex; receptacle densely white-hairy, the hairs about 1.2 mm. long; achenes about 1.5 mm. long.—Aug.–Oct. High mountains and near seashores; Hokkaido, Honshu (Japan Sea side of centr. and n. distr.).—s. Kuriles and Sakhalin.

30. *Artemisia kitadakensis* Hara & Kitam. *A. borealis* var. *wormskjoldii* sensu auct. Japon., non Bess.; *A. sericea* var. *kitadakensis* Kitam.—KITADAKE-YOMOGI. Rhizomes densely tufted, woody; flowering stems tufted, 20–30 cm. long, simple, those of the sterile shoots 10–20 cm. long; lower cauline leaves scalelike, 4–6 mm. long, sometimes 3-lobed, the median leaves 22–26 mm. long, about 2 cm. wide, the petioles about 1 mm. long, twice ternately divided, the segments linear, about 1 mm. wide, acute, white-villous on both sides, the upper leaves gradually smaller, petiolate, once or twice ternately divided, the bracteate leaves absent or simple and linear; heads nodding, about 8 mm. across, pedicelled, in simple racemes; involucre subglobose, densely silky-pubescent, about 5 mm. long, 8 mm. wide; bracts 4-seriate, nearly equal in length, the outer ovate, acute, the inner elliptic, rounded at apex, yellow-green, villous on back.—Aug. Alpine regions; Honshu (Akaishi and Shirane mt. ranges in Kai and Shinano Prov.); rare.

43. *ADENOCAULON* Hook. NOBUKI ZOKU

Perennial herbs; stems erect, branched, with gland-tipped hairs in upper part; leaves membranous, alternate, petiolate, densely glandular-hairy beneath; heads in panicles, small, the disc florets of 2 kinds; involucre subglobose, the bracts herbaceous, 5–7, essentially 1-seriate, equal, reflexed after anthesis; receptacles convex, glabrous; marginal florets 7–11, pistillate, fertile, the corollas broadly campanulate, 4- or 5-lobed; central florets 7–18, sterile, the corollas tubular, 5-lobed, the anthers sagittate, with small acute appendage at apex; style obsoletely bifid in bisexual florets, short-bifid in the marginal pistillate florets; achenes clavate-obovate, with stipitate glands; pappus absent.—Few species, in America and Asia.

1. *Adenocaulon himalaicum* Edgew. *A. adhaerescens* Maxim.; *A. bicolor* var. *adhaerescens* (Maxim.) Makino—NOBUKI. Rhizomes creeping; stems 60–100 cm. long, cobwebby, with stipitate glands on upper portion; lower leaves thin, reniform to cordate, 7–13 cm. long, 11–22 cm. wide, undulately lobulate or toothed, green, nearly glabrous on the upper side, densely white-woolly beneath, the petioles winged,

10–20 cm. long, the median and upper leaves gradually smaller, the uppermost broadly lanceolate, becoming bracteate; heads white, pedicelled, with stipitate glands; involucre about 2.5 mm. long, 5 mm. wide, subglobose, the bracts 5–7, broadly ovate, obtuse; achenes spreading, 6–7 mm. long.—Aug.–Oct. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—s. Kuriles, Korea, Manchuria, China to the Himalayas.

44. *SIEGESBECKIA* L. ME-NAMOMI ZOKU

Erect branched annuals, more or less glandular-pilose; leaves ovate, toothed; heads small, in loose panicles, yellow, the florets of 2 kinds; involucre bracts herbaceous, 5, spreading, linear-spathulate, with stipitate glands on upper half; receptacles chaffy, the scales dilated and enveloping the florets, outer ring of scales coriaceous, densely glandular-hairy on the back, the innermost ones membranous; ligulate florets all pistillate, 1-seriate, fertile, the corollas 3-lobulate, spreading; tubular florets bisexual, fertile, the corollas 5-toothed; anthers sagittate; style-branches in bisexual florets short, slightly flattened, acute; achenes 4-angled, truncate, incurved at tip, narrowed at the base, glabrous, blackish; pappus absent.—About 10 species, widely distributed in warmer regions of the world.

- 1A. Branches forked in upper part; leaves chartaceous, irregularly lobulate. 1. *S. orientalis*
 1B. Branches not forked; leaves thinly membranous, usually toothed.
 2A. Stems and leaves uniformly soft-pubescent on both sides; pedicels not glandular; achenes about 2 mm. long. 2. *S. glabrescens*
 2B. Stems and lower side of leaves densely white-pubescent; pedicels usually glandular-pilose; achenes 2.5-3.5 mm. long. 3. *S. pubescens*

1. *Siegesbeckia orientalis* L. *S. orientalis* forma *angustifolia* Makino; *S. humilis* Koidz.—TSUKUSHI-ME-NAMOMI. Annual herb; stems erect, to 20-70 cm. long, the branches ascending-spreading, forked in upper part, densely short-pubescent; median cauline leaves chartaceous, long-petiolate, ovate-oblong to deltoid-ovate, 5-14 cm. long, 3-12 cm. wide, short-acuminate to acute, truncate to cuneate at base, irregularly obtuse-toothed, 3-nerved, irregularly lobulate on lower margin, densely short-pubescent on both surfaces, glandular-dotted beneath, the upper leaves gradually smaller and narrower, short-petiolate, oblong, obtuse; heads many, 16-21 mm. wide, the long pedicels sometimes glandular-pilose; involucre bracts 5, spreading, glandular-pilose; ligulate corollas 2.2-2.5 mm. long; achenes glabrous.—Apr.-Oct. Honshu (s. Kantō Distr., Kii Prov. and Chōgoku Distr.), Shikoku, Kyushu.—Ryukyus, Formosa, China, Malaysia to India, Caucasus, Africa, and Australia.

2. *Siegesbeckia glabrescens* (Makino) Makino. *S. orientalis* forma *glabrescens* (Makino) Makino—KO-ME-NAMOMI. Annual herb; stems erect, 35-100 cm. long, usually branched, short appressed-pilose; median cauline leaves ovate-deltoid, 5-13 cm. long, 3.5-11 cm. wide, short-acuminate, truncate and cuneate at base, 3-nerved, irregularly toothed, glandular-dotted beneath, densely short appressed-pubescent on both surfaces, winged-petiolate, the upper leaves gradually

smaller, oblong, subsessile, the uppermost linear; heads many, the pedicels 1-3 cm. long, densely short-pubescent; involucre bracts 5, spreading, nearly equal in length, spatulate, pubescent and densely glandular-pilose; ligulate corollas 1.5-2.5 mm. long, yellow, 3-toothed; achenes 4-angled, about 2 mm. long, glabrous.—Sept.-Oct. Waste grounds and roadsides; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, China, Ryukyus, and Formosa.

3. *Siegesbeckia pubescens* (Makino) Makino. *S. orientalis* forma *pubescens* Makino; *S. orientalis* sensu auct. Japon., pro parte, non L.—ME-NAMOMI. Annual herb; stems 60-120 cm. long, branched, densely spreading white-pubescent, especially in upper part; median cauline leaves ovate to deltoid-ovate, 7.5-19 cm. long, 6.5-18 cm. wide, short-acuminate, truncate to rounded and narrowed at base, irregularly toothed, 3-nerved, short appressed-pubescent on both surfaces, the nerves beneath densely white-pubescent, the petioles winged, 6-12 cm. long; heads many, in loose terminal corymbs, the pedicels 15-35 mm. long, densely glandular-pilose; involucre bracts 5, linear, 10-12 mm. long, spreading, rounded at apex, glandular-pilose at base; ligulate corollas about 3.5 mm. long, shallowly 2- or 3-lobed; achenes 4-angled, 2.5-3.5 mm. long, glabrous.—Sept.-Oct. Waste grounds; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and China.

45. ECLIPTA L. TAKASABURŌ ZOKU

Branched strigose annual herb; leaves opposite, toothed, heads small, terminal on the stems and branches, pedicelled, heterogamous; involucre campanulate; receptacle convex, the bracts herbaceous, in 2 series, the inner short; outer chaff lanceolate, the inner linear and bristly; ligulate florets pistillate, nearly in 2 series, fertile, the corollas white; disc florets bisexual, fertile, the corollas tubular, white, 4-lobed; anthers very shortly bifid at base; style-branches obtuse and mammillate at apex; achenes of ligulate florets 3-angled, of the disc florets compressed, 4-angled, truncate and depressed at apex, with 1 to 3 minute teeth on margin, coarsely hairy, tuberculate on both surfaces.—One species, in the warmer parts of the world.

1. *Eclipta prostrata* (L.) L. *Verbesina prostrata* L.; *V. alba* L.; *E. alba* (L.) Hassk.; *E. thermalis* Bunge—TAKASABURŌ. Stems erect or ascending, branched, strigose-pilose, 10-60 cm. long; leaves lanceolate, 3-10 cm. long, 5-25 mm. wide, gradually acuminate, narrowed to the base, sessile or very short-petiolate, serrulate, subtrinerved, densely strigose-pilose on both surfaces; heads on pedicels 2-4.5 cm. long; involucre campanulate at anthesis, 5 mm. long, 6-7 mm.

across, to 11 mm. across in fruit, the bracts 5 or 6, green, oblong, acute; ligulate corollas white, 2.5-3 mm. long, 0.4 mm. wide, entire or bifid; achenes about 2.8 mm. long, trigonous in the ligulate florets, compressed-tetragonous in the disc ones, ribbed on margin.—July-Nov. Wet places, especially common in paddy fields in lowlands; Honshu, Shikoku, Kyushu.—Korea, China, Ryukyus, Formosa and in warmer regions of the world.

46. WEDELIA Jacq. HAMA-GURUMA ZOKU

Perennial herbs or shrubs, scabrous or sometimes strigose; stems creeping or scandent, elongate; leaves opposite; heads terminal and in upper axils, peduncled, heterogamous; involucre subglobose, the bracts 1-seriate, green, coarsely strigose; receptacles convex, the scales convex or folded; ligulate florets fertile, the corollas spreading, yellow; tubular florets bisexual, fertile, the corollas tubular, 5-toothed; anthers appendaged at apex, entire at base; styles in bisexual florets acute, hairy on back; achenes of the disc florets oblong-cuneate or obovate, flattened laterally, trigonous in the ligulate ones; pappus crownlike, toothed or ringlike, with 1 or 2 small short deciduous spines at apex.—More than 50 species, in all warmer regions.

- 1A. Pappus vase- or cup-shaped; peduncles 6-12 cm. long; involucre 8-9 mm. long. 1. *W. chinensis*
 1B. Pappus crownlike, with 1 or 2 deciduous short bristles; peduncles 1-7 cm. long; involucre 4-6 mm. long.
 2A. Stems creeping; leaves acute to obtuse, cuneate at base, sparsely toothed.
 3A. Leaves ovate, 3-12 cm. long, thick-chartaceous; heads usually in 3's; achenes about 3 mm. long. 2. *W. robusta*
 3B. Leaves oblong, 1.5-4.5 cm. long, thick-coriaceous; heads usually solitary; achenes 3.5-4 mm. long. 3. *W. prostrata*
 2B. Stems scandent; leaves 7-14 cm. long, acuminate, rounded at base, much-toothed. 4. *W. biflora*

1. *Wedelia chinensis* (Osbeck) Merr. *Solidago chinensis* Osbeck; *Verbesina calendulacea* L.; *W. calendulacea* (L.) Less., non Pers.—KUMANO-GIKU, HAMA-GURUMA. Stems prostrate, elongate, rooting from the nodes, appressed-pilose; leaves chartaceous, lanceolate, sometimes oblong, 2–7 cm. long, 6–12 mm. wide, acute, abruptly narrowed at base, mucronate-tipped, sessile or short-petiolate, appressed-pilose on both surfaces, mucronate-toothed; heads 2–2.5 cm. across, solitary on erect branches, the peduncles 6–12 cm. long; involucre subglobose, 8–9 mm. long, the bracts 5, nearly equal in length, 1-seriate, oblong, acute or sometimes obtuse, short appressed-pubescent; achenes obovate, 3.5 mm. long, 1.5–2 mm. wide, coarsely hairy at tip; pappus vase- or cup-shaped.—May–Sept. Seashores; Honshu (Izu and Kii Prov.), Shikoku, Kyushu.—Ryukyus, Formosa, China, Malaysia, and India.

2. *Wedelia robusta* (Makino) Kitam. *W. prostrata* var. *robusta* Makino—Ô-HAMA-GURUMA. Stems much elongate, creeping, rooting at the nodes, appressed-strigose; leaves thick-chartaceous to somewhat coriaceous, ovate, 3–12 cm. long, 1.5–6 cm. wide, acute, cuneate at base, loosely obtuse-toothed, appressed-strigose on both surfaces, the petioles 3–28 mm. long; heads in 3's or sometimes solitary, 2–2.5 cm. across; involucre subglobose, the bracts ovate, densely short-strigose on back; achenes about 3 mm. long, 2–2.5 mm. wide, cuneate at base, 3- or 4-angled, short-strigose at tip; pappus crownlike, at first strigose-hairy, with 1 or 2 bristles in fruit.—Apr.–Sept. Seashores; Honshu (Kii Prov.), Shikoku, Kyushu.

3. *Wedelia prostrata* (Hook. & Arn.) Hemsl. *Eclipta dentata* Lévl. & Van't.; *Wollastonia prostrata* Hook. & Arn.,

non DC.; *Verbesina prostrata* Hook. & Arn.—HAMA-GURUMA, NEKO-NO-SHITA. Stems long-creeping, rooting at the nodes, coarsely hirsute; flowering branches ascending, leafy, densely strigose; cauline leaves thick-coriaceous, oblong, sometimes ovate or lanceolate, 1.5–4.5 cm. long, 4–14 mm. wide, usually obtuse, rarely acute, cuneate at base, loosely toothed, 3-nerved, coarsely strigose, short-petiolate; heads 16–22 mm. long, usually solitary, terminal; involucre subglobose, the bracts ovate, 2–3.5 mm. wide, coarsely strigose; ligulate florets 1-seriate, the corollas yellow, 8–11 mm. long, about 4 mm. wide; achenes 3.5–4 mm. long, 2 mm. wide, densely strigose, 3- or 4-angled.—July–Oct. Near seashores; Honshu (Kantô Distr. and westw.), Shikoku, Kyushu.—Korea, Ryukyus, Formosa, Bonins, China, and Indochina.

4. *Wedelia biflora* (L.) DC. ex Wight. *Wollastonia biflora* (L.) DC.; *Verbesina biflora* L.; *Acemella biflora* Spreng.—KIDACHI-HAMA-GURUMA, TOKIWA-HAMA-GURUMA. Stems elongate, branched, scandent, coarsely appressed-strigose; leaves thick-chartaceous, ovate, 7–14 cm. long, acuminate, rounded at base, much toothed, appressed-strigose on both surfaces, the petioles 12–23 mm. long; heads 3–6, terminal, 2–3 cm. wide, the pedicels slender; involucre bracts ovate-lanceolate or narrowly ovate, gradually narrowed to tip, densely appressed-strigose; ligulate corollas 9–13 mm. long, 3.5–4.5 mm. wide, yellow, 2- or 3-toothed; achenes 3–3.5 mm. long, 2–2.5 mm. wide, cuneate at base, 3-angled, coarsely strigose toward the tip.—May–Oct. Near seashores; Kyushu (Yakushima and Tanegashima).—Bonins, Ryukyus, Formosa, China, Malaysia, India to Australia, and Africa.

47. SYNEDRELLA Gaertn. FUSHIZAKI-SÔ ZOKU

Strigose annual or biennial branched herbs; leaves opposite, toothed, on winged petioles; heads sessile or pedunculate, axillary, solitary or in a dichasium, heterogamous; involucre globose, the bracts and outer chaff oblong, the inner chaff slightly smaller and narrowly oblong, scarious; ligulate florets 2-seriate, fertile, the corollas bifid; tubular florets fertile, the corollas 4-lobed; anthers shortly bifid at base; achenes of the ligulate florets much flattened dorsally, winged, the wings lacerate and awned at apex; achenes of the tubular florets narrowly oblong, flat, 2-awned.—Two species, in the Tropics of Asia and America.

1. *Synedrella nodiflora* (L.) Gaertn. *Verbesina nodiflora* L.—FUSHIZAKI-SÔ. Annual herb; stems erect, 25–30 cm. long, with long internodes, short-pilose, dichotomously branched; median leaves ovate, 5–12 cm. long, 2–6 cm. wide, acute to obtuse, cuneate at base, short-toothed, strigose on both surfaces, 3-nerved, the petioles short, briefly connate at base to the opposite petiole; upper leaves smaller, 3.5–4 cm. long; inflorescence globose, in leaf-axils, the heads sessile or short-

pedicelled; involucre tubular, about 7 mm. long, 5–7 mm. wide, the bracts and outer chaff oblong, obtuse; ligulate corollas yellow, 3.5 mm. long, about 1 mm. wide, bifid; achenes of the tubular florets 4.5 mm. long, coarsely strigose, the short-strigose awns 2–3.5 mm. long.—Honshu (Hachijo Isl.).—Ryukyus, Formosa, s. China, India, Indochina, Malaysia, and tropical America.

48. BIDENS L. SENDANGUSA ZOKU

Erect branched annuals; lower leaves opposite, the upper sometimes alternate, toothed, sometimes 1 to 3 times ternate or pinnate; heads solitary or in corymboselike panicles, heterogamous; involucre bracts herbaceous, often spreading, 1-seriate, the outer chaff oblong, scarious; ligulate florets 1-seriate, sterile, rarely pistillate, sometimes absent, the corollas yellow or white, spreading; tubular florets bisexual, fertile, the corollas 4- or 5-toothed; achenes flattened dorsally or nearly 4-angled, cuneate or linear, beakless, with 2 to 4 usually retrorsely spinulose awns.—About 230 species, in temperate to warmer regions, especially abundant in America.

1A. Achenes obovate-cuneate, truncate.

2A. Achenes 4-angled, 4-awned; tubular corollas 5-toothed. 1. *B. cernua*

2B. Achenes flat, 2- rarely 3- or 4-awned; tubular corollas 4-toothed.

3A. Heads ligulate; median leaves pinnately compound, at least the terminal leaflets distinctly petiolate. 2. *B. frondosa*

3B. Heads eligulate; median leaves pinnately compound.

4A. Body of achenes 7–11 mm. long. 3. *B. tripartita*

4B. Body of achenes 4.5–5.5 mm. long. 4. *B. radiata* var. *pinnatifida*

1B. Achenes linear, narrowed to the tip.

5A. Achenes 2-awned; leaves much dissected, the ultimate segments about 2 mm. wide; tubular corollas 4-toothed. . . . 5. *B. parviflora*

5B. Achenes 3- or 4-awned; leaves at most 2 or 3 times pinnate; tubular corollas 5-toothed.

6A. Involucral bracts spatulate, broadened at tip; leaves usually ternate. . . . 6. *B. pilosa*

6B. Involucral bracts lanceolate, not broadened at tip; leaves usually 2 or 3 times pinnate.

7A. Terminal leaf segments narrow, acuminate, few-toothed. . . . 7. *B. bipinnata*7B. Terminal leaf segments ovate, short-acuminate, rather prominently toothed. . . . 8. *B. biternata*

1. *Bidens cernua* L. *B. cernua* var. *radiata* DC.—YANAGI-TA-UKOGI. Stems 25-90 cm. long, branched, short-pilose or glabrate; leaves lanceolate, 8-17 cm. long, acuminate at both ends, mucronate-toothed, minutely scabrous on both surfaces; upper leaves slightly dilated, clasping at base; heads ligulate; involucral bracts 5-7, herbaceous, lanceolate, about 2 cm. long; ligulate corollas 12 mm. long, about 5 mm. wide, yellow; tubular corollas 5-toothed; achenes narrowly cuneate, 4-angled, retrorsely spinulose on the angles, the awns 4, 2 or 3 mm. long.—Sept. Wet places; Hokkaido, Honshu (n. distr.).—Korea, China, and widely distributed in the N. Hemisphere.

2. *Bidens frondosa* L. AMERIKA-SENDANGUSA. Stems 1-1.5 m. long, nearly glabrous; leaves and leaflets petiolate, the leaflets 3-5, lanceolate to lanceolate-ovate, 3-13 cm. long, coarsely toothed; heads ligulate; involucral bracts foliaceous, the inner bracts and chaff 5-9 mm. long; ligulate corollas short, yellow; tubular corollas 4-toothed; achenes cuneate, the outer ones 5-7 mm. long, the inner ones 7-10 mm. long, the awns 2.5-5 mm. long.—Sept.-Oct. North American weed widely naturalized in lowlands in our area.

3. *Bidens tripartita* L. *B. taquetii* Lévl. & Van't; *B. shimadae* Hayata; *B. tripartita* var. *cernuaefolia* Sherff.—TA-UKOGI. Stems 20-150 cm. long, glabrous, branched; median leaves simple, oblong-lanceolate, or more commonly 3(-5)-parted, the terminal segments larger, oblong-lanceolate, toothed, gradually narrowed at both ends, the lateral segments spreading, the petioles more or less winged, 5-13 cm. long; heads elongate, the involucral bracts oblanceolate, 1.5-4.5 cm. long in fruit, the outer chaff oblong, 9-11 mm. long; tubular corollas 4-toothed; achenes 7-11 mm. long, retrorsely spinulose on margin and ribs, the well-developed awns 2, 3-4 mm. long, with 1 or 2 additional imperfect ones at the tip.—Aug.-Oct. Hokkaido, Honshu, Shikoku, Kyushu.—Formosa, Ryukyus, China, Korea, Eurasia to N. Africa, and Australia.

Var. *repens* (D. Don) Sherff. *B. repens* D. Don; *B. minuscula* Lévl. & Van't.—HAI-TA-UKOGI. Stems 1-40 cm. long; leaves or the segments unequally and coarsely toothed; achenes 6.5-7.5 mm. long, glabrous; awns 2, 2-3 mm. long, retrorsely spinulose or smooth.—Reported in Honshu (Oomi Prov.).—Korea, China, India, and Malaysia.

4. *Bidens radiata* Thuill. var. *pinnatifida* (Turcz.) Kitam. *B. tripartita* var. *pinnatifida* Turcz. ex DC.; *B. maximowicziana* Oett.—EZO-NO-TA-UKOGI, KIKUBA-TA-UKOGI. Stems 15-70 cm. long, nearly 4-angled, nearly glabrous; median leaves about 15 cm. long inclusive of the petiole, glabrous, pinnately parted, the segments 2 or 3 pairs, usually linear-lanceolate, acuminate, with incurved coarse teeth, the terminal segments larger, lanceolate, acuminate, lobulate; involucral bracts 12-14, 1-seriate, foliaceous, 2-3.5 cm. long, rarely to 7 cm. long, linear-lanceolate, pinnately lobulate, the outer chaff about 8 mm. long; ligulate corollas absent; tubular corollas 4-toothed; achenes flat, 4.5-5.5 mm. long, glabrous, retrorsely spinulose on margins, the awns 2, 2.5-3 mm. long.—Aug.-

Sept. Wet places; Hokkaido.—s. Kuriles, Sakhalin, Korea, Manchuria, and Dahuria. The typical phase occurs from Siberia to Europe.

5. *Bidens parviflora* Willd. HOSOBAS-SENDANGUSA. Stems 20-70 cm. long, often short-hairy; median leaves 2 or 3 times pinnately compound, short-hairy above, with longer hairs on nerves beneath, the petioles 2-3 cm. long, the leaflets pinnately divided and again pinnatolobed to pinnatifid, or toothed, the ultimate segments oblong, about 2 cm. wide, acute; heads elongate; outer involucral bracts herbaceous, 4 or 5, lanceolate, 4 mm. long in anthesis, 6-9 mm. long in fruit, gradually narrowed at apex, the chaff 10-12 mm. long in fruit; tubular florets 6-12; achenes linear, 13-16 mm. long, about 1 mm. wide, tetragonus, compressed, short-strigose, the awns 2, 3-3.5 mm. long.—Sept. Honshu (centr. distr. and westw.), Kyushu.—Korea, Manchuria, China, and e. Siberia.

6. *Bidens pilosa* L. KO-SENDANGUSA. Stems 25-85 cm. long, loosely crisped-pilose in upper portion; median leaves 12-19 cm. long inclusive of the petiole, usually ternate, loosely short-hairy on both sides, the lateral segments ovate, acute, short-petiolate, the terminal segments ovate or narrowly so, short-acuminate; involucral bracts 7 or 8, spatulate, 3-4 mm. long in anthesis, 5 mm. long in fruit, the inner chaff to 9 mm. long, narrow; heads elongate; tubular corollas 5-toothed; achenes linear, 7-13 mm. long, about 1 mm. wide, flat, 4-angled, short-strigose, the awns 3 or 4, 1.5-2.5 mm. long.—Kyushu (Hyuga Prov.). Widespread in tropical regions.

Var. *minor* (Bl.) Sherff. *B. sundaica* var. *minor* Bl.; *B. pilosa* var. *radiata* Schultz-Bip.; *B. albiflora* Makino; *B. pilosa* var. *albiflora* Maxim.—SHIROBANA-SENDANGUSA. Heads with 5-7 sterile ligulate florets, the corollas 5-8 mm. long, 3.5-5 mm. wide, white.—Honshu and Kyushu.—Korea, China, Formosa, Ryukyus, and generally in the tropics.

7. *Bidens bipinnata* L. *B. pilosa* var. *bipinnata* (L.) Hook. f.—KOBAS-NO-SENDANGUSA. Stems 25-85 cm. long, slightly hairy on upper part; median leaves 11-19 cm. long, slightly hairy on both sides, bipinnately parted, the petioles 3.5-5 cm. long, the lower segments often 2 or 3, or pinnately cleft, the terminal segments narrow, acuminate, few-toothed near base; involucral bracts 5-7, lanceolate, 2.5 mm. long at anthesis, to 5 mm. long in fruit, the outer chaff 3.5-4 mm. long in anthesis, 6-8 mm. long in fruit; ligulate florets 1-3, sterile, the corollas yellow, 5-6 mm. long, 2.5-3 mm. wide; achenes linear, 12-18 mm. long, about 1 mm. wide, flat, 3 or 4 angled, more or less short-strigose, the awns 3 or 4, 3-4 mm. long.—Aug.-Oct. Waste grounds; Honshu.—Korea, Manchuria, China, Malaysia, India, Australia, Europe, and America.

8. *Bidens biternata* (Lour.) Merr. & Sherff. *Coreopsis biternata* Lour.; *B. chinensis* Willd.; *B. pilosa* sensu auct. Japon., non L.; *B. robertianaeifolia* Lévl. & Van't.—SENDANGUSA. Stems 30-150 cm. long, subtetragonus, loosely crisped-pilose; median leaves 9-15 cm. long inclusive of the 5-cm.-long petiole, prominently soft-pubescent on both surfaces, once or twice pinnately parted, the terminal segments

ovate, short-acuminate, rather prominently toothed, the lateral segments ovate, sometimes pinnatifid in the lower ones; involucre bracts 8-10, linear, 3-6.5 mm. long, acute, the outer chaff 5-6 mm. long; ligulate florets absent or 1-5, sterile, the corollas yellow, 5.5 mm. long, 2.5-3 mm. wide; achenes linear, 9-19 mm. long, about 1 mm. wide, compressed, 4-angled, short-strigose, the awns 3 or 4, 3-4 mm. long.—Sept.-Nov. Wet places and roadsides; Honshu (Kantō Distr. and westw.),

Shikoku, Kyushu.—Korea, Manchuria, China, Formosa, India, Malaysia, Australia, Asia Minor, and Africa.

Var. *mayebarae* (Kitam.) Kitam. *B. mayebarae* Kitam.—MARUBA-TA-UKOGI. Lower stems 50-60 cm. long; leaves simple, ovate-oblong, 5-13 cm. long, 2.5-6.5 cm. wide, acute, truncate-rounded at base, serrulate, the petioles winged in upper part; achenes very densely setulose.—Near seashores; Kyushu (Higo Prov.).

49. GLOSSOGYNE Cass. SERIBA-NO-SENDANGUSA ZOKU

Glabrous perennials with a thick caudex; stems erect, few-leaved, branched; radical leaves long-petiolate, pinnately parted, the cauline alternate; heads small, solitary, heterogamous; involucre bracts and outer chaff oblong, slightly connate and somewhat inflated at base, the inner chaff narrowed and flat; ligulate florets 1-seriate, fertile, the corollas spreading, 3-toothed, the tubular corollas 4-toothed; anthers obtuse at base; achenes glabrous, flattened dorsally, linear, truncate, 2-awned, the awns retrorsely spinulose.—About 6 species, in tropical Asia and Australia.

1. *Glossogyne tenuifolia* Cass. SERIBA-NO-SENDANGUSA. Perennial herb, woody at the base; stems 20-30 cm. long, somewhat tufted; radical leaves persistent, long-petiolate, 4.5-9 cm. long, pinnately parted, the segments 2 or 3 pairs, linear, about 2 mm. wide, the lower segments 8-20 mm. long, the median leaves few, petiolate, 3-4 cm. long, pinnately parted, the upper

ones smaller, linear; involucre bracts and chaff about 3 mm. long; ligulate corollas about 3.5 mm. long, 2-2.5 mm. wide, 3-toothed; achenes 6.5-7 mm. long.—Honshu (Hachijo Isl. in Izu).—Bonins, Formosa to s. China, Malaysia, and Australia.

50. ATRACTYLODES DC. OKERA ZOKU

Erect, sometimes branched, stiff herbs; leaves alternate, entire or pinnate, spinulose on margin; florets tubular, bisexual and pistillate, the corollas deeply 5-lobed; involucre campanulate or tubular, the subtending bracteal leaves finely dissected and bristlelike, the bracts many-seriate, obtuse, entire, the innermost row purplish at the tip; receptacle flat, bristly-setose; style thickened at the tip in bisexual flowers, the lobes short, deltoid, mammillate on back, reflexed in the pistillate flowers; achenes terete, truncate, villous; pappus bristles nearly equal in length, pinnate, connate at base into a ring.—Few species, in Japan and China.

1. *Atractylodes japonica* Koidz. ex Kitam. *Atractylis ovata* sensu auct. Japon., non Thunb.; *Atractylis ovata* var. *ternata* Komar.; *Atractylodes lyrata* var. *ternata* (Komar.) Koidz.—OKERA. Perennial with elongate, knotty rhizomes 5-8 cm. long, 1.5-3 cm. wide; stems 30-100 cm. long, terete; radical leaves withering before anthesis, the cauline firmly chartaceous, long-petiolate, pinnately 3- to 5-sected, 8-11 cm. long, short-spinulose on margin, the segments elliptic or obovate-oblong, the terminal larger, glabrous and lustrous

above, slightly cobwebby beneath, with prominent veinlets, the upper leaves small and often simple, subsessile; heads terminal, erect, 15-20 mm. across, the bracteal leaves 2-seriate, as long as the head, bipinnate, the segments bristlelike; involucre campanulate, 10-12 mm. long, 12-14 mm. wide, the bracts 7- or 8-seriate, the corollas whitish, 10-12 mm. long; pappus brownish, 8-9 mm. long.—Sept.-Oct. Hills and mountains; Honshu, Kyushu; common.—Korea and Manchuria.

51. CARDUUS L. HIRE-AZAMI ZOKU

Erect, branched herbs; leaves alternate, often long-decurrent and winged, sinuate-toothed or pinnately cleft, spinulose; heads red-purple or white; involucre campanulate to globose, the bracts many-seriate, narrow, spine-tipped, entire, erect or recurved; receptacles setose; florets all alike, fertile, the corollas 5-lobed; style thickened and mammillate with elongate slightly spreading connate branches; filaments papillose-hairy; achenes glabrous, oblong, slightly flattened, striate, truncate, abruptly narrowed at base; pappus-bristles many, firm, simple, minutely scabrous.—About 100 species, in Eurasia and n. Africa.

1. *Carduus crispus* L. HIRE-AZAMI. Biennial herb; stems 70-100 cm. long, branched, crisped-pubescent, with spine-toothed wings; lower cauline leaves oblong-lanceolate, 5-20 cm. long, obtuse to acute, decurrent on the winged base, sessile, pinnately cleft to parted, the segments obtuse, toothed, spine-margined, with cobwebby hairs beneath while young, the upper leaves smaller; heads many; involucre campanulate,

about 20 mm. long, the bracts 7- or 8-seriate, the outer row gradually smaller, the median row linear-lanceolate, spine-tipped, spreading or recurved at tip; flowers red-purple or rarely white; achenes oblong, about 3 mm. long, 1.5 mm. wide; pappus about 15 mm. long.—May-July. Waste grounds, roadsides, and cultivated fields in lowlands; Honshu, Shikoku, Kyushu.—Europe, Caucasus, and e. Asia.

52. CIRSIMUM Adans. AZAMI ZOKU

Biennial or perennial usually spiny herbs; leaves alternate, simple or divided; heads terminal, polygamous, peduncled or sessile and spicate, nodding or erect, purplish, reddish, or white; involucre globose, campanulate, or tubular, cobwebby-hairy, often viscid, the bracts many-seriate, erect or spreading, entire or spinulose; receptacles setose; florets equal, bisexual, the corollas 5-

- 29A. Leaves and heads densely arranged. 25. *C. confertissimum*
 29B. Leaves and heads not densely arranged.
 30A. Leaves auriculate-clasping. 26. *C. aidzense*
 30B. Leaves merely clasping.
 31A. Leaves often falcate; heads loosely arranged. 27. *C. bichuense*
 31B. Leaves not falcate; heads fasciculate-spicate. 28. *C. buergeri*
 28B. Outer and median involucre bracts barely recurved.
 32A. Cauline leaves toothed to shallowly pinnatifid; involucre bracts 9-seriate, the outer ones ovate. 29. *C. heianum*
 30. *C. suzukense*
 32B. Cauline leaves deeply pinnatifid; involucre bracts 6-seriate, the outer ones lanceolate or ovate-lanceolate.
 27B. Heads nodding or pendulous.
 33A. Leaf-segments lanceolate, the spines 3–12 mm. long. 31. *C. gyojanum*
 33B. Leaf-segments oblong-lanceolate, the spines 2–4 mm. long.
 34A. Plants 1.5–2 m. high, leafy throughout; leaves deeply pinnatifid, not white-variegated; involucre about 2.5 cm. across. 32. *C. kagamontanum*
 34B. Plants 50–80 cm. high, subsessile, densely leafy at base; leaves much cleft and incised, obsolete white-variegated on upper surface; involucre about 2 cm. across. 33. *C. longepedunculatum*
 26B. Cauline leaves not clasping.
 35A. Heads on slender peduncles; leaves oblong or lanceolate, the segments spreading.
 36A. Involucres narrowly tubular, 1.4–2 cm. across, the bracts elongate, prominently recurved at tip. 34. *C. effusum*
 36B. Involucres campanulate, about 2.2 cm. across, the bracts relatively short, barely recurved at tip. 35. *C. gratioisum*
 35B. Heads sessile; leaves elliptic or elliptic-lanceolate, the segments erect.
 37A. Involucre bracts elongate, acute, recurved.
 38A. Involucres 1.7–2 cm. wide; leaf-segments oblong, short-acuminate, the spines 1–2 mm. long. 36. *C. congestissimum*
 38B. Involucres 1.5–1.7 cm. wide; leaf-segments oblong-lanceolate, acuminate, the spines 3–10 mm. long. 37. *C. spicatum*
 37B. Involucre bracts short, acuminate, barely recurved.
 39A. Involucres 1–1.7 cm. across, green, viscid, scarcely cobwebby; leaves loosely cobwebby beneath. 38. *C. tenue*
 39B. Involucres 1.7–2 cm. across, purplish, scarcely viscid, densely cobwebby; leaves densely cobwebby beneath. 39. *C. microspicatum*
 25B. Involucres campanulate or campanulate-globose.
 40A. Heads nodding at anthesis.
 41A. Leaves not clasping.
 42A. Involucres campanulate or tubular-campanulate, 2–3 cm. across.
 43A. Outer involucre bracts as long as the others.
 44A. Leaves elliptic-lanceolate. 40. *C. nipponicum*
 44B. Leaves linear-lanceolate.
 45A. Involucres 2–2.3 cm. across; corolla about 16 mm. long; leaf-segments acuminate. 41. *C. yakushimensis*
 45B. Involucres about 2.5 cm. across; corolla 17–21 mm. long; leaf-segments short-acuminate. 42. *C. chikushiensis*
 43B. Outer involucre bracts shorter than the others.
 46A. Involucre bracts not recurved at tip. 43. *C. indefensum*
 46B. Involucre bracts shortly recurved at tip. 44. *C. hanamakiensis*
 42B. Involucres campanulate-globose to depressed-globose, 3.5–4.5 cm. across.
 47A. Leaf-segments acuminate, the spines 2–5 mm. long; heads nodding at anthesis; involucre campanulate-globose, the outer bracts lanceolate. 45. *C. suffultum*
 47B. Leaf-segments acute, the spines 2–3 mm. long; heads erect at anthesis; involucre depressed-globose, the outer bracts lanceolate to linear-lanceolate. 46. *C. hachijouensis*
 41B. Leaves clasping.
 48A. Leaves densely white-cobwebby beneath. 47. *C. norikurensis*
 48B. Leaves green beneath.
 49A. Leaves narrowly oblong-lanceolate, the segments of about 8 pairs, prominently spiny. 48. *C. senjousensis*
 49B. Leaves elliptic-lanceolate, the segments 3–6 pairs, usually subsessile.
 50A. Heads erect at anthesis, about 3 cm. across; involucre bracts linear-lanceolate, rather thin. 49. *C. amplexifolium*
 50B. Heads nodding at anthesis, 3–4 cm. across; involucre bracts lanceolate to ovate, rather thick.
 51A. Outer and median involucre bracts viscid on back. 50. *C. matsumurae*
 51B. Outer and median involucre bracts not viscid.
 52A. Leaf-segments 5 or 6 pairs, spreading; corolla about 15 mm. long. 51. *C. babanum*
 52B. Leaf-segments 3 or 4 pairs, erect; corolla about 17 mm. long. 52. *C. ganjuensis*
 40B. Heads erect at anthesis.
 53A. Cauline leaves deeply pinnatifid, the segments prominently incised-toothed; corolla about 15 mm. long. 53. *C. nambuensis*
 53B. Cauline leaves pinnately cleft to entire, the segments loosely lobulate; corolla 18–20 mm. long.
 54A. Cauline leaves dilated at base and broadly clasping. 54. *C. homolepis*
 54B. Cauline leaves slightly dilated and semiclasping. 55. *C. inundatum*

1. *Cirsium purpuratum* (Maxim.) Matsum. *Cnicus purpuratus* Maxim.—FUJI-AZAMI. Large stout perennial; stems tufted, 50–100 cm. long, densely leafy at base, ascending, branched, cobwebby; radical leaves large, narrowly oblong, 50–70 cm. long, 17–30 cm. wide, pinnately cleft, the lobes narrowly elliptic, 5 or 6 pairs, acute to acuminate, spinulose, cobwebby on both sides, glabrescent, the cauline leaves gradually smaller, sessile, partially clasping, sometimes auriculate at base; heads large, nodding, long-pedunculate; involucre depressed-globose, 6.5–8.5 cm. across, purplish, glabrous; bracts about 10-seriate, coriaceous, the outer and median acute, 5–9 mm. wide, densely spinulose-margined, reflexed; corollas rose-purple, 23–29 mm. long.—Aug.–Oct. Gravelly and sandy slopes in mountains; Honshu (Kantō and centr. distr.).—Forma *albiflorum* (Kitam.) Kitam. *C. purpuratum* var. *albiflorum* Kitam.—SHIROBANA-FUJI-AZAMI. Corollas white.

Cirsium × *misawaense* Nakai. *Misawa-AZAMI*. Hybrid of *C. nipponicum* var. *incomptum* × *C. purpuratum*.—Honshu (centr. distr.).

2. *Cirsium pendulum* Fisch. *C. falcatum* Turcz.; *Cnicus pendulus* (Fisch.) Maxim.; *Cnicus hilgendorffii* Fr. & Sav.; *Cirsium hilgendorffii* (Fr. & Sav.) Makino.—TAKA-AZAMI. Biennial; rhizomes short; roots narrowly fusiform at base; stems erect, 1–2 m. long, branched and cobwebby on upper portion; radical and lower cauline leaves large, short-petiolate, 40–50 cm. long, about 20 cm. wide, caudate, pinnately cleft, the lobes about 5 pairs, linear, glabrous, the median leaves narrowly elliptic, 15–25 cm. long, sessile; heads many, pendulous at anthesis; involucre ovoid, about 2 cm. long, 2.5–3.5 cm. wide, slightly cobwebby; bracts 8-seriate, the median and outer linear, often reflexed, with a dark midrib; corollas capillary, 17–22 mm. long, purplish.—Aug.–Oct. Grassy places in lowlands; Hokkaido, Honshu (Kantō Distr. and northw.).—Korea, Manchuria, Amur, Ussuri, and Dauria.—Forma *albiflorum* (Makino) Kitam. *C. pendulum* var. *albiflorum* Makino.—SHIROBANA-TAKA-AZAMI. Corollas white.

Cirsium × *iburiense* Kitam. *IBURI-AZAMI*. Hybrid of *C. amorense* × *C. pendulum*.—Hokkaido (Iburi Prov.).

3. *Cirsium kamtschaticum* Ledeb. *C. kamtschaticum* var. *genuinum* Herd. and var. *weyrichii* Herd.; *Cnicus kamtschaticus* (Ledeb.) Maxim.; *Cnicus weyrichii* (Herd.) Maxim.; *Cnicus borealis* Kitam.—CHISHIMA-AZAMI, EZO-AZAMI. Rhizomes stout, woody; stems erect, usually 1–2 m. long, stout, simple or branched, hairy or glabrous, cobwebby in upper part; lower and median cauline leaves rather thin, elliptic to narrowly so, 17–35 cm. long, acute to acuminate, narrowed at base, sessile or short-petiolate, decurrent, spinulose, entire or pinnately cleft, the lobes usually of few pairs, nearly glabrous above, crisped-pubescent, cobwebby-hairy beneath while young; heads many, nodding in anthesis; involucre globose-campanulate, cobwebby, 17–20 mm. long, about 4 cm. wide; bracts about 7-seriate, the outer and median linear-lanceolate, spreading; corolla 15–17 mm. long, purplish.—July–Sept. Hokkaido.—Sakhalin, Kuriles, Kamchatka, and Aleutians.

4. *Cirsium pectinellum* A. Gray. *Cnicus pectinellus* Maxim.; *Cirsium mamiyanum* Koidz.—EZO-NO-SAWA-AZAMI. Stems 50–150 cm. long, slender, often hairy, cobwebby in upper portion, usually branched; radical leaves elliptic, caudate, abruptly narrowed at base, pinnately divided, the long winged petiole 30–45 cm. long, the segments 10 or 11 pairs, linear-lanceolate, 3–8 cm. long, 1–1.5 cm. wide, often deflexed, pecti-

nate, glabrous on upper side, paler and pubescent on nerves beneath, the spines about 3 mm. long; cauline leaves elliptic to lanceolate, sessile or short-petiolate, decurrent, pectinate; heads pendulous on slender peduncles; involucre depressed-globose, about 1.6 cm. long, 3 cm. wide, slightly cobwebby; bracts 7-seriate, the outer and median linear-lanceolate, spreading; corollas purplish, 15–16 mm. long.—July–Aug. Wet places in lowlands; Hokkaido.—Sakhalin and Kuriles.

Var. *alpinum* Koidz. *MIYAMA-SAWA-AZAMI*. Stems shorter, 25–27 cm. long; leaf-segments broader.—Alpine; Hokkaido (centr. distr.).

5. *Cirsium apoiese* Nakai. *APOI-AZAMI*. Stems 50–80 cm. long, crisped-pubescent, slightly branched in upper portion; lower cauline leaves elliptic-lanceolate, acuminate, pinnately parted, the segments of 7 or 8 pairs, approximate, oblong, 17–22 cm. long, about 7.5 cm. wide, toothed, glabrous on both sides, spines 2–4 mm. long, winged-petiolate, decurrent, wings prominently spiny; heads simple, nodding at anthesis; involucre globose-campanulate, about 1.5 cm. long, 2–2.8 cm. wide, cobwebby; bracts 6-seriate, the outer oblong-lanceolate, acuminate, spine-tipped, the median row lanceolate; florets about 15 mm. long.—Aug. Hokkaido (Mount Apoi in Hidaka Prov.).

6. *Cirsium ugoense* Nakai. *UGO-AZAMI*. Stems erect, 30 cm. or more long, loosely pubescent or glabrous, sometimes cobwebby in upper portion; median cauline leaves closely approximate, elliptic to oblong-lanceolate, 15–20 cm. long, acute to acuminate, spine-margined, sessile, sometimes clasping and decurrent, pinnately parted to entire, the segments approximate, ovate to lanceolate, loosely pubescent on upper side, pubescent on nerves beneath, sometimes glabrous on both sides, the spines 2–3 mm. long; heads sessile or short-pedunculate; involucre slightly cobwebby, globose-campanulate, 1.5–2.2 cm. long, 2.5–3.5 cm. wide; bracts 6-seriate, erect, nearly equal, the outer sometimes slightly shorter, short spine-tipped; corollas purplish, 16–17 mm. long.—Aug. Alpine regions; Honshu (n. distr.).

7. *Cirsium grayanum* (Maxim.) Nakai. *Cnicus kamtschaticus* var. *grayanus* Maxim.; *Cirsium kamtschaticum* var. *grayanum* (Maxim.) Matsum.—MARUBA-HIRE-AZAMI. Rhizomes stout; stems 1.5–2 m. long, short-pubescent, branched in upper portion, loosely cobwebby on the peduncles; median and lower cauline leaves elliptic-lanceolate, 20–25 cm. long, acute to acuminate, narrowed at base, clasping and decurrent, entire to pinnately parted, spiny, the segments about 6 pairs, spreading, oblong-lanceolate, acute, toothed, glabrous on upper side, short-pubescent on nerves beneath, the spines 3–5 mm. long; heads few, approximate, erect at anthesis; involucre campanulate-globose, about 1.5 cm. long, 2.5–3 cm. wide; bracts 6-seriate, the outer shorter, linear-lanceolate, the outer and median spine-tipped, sometimes spinulose on margin; corolla purplish, 16–17 mm. long.—July–Sept. Wet places in lowlands; Hokkaido (s. distr.), Honshu (Mutsu Prov.).

8. *Cirsium sieboldii* Miq. *Cnicus sieboldii* (Miq.) Maxim.; *Cnicus reinii* Fr. & Sav.; *Cirsium reinii* (Fr. & Sav.) Matsum.; *Cirsium longipes* Nakai.—MA-AZAMI, KISERU-AZAMI. Stems subscapose, loosely leaved, 50–100 cm. long, cobwebby or pubescent in upper portion; radical leaves rosulate, much larger than the cauline, ligulate, 15–55 cm. long, winged-petiolate, usually pinnatifid, the lobes spreading or erect, usually narrow and approximate, incised, glabrous on both sides, the spines 2–3 mm. long; cauline leaves few, gradually smaller, lanceolate or broadly so, pinnately lobed to in-

cised, sessile; heads solitary, terminal, nodding at anthesis, erect in fruit, long-pedunculate; involucre campanulate-globose, about 2.2 cm. long, 3-4 cm. wide; bracts sometimes cobwebby, 7-seriate, acute to obtuse, the outer very short, 3-4 mm. long, spine-tipped, appressed; corollas purplish, 17-19 mm. long; achenes 4-4.5 mm. long.—Sept.-Oct. Wet places along rivers and streams in lowlands; Honshu, Shikoku, Kyushu.

Var. *austrorokushianum* (Kitam.) Kitam. *C. austrokiushianum* Kitam.—SATSUMA-AZAMI. Leaves narrowly elliptic, often prominently spinose; heads larger, often with 1-3 linear bracts at base; involucre 25-27 mm. long, 4-5 cm. wide, the bracts loosely imbricate; corolla 20-23 mm. long.—Wet places along rivers in Kyushu (s. distr.).

Cirsium × *pilosum* Kitam. KE-MA-AZAMI. Hybrid of *C. sieboldii* × *C. tanakae*.—Honshu (Shirakawa in Iwaki Prov.).

9. *Cirsium yezoense* (Maxim.) Makino. *Cnicus yezoensis* Maxim.; *Cirsium maximowiczii* var. *riparium* Koidz.; *Cirsium riparium* (Koidz.) Koidz.; *Cirsium yoshizawae* Koidz.—SAWA-AZAMI. Stems 1-2(-3) m. long, cobwebby, branched, leafy; radical leaves thin, large, broadly elliptic, 50-60 cm. long, about 30 cm. wide, pinnatifid, the lobes of about 5 pairs, lanceolate-elliptic, irregularly toothed, short spine-tipped, glaucous and mealy-puberulent above, glabrous beneath; cauline leaves gradually smaller, lanceolate to broadly elliptic, pinnatifid; heads solitary on the branches, nodding, usually subtended by few bracteal leaves; involucre depressed-globose, 2.5-2.7 cm. long, 4-4.5 cm. wide; bracts thin, flat, cobwebby, about 7-seriate, the outer lanceolate, obliquely spreading, the median nearly unarmed; corollas reddish, 18-21 mm. long; achenes 3-4 mm. long.—Sept.-Oct. Woods; Hokkaido (s. distr.), Honshu (Kinki Distr. and northw.).

10. *Cirsium tenuisquamatum* Kitam. SAMBE-SAWA-AZAMI. Stems 50-100 cm. long, branched, cobwebby; radical leaves rosulate, lanceolate-elliptic, 25-50 cm. long, 12-20 cm. wide, usually obtuse, narrowed below to a winged petiole, pinnately cleft, the lobes about 5 pairs, oblong, coarsely toothed, short-spinulose, deep green and slightly scabrous above, glabrous beneath; cauline leaves gradually smaller, oblong-lanceolate, slightly clasping or not at all, pinnatifid to toothed, the spines short; heads solitary on the branches, nodding, subtended by 2-4 lanceolate, spinulose-toothed bracteal leaves; involucre depressed-globose, 2-2.2 cm. long, 3.5-4.5 cm. wide, cobwebby; bracts about 6-seriate, the outer narrowly linear, acuminate, 0.5-1 mm. wide, about half as long as the inner, the inner and median obliquely spreading, spine-tipped, mealy dotted, the inner recurved; corollas purplish, 21-22 mm. long.—Oct.-Nov. Woods along rivers; Honshu (Chūgoku Distr.).

11. *Cirsium lucens* Kitam. TERI-HA-AZAMI. Stems 1-1.5 m. long, densely leafy, cobwebby, branched; radical leaves thin, elliptic, 55-60 cm. long, 20-30 cm. wide, narrowed at base to a winged petiole, lustrous and nearly glabrous above, yellow-green, loosely cobwebby and short-hairy on nerves beneath, pinnately cleft, the lobes 4-7 pairs, oblong, coarsely toothed, the spines thick, 5-6 mm. long; upper leaves gradually smaller, lanceolate, pinnatifid or coarsely toothed, acute, partially clasping at base, nearly glabrous on both sides; heads solitary, nodding, bracteal leaves at base few or absent; involucre depressed-globose, cobwebby, about 1.8 cm. long, 3.5 cm. wide; bracts rather thin, flat, 6- or 7-seriate, obliquely

spreading at the tip, entire, spine-tipped, the outer linear-lanceolate, the median ovate-lanceolate; corollas pink, 19-20 mm. long.—Sept.-Oct. Along rivers; Kyushu.

12. *Cirsium tashiroi* Kitam. WATAMUKI-AZAMI. Stems scapose, slender, 30-50 cm. long, rarely to 1 m. long, hairy and cobwebby, usually slightly branched; radical leaves very thin, rosulate, lanceolate-elliptic, usually 15-30 cm. long, acute to acuminate, gradually narrowed at base, subsessile, deeply pinnatifid, the segments 7-9 pairs, approximate, ovate, irregularly 3- to 5-lobed, glabrous or pubescent on upper side, pubescent on nerves beneath, the spines 2-3(-5) mm. long; cauline leaves few, small, oblong or lanceolate, acuminate, slightly clasping, pinnately lobulate or incised; heads few, nodding, on long peduncles, the bracteal leaves 1-3, obsolete; involucre cobwebby, campanulate-tubular, 1.5-1.7 cm. long, 1.5-2.5 cm. wide; bracts thin, 6-seriate, erect or spreading, short spine-tipped, the outer linear-lanceolate; corollas purplish, 18-21 mm. long.—Sept.-Oct. Woods in mountains; Honshu (Kinki Distr. and Tōtōmi Prov.).

13. *Cirsium hidaense* Kitam. HIDA-AZAMI. Stems 15-50 cm. long, branched, hairy and cobwebby; radical leaves rosulate, lanceolate-elliptic, 15-37 cm. long, acute to obtuse, long-petiolate, entire to pinnately lobed, spinose, the lobes oblong or ovate, toothed or incised, sometimes hairy on both sides; cauline leaves gradually becoming smaller in the upper ones, acute to acuminate, sessile, entire to pinnately lobed, spinose; heads terminal, nodding at anthesis; involucre campanulate, cobwebby, 1.5-1.9 cm. long, 2.5-3 cm. wide; bracts thin, 7-seriate, the outer and median elongate, linear-lanceolate, long-acuminate, short spine-tipped; corollas purplish, 16-20 mm. long.—Sept.-Nov. Woods; Honshu (Mino and Hida Prov.).

14. *Cirsium spinosum* Kitam. OIRAN-AZAMI. Stems stout, branched, cobwebby; radical leaves rather thick, oblong, about 30 cm. long, long-petiolate, pinnately parted, the segments spreading, ovate, approximate, toothed, spine-tipped, glabrous above, cobwebby beneath, rarely short-pubescent on nerves beneath; cauline leaves gradually smaller, elliptic or broadly ovate, auriculate-clasping, pinnately lobed to cleft, the lobes prominently spiny, cobwebby beneath; heads subsessile, congested, the spines of the bracteal leaves 10-15 mm. long; involucre campanulate, 1.7-1.8 cm. long, 2-2.5 cm. wide; bracts 5- or 6-seriate, erect, spine-tipped, nearly equal in length or the outer slightly shorter, the outer ovate, acuminate, ciliate; corollas 18-20 mm. long.—Aug.-Oct. Near seashores; Kyushu (s. distr.).—Ryukyus.

15. *Cirsium maritimum* Makino. HAMA-AZAMI. Stems ascending, 15-60 cm. long, branched at base, hairy and cobwebby; radical leaves spreading, narrowly oblong, 15-35 cm. long, obtuse, narrowed at base, spiny, short-petiolate, pinnately parted, the segments rather thick, elliptic, variously lobed, deep green and lustrous above, densely pubescent on nerves beneath, the cauline leaves narrowly oblong, sessile, scarcely clasping at base; heads erect, short-pedunculate, in loose corymbs, usually with few rather large bracteal leaves at base; involucre campanulate, 2.2-2.5 cm. long, 2.2-2.8 cm. wide; bracts 6-seriate, short spine-tipped, the outer elongate, ovate-lanceolate, obliquely ascending in upper half; corollas purplish to white, 27-28 mm. long.—July-Sept. Near seashores; Honshu (Izu Prov. and westw.), Shikoku, Kyushu.

16. *Cirsium japonicum* DC. *Cnicus japonicus* (DC.) Maxim., and var. *intermedius* Maxim.; *Cirsium laciniatum*

Nakai; *C. senile* Nakai; *C. maeckii* var. *kjusianum* Nakai—No-AZAMI. Plant 0.5–1 m., rarely to 2 m. high; stems often densely pubescent at base; radical leaves obovate-oblong, 15–30 cm. long, narrowed at base, loosely pubescent above, pubescent on nerves beneath, pinnately cleft to toothed, the lobes 5 or 6 pairs, oblong, short spine-tipped, the median cauline leaves oblong, broadly clasping at base, pinnately cleft; heads usually terminal, erect, viscid; involucre depressed-globose, 1.5–2 cm. long, 2.5–4 cm. wide; bracts 6- or 7-seriate, slightly cobwebby, linear, the outer very short, somewhat longer in the inner, acuminate, short spine-tipped, entire, viscid on back; corollas purplish or rose-colored, 18–23 mm. long.—June-Aug. (–Oct.). Lowlands and low elevations in the mountains; Honshu, Shikoku, Kyushu; very common and variable; sometimes cultivated for cut-flowers.

Var. *horridum* Nakai. TOGE-AZAMI. Stems 15–20 cm. long, densely leafy; spines 5–7 mm. long.—Alpine; Shikoku.

Var. *ibukiense* Nakai. *C. ibukiense* (Nakai) Nakai—MIYAMA-KO-AZAMI. Stems short, densely leafy; spines stout, 3–5 mm. long.

Var. *vestitum* Kitam. KESHŌ-AZAMI. Leaves densely cobwebby and white beneath.—Honshu (Tanba and Settsu Prov. westw.), Shikoku.

Var. *ussuriense* (Regel) Kitam. *Cirsium littorale* var. *ussuriense* Regel; *Cirsium maeckii* Maxim.; *Cnicus japonicus* var. *maeckii* (Maxim.) Maxim.; *Cnicus maeckii* var. *koraensis* Nakai; *Cirsium maeckii* var. *koraense* (Nakai) Nakai; *Cirsium asperum* Nakai—KARA-NO-AZAMI. Leaves thicker, darker when dried; heads slightly nodding to erect; involucre very viscid.—Kyushu (Tsushima).—Manchuria, Ussuri, and Korea.

Var. *diabolicum* (Kitam.) Kitam. *Cirsium diabolicum* Kitam.—ONŌ-ŌNO-AZAMI. Stems densely long-pubescent, cobwebby above; leaves deeply pinnatifid, the lobes about 10 pairs; heads nodding in anthesis, very viscid.—Mountains of Japan Sea side of Honshu.

17. *Cirsium aomorense* Nakai. *Cnicus japonicus* var. *yezoensis* Maxim.; *Cirsium maximowiczii* Nakai; *C. yessoanum* Nakai; *C. japonicum* var. *yezoense* (Maxim.) Matsum.—ŌNO-AZAMI, AOMORI-AZAMI. Stems about 50 cm. long, subscape, often densely cobwebby; radical leaves much larger than the cauline, elliptic to elliptic-lanceolate, 30–60 cm. long, 11–25 cm. wide, narrowed at base, lustrous and glabrous above, slightly cobwebby to glabrous beneath, once to twice pinnatifid, the lobes incised; lower cauline leaves semiclasping; median leaves loosely arranged, small, clasping, narrowly oblong, pinnatifid, loosely cobwebby beneath; heads long-pedunculate, erect at anthesis; involucre depressed-globose, 1.8–2 cm. long, 3–4 cm. wide, cobwebby; bracts 6- or 7-seriate, linear, short spine-tipped, the outer often elongate; corollas 20–22 mm. long.—Aug.–Sept. Grassy places in lowlands; Hokkaido, Honshu (n. distr.).

Cirsium perplexissimum Kitam. MAYOWASE-AZAMI. Hybrid of *C. aomorense* × *C. heianum*.

18. *Cirsium tanakae* (Fr. & Sav.) Matsum. *Cnicus tanakae* Fr. & Sav.; *Cirsium autumnale* Kitam.—NOHARA-AZAMI. Stems 50–100 cm. long, scapose, pubescent, glabrous, or cobwebby; radical leaves 25–40 cm. long, oblong-lanceolate, narrowed at base, glabrous or loosely cobwebby on upper side, with reddish nerves, loosely cobwebby beneath, often pubescent on nerves, pinnatifid, the lobes 8–12 pairs, incised; cauline leaves smaller, scattered, oblong or lanceolate,

pinnatifid, clasping; heads erect, sometimes with 1 to 3 bracteate leaves at base; involucre campanulate-globose, cobwebby, 1.6–1.8 cm. long, 2–2.5 cm. wide; bracts 6- or 7-seriate, linear-lanceolate, short spine-tipped, the outer short or slightly elongate; corollas purplish, 17–18 mm. long.—Aug.–Oct. Grassy places; Honshu (n. and centr. distr.).

Var. *nikkoense* (Nakai) Kitam. *Cirsium nikkoense* Nakai; *C. japonicum* subsp. *nikkoense* (Nakai) Nakai—NIKKŌ-AZAMI. Leaves twice pinnately cleft, the lobes narrower and congested.—Honshu (Nikko in Shimotsuke).

Var. *niveum* (Kitam.) Kitam. *C. nikkoense* var. *niveum* Kitam.—OKINA-AZAMI. Stems white-villous; leaves glabrous to whitish cobwebby beneath, the lobes narrower.—Mountains of Honshu (Shinano and Echigo Prov.).

19. *Cirsium nipponense* (Nakai) Koidz. *C. nipponense* var. *spinulosum* Kitam.; *C. japonicum* subsp. *yesoense* var. *nipponense* Nakai; *C. maximowiczii* var. *nipponense* (Nakai) Nakai; *C. maximowiczii* var. *glutinosum* Nakai, pro parte.—ONŌ-AZAMI, ONŌ-NO-AZAMI. Stems 50–100 cm. long, stout, crisped-pubescent and cobwebby on upper portion; radical leaves large, oblong to elliptic-lanceolate, 35–65 cm. long, obtuse to short-acuminate, narrowed at base, long-petiole, pinnatifid, the lobes 5–8 pairs, spreading, ovate or oblong, acute, slightly toothed, spinulose, cobwebby on both sides; cauline leaves gradually smaller, acuminate, broadly auriculate-clasping, pinnatifid, the lobes 5–8 pairs, oblong, hairy above, cobwebby beneath while young, the spines 5–8 mm. long; heads nodding at anthesis, often with bracteate leaves at base; involucre globose, viscid, 2–2.2 cm. long, 3–4.5 cm. wide, spine-tipped; bracts 6-seriate, the outer short, ovate, acuminate, often spinulose on margin; corollas purplish, 15–18 mm. long.—June–Sept. Mountains; Honshu (n. and centr. distr.).

20. *Cirsium chokaiense* Kitam. *C. maximowiczii* var. *glutinosum* Nakai, pro parte.—CHŌKAI-AZAMI. Stems 1–1.5 m. long, densely pubescent in upper portion; radical leaves rosulate, oblong, about 40 cm. long, acute, pinnatifid, the lobes about 6 pairs, oblong, acute, incised-toothed, densely crisped-pubescent above, loosely cobwebby beneath and pubescent on nerves; median cauline leaves oblong-lanceolate, 17–20 cm. long, long-acuminate, broadly clasping, lobed to cleft, the spines 5–20 mm. long; heads nodding at anthesis, with 1 or 2 bracteate leaves; involucre depressed-globose, prominently viscid, about 2.7 cm. long, 4–5 cm. wide, short-acuminate, the outer bracts short, ovate-lanceolate, the median oblong-lanceolate; corollas about 18 mm. long, purplish.—Aug. Alpine regions; Honshu (Mount Chōkai in Ugo Prov.).

21. *Cirsium maruyamanum* Kitam. MURA-KUMO-AZAMI. Stems 50–90 cm. long, crisped-pubescent and cobwebby-hairy; radical leaves rosulate, narrowly to broadly oblong, 20–35 cm. long, pinnately cleft to parted, the lobes 8–9 pairs, spreading, often 3-lobulate, spinulose, glabrous on both sides; cauline leaves many, gradually smaller, oblong, acuminate, broadly clasping, pinnatifid, loosely pubescent to glabrous on upper side; heads nodding at anthesis, often bracteate; involucre depressed-globose, about 2 cm. long, about 3.5 cm. wide, loosely cobwebby; bracts about 5-seriate, viscid on the midrib, blackish, the outermost lanceolate to linear-lanceolate, about 1/5 as long as the inner, acuminate, very short spine-tipped; corollas purplish, about 20 mm. long.—May–June. Wet places in lowlands; Honshu (Chūgoku Distr.).

22. *Cirsium magofukui* Kitam. INABE-AZAMI. Stems nearly glabrous, branched; cauline leaves elliptic to elliptic-

lanceolate, 20–25 cm. long, acuminate, abruptly narrowed at base, sessile, slightly clasping, pinnatifid, the lobes about 5 pairs, oblong-lanceolate, acuminate, coarsely toothed, spinulose, nearly glabrous on both sides; heads solitary, long-pedunculate; involucre campanulate-globose, about 2.7 cm. long, about 4.5 cm. wide; bracts 6-seriate, long-acuminate, the outer lanceolate or ovate-lanceolate, spine-tipped, the median oblong-lanceolate, 3.5–4 mm. wide, strongly reflexed, loosely spinulose on margin; corollas purplish, about 21 mm. long.—Oct. Honshu (Ise Prov.).

23. *Cirsium dipsacolepis* (Maxim.) Matsum. *Cnicus dipsacolepis* Maxim.—MORI-AZAMI, YABU-AZAMI. Rhizomes short; roots fusiform, to 2 cm. across, unbranched; stems 50–100 cm. long, pubescent or glabrous; lower cauline leaves long-petiolate, lanceolate-oblong, sometimes broadly ovate or lanceolate, 15–20 cm. long, rarely to 40 cm. long, pinnately cleft to incised, the lobes chartaceous, spreading, coarsely incised, the lobules short spine-tipped, pubescent to glabrous on both sides; heads solitary on the branches, erect at anthesis, sometimes bracteate at base; involucre depressed-globose, 2–3 cm. long, 3–4 cm. wide, cobwebby; bracts 6- to 7-seriate, many-ribbed on back, the outer elongate, spreading, lanceolate, the median longer and broader than the inner, 2–3 mm. wide, obliquely spreading at tip, often ciliate; corollas purplish or rose-colored, 17–18 mm. long.—Sept.–Oct. Lowlands; Honshu, Shikoku, Kyushu.

Var. *calicicola* (Nakai) Kitam. *C. calicicola* Nakai—AKIYOSHI-AZAMI. Stems 30–60 cm. long; lower cauline leaves broadly lanceolate, 10–12 cm. long, irregularly incised-serrate, crisped-pubescent on both sides, sometimes cobwebby beneath, sessile; involucre about 17 mm. long, 22–35 mm. wide; bracts 5-seriate, the outer short, broadly lanceolate, acuminate, not recurved at tip; corollas 18–19 mm. long.—Honshu (Nagato Prov.).

24. *Cirsium lineare* (Thunb.) Schultz-Bip. *Carduus linearis* Thunb.; *Spaniophylon lineare* (Thunb.) Less.; *Cnicus linearis* (Thunb.) Benth.—YANAGI-AZAMI. Rhizomes short; roots fusiform; stems about 1 m. long, glabrous or pubescent, branched and cobwebby on upper portion; median cauline leaves many, linear, 6–20 cm. long, 5–10 mm. wide, gradually attenuate, narrowed at base, decurrent, entire or irregularly undulate-incised, sessile or short-petiolate, the lobules spinulose on margin, glabrous above, loosely cobwebby and distinctly 1-nerved beneath, the upper leaves linear, smaller; heads solitary on the branches, erect; involucre globose, cobwebby, about 1.5 cm. long, 2–2.5 cm. wide; bracts 6- to 7-seriate, 1-ribbed on back, the outer and median linear, appressed, spine-tipped; corollas purplish, about 17 mm. long.—Sept.–Oct. Lowlands; Honshu (Suwō Prov.), Shikoku, Kyushu.

Var. *discolor* Nakai. URAYUKI-YANAGI-AZAMI. Leaves whitish cobwebby.

25. *Cirsium confertissimum* Nakai. *C. confertissimum* var. *saxatile* Nakai—KO-IBUKI-AZAMI. Stems 50–100 cm. long, hairy, densely leafy, much branched above; radical and lower cauline leaves elliptic-oblancheolate or oblong, 25–45 cm. long, acute, short-petiolate, pinnatifid, the lobes 8 or 9 pairs, oblong, approximate, spreading, acute, coarsely incised at base, short spine-tipped, often white-variegated above, loosely pubescent to glabrous beneath; cauline leaves very many, 12–18 cm. long, caudate, broadly clasping, the lobes 4 or 5 pairs; heads many, erect; involucre tubular, 1.4–1.5 cm. long, 1.5–2 cm. wide, cobwebby and viscid; bracts 6-seriate, the outer short,

deltoid, acute, the median oblong, acute to obtuse, scarcely spine-tipped; corollas purple, 15–18 mm. long.—Sept.–Oct. Honshu (Mount Ibuki in Oomi).

Var. *herbicola* Nakai. IBUKI-AZAMI. Larger in all respects.—Woods; occurs with the typical phase.

26. *Cirsium aizuenae* Nakai. AIZU-HIME-AZAMI. Stems 1–1.5 m. long, prominently hairy; median cauline leaves oblong, 16–20 cm. long, 10–12 cm. wide, acuminate, narrowed at base, short-spined, puberulent above, slightly cobwebby beneath, the midrib hairy beneath, broadly auriculate-clasping, pinnately parted to divided, the segments 4 or 5 pairs, oblong, acute, coarsely toothed, short spined-tipped, the upper leaves smaller and narrower; inflorescence large; heads erect or ascending, on long slender peduncles; involucre tubular, 1.6–1.7 cm. long, 1.7–2 cm. wide, cobwebby; bracts 8-seriate, the outer short, lanceolate to ovate, about 2 mm. long, the median oblong, acute, recurved or straight; corollas purplish, 15–17 mm. long.—Aug.–Oct. Honshu (Iwashiro Prov.).

27. *Cirsium bitchuense* Nakai. BITCHŪ-AZAMI. Rhizomes stout; stems 1–2 m. long, pubescent; median cauline leaves often falcate, oblong-lanceolate or lanceolate, 20–30 cm. long, acuminate, narrowed at base, short-pubescent above, cobwebby and pubescent on the nerves beneath, broadly clasping, spinulose, entire to pinnately lobed, the lobes 4 or 5 pairs, acuminate, coarsely toothed, the spines 3–4 mm. long; heads small, rather many, loose, on long slender peduncles; involucre tubular, 1.6 cm. long, 1.6–1.9 cm. wide; bracts viscid, 9-seriate, the outer very short, linear to ovate, acuminate, short spine-tipped, the median row ovate-lanceolate, acute, appressed; corollas purplish, 17–18 mm. long.—Sept.–Oct. Woods; Honshu (Chūgoku Distr.).

Var. *manisanense* Kitam. MANISAN-AZAMI. Leaves larger, 25–40 cm. long, cobwebby; bracts scarcely or not viscid.—Honshu (Tajima and Inaba Prov.).

28. *Cirsium buergeri* Miq. *Cnicus buergeri* (Miq.) Maxim.—HIME-AZAMI, HIME-YAMA-AZAMI. Stems 1–2 m. long, pubescent; median cauline leaves oblong-lanceolate, 15–25 cm. long, long-acuminate, slightly narrowed at base, sometimes white-variegated, glabrous or crisped-pubescent above, pubescent on nerves beneath, clasping, pinnatifid, the lobes 4–6 pairs, lanceolate, acuminate, spines stout, 3–4 (10) mm. long; heads small, many, in spike-like fascicles, usually erect; involucre cobwebby, tubular, 1.6–1.9 cm. long, 2–2.5 cm. wide; bracts 8-seriate, sometimes slightly viscid on back, the outer very short, ovate, acute, the median appressed, narrowly oblong, acute to obtuse, spine-tipped; corollas purplish, 16–18 mm. long.—Aug.–Nov. Mountains; Honshu (Kinki Distr. and westw.), Kyushu.

Cirsium × *connexum* Kitam. KASUGAI-AZAMI. Hybrid of *C. buergeri* × *C. lucens*.

29. *Cirsium heianum* Koidz. *Cnicus buergeri* var. *albrechtii* Maxim.; *Cirsium albrechtii* (Maxim.) Kudo; *C. buergeri* var. *albrechtii* (Maxim.) Nakai; *C. rudemale* Nakai—EZO-YAMA-AZAMI. Stems 1.5–2 m. long, pubescent while young; median cauline leaves oblong or elliptic-lanceolate, acute, narrowed at base, sessile, usually clasping, toothed, spine-tipped, sometimes pinnately lobed, the lobes chartaceous, ovate, acute, glabrous above, puberulent or loosely cobwebby beneath, glabrescent; heads small, many, in spike-like fascicles or in corymbs; involucre campanulate-tubular, 1.3–1.8 cm. long, 1.5–2 cm. wide, cobwebby; bracts about 9-seriate, the outer very short, ovate, acute, the median oblong-lanceolate, re-

curved, short spine-tipped; corollas purplish, 16-17 mm. long.—Aug.-Sept. Hokkaido, Honshu (n. distr.).

30. *Cirsium suzukaense* Kitam. SUZUKA-AZAMI. Stems 1-1.5 m. long, densely pubescent or cobwebby; lower cauline leaves elliptic or elliptic-lanceolate, about 30 cm. long, caudate, glabrous or short-pubescent on both sides, sessile, sometimes clasping, deeply pinnatifid, the lobes 4 or 5 pairs, acuminate, the spines 5-10 mm. long; heads sessile or short-pedunculate, erect or ascending; involucre tubular, 1.6-1.9 cm. long, 2-2.3 cm. wide, cobwebby, viscid; bracts 6-seriate, short-recurved and spine-tipped, the outer small, lanceolate or ovate-lanceolate, acuminate, the median oblong-lanceolate, acuminate; corollas purplish, 14-20 mm. long.—Sept.-Oct. Honshu (Kinki and Tōkaidō Distr.).

31. *Cirsium gyojanum* Kitam. GYŌJA-AZAMI. Stems about 70 cm. long, pubescent; median cauline leaves elliptic-lanceolate or oblong-lanceolate, caudate, narrowed at base, sparingly pubescent on both sides, sessile, clasping, deeply-pinnatifid, the lobes 4-7 pairs, lanceolate, acuminate, the spines 3-12 mm. long; heads small, many, nodding in anthesis; involucre tubular, 1.4-1.7 cm. long, 1.2-1.8 cm. across, cobwebby, prominently viscid, the bracts 7-seriate, the outer short, lanceolate or ovate-lanceolate, acute to obtuse, short spine-tipped, the median appressed, oblong-lanceolate; corollas purplish, 14-16 mm. long.—Aug.-Sept. Mountains; Honshu (Mount Omine in Yamato).

32. *Cirsium kagamontanum* Nakai. *C. kagamontanum* var. *spinuliferum* Kitam.; *C. buergeri* var. *sparsum* Nakai.—KAGA-NO-AZAMI. Stems 1.5-2 m. long, glabrous, leafy throughout; lower cauline leaves large, elliptic or elliptic-lanceolate, 30-50 cm. long, acute, narrowed at base, glabrous above, thinly silky beneath, clasping, deeply pinnatifid, the lobes about 5 pairs, oblong-lanceolate, the spines 2-3 mm. long; heads small, pendulous at anthesis, many, on long peduncles, bractless; involucre campanulate, cobwebby, viscid, about 1.6 cm. long, 2.5 cm. wide; bracts 7- or 8-seriate, the outer short, oblong or ovate, obtuse, short spine-tipped, the median narrowly oblong, appressed; corollas purplish, 16-17 mm. long.—Aug.-Oct. Mountains; Honshu.

33. *Cirsium longepedunculatum* Kitam. *C. buergeri* var. *glutinosum* Kitam., pro parte.—NAGAE-NO-AZAMI, NE-BARI-HIME-AZAMI. Stems 50-80 cm. long, subscapose, densely leafy at base, loosely so above, glabrous, the branches cobwebby toward the top; lower cauline leaves thin, large, subrotulate, elliptic to elliptic-lanceolate, 30-40 cm. long, acuminate, abruptly narrowed at base, glabrous and usually white-variegated above, loosely silky beneath, sessile and clasping or short-petiolate, pinnatifid, the lobes about 4 pairs, again pinnatifid or coarsely incised, the spines 3-4 mm. long; upper leaves few, lanceolate to linear, small; heads small, nodding at anthesis, the peduncles slender, very long; involucre campanulate-globose, 1.6-1.8 cm. long, about 2 cm. wide, prominently viscid; bracts 7-seriate, the outer very short, lanceolate or ovate, acute, spine-tipped, the median oblong, appressed; corollas purplish, 15-18 mm. long.—Aug.-Oct. Mountains; Honshu (n. Kinki Distr.).

34. *Cirsium effusum* (Maxim.) Matsum. *Cnicus effusus* Maxim.—HOSOE-NO-AZAMI. Stems about 1 m. long, glabrous, densely leafy; branches short-pubescent and loosely cobwebby; median cauline leaves oblong to linear-lanceolate, 20-40 cm. long, long-acuminate, narrowed at base, loosely short-pubescent above, short-pubescent on nerves beneath, sessile,

deeply pinnatifid, the lobes about 8 pairs, ovate, short-acuminate, trilobulate nearly to the base, the spines 5-10 mm. long; upper leaves linear; heads in racemes, short-pedunculate; involucre narrowly tubular, 1.5-1.8 cm. long, 1.4-2 cm. wide, scarcely cobwebby; bracts 6-seriate, recurved, the outer lanceolate or ovate, acuminate, long spine-tipped, the median oblong, long-acuminate, often spinulose-margined; corollas purplish, 17-18 mm. long.—Sept.-Oct. Woods in mountains; Honshu (Sagami, Suruga, Kai, and Musashi Prov.).

35. *Cirsium gratosum* Kitam. HŌKI-AZAMI. Stems 60 cm. or more long, cobwebby; lower cauline leaves oblong, about 30 cm. long, acuminate, cuneate at base, nearly glabrous on both sides, short-petiolate, the lobes 9 pairs, acuminate, coarsely toothed, spines stout; upper leaves gradually smaller, sessile; heads nodding, long-pedunculate, in paniculate corymbs; involucre campanulate, about 1.6 cm. long, 2.2 cm. wide; bracts 7- or 8-seriate, the margins scarious, undulate, shortly recurved, the outer short, ovate, acute, short spine-tipped, the median oblong, acute; corollas purple, 16-17 mm. long.—Aug. Honshu (Akaishi Mt. range in Shinano).

Var. *alpinum* (Nakai) Kitam. *C. effusum* var. *alpinum* Nakai.—MIYAMA-HOSOE-NO-AZAMI. Involucral bracts elongate, short spine-tipped.—Honshu (Mount Yatsugatake in Shinano Prov.).

36. *Cirsium congestissimum* Kitam. HITSUKI-AZAMI. Stems 1-1.5 m. long, cobwebby above; radical leaves elliptic or elliptic-lanceolate, short-acuminate, narrowed at base, pinnatifid, the lobes 5 or 6 pairs, oblong, irregularly incised, spines 1-2 mm. long, glabrous above, short-pubescent on midrib beneath; median and lower cauline leaves elliptic or elliptic-lanceolate, 25-40 cm. long, short-acuminate, narrowed at base; upper leaves small, rounded at base, semiclasping; heads congested, many, short-pedunculate or sessile; involucre tubular, 1.5-1.6 cm. long, 1.7-2 cm. wide, recurved, spine-tipped, the outer bracts lanceolate or ovate-lanceolate, the median oblong-lanceolate, elongate; corollas purplish, 16-19 mm. long.—Sept.-Oct. Slopes in mountains; Honshu (Kinki and Chūgoku Distr.).

37. *Cirsium spicatum* (Maxim.) Matsum. *Cnicus spicatus* Maxim.—YAMA-AZAMI. Stems 1.5-2 m. long, stout, glabrous or sometimes pubescent, densely leafy; median cauline leaves chartaceous, elliptic to elliptic-lanceolate, 25-35 cm. long, long-acuminate, cuneate at base, glabrous on both sides or short-pubescent beneath, sessile, pinnatifid, the lobes 4-6 pairs, oblong-lanceolate, long-acuminate, often 3-lobulate nearly to the base, spines 3-10 mm. long; heads many, small, in dense spikes, erect or ascending; involucre tubular, more or less cobwebby, 1.4-1.5 cm. long, 1.5-1.7 cm. wide; bracts 7-seriate, recurved, the outer short, lanceolate or ovate, acuminate, stout spine-tipped, the median narrowly oblong, sometimes spinulose-margined; corollas purplish, 17-18 mm. long.—Mountains; Shikoku, Kyushu.

38. *Cirsium tenue* Kitam. USUBA-AZAMI. Stems 1-1.5 m. long, rather slender, glabrous at base; median and lower cauline leaves thin, elliptic-lanceolate, acuminate, narrowed at base, sometimes whitish above along the pubescent nerves, loosely cobwebby beneath, sessile or short-petiolate, pinnatifid, the lobes 5-7 pairs, oblong-lanceolate to lanceolate, acuminate, sometimes coarsely incised near base, spines 5-10 mm. long; heads spicate, sometimes short-pedunculate, ascending in anthesis; involucre tubular, scarcely cobwebby, prominently viscid, 1.6-1.7 cm. long, 1-1.7 cm. wide; bracts 7-seriate, the outer

short, lanceolate to ovate, acute to acuminate, the median oblong or narrowly so, usually acuminate, often spreading at apex; corollas purplish, 17–18 mm. long.—Sept.–Oct. Honshu (Bitchū Prov.).

Var. *ishizuchiense* Kitam. ISHIZUCHI-USUBA-AZAMI. Lobes of radical leaves about 8 pairs, long-acuminate; spines of cauline leaves large and stout, 6–15 mm. long; involucre long-acuminate and spreading.—Shikoku.

39. *Cirsium microspicatum* Nakai. AZUMA-YAMA-AZAMI. Stems 1.5–2 m. long, densely cobwebby in upper portion; lower and median cauline leaves thin, elliptic or elliptic-lanceolate, 23–60 cm. long, abruptly acuminate, narrowed at base, sometimes white-variegated and mealy-puberulent or glabrous above, densely cobwebby and puberulent beneath, short-petiolate or sessile, pinnately cleft to lobed, the lobes lanceolate, 4 or 5 pairs, narrowly acuminate, often irregularly 3-lobulate nearly to the base, spines 5–10 mm. long; heads spicate, erect or ascending, usually pedunculate, rarely sessile; involucre tubular-campanulate, densely cobwebby, 1.5–1.8 cm. long, 1.7–2 cm. wide, purplish; bracts 7-seriate, the outer short, ovate or lanceolate, acuminate, spine-tipped, the median narrowly oblong; corollas purplish, 18–20 mm. long.—Sept.–Oct. Mountains; Honshu (Kantō to Kinki Distr.).

Var. *kiotense* Kitam. OHARAME-AZAMI. Outer and median involucre bracts obtuse, very rarely acute, appressed, scarcely spine-tipped.—Honshu (Kinki and w. Hokuriku Distr.).

Var. *yeichizenense* Kitam. ECHIZEN-AZAMI. Leaves usually elliptic, pinnatolobed, the lobes entire, spinulose, short spine-tipped; heads nodding; involucre campanulate, 12–17 mm. long, the bracts imbricate, obtuse or acute, scarcely spine-tipped.—Honshu (Echizen Prov.).

40. *Cirsium nipponicum* (Maxim.) Makino. *Cnicus nipponicus* Maxim.—Nambu-Azami. Stems 1–2 m. long, cobwebby to glabrous; median cauline leaves thick, elliptic-lanceolate, 20–30 cm. long, acuminate, narrowed at base, entire or incised-toothed, glabrous above, crisped-pubescent or sometimes glabrous beneath, sessile or short winged-petiolate, sometimes pinnatifid, the spines 1–2 mm. long, the lobes 5 or 6 pairs, acuminate, lobulate nearly to the base; heads many, pedunculate, nodding in anthesis; involucre campanulate, sometimes cobwebby; bracts 7-seriate, the outer and median often lanceolate and elongate, long-recurved or spreading, sometimes short and spreading; corollas purplish, 16–20 mm. long.—Aug.–Oct. Honshu (n. and centr. distr.).—Forma *lanuginosum* (Nakai) Kitam. *C. pseudopendulum* Nakai, excl. syn.; *C. nipponicum* var. *lanuginosum* Nakai.—URAGE-HIME-AZAMI. Leaves cobwebby beneath.

Var. *sendaicum* (Nakai) Kitam. *Cirsium sendaicum* Nakai; *C. matsushimense* Kitam.—MATUSHIMA-AZAMI. Lower and median leaves pinnatiparted, the segments 5 pairs, glabrous above, short-pubescent beneath.—Honshu (n. distr.).

Var. *amplexicaule* (Nakai) Kitam. *C. sendaicum* var. *amplexicaule* Nakai.—DAKIBA-NAMBU-AZAMI. Differs from var. *sendaicum* in having cauline leaves slightly clasping.—Honshu (Matsushima in Rikuzen).

Var. *comosus* (Fr. & Sav.) Kitam. *Cnicus comosus* Fr. & Sav.; *Cirsium comosum* (Fr. & Sav.) Matsum.—IGA-AZAMI. Heads congested or short-pedunculate; involucre bracts and leaves with thick stout spines.—Grassy places near seashore; Honshu (s. Kantō Distr.).

Var. *incomptum* (Maxim.) Kitam. *Cnicus suffultus* var. *incomptum* Maxim.; *Cirsium suffultum* var. *incomptum* (Maxim.) Matsum.; *Cnicus incomptus* (Maxim.) Fr. & Sav.; *Cirsium incomptum* (Maxim.) Nakai; *C. fauriei* Nakai; *C. nipponicum* var. *incomptum* (Maxim.) Kitam.; *C. tonense* Nakai; *C. spicatum* Matsum., pro parte.—TAI-AZAMI. Stems 1–2 m. long; leaves pinnatifid, sometimes merely toothed; spines shorter; heads often rather long-pedunculate; involucre bracts with a shorter spine-tip.—Honshu (Kantō, Tōkaidō, and e. Kinki Distr.).

Var. *sawadae* (Kitam.) Kitam. *C. comosum* var. *sawadae* Kitam.—HAKONE-AZAMI. Stems often hairy; leaves pinnately cleft, the lobes very narrow, long-acuminate; heads campanulate, about 25 mm. wide, ascending at anthesis, short-pedunculate or sessile.—Mountains; Honshu (Sagami and Suruga Prov.).

Var. *yatsugatakenae* (Nakai) Kitam. *C. yatsugatakenae* Nakai; *C. comosum* var. *yatsugatakenae* (Nakai) Kitam.—YATSUGATAKE-AZAMI. Median leaves long-acuminate, short-pubescent on both sides, often cobwebby beneath, sometimes partially clasping, the lobes 4–6 pairs, spines 5–10 mm. long.—High mountains; Honshu (Shinano, Iwashiro Prov.).

Var. *yoshinoi* (Nakai) Kitam. *C. yoshinoi* Nakai; *C. inflatum* Kitam.—YOSHINO-AZAMI. Leaves entire to pinnately cleft, acuminate, not clasping; spines 2–4 mm. long; heads many, sometimes in racemes, nodding at anthesis; involucre about 1.6 cm. long, 1.5–2 cm. wide, the outer bracts short, recurved toward the tip, short spine-tipped, sometimes viscid.—Honshu (Kinki and Chūgoku Distr.).

Var. *shikokianum* Kitam. SHIKOKU-AZAMI. Differs from the preceding variety in the slightly larger heads with spreading marginal florets; involucre bracts slightly elongate, acutely recurved, short-spined.—Shikoku.

41. *Cirsium yakushimense* Masam. YAKUSHIMA-AZAMI. Stems 30–40 cm. long, densely leafy, cobwebby and often short-pubescent; lower cauline leaves lanceolate, 17–27 cm. long, narrowly long-acuminate, narrowed at base, usually short-pubescent above, glabrous or the nerves pubescent beneath, sessile or the petiole winged, deeply pinnatifid, the lobes 6–9 pairs, acuminate, spines stout, 5–10 mm. long; median leaves sometimes partially clasping; heads in spikes, erect or ascending at anthesis, bracteate; involucre campanulate, 1.6–1.7 cm. long, 2–2.3 cm. wide; bracts 6-seriate, slightly cobwebby, the outer ovate, acuminate, elongate, spine-tipped, the median oblong, acuminate; corollas purplish, about 16 mm. long.—Mountains; Kyushu (Yakushima).

42. *Cirsium chikushiense* Koidz. NOMA-AZAMI. Stems 70–100 cm. long, densely cobwebby; lower cauline leaves lanceolate, 22–33 cm. long, narrowly long-acuminate, short-petiolate or sessile, pinnatifid, the lobes 5 or 6 pairs, ovate, short-acuminate, irregularly 3-lobulate, loosely cobwebby on both sides, the spines very stout, 8–16 mm. long, the median leaves very long-acuminate; involucre campanulate-globose, slightly cobwebby, about 1.9 cm. long, 2.5 cm. wide; bracts 6-seriate, the outer elongate, linear-lanceolate, the median elongate, ovate or oblong-acuminate, erect or sometimes recurved; corollas purplish, 17–21 mm. long.—Oct.–Nov. Kyushu (Satsuma and Oosumi Prov.).

43. *Cirsium indensum* Kitam. TOGE-NASHI-AZAMI. Stems about 2 m. long, densely white-villous while young; lower cauline leaves elliptic-lanceolate, about 40 cm. long, gradually narrowed at tip, cuneate at base, short-petiolate or

sessile, pinnatifid, the lobes 5 or 6 pairs, ovate or oblong, acute, scarcely spiny, sometimes short-pubescent above, loosely cobwebby beneath; heads small, many, nodding at anthesis, on slender peduncles; involucre tubular, 1.8–2 cm. long, 2.5–3 cm. wide, cobwebby; bracts 8-seriate, appressed, scarcely spine-tipped, sometimes slightly viscid at tip, the outer oblong or ovate, about 2 mm. long, 1 mm. wide, acute, the median oblong, abruptly acute; corollas purplish, 19–20 mm. long.—Nov. Honshu (Chūgoku Distr.).

44. *Cirsium hanamakiense* Kitam. HANAMAKI-AZAMI. Stems 1.5–2 m. long, glabrous at base, short-pubescent on upper part; lower cauline leaves elliptic or elliptic-lanceolate, 35–45 cm. long, short-acuminate, cuneate at base, short-petiolate, deeply pinnatifid, the lobes 5 or 6 pairs, oblong to ovate, acuminate, glabrous on upper side, glabrous to short-silky beneath, the spines 3–7 mm. long; heads small, many, nodding at anthesis, on rather long peduncles; involucre campanulate, 1.5–1.7 cm. long, 2.4–2.9 cm. wide, loosely cobwebby; bracts 8-seriate, densely brown-pubescent on margin, the outer very short, lanceolate to ovate-lanceolate, the median oblong, acuminate, scarcely spiny, recurved; corollas purplish, 15–16 mm. long.—Sept.–Oct. Along ravines and valleys; Honshu (n. distr.).

45. *Cirsium suffultum* (Maxim.) Matsum. *Cnicus suffultus* Maxim.; *C. suffultus* var. *pexus* Maxim.; *C. pexus* (Maxim.) Fr. & Sav.; *Cirsium pexus* (Maxim.) Nakai; *C. kiushianum* Nakai; *C. ogatae* Koidz.—TSUKUSHI-AZAMI, TSUKUSHI-YAMA-AZAMI. Stems about 1 m. long, loosely cobwebby; radical and lower cauline leaves elliptic or elliptic-lanceolate, 30–40 cm. long, short-acuminate, petiolate, pinnatifid, the lobes 7 or 8 pairs, oblong-lanceolate, acuminate, irregularly pinnatifid, white-variegated, glabrous to loosely pubescent above and below, especially on nerves beneath, the spines 2–5 mm. long; median leaves 25–35 cm. long, with stout spines; heads nodding at anthesis, bracteate at base; involucre campanulate-globose, cobwebby, about 2 cm. long, 2.5–4.5 cm. wide; bracts 6-seriate, the outer lanceolate, acuminate, erect or spreading, the median ovate to oblong-lanceolate, elongate, acuminate; corollas purplish, 22–24 mm. long.—Sept.–Nov. Shikoku, Kyushu; common.

46. *Cirsium hachijoense* Nakai. HACHIJO-AZAMI. Stems 0.5–1.5 m. long, cobwebby; lower cauline leaves elliptic-lanceolate, 25–60 cm. long, short-acuminate to acute, petiolate, pinnatifid, the lobes ovate to oblong, 5 or 6 pairs, acute, coarsely incised-toothed, glabrous on both sides or short-pubescent beneath, the spines 2–3 mm. long; heads erect at anthesis, usually bracteate; involucre depressed-globose, 1.8–2 cm. long, 3–4 cm. wide, cobwebby; bracts 6-seriate, the outer and median linear-lanceolate to lanceolate, elongate, spreading or slightly recurved on upper half; corollas purplish, 16–17 mm. long.—Honshu (Hachijō and Oshima in Izu).

47. *Cirsium norikurens* Nakai. NORIKURA-AZAMI. Stems 1–1.5 m. long, short-pubescent; median cauline leaves oblong-lanceolate, 24–28 cm. long, acuminate, abruptly narrowed at base, sessile, sometimes clasping, pinnately lobed, the lobes 5 or 6 pairs, ovate, acute, glabrous on upper side, densely white-cobwebby beneath, the spines 2–3 mm. long; heads solitary on the branches, nodding at anthesis, sometimes bracteate; involucre campanulate-globose, about 1.7 cm. long, 2.5–3.5 cm. wide, cobwebby; bracts 5- or 6-seriate, much-elongate toward the tip, much recurved, the outer linear-lanceolate or ovate-acuminate, scarcely spine-tipped, the median oblong-lanceolate; corollas purplish, about 16 mm. long.—Aug.–Sept. Woods

and grassy places along streams in high mountains; Honshu (centr. distr.).

Var. *integrifolium* Kitam. *C. kurobense* Honda—YUKI-AZAMI, MARUBA-NORIKURA-AZAMI. Leaves undivided, spine-toothed only on margin.—Honshu (centr. distr.).

48. *Cirsium senjoense* Kitam. SENJO-AZAMI. Stems 70–100 cm. long, cobwebby and short-pubescent; lower cauline leaves narrowly oblong-lanceolate, 16–30 cm. long, acuminate, sessile, clasping, deeply pinnatifid, the lobes 8 pairs, ovate-acuminate, 3-lobulate, crisped-pubescent on upper side, pubescent and cobwebby beneath, the spines 3–7 mm. long; heads 1–3 on the branches, nodding at anthesis; involucre globose-campanulate, 1.5–1.7 cm. long, 1.5–2.5 cm. wide, cobwebby; bracts 5-seriate, usually viscid, scarcely spine-tipped, the outer lanceolate, elongate-acuminate, spreading on upper half; corolla purplish, about 16 mm. long.—Aug. Mountains; Honshu (Akaishi and Shirane Mt. ranges).

Var. *Kurosawae* Kitam. KUROSAWA-AZAMI. Leaves not clasping. Occurs with the typical phase.

49. *Cirsium amplexifolium* (Nakai) Kitam. *C. nipponicum* var. *amplexifolium* Nakai; *C. nipponicum* var. *purpureum* Koidz.; *C. sendaicum* Nakai, pro parte; *C. tobae* Nakai—DAKIBA-HIME-AZAMI. Stems 1.5–2 m. long, glaucescent, glabrous; cauline leaves oblong or elliptic-lanceolate, 18–28 cm. long, acuminate, abruptly narrowed at base, broadly auriculate-clasping, spinulose-toothed or pinnately cleft, the lobes 5–7 pairs, oblong, acute to short-acuminate, coarsely toothed at base, scattered short-pubescent to glabrous on both sides, the spines 3–4 mm. long; heads solitary on the branches, long-pedunculate, erect at anthesis, about 3 cm. across, often bracteate; involucre campanulate, about 1.6 cm. long, about 2 cm. wide, nearly glabrous; bracts 6-seriate, the outer and median linear-lanceolate, acuminate, scarcely spine-tipped, elongate, recurved in upper half, very rarely spinulose on margin; corollas purplish, 17–20 mm. long.—July–Sept. Honshu (n. distr.).

Var. *muraii* (Kitam.) Kitam. *C. muraii* Kitam.—KINKA-AZAMI. Leaf-lobes ovate-linear, reflexed, long-acuminate, the spines 5–15 mm. long; inflorescence with larger leaves.—Honshu (Kinkasan in Rikuchū).

50. *Cirsium matsumurae* Nakai. *C. hokkokuense* Kitam.—HAKUSAN-AZAMI. Stems about 2 m. long, densely leaved, glabrous; lower cauline leaves elliptic or elliptic-lanceolate, about 30 cm. long, short-acuminate, cuneate at base, broadly auriculate-clasping, deeply pinnatifid, the lobes about 5 pairs, spreading, oblong, obtuse to acute, coarsely spine-toothed, glabrous above, loosely silky beneath; heads few, 3–4 cm. across, usually on long slender short-pubescent peduncles, nodding at anthesis; involucre globose-campanulate, sometimes cobwebby, 1.5 cm. long, 2–2.5 cm. wide; bracts 6-seriate, scarcely spine-tipped, viscid on back, obtuse to acute, the outer short, lanceolate to ovate, spreading, oblong; corollas purplish, 16–18 mm. long.—Aug.–Oct. High mountains; Honshu (nw. part of centr. distr.).

Var. *pubescens* Kitam. KE-HAKUSAN-AZAMI. Stems densely pubescent.

Var. *dubium* Kitam. HOKKOKU-AZAMI. Leaves entire to pinnatifid, clasping or not clasping; heads smaller; involucre shorter, the outer bracts short-recurved and densely cobwebby.—Honshu (nw. part of centr. distr.).

51. *Cirsium babanum* Koidz. DAI-NICHI-AZAMI. Stems pubescent; median cauline leaves narrowly elliptic-oblongate, short-acuminate, semiclasping, pinnatifid, the lobes 5 or 6

pairs, distant, ovate-acuminate, coarsely incised, pubescent on both sides, the spines 3–8 mm. long, the upper leaves clasping; heads solitary, long-pedunculate, nodding at anthesis; involucre globose-campanulate, about 2 cm. long, about 4 cm. wide, the bracts 6-seriate, the outer gradually narrowed, 3–3.5 cm. long, longer than the inner; corollas purplish, about 15 mm. long.—Aug. High mountains; Honshu (Hida Mt. range).

Var. *otayae* (Kitam.) Kitam. *C. otayae* Kitam.; *C. fauriei* Nakai, pro parte.—TATEYAMA-AZAMI. Stems 40–100 cm. long; median cauline leaves broader, broadly clasping at base, the lobes approximate, pubescent on both sides, the spines 1–2 mm. long; involucre about 15 mm. long, 2.5–3 cm. wide, the outer and median bracts spreading to recurved on upper half; corolla-limb shorter than the broader part of the tube.—Aug. High mountains; Honshu (Hida Mt. range and Mount Hakusan in Kaga).

52. *Cirsium ganjuense* Kitam. *C. amplexifolium* sensu Nakai, non Kitam.—GANJU-AZAMI. Stems cobwebby, glabrate; cauline leaves elliptic-lanceolate to oblong, acute to acuminate, broadly clasping at base, spine-tipped, entire to pinnately lobed, the lobes 3 or 4 pairs, oblong, acute, glabrous on both sides or slightly cobwebby beneath; heads 1 or 2 on the branches; involucre campanulate-globose, about 2 cm. long, 2.5–3.5 cm. wide, more or less cobwebby; bracts rather thick, outer and median spreading on upper half; corollas purplish, about 17 mm. long.—Aug.–Sept. Alpine regions; Honshu (Mount Iwate and Mount Hayachine in Rikuchu Prov.).

53. *Cirsium nambuense* Nakai. NAMBU-TAKANE-AZAMI. Stems about 50 cm. long, often densely short-pubescent, cobwebby on upper part; median and lower cauline leaves oblong-lanceolate, 20–35 cm. long, acuminate, clasping, deeply pinnatifid, the lobes 8–11 pairs, usually ovate, lobulate, short-pubescent above and on nerves beneath, the spines 2–5 mm. long; heads 2–4, terminal, erect at anthesis, often bracteate; involucre globose-campanulate, 1.2–2 cm. long, 2.5–3 cm. wide, slightly cob-

webby; bracts 5-seriate, lanceolate-linear, equal in length, outer and median elongate, erect; corollas purplish, about 15 mm. long.—Aug.–Sept. Alpine regions; Honshu (n. distr.).

54. *Cirsium homolepis* Nakai. *C. inundatum* subsp. *homolepis* (Nakai) Kitam.—OZENUMA-AZAMI. Stems 50–100 cm. long, glabrous at base, cobwebby on the branches; radical leaves large, to 65 cm. long; median cauline leaves oblong-lanceolate, 15–30 cm. long, acute to acuminate, dilated at base, broadly clasping, pinnately cleft, the lobes narrow, acuminate, lobulate, short-spined, glabrous on both sides; heads erect at anthesis; involucre campanulate, 1.8–2.8 cm. long, 2.5–3.5 cm. wide; bracts 7-seriate, usually equal in length, loosely cobwebby, the outer linear; corollas purplish, 19–20 mm. long.—Aug.–Sept. Wet places; Honshu (Ozegahara Moor).

55. *Cirsium inundatum* Makino. TACHI-AZAMI. Stems 1–1.5 m. long, glabrous, the branches short-pubescent and cobwebby; median cauline leaves oblong or oblong-lanceolate, 15–25 cm. long, acute to acuminate, abruptly narrowed at base, slightly dilated, semiclasping or winged-petiolate, spine-toothed to pinnatifid, the lobes about 4 pairs, acute to acuminate, incised, short-pubescent or glabrous on both sides, the spines 2–6 mm. long; heads many, terminal, erect at anthesis, usually bractless; involucre globose-campanulate, about 1.9 cm. long, 2.5–3 cm. wide, slightly cobwebby, the outer bracts linear-lanceolate, elongate, erect, sometimes ascending, ciliate on margin; corollas purplish, 18–20 mm. long.—Aug.–Oct. Wet places; Honshu (n. and centr. distr.).

Var. *alpicola* (Nakai) Ohwi. *C. alpicolum* Nakai; *C. greatrexi* Miyabe & Kudo; *C. inundatum* subsp. *alpicola* (Nakai) Kitam.—MINE-AZAMI. Leaves broader, elliptic-lanceolate, 17–30 cm. long, pinnatifid, semiclasping; outer and median involucre bracts ascending to spreading; corollas 17–20 mm. long.—High mountains; Hokkaido (sw. distr.), Honshu (n. distr.).

53. BREEA Less.

ARECHI-AZAMI ZOKU

Erect, dioecious, perennial herbs with long-creeping rhizomes; leaves alternate, loosely cobwebby, toothed or pinnatifid, spinulose; heads terminal, many-flowered, homogamous; involucre campanulate, the bracts narrow, many-seriate; receptacle sessile; staminate corollas capillary, 5-lobed, the anthers sagittate, awnlike or lacerate; pistillate corollas capillary, long-tubular; pappus-bristles plumose, connate at base; style thickened above, the branches obtuse; achenes glabrous, oblong, 4-angled.—Mediterranean region, Europe, Siberia, to E. Asia.

- 1A. Stems 50–100 cm. long; involucre of the pistillate flowers 15–20 mm. long. 1. *B. setosum*
1B. Stems 25–50 cm. long; involucre of the pistillate flowers 23 mm. long. 2. *B. segetum*

1. *Breea setosum* (Bieb.) Kitam. *Cephalonoplos setosum* (Bieb.) Kitam.; *Cirsium setosum* Bieb.; *C. setosum* var. *subulatum* Ledeb.; *C. arvense* sensu auct. Japon., non L.—EZO-NOKITSUNE-AZAMI. Slightly cobwebby perennial; stems 50–100 cm. long; lower and median cauline leaves oblong-lanceolate, 10–20 cm. long, obtuse, spinulose, gradually narrowed at base, sessile, flat, coarsely incised-toothed; heads rather numerous, erect, the staminate smaller, with involucre about 13 mm. long, the pistillate involucre 15–20 mm. long, the bracts 8-seriate, the outer short, the median lanceolate; achenes about 2.5 mm. long.—Aug.–Oct. Waste grounds and roadsides in lowlands; Hokkaido, Honshu (n. distr.).—Korea, Manchuria, China, Siberia, and E. Europe.

2. *Breea segetum* (Bunge) Kitam. *Cephalonoplos segetum* (Bunge) Kitam.; *Cirsium segetum* Bunge; *Cnicus segetum* (Bunge) Maxim.—ARECHI-AZAMI. Stems 25–50 cm. long; lower and median cauline leaves oblong-lanceolate, 7–10 cm. long, obtuse, entire to spinulose-toothed, narrowed at base, sessile, rounded at base in upper ones; heads few, long-pedunculate; involucre of the staminate heads about 18 mm. long, in the pistillate 23 mm. long, the bracts 8-seriate, short-acuminate and dark colored at the tip, the outer very short, oblong-lanceolate, the median lanceolate; corolla 17–20 mm. long in the staminate flowers, about 26 mm. long in the pistillate, purplish.—May–Aug. Kyushu (Tsushima).—Korea, Manchuria, and n. China.

54. HEMISTEPTA Bunge KITSUNE-AZAMI ZOKU

Biennial herbs with erect branched stems; leaves alternate, lyrate, pinnatifid, densely whitish tomentose beneath, spineless; heads many, homogamous; involucre ovoid, the bracts many-seriate, imbricate, the outer and median with a keeled appendage on back; receptacle nearly flat, setose; florets bisexual, fertile, capillary, purplish, the narrower portion of tube very long; anthers sagittate-connate, the tails laciniate; style branches rounded-truncate and granular-tuberculate at the tip, tuberculate on back, becoming recurved; filaments glabrous; achenes glabrous, oblong, 15-ribbed; pappus-bristles 2-seriate, the outer very short, few, persistent, rather broad, truncate at apex, the inner plumose, elongate, deciduous.—Few species, in India, China, Australia, and e. Asia.

1. *Hemistepta lyrata* Bunge. *H. carthamoides* (Hamilt.) O. Kuntze; *Cnicus multicaulis* DC.; *Serratula carthamoides* Hamilt. ex Roxb., non Poir.; *Aplotaxis carthamoides* DC.; *Cirsium lyratum* Bunge; *Saussurea affinis* Spreng.; *Serratula tinctoria* Sieb., non L.—KITSUNE-AZAMI. Stems 60–80 cm. long, often branched; leaves broadly oblanceolate, 10–20 cm. long, pinnately parted, the terminal segments largest, deltoid, the lateral segments 7 or 8 pairs, rather narrow, green above,

white-tomentose beneath; heads usually many, erect; involucre globose, 12–14 mm. long, the bracts 8-seriate, with a cristate appendage on back at tip, the outer short, ovate-deltoid, acute; corollas purplish.—May–June. Waste grounds, roadsides and cultivated fields in lowlands; Honshu, Kyushu; common.—Ryukyu, Formosa, China, Korea, Manchuria, India, and Australia.

55. SAUSSUREA DC. TÔ-HIREN ZOKU

Biennials or perennials; leaves toothed or pinnatifid, ending in a callose point; heads usually small, in corymbs or racemes, sometimes solitary, homogamous; involucre globose to campanulate or tubular, the bracts many-seriate, imbricate, not spiny, sometimes with a scarious apical appendage; receptacle glabrous or setose; florets usually rose-purple, sometimes white, bisexual, fertile; corollas tubular, the limb 5-lobed; anthers sagittate, the filaments glabrous; achenes glabrous, obsoletely 4-angled; pappus-bristles 2-seriate, the outer short, scabrous to plumose, deciduous, the inner plumose, persistent, connate at base.—About 150 species, abundant in the mountains of Asia, few in Europe and N. America.

- 1A. Biennials without rhizomes; involucre bracts with a scarious, colored appendage.
 - 2A. Involucres broadly campanulate, 10–14 mm. across. 1. *S. pulchella*
 - 2B. Involucres tubular, 5–8 mm. across. 2. *S. japonica*
- 1B. Perennials with rhizomes; involucre bracts without an appendage.
 - 3A. Receptacles naked; stems 4–10 cm. long; radical leaves persistent at anthesis. 3. *S. chionophylla*
 - 3B. Receptacles setose; radical leaves usually withering before anthesis.
 - 4A. Inflorescence a dense corymb.
 - 5A. Involucres globose to campanulate.
 - 6A. Involucres bracts mucronate-acuminate. 4. *S. robitae*
 - 6B. Involucres bracts gradually narrowed toward tip.
 - 7A. Heads 7–15, campanulate; involucre bracts densely gray-puberulent, recurved. 21. *S. nipponica*
 - 7B. Heads usually 2–5, globose-campanulate.
 - 8A. Involucres bracts cobwebby; median and inner bracts white-woolly on back. 5. *S. franchetii*
 - 8B. Involucres bracts brownish pubescent on back.
 - 9A. Outer involucre bracts erect. 6. *S. brachycephala*
 - 9B. Outer involucre bracts recurved. 7. *S. nikonsensis*
 - 5B. Involucres tubular.
 - 10A. Outer involucre bracts acute to acuminate.
 - 11A. Outer involucre bracts short, acute.
 - 12A. Leaves white-tomentose beneath, elongate-deltoid. 8. *S. gracilis*
 - 12B. Leaves pale green beneath.
 - 13A. Leaves lanceolate.
 - 14A. Leaves undulately lobed, the lobes usually obtuse. 9. *S. scaposa*
 - 14B. Leaves not undulately lobed, acuminate.
 - 15A. Stems much-branched; branches of corymbs with 2 or 3 heads; leaves glabrous. 10. *S. modesta*
 - 15B. Stems nearly simple; branches of corymbs with 5–9 heads; leaves pubescent. 11. *S. kirigaminensis*
 - 13B. Leaves ovate.
 - 16A. Leaves not decurrent. 12. *S. ussuriensis*
 - 16B. Leaves decurrent, at least in the upper cauline.
 - 17A. Leaves undulate-lobulate. 13. *S. triptera*
 - 17B. Leaves not undulate-lobulate. 14. *S. riederii*
 - 11B. Outer involucre bracts elongate, long-acuminate.
 - 18A. Stems 50–100 cm. long; involucre 5–6 mm. wide; narrower portion of corolla-tube 1.5 times as long as the other part.
 15. *S. acuminata* var. *sachalinensis*
 - 18B. Stems 6–30 cm. long; involucre 11–12 mm. wide; narrower portion of corolla-tube as long as the other part.
 16. *S. yanagisawae*
 17. *S. jauricii*
- 10B. Outer involucre bracts obtuse to rounded. 17. *S. jauricii*
- 4B. Inflorescence a loose corymb or raceme.

- 19A. Outer involucre bracts ovate or lanceolate, long-acuminate or cuspidate.
 20A. Involucres 5–8 mm. across.
 21A. Heads few; leaves sagittate at base. 18. *S. sagitta*
 21B. Heads many; leaves hastate to cordate or cuneate at base. 19. *S. spinulifera*
 20B. Involucres 8–12 mm. across.
 22A. Outer involucre bracts recurved.
 23A. Leaves not decurrent, usually consistently undulate to sinuate. 20. *S. yoshinagae*
 23B. Leaves decurrent, mucronate-toothed to undulately lobulate. 21. *S. nipponica*
 22B. Outer involucre bracts not recurved.
 24A. Leaves not decurrent.
 25A. Lower cauline leaves oblong, not sinuate, hastate. 22. *S. amabilis*
 25B. Lower cauline leaves ovate, sinuate, cordate. 23. *S. sinuatooides*
 24B. Leaves decurrent. 24. *S. pennata*
 19B. Outer involucre bracts ovate-deltoid, acute to obtuse.
 26A. Involucral bracts obtuse; leaves oblong, glandular-dotted, pinnately parted to toothed, sometimes entire. . . 25. *S. maximowiczii*
 26B. Involucral bracts acute to cuspidate.
 27A. Inflorescence a loose corymb; leaves not decurrent. 26. *S. insularis*
 27B. Inflorescence racemose; leaves decurrent. 27. *S. tanakae*

1. *Saussurea pulchella* Fisch. ex DC. *Serratula pulchella* (Fisch.) Sims; *Theodorea pulchella* (Fisch.) Cass.; *Saussurea japonica* sensu auct., pro parte, non DC.; *S. japonica* var. *pulchella* (Fisch.) Koidz.; *S. koraiensis* Nakai; *S. pulchella* vars. *subintegra*, *pinnatifida*, *ovata*, and *alata* of Regel.—HIME-HIGOTAI. Biennial; stems 30–150 cm. long, puberulent, winged or wingless; radical and lower cauline leaves petiolate, oblong to narrowly so or elliptic, 12–18 cm. long, pinnatifid, the segments 6–10 pairs, lanceolate, puberulent on both sides, densely glandular-dotted beneath; heads many; involucre broadly campanulate, 11–13 mm. long, 10–14 mm. wide; bracts 6- or 7-seriate, with a lobulate scarious apical appendage, the outer ovate, the median narrowly oblong, the inner linear; corollas purplish, 11–13 mm. long.—Aug.–Oct. Grassy slopes in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Sakhalin, Manchuria, and e. Siberia.

2. *Saussurea japonica* (Thunb.) DC. *Serratula japonica* Thunb.; *S. amara* var. *integra* DC.; *S. scabra* Less.; *S. taquetii* Lévl. & Van't.; *S. pulchella* var. *japonica* (Thunb.) Herd.—HIME-HIGOTAI. Biennial herb; stems 50–150 cm. long, striate, loosely glandular-puberulent; radical leaves long-petiolate, oblong, 20–35 cm. long, gradually narrowed at both ends, usually pinnatifid, sometimes undivided, the terminal lobes oblong-lanceolate, obtuse, the lateral lobes 7 or 8 pairs, narrowly oblong, usually pinnately lobulate, glandular-puberulent on both sides; cauline leaves gradually reduced; heads many; involucre tubular, 8.5–12.5 mm. long, 5–8 mm. wide, cobwebby, the bracts 6-seriate, rounded, with a scarious apical appendage; corollas purplish, 10–14 mm. long.—Oct.–Nov. Grassy slopes in lowlands and mountains; Kyushu.—Korea, Manchuria, China, and Formosa.

3. *Saussurea chionophylla* Takeda. YUKIBA-HIGOTAI. Small perennial herb, 4–10 cm. high; stems simple, densely white-cobwebby; radical and lower cauline leaves coriaceous, persistent at anthesis, spreading, petiolate, ovate to broadly so, 4–8.5 cm. long, cordate to truncate at base, mucronate-toothed, cobwebby above while young, densely white-woolly beneath; median and upper leaves few, truncate to cuneate at base; heads in corymbs, in groups of 5–11; involucre campanulate, 12–14 mm. long, 10–12 mm. wide, cobwebby; bracts 5-seriate, the outer ovate, about half as long as the inner, mucronate, the inner linear, acuminate; receptacles naked; corollas purplish, 11–12 mm. long; achenes 5.5–6.5 mm. long.—Aug. Alpine; Hokkaido (Mount Yubari).

4. *Saussurea tobatae* Kitam. SHINANO-TÔ-HIREN.

Stems 60–70 cm. long, nearly terete, purplish, mealy-puberulent; lower cauline leaves chartaceous, deltoid to elongate-deltoid, 10–13 cm. long, caudate, truncate to subcordate at base, toothed, loosely pubescent on both sides, the petioles narrowly winged; median and upper leaves many, gradually smaller, the uppermost leaves oblong to linear-lanceolate; heads rather many, in loose corymbs, very short pedicellate; involucre globose, about 11 mm. wide, more or less cobwebby; bracts 4-seriate, the outer ovate, mucronate-acuminate, sometimes shortly recurved, black-tinged, the inner linear, acuminate; corollas about 11 mm. long.—Aug. Honshu (Kirigamine in Shinano Prov.). Possibly a hybrid of *S. tanakae* and *S. triptera*.

5. *Saussurea franchetii* Koidz. MIYAMA-KITA-AZAMI. Stems 50–70 cm. long, narrowly winged, densely brownish puberulent in upper part; lower and median cauline leaves cordate, 6–11 cm. long, mucronate-acuminate, cordate, abruptly mucronate-toothed, puberulent above, hairy along the nerves beneath, decurrent, petiolate; upper leaves gradually reduced, broadly ovate to lanceolate; heads in groups of 5–8, corymbose; involucre globose, about 13 mm. long and as wide; bracts 5-seriate, cobwebby, the outer and median herbaceous, as long as the inner, oblong to narrowly so, acuminate, the median and inner white-woolly on back, spreading above, the inner linear, blackish purple, appressed-puberulent; corollas purplish, about 11 mm. long.—Aug. Alpine regions; Honshu (n. distr.).

6. *Saussurea brachycephala* Franch. IWATE-HIGOTAI. Stems 19–70 cm. long, narrowly winged, puberulent, the branches densely brown-puberulent on upper portion; radical and lower cauline leaves broadly to narrowly ovate, mucronate-acuminate, rarely obtuse, hastate or cordate at base, denticulate, brown-puberulent on both sides, usually long winged-petiolate; median and upper leaves gradually reduced, decurrent; heads few, in corymbs, short-pedicelled; involucre campanulate, about 16 mm. long and as wide, cobwebby, densely brown-puberulent; bracts 5-seriate, the outer slightly more than half the length of the inner, ovate-lanceolate, acute, erect, about 4 mm. wide at base, the median lanceolate, acuminate, as long as the inner; corollas purplish, 11–12 mm. long.—Aug.–Sept. Alpine; Honshu (n. distr.).

7. *Saussurea nikoensis* Fr. & Sav. *S. tanakae* var. *phyllolepis* Maxim.; *S. tanakae* var. *intermedia* Matsum. & Koidz.; *S. grandifolia* var. *nikoensis* (Fr. & Sav.) Koidz.; *S. sikkiana* var. *intermedia* (Matsum. & Koidz.) Nakai.—SHIRANE-

AZAMI, AKI-NO-YAHAZU-AZAMI. Stems 35–65 cm. long, narrowly winged, densely brownish crisped-puberulent; radical leaves ovate or oblong, 5–12 cm. long, mucronate-acuminate, deeply cordate to subhastate at base, mucronate-toothed, brown-puberulent on both sides especially toward the margin on upper side and veins beneath, the petioles narrowly winged, the median and upper leaves gradually smaller, ovate to lanceolate, cordate to cuneate at base; heads in groups of 2–8, in loose corymbs, pedicelled; involucre globose-campanulate, 15–16 mm. long, 13–15 mm. wide, densely brownish crisped-puberulent, dark purple on upper portion; bracts 5-seriate, the outer ovate-lanceolate, 2–4 mm. wide at base, as long as the median and inner ones, acuminate, often recurved, the inner oblong-linear, acuminate; corollas purplish, about 10 mm. long.—Aug.–Sept. High mountains; Honshu (Iwaki Prov., n. Kantō Distr. and Shinano Prov.).

Var. sessiliflora (Koidz.) Kitam. *S. sessiliflora* (Koidz.) Kitam.; *S. tanakae* var. *sessiliflora* Koidz.; *S. sikkokiana* var. *sessiliflora* (Koidz.) Nakai—KURO-TŌ-HIREN. Heads usually 2 or 3, rather large, sessile.—Honshu (n. and centr. distr.).

Var. involucreata (Matsum. & Koidz.) Kitam. *S. involucreata* Matsum. & Koidz.; *S. grandifolia* var. *nikoensis* subvar. *involucreata* (Matsum. & Koidz.) Koidz.—NIKKŌ-TŌ-HIREN. Involucres bracts very large, recurved.—Honshu (Nikko in Shimotsuke).

8. Saussurea gracilis Maxim. *S. bicolor* Lév. & Van't. HOKUCHI-AZAMI. Stems slender, cobwebby while young, the branches flat; radical leaves rosulate, long-petiolate, elongate-deltoid, rarely deltoid, 6–11 cm. long, acuminate, hastate to cordate or sagittate at base, mucronate-toothed, glabrous and pale green above, villous or white-tomentose beneath, the upper leaves gradually smaller, lanceolate to linear, short-petiolate or sessile; heads in loose corymbs, rarely solitary, the pedicels 5–30 mm. long; involucre tubular, 13–16 mm. long, 8–14 mm. wide, slightly cobwebby, purplish; bracts 8–11 seriate, 7-nerved on back, the outer ovate-lanceolate to ovate, mucronate-acute, the median oblong or oblong-lanceolate, the inner linear; corollas purplish, about 12 mm. long.—Aug.–Oct. Mountains; Honshu (w. Tōkaidō Distr. and westw.), Shikoku, Kyushu.—Korea.

9. Saussurea scaposa Fr. & Sav. *S. reinii* Franch.—KIRISHIMA-HIGOTAI. Stems 22–50 cm. long, slender, leafy; radical leaves narrowly oblong to broadly lanceolate, acuminate to acute, narrowed below to a winged petiole or truncate at base, usually pinnately lobed, rarely toothed, the lobes spreading, obtuse or acute, crisped-puberulent above, glabrous beneath, the median leaves gradually smaller, broadly linear to broadly lanceolate, slightly clasping and short-decurrent; heads 3 or 4 in a group; involucre narrowly tubular, 9–11 mm. long, about 6 mm. wide, cobwebby; bracts 5-seriate, loosely arranged, the outer short, about 2/5 as long as the inner, ovate-lanceolate or ovate, mucronate, the median oblong, the inner linear, acute, purplish; corollas purplish, 9–10 mm. long.—Aug.–Oct. Grassy slopes in mountains; Shikoku, Kyushu.

10. Saussurea modesta Kitam. NEKO-YAMA-HIGOTAI. Stems about 50 cm. long, angled, glabrous, the branches much-flattened; radical leaves linear-lanceolate, about 15 cm. long, 18 mm. wide, acuminate, gradually narrowed at base to a winged petiole; lower cauline leaves slightly clasping and short-decurrent, loosely toothed, glabrous on both sides, the upper gradually reduced, linear; heads in groups of 2 or 3,

sometimes loosely corymbose; involucre tubular, cobwebby, purplish at tip, 10–12 mm. long, 6–8 mm. wide; bracts 5-seriate, acute, the outer about half as long as the inner, ovate to ovate-lanceolate, mucronate, the median oblong, mucronate, the inner linear; corollas purplish, about 9 mm. long.—Oct. Mountains; Honshu (Chūgoku Distr.).

11. Saussurea kirigaminensis Kitam. KIRIGAMINE-TŌ-HIREN. Stems erect, 35–70 cm. long, nearly simple, narrowly winged, glabrous to pubescent; radical and lower cauline leaves linear-oblongate, 15–30 cm. long, short-acuminate, gradually long-attenuate at base to a winged petiole, sparsely mucronate-toothed, or undulately mucronate-toothed, loosely hairy above, puberulent on midrib beneath, the upper leaves gradually reduced, linear-lanceolate, slightly clasping to more or less decurrent; heads in groups of 5–9, densely arranged; involucre tubular, 9–11 mm. long, about 6 mm. wide, purplish, cobwebby; bracts loose, 5-seriate, the outer half as long as the inner, ovate-lanceolate, acuminate, the median mucronate-acute, the inner linear, acute; corollas purplish, about 9 mm. long.—Honshu (Mount Kirigamine in Shinano Prov.).

12. Saussurea ussuriensis Maxim. *S. ussuriensis* vars. *genuina*, *incisa*, and *pinnatifida* of Maxim.; *S. grandifolioides* Nakai—KIKU-AZAMI. Stems 30–120 cm. long, very leafy, wingless, glabrous; radical leaves ovate to oblong-ovate, 7–18 cm. long, acuminate-mucronate, cordate, truncate, or subhastate at base, puberulent on both sides or glabrous, long-petiolate, usually pinnately lobulate to cleft, the lobes 3 to 7 pairs, obovate, toothed or lobulate, the upper cauline gradually reduced, ovate to lanceolate, truncate to cuneate at base; heads many, in dense corymbs, very short pedicellate; involucre tubular, 12–13 mm. long, 4–7 mm. across, cobwebby; bracts 5- to 7-seriate, the outer very short, oblong or ovate, about 2 mm. long, cuspidate, the inner linear, obtuse; corollas purplish, 11–13 mm. long.—Sept.–Oct. Mountains; Honshu, Kyushu.—Ussuri, Manchuria, Korea, and n. China.

Var. nivea Kitam. USU-YUKI-KIKU-AZAMI. Leaves white-cobwebby beneath.—Honshu (Bingo Prov.).—Korea.

13. Saussurea triptera Maxim. YAHAZU-HIGOTAI. Stems 30–55 cm. long, narrowly to broadly winged, prominently puberulent; radical leaves ovate or ovate-oblong, 5.5–12.5 cm. long, acuminate-mucronate, cordate or sometimes truncate at base, mucronate-toothed to undulate-lobulate, crisped-pubescent on both sides, the lobes dilated above, rounded at apex, mucronate-toothed, the upper cauline leaves broadly ovate to lanceolate, short winged-petiolate or sessile, decurrent, gradually smaller toward tip; heads 7–24, in corymbs, short-pedicellate; involucre tubular, about 11 mm. long, 5 mm. across, cobwebby; bracts 5-seriate, the outer about half as long as the inner, broadly ovate, mucronate, the median oblong, mucronate, the inner linear, acuminate; corollas purplish, about 10 mm. long.—Aug.–Sept. Mountains; Honshu (s. part of centr. distr.).

Var. major (Takeda) Kitam. *S. kaimontana* forma *major* Takeda; *S. triptera* forma *major* (Takeda) Kitam.—MIYAMA-HIGOTAI. Heads 2–7, loosely arranged, sometimes long-pedicellate; involucre 12–13 mm. long, 5–10 mm. across, the bracts somewhat larger, and the mucronate tip often longer.

Var. minor (Takeda) Kitam. *S. kaimontana* forma *minor* Takeda; *S. kimbuenensis* Nakai; *S. triptera* forma *minor* (Takeda) Ohwi.—TAKANE-HIGOTAI. Stems 10–20 cm. long, prominently winged; heads 3–5.—Alpine.

Var. *kaialpina* (Nakai) Kitam. *S. triptera* forma *kaialpina* (Nakai) Ohwi; *S. kaialpina* Nakai—SHIRANE-HIGOTAI. Stems low; heads solitary; involucre about 15 mm. long, 12–15 mm. across, the bracts long-mucronate.—Alpine.

Var. *hisauchii* (Nakai) Kitam. *S. hisauchii* Nakai; *S. triptera* forma *hisauchii* (Nakai) Ohwi—TANZAWA-HIGOTAI. Stems 40–60 cm. long, taller, wingless or scarcely winged; heads in loose corymbs or subsapate, sometimes long-pedicellate; involucre 13–15 mm. long, 8–10 mm. wide, the bracts 6- or 7-seriate; corollas 11–12 mm. long.—Montane; Honshu (centr. distr.).

14. *Saussurea riederi* Herd. var. *yezoensis* Maxim. *S. riederi* sensu auct. Japon., non Herd.; *S. nambuana* Koidz.; *S. riederi* subsp. *yezoensis* (Maxim.) Kitam.—NAGABA-KITA-AZAMI. Stems leafy, narrowly winged, crisped-puberulent in upper portion; radical leaves long, broadly ovate or elongate-deltoid, 5–8.5 cm. long, cuspidate, mucronate-toothed, truncate to cordate, loosely puberulent on both sides, long-petiolate, the cauline becoming gradually smaller toward tip, clasping; heads in dense corymbs, very short-pedicellate; involucre tubular, 8–12 mm. long, cobwebby, dark-purplish on upper side; bracts 4- to 6-seriate, the outer lanceolate or oblong, acute to acuminate, the inner broadly linear, acuminate; corollas purplish, about 10 mm. long.—Aug.-Sept. Alpine regions; Hokkaido, Honshu (n. distr.).—s. Kuriles.

Var. *kudoana* (Tatew. & Kitam.) Kitam. *S. kudoana* Tatew. & Kitam.; *S. tokubuchii* Kudo ex Kitam.; *S. riederi* subsp. *kudoana* Kitam., in syn.—HIDAKA-TÖ-HIREN. Cauline leaves smaller, lanceolate; involucre bracts acute.—Hokkaido (Mount Apoi in Hidaka Prov.).

Var. *elongata* Kitam. *S. yezoensis* Franch. excl. syn.; *S. riederi* var. *yezoensis* forma *elongata* (Kitam.) Ohwi—EZO-TÖ-HIREN. Stems 30–60 cm. long; heads many; involucre about 12 mm. long; corollas 11–12 mm. long.—Hokkaido and Honshu (n. distr.).

Var. *insularis* Tatew. & Kitam. *S. riederi* subsp. *yezoensis* var. *insularis* Tatew. & Kitam.—REBUN-TÖ-HIREN. Stems 5–13 cm. long; involucre about 12 mm. long; corollas about 13 mm. long.—Hokkaido (Rishiri and Rebun Is.).

Var. *japonica* Koidz. *S. riederi* forma *japonica* (Koidz.) Ohwi—OKU-KITA-AZAMI. Outer and median involucre bracts long-caudate.—Honshu (Mount Chokaisan in Ugo Prov.).

Var. *daisetsuensis* (Nakai) Kitam. *S. riederi* forma *daisetsuensis* (Nakai) Ohwi; *S. yezoensis* var. *daisetsuensis* Nakai—DAISETSU-HIGOTAI. Stems stout, many-leaved, about 1 m. long; leaves widely decurrent on the stem; heads many, dense, with elongate involucre bracts.—Hokkaido (Mount Daisetsu). The typical phase occurs in the Kuriles and Kamchatka.

15. *Saussurea acuminata* Turcz. ex DC. var. *sachalinensis* (F. Schmidt) Herd. *S. sachalinensis* F. Schmidt; *S. acuminata* subsp. *sachalinensis* (F. Schmidt) Kitam.—KARAFUTO-AZAMI. Stems 50–100 cm. long, densely leafy, winged, crisped-pubescent or glabrous; radical leaves ovate-oblong, 15–17 cm. long, short-acuminate, usually truncate at base, mucronate callose-toothed, scabrous toward the margin, loosely cobwebby on both sides, short crisped-hairy on the veins beneath, long-petiolate, the cauline acuminate, truncate or gradually narrowed at base, short winged-petiolate and decurrent; inflorescence densely corymbose; involucre narrowly cylindric, 11–12 mm. long, 5–6 mm. wide, the bracts 4-seriate,

the outer ovate, short-mucronate, green, longer than the inner, the inner linear, scarious, often purplish at apex; corollas purplish, 13–14 mm. long.—July–Sept. Hokkaido.—Sakhalin. The typical phase occurs in Manchuria and e. Siberia.

16. *Saussurea yanagisawae* Takeda. USU-YUKI-TÖ-HIREN. Stems 6–30 cm. long, crisped-puberulent and cobwebby, narrowly winged or sometimes wingless; radical and lower cauline leaves petiolate, lanceolate or oblong-lanceolate, 4–7.5 cm. long, acuminate, cuneate to truncate at base, irregularly toothed, prominently crisped-puberulent above and along the veins beneath, cobwebby on both sides while young, the median and upper leaves gradually smaller, lanceolate; heads 4–8, in dense corymbs; involucre campanulate, 11–12 mm. long and as wide, purplish at the tip and cobwebby; bracts 4-seriate, the outer as long as the inner, broadly lanceolate, long-acuminate, sometimes spreading, the innermost lanceolate, acute; corollas purplish, about 11 mm. long.—Aug.–Sept. Alpine regions; Hokkaido. Very variable.—Forma *nivea* (Koidz.) Ohwi. *S. tilesii* var. *nivea* Koidz.—YUKIBA-TÖ-HIREN. Leaves white-tomentose beneath.—Forma *imperialis* (Koidz.) Ohwi. *S. imperialis* Koidz.; *S. tilesii* var. *imperialis* (Koidz.) Koidz.—TAKANE-KITA-AZAMI. Leaves rather loosely cobwebby on both sides; lower leaves ovate, 9–10 cm. long, about 5 cm. wide, rather irregularly coarse-toothed.—Forma *vestita* (Kitam.) Ohwi. *S. yanagisawae* var. *vestita* Kitam.—YUKIBA-TAKANE-KITA-AZAMI. Stems about 20 cm. long; lower leaves ovate, 8–9 cm. long, 5–5.5 cm. wide, acuminate, truncate to cordate at base, cobwebby above, densely white-woolly beneath.—Forma *elegans* (Koidz.) Ohwi. *S. tilesii* var. *elegans* Koidz.; *S. yanagisawae* var. *elegans* (Koidz.) Nakai—Ô-TAKANE-KITA-AZAMI. Stems 18–27 cm. long; radical and lower cauline leaves about 9 cm. long, 4 cm. wide, rounded to cuneate at base, loosely cobwebby on both sides, irregularly coarse-toothed.—Forma *angustifolia* (Nakai) Ohwi. *S. yezoensis* var. *angustifolia* Nakai; *S. yanagisawae* var. *angustifolia* (Nakai) Kitam.—HOSORA-EZO-HIGOTAI. Stems about 22 cm. long; cauline leaves linear-lanceolate, about 12 cm. long, about 1.2 cm. wide, cuneate at base, petiolate, not decurrent, loosely mucronate-toothed, nearly glabrous on both sides.

17. *Saussurea fauriei* Franch. FÖRI-AZAMI. Stems 1.5–2 m. long, stout, densely crisped-puberulent, winged, densely leafy, much branched in upper portion; cauline leaves on short winged petioles, ovate, ovate-oblong, or elliptic-lanceolate, 14–19 cm. long, short-acuminate, cordate to truncate or cuneate at base, mucronately callose-toothed, glabrous above, densely gray-pubescent and whitish beneath, decurrent at base on the winged stem, the upper leaves linear-lanceolate, acuminate; heads in very dense corymbs; involucre narrowly tubular, green, 10–12 mm. long, 4–5 mm. wide; bracts 5-seriate, slightly brownish toward the tip, cobwebby on margin, the outer short, obtuse to rounded, the median narrowly oblong, the inner linear; corollas 1 cm. long.—July–Sept. Rocks near the sea; Hokkaido.—s. Kuriles.

18. *Saussurea sagitta* Franch. *S. sagitta* var. *calvescens* Franch.; *S. sagitta* var. *blepharolepis* Franch.; *S. pseudosagitta* Honda—YAHAZU-TÖ-HIREN. Stems 30–45 cm. long, glabrous; median cauline leaves deltoid-hastate, petiolate, 6–8 cm. long, acuminate, sagittate, mucronately callose-toothed, ciliate, glabrous above, sometimes short crisped-puberulent on the veins beneath, the upper leaves becoming smaller, oblong-lanceolate to lanceolate, long-acuminate, truncate to cuneate at base,

short-petiolate; heads few or often solitary, on slender pedicels; involucre tubular, 9–10 mm. long, 6–8 mm. wide, cobwebby; bracts 6-seriate, sometimes purplish toward the margin, the outer short, acuminate, ovate, the median narrowly oblong, rounded, the inner linear, acute; corollas pale purple, about 10 mm. long.—Aug. Alpine regions; Honshu (centr. and n. distr.).

19. *Saussurea spinulifera* Franch. TOGE-KIKU-AZAMI. Stems 40–70 cm. long, puberulent, winged, branched on upper portion; radical and lower cauline leaves long-petiolate, ovate or deltoid-ovate, acuminate, mucronate, hastate to cordate or cuneate at base, mealy-puberulent above, short-pubescent on the veinlets, pinnately lobed at petiolar end, the median and upper leaves gradually smaller, short-petiolate, broadly ovate to lanceolate, hastate to cuneate at base; heads many, loosely arranged, long-pedicellate; involucre tubular, 12–14 mm. long, 5–7 mm. wide, cobwebby, purplish; bracts 4-seriate, imbricate, the outer ovate to narrowly so, about $\frac{1}{4}$ as long as the inner, the median oblong, mucronate callose-tipped, the inner linear, acuminate; corollas 11.5 mm. long.—Sept.–Oct. Woods in mountains; Honshu (Sagami, Suruga, and Kai Prov.).

20. *Saussurea yoshinagae* Kitam. *S. nipponica* subsp. *yoshinagae* (Kitam.) Kitam.—TOSA-TÔ-HIREN. Stems 55–65 cm. long, densely crisped-puberulent; radical leaves chartaceous, rosulate, ovate, oblong to narrowly so, 7–12 cm. long, 3.5–7 cm. wide, acute, mucronate, cordate or truncate at base, winged-petiolate, sometimes sinuately lobulate at the petiolar end, mucronate-toothed, mealy-puberulent on both sides, the cauline leaves gradually becoming smaller, short-petiolate to sessile, ovate to lanceolate; heads few, rarely racemose; involucre campanulate, about 15 mm. long, 15–17 mm. wide; bracts 6-seriate, the outer oblong-lanceolate, 3–3.5 mm. long, acute, the median lanceolate, acute, green, often spreading, brown-pubescent on back, the inner linear, acuminate, purplish; corollas purplish, 11–13 mm. long.—Sept.–Oct. Shikoku.

21. *Saussurea nipponica* Miq. *S. yamatensis* Honda —ÔDAI-TÔ-HIREN. Stems 50–100 cm. long, slender, mealy-puberulent in upper portion, narrowly winged; radical and lower cauline leaves long-petiolate, narrowly to broadly ovate, 12–18 cm. long, acuminate, mucronate, cordate at base, obsoletely mucronate-toothed, mealy-puberulent above and on veinlets beneath, the median leaves shallowly cordate to cuneate at base, narrowly decurrent, the upper leaves much reduced; heads 7–15, campanulate, short-pedicellate; involucre tubular, 10–14 mm. long, 7–14 mm. wide; bracts 5-seriate, densely gray-puberulent on back, the outer about $\frac{1}{4}$ as long as the inner, lanceolate to ovate, acute, shortly recurved at tip, the inner linear, acuminate; corollas purplish, 10–13 mm. long.—Aug.–Oct. Woods in mountains; Honshu (Kinki Distr.), Shikoku. Very variable.

Var. *kiushiana* (Franch.) Ohwi. *S. kiushiana* Franch.; *S. higomontana* Honda; *S. yakushimensis* Masam.; *S. nipponica* subsp. *kiushiana* (Franch.) Kitam.—TSUKUSHI-TÔ-HIREN. Stems stout; leaves broader, thicker, broadly ovate to subreniform, usually broadly decurrent on the stem; involucre 13–17 mm. long.—Kyushu.

Var. *kurosawae* (Kitam.) Ohwi. *S. kurosawae* Kitam.; *S. nipponica* subsp. *kurosawae* (Kitam.) Kitam.—ABE-TÔ-HIREN. Stems broadly winged; leaves thinner; involucre about 10 mm. long; outer involucre bracts broadly ovate, the median elliptic.—Honshu (Suruga Prov.).

Var. *muramatsui* (Kitam.) Ohwi. *S. muramatsui* Kitam.; *S. nipponica* subsp. *muramatsui* (Kitam.) Kitam.—TÔGA-HIGOTAI. Lower leaves cordate, the petioles often broadly winged; heads erect, densely corymbose, terminal on the branches; outer and median involucre bracts linear-lanceolate, prominently recurved.—Honshu (n. distr., Japan Sea side).

Var. *hokurokuensis* (Kitam.) Ohwi. *S. nipponica* subsp. *hokurokuensis* Kitam.—HOKUROKU-TÔ-HIREN. Involucre glabrous on upper portion, the bracts rather shorter; petioles and stems prominently winged.—Honshu (Hokuriku or Japan Sea side).

Var. *robusta* (Makino) Ohwi. *S. nipponica* subsp. *sikokiana* (Makino) Kitam.; *S. sikokiana* Makino; *S. tanaka* var. *robusta* Makino; *S. nipponica* var. *sikokiana* (Makino) Ohwi —Ô-TÔ-HIREN. Stems stout, with wings often to 2 cm. wide; petioles often winged; involucre 15–16 mm. long, the bracts larger, the outer broadly ovate, the median elliptic, long recurved-tipped.—High mountains; Shikoku.

Var. *sendaica* (Franch.) Ohwi. *S. nipponica* subsp. *sendaica* (Franch.) Kitam.; *S. tanaka* var. *sendaica* Franch.; *S. nikoensis* subsp. *sendaica* (Franch.) Kitam.; *S. sugimurae* Honda; *S. tanaka* var. *crinita* Franch.—Nambu-TÔ-HIREN. Radical leaves broadly ovate or deltoid-ovate, 10–16 cm. long, loosely pubescent on upper side; involucre 15–18 mm. long, cobwebby, the bracts 7- or 8-seriate, recurved on upper half, the outer shorter than the median.—Honshu (Kantô and n. distr.).

Var. *savatieri* (Franch.) Ohwi. *S. nipponica* subsp. *savatieri* Kitam.; *S. triptera* var. *savatieri* Franch.; *S. nipponica* var. *nikoensis* Nakai; *S. sinuatoidea* var. *serrata* Nakai; *S. tsukubensis* Nakai —ASAMA-HIGOTAI. Stems slender; involucre bracts narrower, long-acuminate.—Honshu (Kantô Distr. and ne. Shinano Prov.).

Var. *glabrescens* (Nakai) Kitam. *S. sawadae* Kitam.; *S. sinuatoidea* var. *glabrescens* Nakai—KINTOKI-HIGOTAI. Median leaves ovate, undulately lobulate or lobed; heads 1–3, terminal; involucre cobwebby.—Honshu (Hakone).

22. *Saussurea amabilis* Kitam. *S. obvallata* Nakai, non Wall. ex C. B. Clarke—KÔSHÛ-HIGOTAI. Stems 40–60 cm. long, wingless, sparingly branched; radical leaves long-petiolate, oblong, 8–25 cm. long, acute, hastate at base, mucronate-toothed, pale bluish green beneath, short appressed-puberulent on both sides, the median and upper leaves gradually becoming smaller, short-petiolate or sessile, oblong-lanceolate to lanceolate, gradually acuminate, hastate to cuneate at base; heads 2 or 3, the short peduncles glandular and puberulent, often bracteate; involucre campanulate, about 17 mm. long, 18–20 mm. wide; bracts 7-seriate, the outer and median somewhat shorter than the inner, lanceolate, about 3 mm. wide, acuminate, cobwebby, glandular and short-puberulent on back, long recurved on upper half, the inner linear, acuminate; corollas purplish, 12.5–14 mm. long.—Aug.–Oct. Rocky cliffs in mountains; Honshu (w. Kantô Distr. and Kai Prov.).—Forma *pinnatifida* Kitam. KIREBA-KÔSHÛ-HIGOTAI. Leaves pinnately lobed on lower half.

23. *Saussurea sinuatoidea* Nakai. *S. sinuata* forma *japonica* Nakai—TAKAO-HIGOTAI. Stems slender, 35–60 cm. long, hairy; radical and lower cauline leaves long-petiolate, ovate to broadly so, 7–11 cm. long, mucronate-acuminate, cordate at base, deeply sinuate, irregularly mucronate-toothed, puberulent on both sides, the cauline gradually becoming smaller above, short-petiolate or sessile, cordate to cuneate at

base; heads in racemes or loose corymbs, pedicelled; involucre campanulate, 17–18 mm. long, densely cobwebby; bracts 7-seriate, acuminate, the outer about half as long as the inner, lanceolate, recurved on upper half, the inner membranous; corollas purplish, 13–14 mm. long.—Sept.–Oct. Woods in mountains; Honshu (Musashi and Sagami Prov.).

24. *Saussurea pennata* Koidz. MIYAMA-TÔ-HIREN. Stems slender, 30–40 cm. long, glabrous; lower and median cauline leaves chartaceous, sometimes elongate-deltoid, 7–9 cm. long, long-acuminate, sagittate or rarely truncate at base, decurrent, mucronate-toothed, ciliolate, puberulent above and on veinlets beneath, the upper leaves gradually smaller, short-petiolate or sessile, ovate-oblong to lanceolate, truncate to cuneate at base; heads few, in loose corymbs, with slender pedicels; involucre tubular, 12–13 mm. long, 8–10 mm. wide, the bracts 6-seriate, loosely cobwebby, the outer lanceolate or ovate-lanceolate, acuminate, recurved in upper half, nearly glabrous, the inner membranous, linear, acute; corollas purplish, 12 mm. long.—July–Sept. Honshu (Yamato Prov.), Shikoku.

25. *Saussurea maximowiczii* Herd. MIYAKO-AZAMI. Stems 50–150 cm. long, wingless, loosely short-pubescent, glandular-dotted; radical and lower cauline leaves long-petiolate, large, oblong, 11–30 cm. long, acute or cuspidate, cuneate at base, pinnately parted, the lateral segments 4 to 6 pairs, oblanceolate, mucronate, entire to irregularly sinuate-incised, the terminal segments short-pubescent on both sides, often loosely glandular-dotted beneath, the cauline leaves gradually smaller toward tip, oblong to lanceolate, entire to pinnatifid, short-petiolate or sessile, semiclasping; heads many, in loose corymbs, on slender pedicels; involucre narrowly tubular, 10–14 mm. long, about 6 mm. wide, cobwebby; bracts 8-seriate, the inner gradually longer, broadly linear, obtuse, the outer very short, ovate, the median oblong, ending in a callose tip; corollas purplish, 11–13 mm. long.—Aug.–Oct. Grassy places in mountains; Honshu, Kyushu.—Korea, Manchuria, and Amur.

26. *Saussurea insularis* Kitam. SHIMA-TÔ-HIREN. Stems about 50 cm. long, cobwebby; lower cauline leaves chartaceous, long-petiolate, deltoid-ovate, 9–10 cm. long, 7.5–10 cm. wide, subcaudately acuminate, sagittate-cordate at base, irregularly mucronate-dentate, loosely pubescent above, cobwebby beneath while young, the upper leaves gradually becoming smaller, densely whitish cobwebby; heads in loose corymbs, short-pedicelled; involucre campanulate, about 11 mm. long and as wide, cobwebby; bracts 7-seriate, the outer deltoid, about 2 mm. long, obtuse, mucronate, appressed, the inner linear, acute, densely cobwebby; corollas about 11 mm. long.—Sept. Mountains; Kyushu (Tsushima).

27. *Saussurea tanakae* Fr. & Sav. *S. tanakae* var. *pycnolepis* Franch.—SEITAKA-TÔ-HIREN, AKI-NO-YAHAZU-AZAMI. Stems 70–100 cm. long, puberulent; lower cauline leaves chartaceous, cordate to cordate-deltoid, 8–15 cm. long, cuspidate, cordate to truncate at base, toothed, puberulent on both sides, the petioles sometimes winged, decurrent, the upper leaves gradually becoming smaller, ovate or oblong, acute, rounded at base, entire, sessile; heads in racemes or rarely sub-corymbose; involucre campanulate, about 17 mm. long, 12–15 mm. wide, densely silky-woolly; bracts 9-seriate, imbricate, the outer short, broadly ovate, obtuse, mucronate, much shorter than the inner, the median oblong, obtuse, the inner linear, acute, membranous; corollas purplish, about 13 mm. long.—Sept.–Oct. Grassy places in mountains; Honshu.—Korea.

Hybrids are: *Saussurea* × *mirabilis* Kitam. KÔSHÛ-TÔ-HIREN. (*S. kirigaminensis* × *S. tanakae*); *Saussurea* × *rara* Kitam. KAI-TÔ-HIREN. (*S. amabilis* × *S. tanakae*); *Saussurea* × *karuzawensis* Hara (*S. tanakae* × *S. ussuriensis*); *Saussurea* × *sawatwii* Kitam. ONGATA-HIGOTAL (*S. sinuatoidea* × *S. tanakae*).

56. SERRATULA L. TAMURA-SÔ ZOKU

Erect, often branched perennial herbs; leaves alternate, pinnately parted, toothed, not spiny; involucre campanulate, the bracts many-seriate, the outer gradually shorter, broad, acuminate, short spine-tipped; receptacle densely setose; florets of outer row sterile, filiform, the corollas deeply 3- to 5-lobed, the central florets fertile, the corollas tubular, 5-lobed; filaments mammillate; anthers sagittate; style branches slender, with a tuft of hairs at base; achenes glabrous, terete, truncate at apex, gradually narrowed at base, obliquely attached; pappus-bristles many, unequal in length, scaberrulous.—Many species in the N. Hemisphere.

1. *Serratula coronata* L. var. *insularis* (Iljin) Kitam. *S. insularis* Iljin; *S. koreana* Iljin, pro parte; *S. coronata* sensu auct. Japon., non L.—TAMURA-SÔ. Rhizomes creeping, woody; stems 30–140 cm. long, striate, usually pubescent; lower and radical leaves long-petiolate, ovate-oblong, pinnately parted, the segments 6 or 7 pairs, oblong, acute, narrowly cuneate at base, irregularly toothed, white-puberulent on both sides, the upper leaves smaller, short-petiolate or sessile; heads erect,

long-pedunculate; involucre campanulate, 20–27 mm. long, yellow-green to purplish, slightly cobwebby; bracts 7-seriate, the outer lanceolate or broadly so, the median and inner acuminate, spine-tipped, the inner narrowly lanceolate, scarious; corollas pale rose-purple; achenes about 6 mm. long, 1.5 mm. wide; pappus 11–14 mm. long.—Sept.–Oct. Mountains; Honshu, Shikoku, Kyushu.—Korea. The typical phase occurs in Korea, Manchuria, and Siberia.

57. SYNURUS Iljin YAMA-BOKUCHI ZOKU

Large branched perennials; leaves alternate, ovate or ovate-elliptic, petiolate, incised-toothed to pinnately cleft, mucronate-toothed; heads large, nodding in anthesis; involucre globose or globose-campanulate, large, the bracts many-seriate, acuminate, entire, the outer gradually smaller and recurved, the inner erect; receptacle densely setose; florets dark purple or yellowish to whitish; style 2-fid, the branches erect, obtuse, with a tuft of hairs at base; anther appendages connate around the filaments; achenes oblong, glabrous, truncate at apex, many-ribbed; pappus-bristles unequal in length, slightly scabrous.—e. Asia, Siberia, and Mongolia.

- 1A. Narrow part of corolla-tube slightly shorter than to as long as the other part; leaves deltoid, hastate at base; involucre bracts 2 to 3 mm. wide. 1. *S. excelsus*
 1B. Narrow part of corolla-tube much shorter than the other part.
 2A. Involucre bracts needle-like. 2. *S. palmatopinnatifidus*
 2B. Involucre bracts linear to lanceolate. 3. *S. pungens*

1. *Synurus excelsus* (Makino) Kitam. *Serratula excelsa* (Makino) Makino; *S. atriplicifolia* var. *excelsa* Makino—HABA-YAMA-BOKUCHI. Rhizomes stout; stems stout, 1-2 m. long, purplish, cobwebby, branched in upper portion; lower cauline leaves long-petiolate, deltoid, 10-20 cm. long, acute, mucronate, hastate at base, irregularly incised, mucronate-toothed, green above, densely white-woolly beneath, the upper leaves gradually smaller, ovate-deltoid, truncate to cuneate at base, short-petiolate to sessile; heads rather congested, on stout peduncles; involucre globose, transversely cobwebby, about 3 cm. long, 3-5 cm. wide; bracts many-seriate, the outer gradually smaller, linear-lanceolate, the median 2-3 mm. wide; florets dark-purple; achenes about 6 mm. long, 3 mm. wide, toothed; pappus about 20 mm. long, brownish.—Sept.-Oct. Honshu, Shikoku, Kyushu.

2. *Synurus palmatopinnatifidus* (Makino) Kitam. *Serratula deltoidea* var. *palmatopinnatifida* Makino; *S. palmatopinnatifida* (Makino) Kitam.—KIKUBA-YAMA-BOKUCHI. Rhizomatous; stems 70-100 cm. long, cobwebby, purplish; lower cauline leaves long-petiolate, ovate or ovate-oblong, 15-23 cm. long, acute, mucronate, usually deeply cordate at base, palmately pinnatifid, the segments oblong or lanceolate, acute, irregularly mucronate-toothed or denticulate, green above, white-tomentose beneath, the upper leaves smaller, short-petiolate or sessile, truncate to cuneately rounded at base; involucre globose-campanulate, about 26 mm. long, 3-4 cm. wide, loosely cobwebby; bracts many-seriate, needlelike, spine-tipped, the outer recurved, the inner erect, 1.5 mm. wide; achenes

about 6 mm. long, about 2.5 mm. wide, glabrous, toothed; pappus brownish, about 20 mm. long, rather unequal in length.—Oct. Mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Korea.

Var. *indivisus* Kitam. *Serratula deltoidea* Makino, excl. syn.; *S. atriplicifolia* sensu Makino, non Benth.—YAMA-BOKUCHI. Leaves undivided.—Honshu, Shikoku, Kyushu.—Korea.

3. *Synurus pungens* (Fr. & Sav.) Kitam. *Rhaponticum pungens* Fr. & Sav.; *Serratula pungens* Fr. & Sav.; *S. atriplicifolia* var. *pungens* (Fr. & Sav.) Makino—OYAMA-BOKUCHI. Rhizomes ascending to creeping; stems 1-1.5 m. long, stout, purplish, slightly cobwebby; lower cauline leaves long-petiolate, ovate-oblong or ovate, sometimes broadly ovate, 15-35 cm. long, acute, mucronate, deeply cordate at base, incised mucronate-toothed, white or sometimes reddish woolly-tomentose beneath, the upper leaves smaller, short-petiolate or sessile, ovate, cordate to rounded at base; heads nodding; involucre campanulate-globose, about 3 cm. long, 3.5-4.5 cm. wide, dark purple; bracts many-seriate, acuminate, spine-tipped, the outer gradually smaller, the median linear-lanceolate, 1.5-2 mm. wide, the inner erect, linear; corollas purplish; achenes about 6 mm. long, 3 mm. wide; pappus-bristles brownish, unequal in length, about 16 mm. long.—Sept.-Oct. Hokkaido (sw. distr.), Honshu (centr. and n. distr.).

Var. *giganteus* Kitam. ONI-YAMA-BOKUCHI. Heads larger; pappus bristles to 21 mm. long.—Honshu (centr. distr.).

58. ECHINOPS L. HIGOTAI ZOKU

Large stout perennial herbs; leaves alternate, pinnately lobed to divided, spiny; heads 1-flowered, sessile, densely congested in compound globose heads; involucre bracts many-seriate, the outer needlelike, the median spatulate, awned, the inner narrowly rhomboid or oblong, short-awned; florets all fertile; corollas tubular, deeply 5-lobed, broader part of the tube short; style-branches relatively thick, erect, mammillate on back, thickened and papillose-puberulent below the middle; achenes densely hairy; pappus crownlike, the bristles many, short, scalelike.—s. Europe and S. Africa, few in Asia and tropical Africa.

1. *Echinops setifer* Iljin. *E. sphaerocephalus* sensu auct. Japon., non L.; *E. dahuricus* sensu auct. Japon., non Fisch.—HIGOTAI. Stems stout, about 1 m. long, densely white-villous, slightly branched in upper part, deeply striate at base; radical leaves long-petiolate, about 20 cm. long, pinnately parted, the segments acuminate, short spine-margined, slightly cobwebby above, white-woolly beneath, decurrent, the cauline

leaves oblong, 15-25 cm. long, acuminate, sessile, pinnately lobed; heads sessile, very many, densely congested in a compound globose head, about 5 cm. across; involucre 14-21 mm. long, 4-5 mm. wide, the bracts 16-18; florets blue; achenes terete, densely brownish hairy.—Aug.-Sept. Low mountains; Honshu (Mino, Bingo Prov.), Shikoku, Kyushu.—Korea.

59. LAPSANA L. YABU-TABIRA-KO ZOKU

Annual or biennial herbs; leaves alternate, coarsely toothed to pinnate; heads small, in loose panicles, the peduncles often long; involucre cylindric-campanulate; outer involucre bracts few, small, the inner 1-seriate, nearly alike; receptacle flat, glabrous; flowers all ligulate, the corollas truncate, 5-toothed, yellow; achenes oblong, often slightly flattened, many-ribbed, rounded at apex, narrowed at base, glabrous; pappus absent.—About 10 species, in temperate regions of the Old World.

- 1A. Involucre ovoid to ovoid-globose; achenes oblong, about 2.5 mm. long, without appendages at apex, distinctly shorter than the involucre. 1. *L. humilis*
 1B. Involucre ellipsoidal or oblong; achenes oblong-lanceolate, 4-4.5 mm. long, with 2 short hornlike appendages at apex, nearly as long as the involucre. 2. *L. apogonoides*

1. *Lapsana humilis* (Thunb.) Makino. *Prenanthes humilis* Thunb.; *L. parviflora* A. Gray.—YABU-TABIRA-KO. Sparingly pubescent biennial; radical leaves tufted, petiolate, 5–15 cm. long, 1.5–3 cm. wide, lyrate pinnatifid, the terminal segments largest, rounded at apex; scapiform stems ascending, 10–30 cm. long, few-leaved, branched, several-headed; heads small, nodding in fruit; involucre about 4.5 mm. long, ovoid to ovoid-globose, the inner bracts 7 or 8, broadly lanceolate; achenes oblong, about 2.5 mm. long, reddish-brown, slightly flattened, ribbed on both sides.—Riverbanks, paddy fields, cultivated fields, and thickets in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.

× *Lapsoyoungia musashiensis* (Hiyama) Hiyama. *Lapsana musashiensis* Hiyama.—ONI-YABU-TABIRA-KO. A bigeneric hybrid of *Lapsana humilis* × *Youngia japonica*.—Honshu (Kantō Distr.).

2. *Lapsana apogonoides* Maxim. KO-ONI-TABIRA-KO. Resembles *L. humilis*; biennial sparingly pilose herb; radical leaves tufted, 4–10 cm. long, 1–2 cm. wide, petiolate, lyrate pinnatifid, usually obtuse, mucronate, the terminal segments large; scapiform stems ascending, 10–25 cm. long, few-leaved, the several heads in loose corymbs; heads nodding in fruit; involucre about 4.5 mm. long, as long as to slightly longer than the achenes, ellipsoidal or oblong; inner involucral bracts oblong-lanceolate; achenes pale yellow-brown, flattened, 3-angled, minutely mammillate, oblong-lanceolate, 4–4.5 mm. long, ribbed, with 2 short hornlike appendages at apex.—Apr.–June. Riverbanks, cultivated fields, and thickets in lowlands; Honshu, Shikoku, Kyushu; common.—Korea and China.

60. HYPOCHOERIS L. ŌGON-SŌ ZOKU

Perennials, rarely annuals or biennials; radical leaves tufted, entire to pinnatifid; stems scapiform and bracteate or slightly branched and leafy; heads relatively large, on long peduncles, yellow; involucre oblong-cylindric or campanulate, the bracts many-seriate, imbricate, the outer gradually smaller; receptacle flat, scaly (paleaceous); corolla ligulate, truncate and toothed at apex; achenes oblong or linear, 10-ribbed, sometimes flattened, truncate and toothed at apex, slightly narrowed at base; pappus-bristles 1-seriate, plumose.—About 50 species, chiefly in temperate regions, especially abundant in S. America.

1. *Hypochoeris crepidioides* (Miyabe & Kudo) Tatew. & Kitam. *Picris crepidioides* Miyabe & Kudo; *Achyrophorus crepidioides* (Miyabe & Kudo) Kitag.—EZO-KŌZORI-NA. Perennial with sparse coarse hairs; stems 15–40 cm. long, simple, few-leaved at base; radical leaves few, oblong-lanceolate to oblong-spathulate, 8–13 cm. long, 2–3 cm. wide, obtuse, irregularly toothed, the lower cauline leaves similar to the radical, the upper oblong, sessile, rather small, clasping; heads solitary, about 5 mm. across, yellow; involucre bracts many, blackish, the outer ovate-oblong, elongate-linear, about 7 mm. long, 1.5–2.5 mm. wide, with coarse black and short white-wooly

hairs, the innermost membranous, 2.2 cm. long, 1.5 mm. wide; achenes linear-lanceolate, 1–1.3 cm. long, beaked, rugose; pappus sordid-white, plumose, the bristles about 1 cm. long.—July. Alpine regions; Hokkaido (Mount Apoi).

Hypochoeris ciliata (Thunb.) Makino. *Arnica ciliata* Thunb.; *H. grandiflora* Ledeb.—ŌGON-SŌ. Perennial with few-leaved stems; leaves hispid on midrib beneath and on margin; involucre bracts glabrous, 4–6 mm. wide at base; achenes beakless. Rarely cultivated in our area.—Korea and E. Asia.

61. SCORZONERA L. FUTANAMI-SŌ ZOKU

Perennial, rarely annual or biennial herbs often with woolly hairs; leaves alternate, entire to pinnate; heads relatively large, long-pedunculate; involucre tubular or campanulate, the bracts many-seriate, imbricate, the outer gradually smaller; receptacle flat or alveolate, rarely hairy; corollas ligulate, yellow, truncate, 5-toothed; achenes linear, terete, or angled, rarely winged, narrowed at tip; pappus-bristles many-seriate, unequal in length, toothed or plumose.—About 100 species, in Europe, N. Africa, and Asia.

1. *Scorzonera rebunensis* Tatew. & Kitam. *S. radiata* sensu auct. Japon., non Fisch.; *S. radiata* forma *humilis* Koidz.—FUTANAMI-SŌ. Perennial herb with stout rhizomes, densely covered with brownish marcescent leaves at base; scapiform stems simple, 10–20 cm. long, with few scalelike leaves, short-pubescent above; radical leaves tufted, glabrous, oblanceolate or spatulate, 3-nerved, acute, as long as to

shorter than the stems; heads solitary, relatively large, erect; involucral bracts narrowly scarious-margined, glabrous, rather fleshy; corollas ligulate, yellow, the tube puberulent; achenes glabrous; pappus white, the bristles elongate, some scabrous and some short-plumose.—July–Aug. Hokkaido (Rebun Isl.).

62. PICRIS L. KŌZORI-NA ZOKU

Erect branched herbs usually hispid or coarsely hirsute on stems and leaves; leaves radical and cauline; heads pedunculate; involucre ovoid-urceolate or campanulate, the inner bracts 1-seriate, nearly equal, the outer many; receptacles flat, short-pilose; corollas ligulate, yellow, truncate, 5-toothed; achenes linear or oblong, sometimes angled, 5- to 10-ribbed, rather abruptly narrowed at apex, sometimes beaked; pappus usually in a single series, plumose, sometimes also with an outer series of smaller unbranched bristles.—About 40 species, in Europe, Asia, and N. Africa.

1. *Picris hieracioides* L. var. *glabrescens* (Regel) Ohwi. *P. japonica* Thunb.; *P. japonica* var. *glabrescens* Regel; *P. flexuosa* Thunb.; *P. hieracioides* var. *japonica* (Thunb.) Regel; *P. hieracioides* sensu auct. Japon., non L.;

P. hieracioides subsp. *japonica* (Thunb.) Krylov.—KŌZORI-NA. Biennial brownish red hispid herb; stems terete, 30–80 cm. long, leafy, often branched; lower and radical leaves oblanceolate, 6–15 cm. long, 1–4 cm. wide, mucronate or acutely

toothed, subobtusely, gradually narrowed to a petiolelike base, the median cauline leaves sessile, the upper ones linear-lanceolate, sometimes semiclasping; heads 2-2.5 cm. across, yellow; involucre green, often slightly black-tinged, the inner bracts linear-lanceolate, 8-12 mm. long, about 1.5 mm. wide, hispid and short-pubescent on back, the outer very short; achenes red-brown, narrowly fusiform, about 4 mm. long, longitudinally ribbed, nearly beakless; pappus sordid-white, 7-8 mm. long.—May-Oct. Grassy places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Sakhalin.

Var. *jessoensis* (Tatew.) Ohwi. *P. jessoensis* Tatew.; *P. hieracioides* subsp. *jessoensis* (Tatew.) Kitam.; *P. japonica* var. *jessoensis* (Tatew.) Ohwi.—HOSOGA-KÖZORI-NA. Plant less hispid; radical leaves rather prominent, the cauline narrow, fewer; involucre bracts blackish green; corollas deep yellow.—Serpentine rocks in mountains; Hokkaido.

Var. *akaishiensis* Kitam. *P. japonica* var. *akaishiensis* (Kitam.) Ohwi.—AKAISHI-KÖZORI-NA. Leaves linear-lanceolate; heads smaller; involucre bracts less hispid.—Honshu (centr. distr.).

Var. *mayebarae* (Kitam.) Ohwi. *P. hieracioides* subsp. *mayebarae* Kitam.; *P. japonica* var. *mayebarae* (Kitam.) Ohwi.—HIGO-KÖZORI-NA. Plants moderately hispid; involucre bracts blackish green; corollas deep yellow.—Flow-ering in late autumn; Kyushu (Higo Prov.).

Var. *alpina* Koidz. *P. kamtschatica* Ledeb.; *P. hieracioides* subsp. *kamtschatica* (Ledeb.) Hult.—KANCHI-KÖZORI-NA. Plant short, dark green, very hispid; involucre dark green, the bracts prominently hispid; corollas deep yellow.—Hokkaido and alpine regions of Honshu (centr. and n. distr.).—Kuriles, Kamchatka, and Aleutians. The typical phase occurs in Eurasia; introduced in N. America.

63. TARAXACUM Wiggers TAMPOPO ZOKU

Acaulescent perennial herbs; leaves radical, entire to pinnate; heads on a scape; involucre campanulate or oblong, the bracts herbaceous, the innermost 1-seriate, elongate, the outer short, many-seriate, often reflexed at tip; receptacle flat, glabrous; corolla ligulate, truncate, 5-toothed; achenes oblong or narrowly so, 4- or 5-angled or slightly compressed, 10-ribbed, narrowed at base, beaked, often warty-tuberculate near base of beak; pappus-bristles simple, many, slender, unequal in length.—Many species, in temperate to Arctic regions, especially abundant in the N. Hemisphere.

- 1A. Outer involucre bracts reflexed from the base; introduced. 1. *T. officinale*
- 1B. Outer involucre bracts erect or ascending, not reflexed; indigenous.
- 2A. Involucres dark green; corollas orange-yellow; alpine or boreal plants with dense usually brown scales on neck of caudex.
- 3A. Involucres small, 12-15 mm. long at anthesis.
- 4A. Leaves pinnately divided, the sinus reaching the midrib, the terminal segments usually acuminate; outer involucre bracts oblong, not corniculate. 2. *T. yuzepense*
- 4B. Leaves pinnately cleft to parted, the sinus reaching part-way to the midrib, the terminal segments usually obtuse, rarely acute; outer involucre bracts ovate, corniculate. 3. *T. trigonolobum*
- 3B. Involucres large, 15-21 mm. long at anthesis.
- 5A. Outer involucre bracts very short, about $\frac{1}{2}$ as long as the inner; leaves lingulate, toothed or pinnately cleft to parted. 4. *T. yatsugataense*
- 5B. Outer involucre bracts half or more than half as long as the inner.
- 6A. Outer involucre bracts about half as long as the inner, with broad membranous margins. 5. *T. platycedium*
- 6B. Outer involucre bracts more than half as long as the inner.
- 7A. Involucres pruinose, 15-18 mm. long, the outer bracts oblong to oblong-lanceolate, not corniculate, obsolete membranous on margin. 6. *T. alpicola*
- 7B. Involucres not pruinose, 17-19 mm. long, the outer bracts oblong to ovate-oblong, usually corniculate, distinctly membranous on margin. 7. *T. shikotanense*
- 2B. Involucres bright to pale green; corollas yellow or white; lowland and mountain plants with few brown scales on neck of caudex.
- 8A. Corollas yellow; leaves and bracts green.
- 9A. Involucres 13-14 mm. long at anthesis.
- 10A. Outer involucre bracts less than half as long as the inner, oblong-lanceolate to ovate-lanceolate, corniculate or not. 8. *T. japonicum*
- 10B. Outer involucre bracts about half to more than half as long as the inner.
- 11A. Outer involucre bracts about half as long as the inner.
- 12A. Outer involucre bracts ovate to ovate-oblong, corniculate. 9. *T. kishianum*
- 12B. Outer involucre bracts oblong, usually not corniculate, rarely so. 10. *T. kuzakense*
- 11B. Outer involucre bracts more than half as long as the inner. 11. *T. variabile*
- 9B. Involucres 15-20 mm. long at anthesis.
- 13A. Outer involucre bracts less than half as long as the inner, broadly ovate or ovate-oblong, obtuse; leaves pectinate. 12. *T. pectinatum*
- 13B. Outer involucre bracts about half to more than half as long as the inner.
- 14A. Outer involucre bracts more than half as long as the inner.
- 15A. Outer involucre bracts blackish on back, ovate-lanceolate; achenes about 5 mm. long, 1 mm. wide. 13. *T. mariyamatum*
- 15B. Outer involucre bracts green.
- 16A. Outer involucre bracts oblong, relatively short-corniculate. 14. *T. sendaicum*
- 16B. Outer involucre bracts oblong-lanceolate, long-corniculate. 15. *T. longependiculatum*
- 14B. Outer involucre bracts about half as long as the inner.
- 17A. Outer involucre bracts oblong or lanceolate.
- 18A. Outer involucre bracts small-corniculate or not so. 16. *T. elatum*
- 18B. Outer involucre bracts prominently corniculate. 17. *T. ceratolepis*

17B. Outer involucre bracts ovate or ovate-oblong.

19A. Outer involucre bracts usually prominently corniculate, green, ovate to lanceolate. 18. *T. platycarpum*

19B. Outer involucre bracts not corniculate or rarely slightly so.

20A. Outer involucre bracts green. 19. *T. hondoense*

20B. Outer involucre bracts scarious, reddish at tip. 20. *T. arakii*

8B. Corollas white, rarely pale yellow; leaves and bracts pale green.

21A. Scapes longer than the leaves; outer involucre bracts ovate-oblong, prominently corniculate. 21. *T. albidum*

21B. Scapes as long as or shorter than the leaves; outer involucre bracts ovate or ovate-lanceolate, small-corniculate or not so.

22. *T. shinanense*

1. *Taraxacum officinale* Weber. *Leontodon taraxacum* L.—SEIYŌ-TAMPOPO. Rather robust soft perennial; leaves variously pinnatifid to deeply toothed, usually 20–30 cm. long, 2.5–5 cm. wide; heads rather large, 4–5 cm. across, clear yellow, the outer involucre bracts usually narrowly lanceolate, about half as long as the inner, not appendaged just below the apex; achenes about 4 mm. long, more or less muricate.—Mar.–May. Naturalized around towns and cities.—Introduced from Europe.

2. *Taraxacum yuparense* H. Koidz. *T. officinale* var. *lividum* subvar. *dissectissimum* Koidz.—TAKANE-TAMPOPO, YŪBARI-TAMPOPO. Leaves pinnately divided, the sinus reaching to the midrib, the segments acute to acuminate, acutely toothed on upper margin, the petioles slender; scapes 20–45 cm. long; involucre bracts not corniculate, the outer oblong, short-acuminate, appressed, scarious on margin, the innermost lanceolate to linear-lanceolate; achenes prominently 5- or 6-ribbed, with rather large spinelike tubercles.—Alpine regions; Hokkaido (Ishikari and Hidaka Prov.).

3. *Taraxacum trigonolobum* Dahlst. *T. chamissonis* Greene, pro parte; *T. yesoalpinum* Nakai; *T. livens* H. Koidz.; *T. crassicolium* H. Koidz.—KUMOMA-TAMPOPO. Roots thickened; leaves rather thick, oblanceolate or spatulate-ob lanceolate, pinnately cleft to parted, the sinus reaching part-way to the midrib, the terminal segments usually obtuse; heads about 4 cm. across; outer involucre bracts appressed to slightly spreading, ovate or ovate-oblong, small-corniculate, about half as long as the inner, the inner linear; achenes 4.5–5 mm. long, with spinelike tubercles.—Alpine regions; Hokkaido (Ishikari Prov.).—Kuriles, Kamchatka, Aleutians, and Alaska.

4. *Taraxacum yatsugatakenae* H. Koidz. YATSUGATAKE-TAMPOPO. Plant about 25 cm. high; leaves suberect, oblanceolate, lingulate, toothed or pinnately cleft to parted; scapes white woolly-pubescent on upper part; heads 2.5–3 cm. across; involucre rounded at base, the bracts not corniculate, the outer appressed, ovate or ovate-rounded, 1/3 as long as the inner, nearly glabrous on margin, the inner linear-lanceolate, glabrous.—Alpine regions; Honshu (Mount Yatsugatake in Shinano and in Akaishi Mt. range).

5. *Taraxacum platyepedum* Diels. *T. otagirianum* Koidz.; *T. imbricatum* H. Koidz.; *T. pruinatum* H. Koidz.; *T. saxatile* H. Koidz.; *T. sugawarae* H. Koidz.; *T. koidzumii* Nemoto; *T. albomarginatum* Kitam.; *T. multisectum* Kitag.—ONASAMU-TAMPOPO. Roots thickened; leaves oblanceolate, 10–20 cm. long, 1–5 cm. wide, irregularly pinnatifid, the petioles slightly purplish; heads about 4 cm. across; outer involucre bracts ovate to broadly so, about half as long as the inner, sometimes small-corniculate, broadly membranous on margin, white-pubescent on upper surface; achenes pale yellow-brown, about 3.5 mm. long, 1 mm. wide, with spreading spinelike tubercles toward the tip.—Alpine regions; Hokkaido (Shiribeshi Prov.).—Sakhalin, Korea, Manchuria, and China.

6. *Taraxacum alpicola* Kitam. *T. officinale* var. *lividum* sensu auct. Japon., non K. Koch; *T. japonense* Nakai; *T. kurohimense* H. Koidz.; *T. togakushiense* H. Koidz.—MIYAMA-TAMPOPO, TATEYAMA-TAMPOPO. Roots thickened; leaves lingulate, 15–30 cm. long, 4–6 cm. wide, obtuse or rounded, petiolelike at base, usually incised; scapes longer than the leaves at anthesis, loosely pubescent, villous under the head; heads about 4 cm. across; involucre pruinose, 15–18 mm. long, the outer bracts erect, lanceolate-oblong or oblong, not corniculate, the inner 14–15 mm. long, linear-lanceolate; achenes oblong-linear, 3.5–4 mm. long, slightly flattened, pale yellow-brown, with spinelike tubercles on upper part, smooth at base.—July–Aug. Alpine regions; Honshu (centr. and n. distr.).

Var. *shiroumense* (H. Koidz.) Kitam. *T. shiroumense* H. Koidz.—SHIROUMA-TAMPOPO. Involucre bracts usually corniculate.—Honshu (centr. distr.).

7. *Taraxacum shikotanense* Kitam. SHIKOTAN-TAMPOPO, NEMURO-TAMPOPO. Roots thick; leaves oblanceolate, obtuse, gradually narrowed and petiolelike at base, pinnately lobed to cleft; heads large, about 5 cm. across; involucre 17–19 mm. long, the outer bracts erect, oblong to ovate-oblong, narrowed at tip and corniculate, dark purplish, distinctly membranous on margin; achenes brown to pale yellow-brown, oblong, about 4 mm. long, 1.3 mm. wide, narrowed at tip, with dense spinelike tubercles on upper part, gradually less so toward the base.—July. Near seashores; Hokkaido.—Kuriles.

8. *Taraxacum japonicum* Koidz. *T. kansaiense* Koidz.; *T. bitchuense* H. Koidz.; *T. liukiuense* H. Koidz.; *T. okinawense* H. Koidz.—KANSAI-TAMPOPO, KANSEI-TAMPOPO. Plant about 20 cm. high; leaves lyrate, pinnately cleft, obtuse, acute or rounded, nearly glabrous; scapes few, slender, longer than the leaves at anthesis; heads 2–3 cm. across; outer involucre bracts 2-seriate, oblong, lanceolate or ovate-lanceolate, obtuse, less than half as long as the inner, the inner linear-lanceolate or ovate-lanceolate, obtuse, 12–14 mm. long, corniculate or sometimes not so; achenes about 5 mm. long, pale yellow-brown with spinelike tubercles on upper part.—Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Ryukyu.

9. *Taraxacum kiushianum* H. Koidz. *T. shikokianum* Kitam.; *T. imaizumii* H. Koidz.; *T. japonicum* var. *macrolepis* H. Koidz.—TSUKUSHI-TAMPOPO. Leaves broadly oblanceolate, 10–30 cm. long, acute to obtuse, pinnatifid; scapes many, longer than the leaves at anthesis, loosely pubescent, villous toward the tip; heads 3–4 cm. across; outer involucre bracts appressed, broadly ovate to ovate-oblong, corniculate, the inner 1–1.4 cm. long, blackish on back; achenes slightly flattened, brownish, 4–5 mm. long, about 1 mm. wide.—Shikoku, Kyushu (n. distr.).

10. *Taraxacum kuzakaiense* Kitam. KUZAKAI-TAMPOPO. Leaves linear-oblanceolate, loosely pubescent, 5–11 cm. long, 7–20 mm. wide, obtuse to acute, irregularly pinnatisect;

scapes shorter than to as long as the leaves at anthesis, densely cobwebby toward the tip, villous under the head; involucre small, the outer bracts appressed, oblong, acuminate, pubescent toward the tip, usually not coriaceous or sometimes so, the inner lanceolate, glabrous; achenes brownish, narrowly oblong, about 3 mm. long, 1 mm. wide, with spinelike tubercles on upper part.—Honshu (Rikuchū Prov.).

11. *Taraxacum variabile* Kitam. *T. platycarpum* var. *variabile* (Kitam.) H. Koidz.—KITSUNE-TAMPOPO. Leaves spreading, lingulate-lanceolate, 7–10 cm. long, 1.5–2 cm. wide, obtuse, pubescent, pinnately cleft; scapes commonly shorter than the leaves, prominently hairy; heads small, 3–3.5 cm. across; involucre small, 12–14 mm. long, the outer bracts erect, ovate-oblong, gradually acute to acuminate, usually not coriaceous or sometimes so, more than half as long as the inner, reddish at tip, the inner bracts linear-lanceolate, scarious on margin, blackish, with a small hornlike tubercle at apex; achenes oblong, 4–4.5 mm. long, 1 mm. wide, angled, with spinelike tubercles on upper part.—Honshu (Sagami Prov.).

12. *Taraxacum pectinatum* Kitam. *T. nemotoi* H. Koidz.; *T. numajirii* H. Koidz.—KUSHIBA-TAMPOPO. Leaves many, linear-lanceolate, 10–30 cm. long, 3–4 cm. wide, acute, pinnately parted, pectinate, the segments linear, the terminal one smaller; scapes many, shorter than to as long as the leaves, loosely cobwebby, villous under the head; heads 3.5–4 cm. across; involucre 15–20 mm. long, about 2 cm. wide, the outer bracts appressed, coriaceous or rarely not so, white-ciliate, broadly ovate or ovate-oblong, obtuse, less than half as long as the inner, the inner bracts linear-lanceolate, distinctly scarious on margin, blackish; achenes pale yellow-brown or brownish, oblong, 4.5 mm. long, 1.3 mm. wide, somewhat warty, with a spinelike apical appendage.—Honshu (Etchu Prov., Kinki Distr. and westw.), Shikoku.

13. *Taraxacum maruyamanum* Kitam. OKI-TAMPOPO. Roots thickened; leaves many, oblanceolate, 18–28 cm. long, 3–4.5 cm. wide, glabrous on both sides, pinnately cleft, the terminal segment small, obtuse; scapes many, as long as to longer than the leaves, glabrescent, except pubescent at apex; heads 3.5–4 cm. across; involucre 16–18 mm. long at anthesis, 2–2.2 cm. long in fruit, the outer bracts 2-seriate, appressed, ovate-lanceolate, blackish on back, acuminate, coriaceous or not so, the inner bracts oblong-lanceolate or lanceolate, green or with broad scarious margins, blackish toward the tip; achenes brownish, narrowly oblong, about 5 mm. long, 1 mm. wide, with a spinelike apical appendage.—Honshu (Okai Isl.).

14. *Taraxacum sendaicum* Kitam. *T. platycarpum* var. *sendaicum* (Kitam.) H. Koidz.—SENDAI-TAMPOPO. Leaves few, lanceolate-lingulate, about 15 cm. long, 2–2.5 cm. wide, acute, pubescent while young, usually pinnately lobed to cleft, rarely coarsely toothed; scapes many, longer than to as long as the leaves at anthesis, pubescent, villous under the head; heads about 3 cm. across; involucre about 13 mm. long, the outer bracts oblong, acute, relatively short-coriaceous, the inner lanceolate, blackish at apex, small-coriaceous.—Honshu (Rikuzen Prov.).

15. *Taraxacum longeaependiculatum* Nakai. *T. micranthum* Kitam.; *T. tokaense* Kitam.; *T. candidum* H. Koidz.; *T. nakaii* H. Koidz.; *T. longeaependiculatum* var. *tokaense* (Kitam.) Kitam.—HIRO-HA-TAMPOPO, TŌKAI-TAMPOPO. Leaves oblanceolate or spatulate-oblanceolate, toothed or pinnately lobed, pubescent while young, rounded, mucro-

nate; scapes loosely pubescent, villous under the head; heads about 3 cm. across; involucre 15–16 mm. long, the outer bracts erect, oblong to lanceolate, long-coriaceous, the inner narrowly lanceolate; achenes oblong, slightly flattened, 3–4 mm. long, 1.2–1.4 mm. wide, pale yellow-brown and somewhat greenish, about 1.3 mm. wide with spinelike tubercles toward the tip, sparingly tubercled at base.—Honshu (Awa Prov., Tōkaidō Distr., S. Kinki and Chūgoku Distr.).—Forma *albiflavescens* Kitam. Flowers pale yellow.—Honshu (Mino Prov.).

16. *Taraxacum elatum* Kitam. *T. japonicum* Koidz., pro parte; *T. kisoense* H. Koidz.; *T. minoense* H. Koidz.; *T. yetchuense* H. Koidz.—SEITAKA-TAMPOPO. Leaves few, ascending, linear-oblanceolate, 25–35 cm. long, 5–8 cm. wide, deeply pinnatifid, the terminal segments small, acute, mucronate; scapes longer than to as long as the leaves, cobwebby while young, villous under the head; heads 3.5–4 cm. wide; involucre about 2 cm. long, the outer bracts appressed or erect, oblong or lanceolate, dark purplish toward the tip, coriaceous or not so, the inner linear-lanceolate; achenes gray to brown, narrowly oblong, about 4 mm. long, with spinelike tubercles on upper part, warty-tubercled or nearly smooth on lower part.—Honshu (w. part of centr. distr., Oomi and Ise Prov.).

Var. *ibukiense* Kitam. IBUKI-TAMPOPO. Involucral bracts dark green, narrowly white-membranous on margin.—Honshu (Mount Ibuki in Oomi Prov.).

17. *Taraxacum ceratolepis* Kitam. KENSAKI-TAMPOPO. Leaves obovate-oblong, about 30 cm. long, 5–7.5 cm. wide, obtuse, pinnately cleft; scapes many, somewhat shorter than the leaves at anthesis, much elongate after anthesis; heads about 5 cm. across; involucre about 21 mm. long, the outer bracts somewhat spreading, oblong, prominently coriaceous, the inner lanceolate, coriaceous; achenes dark brown, oblong, 4–5 mm. long, slightly flattened, with spinelike tubercles at apex, slightly warty-tubercled toward the base.—Honshu (Tanba and Izumo Prov.).

18. *Taraxacum platycarpum* Dahlst. *T. officinale* var. *platycarpum* (Dahlst.) Nakai; *T. denticorne* H. Koidz.; *T. hitachiense* H. Koidz.; *T. luteopapposum* H. Koidz.; *T. tsurumachii* Kitam.; *T. platycarpum* var. *corniculatum* H. Koidz.—KANTŌ-TAMPOPO. Leaves oblanceolate, obtuse, rarely acute, pinnately incised or parted, 20–30 cm. long, 2.5–5 cm. wide; scapes as long as to shorter than the leaves at anthesis, villous under the head; heads 3.5–4.5 cm. across; involucre 15–18 mm. long, the outer bracts narrowly ovate to broadly lanceolate, erect, prominently coriaceous, green, the inner linear-lanceolate; achenes oblong or fusiform, 4.5–5 mm. long, 1–1.2 mm. wide, yellow-brown with spreading spinelike tubercles.—Honshu (Kantō Distr., Kai and Suruga Prov.).

19. *Taraxacum hondoense* Nakai ex H. Koidz. *T. albociliatum* H. Koidz.; *T. brachyphyllum* H. Koidz.; *T. denticulatomarginatum* H. Koidz.; *T. filicinum* H. Koidz.; *T. fujiisanense* H. Koidz.; *T. inugawense* H. Koidz.; *T. miyabei* H. Koidz.; *T. napifolium* H. Koidz.; *T. neorhodobasis* H. Koidz.; *T. patulum* H. Koidz.; *T. rhodobasis* H. Koidz.; *T. robustius* H. Koidz.; *T. sonchifolium* H. Koidz.; *T. tobai* H. Koidz.; *T. towadense* H. Koidz.; *T. venustum* H. Koidz.; *T. yuhki* H. Koidz.; *T. tenuifolium* H. Koidz., non K. Koch.—EZO-TAMPOPO. Leaves rather numerous, oblanceolate, lanceolate, or lingulate, subacute, sometimes obtuse, toothed to pinnately parted, to 35 cm. long, 2–8 cm. wide; scapes villous under the head; heads 2–4 cm. wide; involucre to 2.5 cm.

long, the outer bracts erect or appressed, many, ovate to broadly so, obtuse, coriaceous or not so, green, the inner lanceolate or linear-lanceolate, blackish on back; achenes slightly flattened, obovate-oblong, 4-5 mm. long, brown, with spinelike tubercles.—Hokkaido, Honshu (centr. and n. distr.).—Forma *albiflavescens* H. Koidz. USUJIRO-TAMPOPO. Corollas pale yellow.—Forma *rubicundum* (Koidz.) H. Koidz. BENI-TAMPOPO. Corollas reddish.

20. *Taraxacum arakii* Kitam. *T. albobimbratum* H. Koidz.; *T. iyoense* H. Koidz.; *T. arakii* var. *ecorniculatum* H. Koidz.—YAMAZATO-TAMPOPO. Leaves ascending, linear-lanceolate, to 30 cm. long, 4-5 cm. wide, obtuse, pinnately cleft; scapes many, shorter than to as long as the leaves at anthesis, cobwebby while young, villous under the head; involucre about 18 mm. long, the outer bracts appressed, oblong-ovate or ovate, caudate, coriaceous or not so, scarious, reddish at the tip, densely woolly on margin, green on midrib, the inner linear-lanceolate, green, not coriaceous, dark reddish at the tip; achenes pale yellow-brown or brownish, oblong-fusiform, about 5 mm. long, with spinelike tubercles on upper part and warty-tubercles on lower part.—Honshu (Kinki and Chūgoku Distr.), Shikoku.

21. *Taraxacum albidum* Dahlst. *T. officinale* var. *albiflorum* Makino; *T. albiflorum* (Makino) Koidz.; *T. hideoi* Nakai ex H. Koidz.—SHIROBANA-TAMPOPO. Leaves lanceolate to oblanceolate, 20-30 cm. long, 3-5 cm. wide, obtuse or

subacute, pinnately parted to cleft; scapes usually longer, rarely shorter than the leaves at anthesis, glabrous, white-pubescent under the head; heads 3.5-4.5 cm. across; involucre 17-20 mm. long at anthesis, the outer bracts narrowly ovate-oblong, ascending, prominently coriaceous; achenes narrowly obovoid-oblong, pale yellow-brown, with spinelike tubercles on upper part and warty tubercles below except at the base, slightly flattened, about 4 mm. long.—Honshu (Kantō, Tōkaidō, Kinki, and Chūgoku Distr.), Shikoku, Kyushu.—Forma *sulphureum* (H. Koidz.) Kitam. *T. albidum* var. *sulphureum* H. Koidz.—KIBANA-SHIRO-TAMPOPO. Corollas pale yellow.—Honshu (Chūgoku Distr.), Kyushu.

22. *Taraxacum shinanense* H. Koidz. *T. denudatum* H. Koidz.; *T. nambuense* H. Koidz.; *T. shinanense* var. *nambuense* (H. Koidz.) H. Koidz.—USUGI-TAMPOPO. Leaves tufted, spatulate-oblongate to linear-oblongate, pinnately lobed or parted, 10-30 cm. long, 2-8 cm. wide, obtuse, mucronate; scapes as long as to shorter than the leaves at anthesis; heads 3-4.5 cm. across; involucre 1.7-2 cm. long, the outer bracts appressed or slightly spreading, ovate or ovate-oblongate, small coriaceous or not so, the inner narrowly lanceolate, usually not coriaceous; achenes 5-6 mm. long, obovoid-oblong, with loose spinelike tubercles toward the tip, with warty tubercles toward the base.—Honshu (Shinano, Hitachi Prov. and n. distr.).

64. HIERACIUM L. MIYAMA-KŌZORI-NA ZOKU

Perennial herbs; stems leafy; leaves alternate, cauline or radical, entire or toothed; heads solitary, or in loose panicles or corymbs, yellow to orange-yellow, rarely red; involucre tubular-campanulate, usually with blackish hairs, the bracts narrow, herbaceous, the inner nearly equal; receptacle flat, glabrous or hairy; corollas all lingulate, the tube slightly shorter to as long as the limb, truncate, 5-toothed at apex; achenes cylindric, smooth, 10- or 15-ribbed and terete, or 4- or 5-ribbed and angled, truncate at apex; pappus-bristles many, 1- or 2-seriate, firm, simple, persistent.—About 400 species, especially abundant in Europe, few in N. and S. America, Asia, and S. Africa.

- 1A. Stems 10-30 cm. long, few-leaved; cauline leaves, or some of them, oblanceolate, obtuse to subobtusely, glandular-hairy and with long spreading coarse hairs, mucronate-toothed; achenes about 2 mm. long. 1. *H. japonicum*
 1B. Stems 40-80 cm. long, many-leaved; cauline leaves, or some of them, lanceolate to linear-lanceolate, acuminate, scabrous on margin and often on underside, entire or with few short teeth; achenes 3-3.5 mm. long. 2. *H. umbellatum* var. *japonicum*

1. *Hieracium japonicum* Fr. & Sav. MIYAMA-KŌZORI-NA. Perennial rhizomatous herb; stems 10-30(-40) cm. long, few-leaved; radical leaves membranous, oblanceolate, 5-10(-15) cm. long, 1-2.5 cm. wide, obtuse to subobtusely, mucronate-toothed, glandular-hairy and with long-spreading coarse brownish hairs; lower cauline leaves similar to the radical, sessile, clasping at base, the upper leaves small; heads few, deep yellow, 1.5-2 cm. across; pedicels, upper part of stems, and back of involucre bracts with long-spreading coarse brown hairs and dense red-brown short hairs; involucre blackish, 6-8 mm. long; achenes about 2 mm. long; pappus pale brown.—July-Aug. Alpine grassy slopes; Honshu (centr. and n. distr.).

2. *Hieracium umbellatum* L. var. *japonicum* Hara.

H. umbellatum var. *serotinum* sensu auct. Japon., non DC.—YANAGI-TAMPOPO. Perennial; stems erect, simple, rarely branched, firm, terete, 40-80 cm. long; cauline leaves many, the median rather thick, linear-lanceolate to lanceolate, 4-12 cm. long, 5-12 mm. wide, acuminate, sessile, scabrous on margin and often on underside, entire or with few short teeth; heads few, in terminal subumbellate corymbs, yellow, 2.5-3.5 cm. wide, the pedicels white-puberulent; involucre nearly glabrous, greenish black, 1-1.3 cm. long; achenes red-brown, 3-3.5 mm. long, brownish.—Aug.-Sept. Grassy slopes in mountains; Hokkaido, Honshu, Shikoku.—s. Kuriles, Sakhalin, and Korea. The typical phase occurs in Europe, Asia, N. Africa, and N. America.

65. HOLOLEION Kitam. SUI-RAN ZOKU

Nearly glabrous stoloniferous perennials; leaves narrow, alternate; heads erect at anthesis; involucre terete, cylindric, the bracts herbaceous, the inner nearly equal, the outer gradually becoming shorter; receptacle flat, alveolate; corollas all lingulate, yellow, truncate, 5-toothed, the tube much shorter than the limb; achenes linear-oblong, 6-9 mm. long, 4-angled, truncate; pappus-bristles 1-seriate, nearly equal, persistent or deciduous, minutely scabrous.—About 3 species, in e. Asia.

- 1A. Outer involucre bracts lanceolate to narrowly deltoid, acute; achenes 7.5-9 mm. long; peduncles 3.5-10 cm. long. 1. *H. kramerii*
 1B. Outer involucre bracts ovate-lanceolate, obtuse; achenes 5.5-6 mm. long; peduncles 1.5-3(-6) cm. long. 2. *H. maximowiczii*

1. *Hololeion krameri* (Fr. & Sav.) Kitam. *Hieracium krameri* Fr. & Sav.—SUI-RAN. Nearly glabrous perennial with soft white ascending rhizomes and subterranean slender naked stolon; stems simple or branched, 50–100 cm. long, erect; radical leaves few, linear-lanceolate, 15–50 cm. long, 1–3 cm. wide, acuminate, loosely toothed or mucronate-toothed, glaucous beneath; cauline leaves similar, narrow, elongate, sessile, the upper filiform-linear, small; peduncles 3.5–10 cm. long; heads loosely arranged, 3–3.5 cm. across, yellow, 10–30-flowered; involucre about 12 mm. long, the outer bracts lanceolate to narrowly deltoid, acute; achenes linear, 4-angled, 7.5–9 mm. long, about 1 mm. wide; pappus about 6 mm. long, pale brown.—Oct.–Nov. Wet boggy places; Honshu (Tōkaidō, Kinki Distr. and westw.), Shikoku, Kyushu.

2. *Hololeion maximowiczii* Kitam. *Hieracium hololeion* Maxim.; *H. sparsum* subsp. *hololeion* (Maxim.) Zahn—CHŌSEN-SUI-RAN, ITO-SUI-RAN. Rhizomes with innovation-shoots; stems 50–100 cm. long; radical leaves linear-lanceolate, acute with a mucro at apex; lower cauline leaves 15–40 cm. long, 5–30 mm. wide, entire, the median smaller, sessile; heads in loose corymbs, yellow, about 3 cm. across; involucre about 13 mm. long, the outer bracts ovate-lanceolate, obtuse; achenes 4-angled, 5.5–6 mm. long, about 1 mm. across; pappus about 7 mm. long, pale yellow.—Sept.–Oct. Wet places; Kyushu.—Korea, Manchuria, and Amur.

66. PRENANTHES L. FUKUŌ-SŌ ZOKU

Erect or sometimes scandent herbs; leaves alternate, sagittate-cordate, coarsely pinnatifid, the upper sessile and auriculate-clasping; heads usually in loose slender panicles, nodding at anthesis; involucre tubular, the inner bracts 1- or 2-seriate, equal, the outer few, small; receptacle flat, glabrous; corollas truncate, 5-toothed, the tube as long as to slightly shorter than the limb; achenes narrowly oblong, slightly flattened, 3- to 5-angled or terete, 10-ribbed, subtruncate, crowned with the persistent base of pappus; pappus-bristles 2- or 3-seriate, simple, deciduous.—About 30 species, in Europe, Asia, and N. America.

- 1A. Stems leafy only near base; leaves usually palmately 3- to 7-cleft to -parted, cordate; stems 40–60 cm. long, usually with long-spreading coarse glandular hairs; corollas blue-white; outer involucre bracts about $\frac{1}{3}$ as long as the inner; achenes 3.5–4.5 mm. long. 1. *P. acerifolia*
1B. Stems leafy throughout; leaves often pinnately parted, sagittate; stems 80–150 cm. long, usually without glandular hairs; corollas pale yellow; outer involucre bracts about half as long as the inner; achenes 7–9 mm. long. 2. *P. tanakae*

1. *Prenanthes acerifolia* (Maxim.) Matsum. *Nabalus acerifolius* Maxim.—FUKUŌ-SŌ. Stoloniferous; stems 40–60 cm. long, leafy only near base, simple, long coarse glandular-hairy; radical leaves long-petiolate, ovate-cordate, about 6–10 cm. long and as wide, coarsely toothed and incised, glandular-hairy on underside, usually palmately 3–7-cleft to -parted, the petioles distinctly winged, the wings in lower cauline leaves broadly clasping the stems; panicles large, the heads about 1.5 cm. across; involucre gray-green, 1–1.2 cm. long, with long coarse hairs on back, the outer bracts ovate to narrowly oblong, about $\frac{1}{3}$ as long as the inner; corollas blue-white; achenes 3.5–4.5 mm. long; pappus about 7 mm. long.—Aug.–Sept. Mountains; Honshu, Shikoku, Kyushu.—Forma *heterophylla* Matsum. & Koidz.—MARUBA-FUKUŌ-SŌ. Leaves undivided, rounded at base.—Honshu.—Forma *nipponica* (Fr. & Sav.) Matsum. & Koidz. *Nabalus nippon-*

icus (Fr. & Sav.) Makino—FUKUŌ-NIGANA. Plants sparsely coarse-hirsute; involucre bracts smooth.—Honshu.

2. *Prenanthes tanakae* (Fr. & Sav.) Koidz. *Nabalus tanakae* Fr. & Sav. ex Tanaka & Ono; *P. ochroleuca* var. *tanakae* (Fr. & Sav.) Koidz.—Ō-NIGANA. Stoloniferous; stems 80–150 cm. long, leafy throughout, usually simple, smooth or sparsely coarse-hairy; median cauline leaves ovate-deltoid, sagittate, long winged-petiolate, shallowly incised or pinnately cleft to parted, the segments retrorse, 8–17 cm. long, 6–12 cm. wide, often with spreading coarse hairs on nerves beneath, the upper leaves narrowly lanceolate, smaller, pinnately few-cleft or entire, acuminate, sessile; panicles large, the heads 3.5–4 cm. across; corollas pale yellow; involucre nearly glabrous, the outer bracts lanceolate, about half as long as the inner; achenes 7–9 mm. long, linear; pappus as long as the achene.—Sept.–Oct. Honshu (Kinki Distr. and eastw.).

67. CREPIDIASTRUM Nakai AZE-TŌ-NA ZOKU

Glabrous glaucous suffrutescent herbs with stout simple or branched stems; leaves rosulate or cauline, alternate, entire or pinnately incised; flowering branches lateral, leafy; heads rather small, in corymbs, yellow or white; involucre narrow, the inner bracts equal, 1-seriate, the outer small, few; corollas all ligulate, truncate, 5-toothed; achenes slightly flattened, with 10 longitudinal ribs; pappus bristles 1-seriate, slightly scabrous, deciduous.—About 10 species, in e. Asia.

- 1A. Leaves spatulate, 1–2 cm. wide, rounded at apex, shallowly toothed. 1. *C. keiskeanum*
1B. Leaves not spatulate, 2–7 cm. wide.
2A. Radical leaves ovate to narrowly so, 2–4 cm. wide, usually obtuse, the petioles 2–3 mm. wide; cauline leaves obtuse, 1–2 cm. wide, rather thin. 2. *C. lanceolatum*
2B. Radical leaves obovate or obovate-elliptic, 4.5–7 cm. wide, rounded at apex, the petioles 5–7 mm. wide; cauline leaves rounded or sometimes subacute, 2–4 cm. wide, rather thick. 3. *C. platyphyllum*

1. *Crepidiastrum keiskeanum* (Maxim.) Nakai. *Crepis keiskeana* Maxim.; *Lactuca keiskeana* (Maxim.) Makino; *Ixeris keiskeana* (Maxim.) Stebbins—AZE-TŌ-NA. Caudex stout, short, rhizomelike, with a tuft of rosulate leaves at apex; branches solitary to several, lateral, decumbent; radical leaves spatulate, 3–10 cm. long, 1–2 cm. wide, gradually rounded at

tip, shallowly toothed; heads many, rather densely arranged, about 1.5 cm. across, yellow; involucre about 1 cm. long.—Sept.–Dec. Rocky places near the sea; Honshu (Izu Prov. and westw.), Shikoku, Kyushu.—Forma *pinnatifidum* Hsiao-chi. SOTETSUBA-AZE-TŌ-NA. Leaves pinnately lobed to cleft.

2. *Crepidiastrum lanceolatum* (Houtt.) Nakai. *Pre-*

nanthes lanceolata Houtt.; *P. integra* Thunb.; *Youngia lanceolata* (Houtt.) DC.; *Crepis tanegana* Miq.; *Lactuca lanceolata* (Houtt.) Makino; *Crepidiastrium integrum* (Thunb.) T. Tanaka; *Ixeris lanceolata* (Houtt.) Stebbins; *Crepis integra* (Thunb.) Miq.—HOSOGAWA-WADAN. Caudex stout, short, rhizomelike, with a tuft of rosulate leaves at apex; inflorescence branches lateral, decumbent; radical leaves ovate to narrowly so, rarely elliptic, 8–18 cm. long, 2–4 cm. wide, obtuse, rarely rounded at apex, narrowed at base, entire, the petioles 2–3 mm. wide, the cauline leaves obtuse, 1–2 cm. wide, clasping at base; flowering branches 10–40 cm. long; heads many, yellow, about 1.5 cm. across; involucre 8–9 mm. long.—Oct.–Jan. Rocky places near the sea; Honshu (w. distr.), Shikoku, Kyushu.—s. Korea, Ryukyus, and Formosa.—Forma *pinnatifidum* (Maxim.) Nakai. *Crepis integra* var. *pinnatifida* Maxim.; *Lactuca quercus* Lévl. & Van't.; *Crepidiasterum quercus* (Lévl. & Van't.) Nakai.—HAMA-NAREN, SOTETSU-NA. Leaves pinnately lobed.—Occurs with the typical phase.

3. *Crepidiastrium platyphyllum* (Fr. & Sav.) Kitam. *Crepis integra* var. *platyphylla* Fr. & Sav.; *Lactuca platyphylla* (Fr. & Sav.) Makino; *Crepidiastrium lanceolatum* var. *latifolium* Nakai; *Ixeris lanceolata* subsp. *platyphylla* (Fr. & Sav.) Stebbins; *C. lanceolatum* var. (?) *platyphyllum* (Fr. & Sav.) Tuyama.—WADAN. Caudex stout, short, erect, rhizomelike, with a tuft of rosulate leaves at apex; inflorescence branches axillary, decumbent; scapes 20–40 cm. long; radical leaves rather thick, obovate or obovate-elliptic, 8–18 cm. long, 4.5–7 cm. wide, rounded at apex, narrowed at base, entire, the petioles 5–7 mm. wide; cauline leaves broadly obovate-elliptic, 2–4 cm. wide, usually rounded to subacute, the uppermost subtending the inflorescence, clasping; heads many, very congested, yellow, about 1 cm. across; involucre 6–7 mm. long.—Sept.–Nov. Seashores; Honshu (s. Kantō and Tōkaidō Distr.).—s. Korea.

68. CREPIS L. FUTA-MATA-TAMPOPO ZOKU

Glabrous to coarsely hirsute perennials, sometimes annuals or biennials; stems leafy or scapiform; leaves radical and/or cauline, alternate; heads peduncled, solitary or in panicles; involucre tubular, campanulate, or inflated at base in fruit, the inner bracts nearly equal, 1-seriate, the outer usually much shorter, few-seriate; receptacle flat or depressed, glabrous or hairy; corollas all lingulate, truncate, 5-toothed; achenes many-ribbed, terete, narrowed above or beaked; pappus-bristles many, slender, simple.—About 200 species, in Eurasia, Africa, and N. America.

- 1A. Radical leaves pinnatifid or sinuately shallow-lobed to runcinate; stems pubescent toward summit; heads 1 or 2. . . . 1. *C. hokkaidoensis*
 1B. Radical leaves spatulate, remotely repand-denticulate, mucronate-toothed; stems glabrous; heads 3 to 8. 2. *C. gymnopus*

1. *Crepis hokkaidoensis* Babcock. *C. burejensis* sensu auct. Japon., non F. Schmidt; *C. miyabei* Tatew. & Kitam.—FUTA-MATA-TAMPOPO. Rhizomes vertical or oblique; stems 5–20 cm. long, erect, rather stout, simple or rarely branched, with brown multicellular hairs and short white puberulence; radical leaves pinnatifid or sinuately shallow-lobed to runcinate, 5–15 cm. long, 1–3 cm. wide, acute, acuminate, or obtuse, gradually narrowed to a narrowly winged petiole, slightly pubescent on both sides; cauline leaves few, sessile, semi-clasping; upper leaves linear and small; heads 1 or 2 on long peduncles, yellow; involucre 1–1.5 cm. long, with brown, often glandular, long hairs; achenes black-brown, about 1 cm. long, 1 mm. across, gradually narrowed toward apex, about 20-ribbed, puberulent; pappus 7.5–8 mm. long, white.—July–Aug. Alpine slopes; Hokkaido.—s. Kuriles and Sakhalin.

2. *Crepis gymnopus* Koidz. *Youngia gymnopus* (Koidz.) Hara.—EZO-TAKANE-NIGA-NA. Rhizomes vertical or oblique; stems scapiform, 20–45 cm. long, rather slender, loosely woolly pubescent while young, becoming glabrous; leaves all radical, spatulate, 8–15 cm. long, 1.2–3 cm. wide, rounded at apex, remotely repand-denticulate, mucronate-toothed, glabrous or loosely short hairy on upper side; scalelike leaves of stems absent or single; bracts linear-lanceolate; heads 3 to 8, the pedicels 1.5–6 cm. long, erect, yellow; involucre 1–1.2 cm. long, narrow; achenes brown, 4.5–5 mm. long, about 0.6 mm. across, 20-ribbed, smooth; pappus snow-white, about 5 mm. long.—Alpine regions; Hokkaido.

69. IXERIS Cass. NIGA-NA ZOKU

Low, usually glaucous annuals, biennials, or perennials; leaves radical and cauline, alternate; heads few to many, in corymbs; involucre tubular, the bracts few-seriate, glabrous, herbaceous, the inner much larger than the outer, the outer ones often calyculate; receptacles flat, naked; corollas lingulate, truncate, 5-toothed, yellow, white, or purplish achenes somewhat flattened, narrowly oblong, equally 10-ribbed, long-beaked; pappus-bristles many, slender, scaberulous, nearly equal.—About 20 species, in e. Asia.

- 1A. Stems much elongate; stems scapose or scapiform.
 2A. Leaves palmately 3- to 5-cleft, -parted or -divided; outer involucre bracts rather prominent, about 2/5–1/2 as long as the inner; beak of achenes about 1 mm. long; sandy beaches. 1. *I. repens*
 2B. Leaves spatulate, entire or shallowly toothed; outer involucre bracts few, short, about 1/4–1/3 as long as the inner; beak of achenes longer.
 3A. Involucres 12–14 mm. long; beak of achene 2.5 mm. long. 2. *I. japonica*
 3B. Involucres about 8–10 mm. long; beak of achene 3 mm. long. 3. *I. stolonifera*
 1B. Stems absent or short; stems usually distinctly leafy (except in nos. 9 and 10).
 4A. Heads nodding at maturity, in false umbels; cauline leaves sagittate; achenes deeply sulcate, acutely winged; biennial. 4. *I. polycephala*
 4B. Heads erect at maturity, in loose corymbs; cauline leaves auriculate; achenes shallowly grooved, obtusely winged; perennials.

- 5A. Beak 1/5–1/3 as long as the body of achene.
 6A. Involucres 4–5 mm. long at anthesis; achenes about 2.5 mm. long. 5. *I. makinoana*
 6B. Involucres 6–9 mm. long at anthesis; achenes 3–5 mm. long.
 7A. Radical leaves broadly linear to oblong-lanceolate, rarely nearly oblong, acute to acuminate; heads in loose corymbs; involucre 7–9 mm. long. 6. *I. dentata*
 7B. Radical leaves orbicular to broadly ovate, rounded; heads in dense corymbs; involucre about 6 mm. long. 7. *I. nipponica*
 5B. Beak nearly as long as the body of achene.
 8A. Involucres about 5 mm. long; pappus brown. 8. *I. laevigata* var. *lanceolata*
 8B. Involucres 9–11 mm. long; pappus white.
 9A. Radical leaves many, broadly linear, usually entire; outer involucre bracts somewhat unequal, often ascending at tip. 9. *I. tamagawaensis*
 9B. Radical leaves rather few, spatulate, mucronate-toothed or incised; outer involucre bracts nearly equal, appressed. 10. *I. chinensis* var. *strigosa*

1. *Ixeris repens* (L.) A. Gray. *Prenanthes repens* L.; *Lactuca repens* (L.) Benth.—HAMA-NIGA-NA. Stems rather slender, much elongate below ground, remotely leafy; leaves rather thick, long-petiolate, 3- to 5-angled, cordate, palmately 3- to 5-cleft, parted, or divided, 3–5 cm. long and as wide, the segments broadly elliptic, rounded at apex, 2- to 3-lobed and obsoletely toothed; scapes axillary from radical leaves, 3–15 cm. long, 2- to 5-headed, the lowest bracts sometimes subfoliaceous; heads about 3 cm. across, rather many-flowered; involucre 11–14 mm. long, the outer involucre bracts rather prominent, about 2/5–1/2 as long as the inner, the inner bracts 6–8; achenes about 5 mm. long; pappus white, 5–6 mm. long.—May–July. Sandy beaches; Hokkaido, Honshu, Shikoku, Kyushu; common.—Formosa, Ryukyus, China, Korea, Manchuria, and Kamchatka.

2. *Ixeris japonica* (Burm.) Nakai. *Lapsana japonica* Burm.; *Prenanthes debilis* Thunb.; *I. debilis* (Thunb.) A. Gray; *Lactuca debilis* (Thunb.) Benth.; *I. japonica* formae *integra* and *sinuata* of Nakai—JI-SHIBARI, Ô-JI-SHIBARI, TSURU-NIGA-NA. Perennial herb with slender, creeping, branched, leafy stems; leaves oblanceolate to spatulate-elliptic, 6–20 cm. long inclusive of the petioles, 1.5–3 cm. wide, obtuse to rounded, entire or loosely toothed on the lower half, long-petiolate; scapes 10–30 cm. long, sometimes with a single leaf; heads 1–5, 2.5–3 cm. across, rather many-flowered, pedicelled, yellow; involucre 12–14 mm. long, the inner bracts about 8; achenes about 4 mm. long, narrowly fusiform, deeply sulcate, acutely winged, the beak about 2.5 mm. long; pappus white, about 7 mm. long.—May. Cultivated fields and waste grounds in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus and Korea.

3. *Ixeris stolonifera* A. Gray. *Lactuca stolonifera* (A. Gray) Benth.—IWA-NIGA-NA, JI-SHIBARI, HAI-JI-SHIBARI. Prostrate, very slender, branched perennial; stems remotely leafy; leaves thin, ovate-orbicular, broadly ovate to broadly elliptic, 2–8 cm. long inclusive of the petioles, 2–8 cm. wide, rounded at both ends, entire or loosely toothed on margin; scapes slender, 8–15 cm. long; heads 1–3, 2–2.5 cm. across, yellow; involucre 8–10 mm. long, the inner bracts usually 9 or 10; achenes narrowly fusiform, about 3 mm. long, rather narrowly winged, the beak as long as the body of achene; pappus white, about 5 mm. long.—May–June. Cultivated fields, waste grounds, and open mountain slopes; Hokkaido, Honshu, Shikoku, Kyushu; common.—Forma *sinuata* (Makino) Ohwi. *Lactuca stolonifera* var. *sinuata* Makino—KIKUBA-JI-SHIBARI. Leaves pinnately incised.—Forma *capillaris* (Nakai) Ohwi. *Lactuca capillaris* (Nakai) Makino & Nemoto; *I. stolonifera* subsp. *capillaris* (Nakai) Kitam.—MIYAMA-IWA-NIGA-NA. Slender alpine phase.

Ixeris × *nikoensis* Nakai. Alleged hybrid of *I. stolonifera* × *I. tamagawaensis*.

4. *Ixeris polycephala* Cass. *Lactuca polycephala* (Cass.) Benth. & Hook. f.; *L. matsumurae* Makino; *I. matsumurae* (Makino) Nakai; *L. bauriculata* Lév. & Vant.—NO-NIGA-NA. Glauous biennial; stems 15–40 cm. long, erect, often branched at base; radical leaves linear-lanceolate, 10–25 cm. long, 7–15 mm. wide, acuminate, narrowed to a petiolelike base, entire; cauline leaves few, 7–15 cm. long, sessile, sagittate; inflorescence umbelliform; heads about 8 mm. across, pedicelled, yellow, nodding at maturity; involucre 7–8 mm. long in fruit, the inner bracts 8–9, narrowly lanceolate; achenes fusiform, obtuse at base, 3–3.5 mm. long, deeply sulcate, acutely winged, the beak about 1.5 mm. long; pappus snow-white, about 5 mm. long.—May. Wet places around paddy fields; Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, Korea, China, India to the Caucasus.—Forma *dissecta* (Makino) Ohwi. *Lactuca matsumurae* var. *dissecta* Makino—KIKUBA-NO-NIGA-NA. Leaves pinnately dissected.

Ixeris × *sekimotoi* Kitam. NO-JI-SHIBARI. Hybrid of *I. japonica* × *I. polycephala*.

5. *Ixeris makinoana* (Kitam.) Kitam. *Lactuca thunbergii* var. *angustifolia* Makino; *I. dentata* var. *angustifolia* (Makino) Makino; *I. makinoana* Kitam.; *I. dentata* var. *angustifolia* (Makino) Nakai—HOSABA-NIGA-NA. Perennial herb; stems erect, 30–40 cm. long, branched at the top, loosely few-leaved; radical leaves linear or linear-oblong, 6–13 cm. long, 3–7 mm. wide, acuminate at both ends, entire; cauline leaves simulating the radical, sessile, suberect; heads many, loosely arranged, yellow, 6–7 mm. across; involucre 5–6 mm. long in fruit, the inner bracts about 5, broadly linear; achenes about 2.5 mm. long, lanceolate, rather narrowly ribbed, the beak very short; pappus 2.5–3 mm. long, brown.—May–June. Honshu (Kantô Distr. and westw.), Shikoku, Kyushu.

6. *Ixeris dentata* (Thunb.) Nakai. *Prenanthes dentata* Thunb.; *I. thunbergii* A. Gray; *Lactuca thunbergii* (A. Gray) Maxim.; *I. dentata* (Thunb.) Robins.—NIGA-NA. Perennial herb with short rhizomes, rarely with short stolons; stems erect, 20–50 cm. long, rather slender, few-leaved; radical leaves broadly linear to oblong-lanceolate, rarely oblong, long-petiolate, the blades 3–10 cm. long, 5–30 mm. wide, acute to acuminate, rarely rounded and mucronate, entire or remotely mucronate-toothed, rarely shallowly incised; cauline leaves rather short, sessile, auriculate-clasping; heads in loose corymbs, about 15 mm. across, yellow or rarely white, usually 5-flowered; involucre 7–9 mm. long, the inner bracts 5–6; achenes 3–3.5 mm. long, beak less than 1 mm. long; pappus brown, about 4 mm. long.—May–July. Sunny places in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common.—s. Kuriles, Ryukyus, and Korea.

Var. *albiflora* (Makino) Nakai. *Lactuca thunbergii* var. *albiflora* Makino; *I. dentata* var. *amplifolia* forma *leucantha* Hara—SHIROBANA-HANA-NIGA-NA. Plant somewhat larger;

leaves slightly broader; florets 7-8, the corollas white.—Mountains; Hokkaido, Honshu.—Forma **amplifolia** (Takeda) Hiyama. *I. dentata* var. *amplifolia* Kitam.—HANA-NIGA-NA. Corollas yellow; more common than the white-flowered phase.

Var. **alpicola** (Takeda) Ohwi. *Lactuca thunbergii* lusus *alpicola* Takeda; *L. dentata* var. *flaviflora* subvar. *alpicola* (Takeda) Makino; *L. dentata* var. *alpicola* (Takeda) Makino; *I. alpicola* (Takeda) Nakai.—TAKANE-NIGA-NA. Stems low; leaves narrower, shorter; heads fewer, about 1 cm. long, the florets 6-9, yellow; achenes slightly longer.—Rocky alpine slopes; Hokkaido, Honshu, Shikoku, Kyushu (Yakushima).

Var. **kimurana** (Kitam.) Ohwi. *I. kimurana* Kitam.; *I. dentata* subsp. *kimurana* (Kitam.) Kitam.—KUMOMA-NIGA-NA. Alpine phase intermediate between *alpicola* and var. *albiflora* forma *amplifolia*.—Forma **albescens** Kitam. SHIROBANA-KUMOMA-NIGA-NA. Flowers white.—Alpine.

Var. **stolonifera** (Kitam.) Nemoto. *I. albiflora* A. Gray; *Lactuca albiflora* (A. Gray) Maxim.; *L. dentata* var. *stolonifera* Kitam.—HAI-NIGA-NA. Stems creeping; florets 5 in a head.—Honshu, Shikoku, Kyushu.

Ixeris musashiensis Makino & Hisauchi. TAKASAGO-NIGA-NA. Alleged hybrid of *I. dentata* and an undetermined second parent.

7. **Ixeris nipponica** Nakai. *Lactuca nipponica* Nakai ex Makino & Nemoto.—ISO-NIGA-NA. Perennial (?) with short rhizomes; stems 10-20 cm. long; radical leaves orbicular or broadly ovate, sometimes obovate, rounded at apex, abruptly petiolate, mucronate-toothed, the blades 3-5 cm. long, about 3 cm. wide; cauline leaves few, broadly ovate or orbicular-cordate, 3-8 cm. long, about 3 cm. wide, auriculate-clasping; heads about 1 cm. across, in dense interrupted corymbs, yellow; involucre about 6 mm. long, the inner bracts 6-8.—June. Sandy beaches; Honshu (Echigo Prov.).

8. **Ixeris laevigata** (Bl.) Schultz-Bip. var. **lanceolata** (Makino) Kitam. *Lactuca oldhamii* Maxim.; *L. dentata* var. *lanceolata* Makino; *L. stenophylla* Makino; *I. oldhamii* (Maxim.) Kitam.—ATSUBA-NIGA-NA. Perennial herb;

flowering stems 20-40 cm. long, few-leaved; radical leaves oblong to lanceolate, blades 6-12 cm. long, 1-2 cm. wide, acuminate, mucronate-toothed, acute at base, petiolate; cauline leaves gradually narrowed below to a petiolelike base; inflorescence many-headed; heads 8-10 mm. across, about 10-flowered; involucre about 5 mm. long, the bracts about 8; achenes narrowly lanceolate, 4-5 mm. long inclusive of the beak; pappus about 3 mm. long, brown.—Kyushu (Oosumi and Satsuma Prov.).—Ryukyus and Formosa. The typical phase occurs in the Philippines, s. China, Indochina, and Malaysia.

9. **Ixeris tamagawaensis** (Makino) Kitam. *Lactuca tamagawaensis* Makino; *L. versicolor* var. *arenicola* Makino; *I. chinensis* subsp. *arenicola* (Makino) Kitam.—KAWARA-NIGA-NA. Perennial herb with tufted rhizomes; stems erect, 15-30 cm. long, naked or 1-leaved; radical leaves many, broadly linear, 8-15 cm. long, 3-5 mm. wide, acute to acuminate, usually entire or slightly mucronate-toothed, narrowed to a short petiolelike base; heads few to rather many, pedicelled, 15-20 mm. across, pale yellow, 25- to 30-flowered; involucre 9-10 mm. long, the outer bracts somewhat unequal, the inner about 10; achenes lanceolate, about 6 mm. long inclusive of the beak nearly as long as the body; pappus white, 5-6 mm. long.—June-Aug. Waste grounds along rivers; Honshu, Kyushu.—Korea and Formosa.

10. **Ixeris chinensis** (Thunb.) Nakai var. **strigosa** (Lév. & Van't.) Ohwi. *Prenanthes chinensis* Thunb., pro parte; *Lactuca strigosa* Lév. & Van't.—TAKASAGO-SŌ. Perennial herb; flowering stems erect, 20-40 cm. long, naked or 1-leaved; radical leaves rather few, spatulate, 7-15 cm. long, 5-15 mm. wide, acute to acuminate, narrowed to a rather broad petiolelike base, sparsely mucronate-toothed or incised; cauline leaves clasping but scarcely auriculate; heads rather many, white to purplish, about 20-flowered, 2-2.5 cm. across; involucre 9-11 mm. long, the outer bracts nearly equal, the inner about 8; achenes narrowly lanceolate, about 6 mm. long inclusive of the beak slightly shorter than the body; pappus white, about 6 mm. long.—Apr.-June. Honshu, Shikoku, Kyushu.—Korea. The typical phase occurs in China and e. Siberia.

70. LACTUCA L. AKI-NO-NOGESHI ZOKU

Glabrous or sometimes slightly hairy annual, biennial, or perennial herbs; stems usually tall; leaves radical and cauline, alternate, entire or coarsely toothed, sometimes pinnately cleft; cauline leaves usually auriculate-clasping; heads in panicles, sessile or pedicelled; involucre tubular, the bracts few-seriate, the outer smaller; receptacle flat, glabrous; corollas ligulate, truncate, 5-toothed, the tube half to as long as the limb; achenes ovate or lanceolate, distinctly flattened, narrowed at both ends, few-ribbed on both sides, the beak with a ring at apex; pappus-bristles many-seriate, simple, persistent or individually deciduous.—About 70 species, in temperate and warmer regions of the N. Hemisphere.

- 1A. Achenes barely flattened, narrowly oblong or narrowly fusiform; perennial herbs with purplish corollas.
- 2A. Heads about 1 cm. across; inner involucre bracts 7 or 8, the outer bracts much shorter than the inner, caliclelike; leaves pinnately divided; inflorescence pyramidal, paniculate. 1. *L. sororia*
- 2B. Heads 3-3.5 cm. across; inner involucre bracts about 15, the outer bracts unequal; leaves entire or incised; inflorescence flat-topped, corymbiform. 2. *L. sibirica*
- 1B. Achenes distinctly flattened, elliptic; annual or biennial herbs with yellowish corollas.
- 3A. Petioles scarcely or not clasping.
- 4A. Achenes elliptic or obovate-elliptic, about 5 mm. long, 2.5 mm. wide, 1-ribbed on each side; involucre bracts about 2.5 mm. wide. 3. *L. indica*
- 4B. Achenes obovate-oblong, about 4 mm. long, 1.5 mm. wide, 3-ribbed on each side; involucre bracts about 1.5 mm. wide. 4. *L. raddeana*
- 3B. Petioles distinctly clasping, except the uppermost ones. 5. *L. triangulata*

1. **Lactuca sororia** Miq. *L. polypodiifolia* Franch.; *Myelis sororia* (Miq.) Nakai; *M. sororia* var. *nudipes* Migo; *L. sororia* var. *nudipes* (Migo) Kitam.; *L. sororia* var. *glabra*

Kitam.—MURASAKI-NIGA-NA. Perennial short rhizomatous herb, sometimes with short stolons; stems erect, usually simple, hollow, 70-120 cm. long, glabrous; cauline leaves petiolate,

10–20 cm. long, 5–10 cm. wide, pinnately divided, the terminal segments usually deltoid, acuminate, mucronate-toothed, the petioles wingless, upper leaves membranous, gradually smaller, lanceolate, broadly winged and petiolelike at base, nearly glabrous; panicle 15–30 cm. long, glabrous; heads about 1 cm. across, rather few-flowered; involucre 1–1.2 cm. long, the inner bracts 7–8, the outer ones much shorter than the inner; achenes lanceolate, nearly beakless, 3–3.5 mm. long, weakly ribbed; pappus white, about 6 mm. long.—June–Aug. Honshu, Shikoku, Kyushu.

2. *Lactuca sibirica* (L.) Benth. *Sonchus sibiricus* L.; *Mulgedium sibiricum* (L.) Less.—EZO-MURASAKI-NIGANA. Glabrous perennial herb; stems erect, usually simple, 60–100 cm. long; leaves lanceolate, 7–12 cm. long, 1–2.5 cm. wide, acuminate, mucronate-toothed, sometimes incised, slightly glaucous beneath, sessile; inflorescence a corymb; heads few to rather many, 3–3.5 cm. across, blue-purple; involucre 12–15 mm. long, the inner bracts about 15, the outer ones unequal; achenes lanceolate, scarcely beaked, ribbed, smooth; pappus white, about 1 cm. long.—July–Aug. Hokkaido.—Kuriles, Sakhalin, n. Korea, Siberia, and Europe.

3. *Lactuca indica* L. var. *laciniata* (O. Kuntze) Hara. *Prenanthes laciniata* Houtt.; *P. squarrosa* Thunb.; *L. laciniata* (Houtt.) Makino; *L. squarrosa* var. *laciniata* O. Kuntze.—AKI-NO-NOGESHI. Large glabrous annual or biennial; stems erect, stout, usually simple or branched toward the top, 80–150 cm. long; leaves lanceolate or narrowly oblong in outline, 10–30 cm. long, acuminate, usually pinnately incised or parted, glaucous beneath; upper leaves usually entire, small; inflorescence a narrow cylindrical panicle 20–40 cm. long; heads about 2 cm. across, pale yellow; involucre 12–15 mm. long, the inner bracts about 8; achenes about 5 mm. long inclusive of a very short beak, 2.5 mm. wide, 1-ribbed on each side; pappus white, 7–8 mm. long.—Sept.–Nov. Grassy places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Ryukyus, and Formosa.—Forma *indivisa* (Makino)

Hara. *L. laciniata* forma *indivisa* Makino.—HOSOB-ABI-NO-NOGESHI. Leaves undivided, narrowly to broadly lanceolate.—Occurs with the typical phase.

Var. *dracoglossa* (Makino) Kitam. *L. dracoglossa* Makino.—RYÜZETSU-SAI. Leaves large, entire.—Cultivated.

4. *Lactuca raddeana* Maxim. var. *raddeana*. *L. albiariaefolia* Lévl. & Van't.—CHÛSEN-YAMA-NIGANA. Achenes 2–3 mm. long, 4- or 5-ribbed on both sides; florets 9–14.—Kyushu.—c. Asia.

Var. *elata* (Hemsl.) Kitam. *L. raddeana* sensu auct. Japon., non Maxim.; *L. elata* Hemsl.—YAMA-NIGANA. Annual or biennial herb; stems erect, terete, usually simple, 60–80 cm. long, sometimes with multicellular crisped hairs; leaves membranous, ovate or deltoid-ovate, glaucous beneath; lower leaves often pinnately divided, with a long wingless petiole; median leaves truncate, with a broadly winged petiole, scarcely clasping; upper leaves smaller, broadly rhombic-lanceolate, gradually narrowed at base, sometimes sparingly hairy on upper surface; inflorescence a cylindrical panicle, 20–40 cm. long; heads narrow, about 1 cm. across; florets 8–10, pale yellow; involucre about 1 cm. long, the inner bracts about 5; achenes obovate-oblong, about 4 mm. long inclusive of the very short beak, 1.5 mm. wide, 3-ribbed on each side; pappus white, about 6 mm. long.—Aug.–Sept. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—China and Indochina.

Lactuca × *aogashimaensis* Kitam. YAMA-AKI-NO-NOGESHI. Hybrid of *L. indica* × *L. raddeana*.

5. *Lactuca triangulata* Maxim. MIYAMA-AKI-NO-NOGESHI. Glabrous biennial herb; stems erect, up to 1 m. long, terete, simple or sometimes branched, rather loosely leafy; leaves thin, deltoid or deltoid-cordate, acuminate, irregularly mucronate-toothed, whitish beneath, the petioles winged, clasping; upper leaves smaller and narrower, the petioles not clasping; inflorescence rather many-headed.—Aug. Hokkaido, Honshu (mountains of centr. distr.).—Korea, Manchuria, and Sakhalin (var.).

71. SONCHUS L.

HACHIJÔ-NA ZOKU

Annual, biennial, or perennial herbs sometimes woody at base; leaves alternate, usually auriculate-clasping, often with callose hairs or spinose on margin; involucre ovoid or campanulate, the bracts many-seriate; receptacle flat, glabrous; corollas lingulate, yellow, truncate, 5-toothed; achenes slightly flattened, 10- to 20-ribbed, slightly narrowed at both ends, beakless, glabrous; pappus-bristles many-seriate, very slender, snow-white, connate at base into a ring, deciduous as a whole.—About 45 species, indigenous of the Old World, few widely distributed and naturalizing.

- 1A. Perennial herbs with long rhizomes; heads 4–5 cm. across. 1. *S. brachyotus*
 1B. Annual or biennial herbs without rhizomes; heads about 2 cm. across.
 2A. Cauline leaves irregularly spine-toothed; achenes scaberrulous, longitudinally striate. 2. *S. oleraceus*
 2B. Cauline leaves rather densely spine-toothed; achenes nearly smooth, 3-ribbed on each side. 3. *S. asper*

1. *Sonchus brachyotus* DC. *S. shuzuciniatus* Turcz. ex Trautv.; *S. arvensis* var. *uliginosus* sensu auct. Japon., non Trautv.—HACHIJÔ-NA. Slightly glaucous long-creeping rhizomatous perennial herb; rhizomes with short white woolly hairs on upper part while young; stems erect, 30–80 cm. long, usually simple; cauline leaves rather numerous, oblong-lanceolate to narrowly oblong, 10–20 cm. long, 2–5 cm. wide, obtuse, glaucous beneath, obtusely rounded and auriculate-clasping at base, often incised or pinnately lobed; heads few, 4–5 cm. across, subumbellate, yellow; involucre 1.5–2 cm. long, the outer bracts ovate-deltoid; achenes about 3 mm. long, slightly scabrous, with few longitudinal ribs on both sides; pappus about 12 mm. long.—Aug.–Oct. Sunny grassy places and cultivated fields; Hokkaido, Honshu, Shikoku, Kyushu.—

Kuriles, Sakhalin, Korea, China, Siberia, and Altai Mts.

2. *Sonchus oleraceus* L. NOGESHI, HARU-NO-NOGESHI, KESHI-AZAMI. Nearly glabrous annual or biennial; stems stout, 50–100 cm. long, often branched, hollow; lower leaves oblong-lanceolate, 15–50 cm. long, 5–8 cm. wide, winged-petiolate, pinnately parted to divided, irregularly spine-toothed; median leaves sessile, auriculate-clasping; heads about 2 cm. across, umbelliform, yellow, the peduncles glandular-hairy; involucre 1.2–1.5 cm. long; achenes narrowly obovate, 2.5–3 mm. long, with scaberrulous ribs; pappus about 6 mm. long.—May–Aug. Waste grounds and roadsides in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Sakhalin, Korea, Formosa, Ryukyus, Europe, and N. America.

3. *Sonchus asper* (L.) Hill. *S. oleraceus* var. *asper* L.

—ONI-NOGESHI. Nearly glabrous annual or biennial herb; stems branched, 50–100 cm. long, hollow; leaves ovate-oblong, large, often incised or pinnately parted, rather closely spine-toothed; upper leaves dilated at base, auriculate; heads about

2 cm. across, umbelliform, yellow; involucre 1.2–1.3 cm. long; achenes narrowly obovate, flattened, smooth or nearly so, with 3 ribs or nerves on each side; pappus 7–8 mm. long.—May–Oct. European weed, naturalized in our area.

72. YOUNGIA Cass. ONI-TABIRA-KO ZOKU

Pubescent or glabrous annuals, biennials, or perennials; stems usually much branched; leaves alternate, usually pinnately divided, often prominently dilated at the base and clasping; heads small, in corymbs or panicles, pedicelled; involucre tubular-campanulate, the inner bracts 1-seriate; corollas ligulate, yellow, truncate, 5-toothed; achenes oblong-linear, slightly flattened, many-ribbed, beakless or short-beaked; pappus-bristles 1-seriate, many, persistent or the bristles separately deciduous.—About 50 species, in e. Asia, India, and Australia.

- 1A. Plant pubescent; inflorescence a corymbose-panicle; achenes beakless; pappus-bristles persistent. 1. *Y. japonica*
- 1B. Plant glabrous; inflorescence a terminal or axillary corymb; achenes short-beaked; pappus-bristles separately deciduous from the basal ring.
- 2A. Leaves, at least the upper ones, auriculate-clasping, mucronate-toothed to pinnately divided.
- 3A. Florets 10–13; leaves usually entire, rarely pinnately divided, the upper with large rounded auricles; inner involucre bracts 7 or 8. 2. *Y. denticulata*
- 3B. Florets 5 or 6; leaves pinnately divided, slightly auriculate-clasping; inner involucre bracts about 5. 3. *Y. chelidoniifolia*
- 2B. Leaves not clasping, subtenture or with obscure mucronate teeth; florets 5 or 6; inner involucre bracts about 5. 4. *Y. yoshinoi*

1. *Youngia japonica* (L.) DC. *Prenanthes japonica* L.; *P. multiflora* Thunb.; *P. lyrata* Thunb.; *Y. thunbergiana* DC.; *Crepis japonica* (L.) Benth.; *Y. japonica* subsp. *elstonii* (Hochreut.) Babcock & Stebbins; *Crepis japonica* var. *elstonii* Hochreut.—ONI-TABIRA-KO. Pubescent biennial; stems erect, often branched at base, 20–80 cm. long, naked or with 1–3 leaves; radical leaves tufted, oblanceolate, acute, narrowed to a petiolelike base, pinnately parted, loosely mucronate-toothed, the terminal segment largest, deltoid-ovate; heads 7–8 mm. across, many, in terminal corymbose panicles, yellow; involucre 5–6 mm. long, the inner bracts about 8, the outer much smaller, ovate; achenes about 1.8 mm. long, gradually narrowed at the tip, brown, with slender scaberulous ribs; pappus white, about 3 mm. long, persistent.—May–June. Waste grounds, cultivated fields, and roadsides; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Ryukyus, Formosa, China, India, Polynesia, and Australia.

2. *Youngia denticulata* (Houtt.) Kitam. *Paraixeris denticulata* (Houtt.) Nakai; *Prenanthes denticulata* Houtt.; *P. hastata* Thunb.; *Y. hastata* DC.; *Y. chrysantha* Maxim.; *Lactuca denticulata* (Houtt.) Maxim.; *Ixeris denticulata* (Houtt.) Nakai.—YAKUSHI-SO. Slightly glaucescent annual or biennial; stems 30–70 cm. long, much branched, often purplish red; cauline leaves membranous, spatulate, rarely pinnately divided, 5–10 cm. long, 2–5 cm. wide, rather abruptly winged-petiolate, mucronate-toothed, glaucous beneath; upper leaves ligulate, sessile, auriculate-clasping; corymbs terminal and axillary, few-headed; heads about 1.5 cm. across, yellow, nodding in fruit, the florets 10–13; involucre dark green, the inner bracts 7 or 8; achenes lanceolate, 2.5–3 mm. long inclusive of the short beak, punctate-scaberulous.—Sept.–Nov. Sunny slopes and roadsides in mountains; Hokkaido, Honshu,

Shikoku, Kyushu; common.—Korea, Manchuria, China, and Indochina.—Forma *pinnatipartita* (Makino) Kitam. *Lactuca denticulata* var. *typica* lusus *pinnatipartita* Makino.—HANA-YAKUSHI-SO. Leaves pinnatiparted.

3. *Youngia chelidoniifolia* (Makino) Kitam. *Paraixeris chelidoniifolia* (Makino) Nakai; *Lactuca chelidoniifolia* Makino; *Ixeris chelidoniifolia* (Makino) Stebbins.—KUSANO-ŌBA-NOGIKU. Rather slender annual or biennial; stems 20–50 cm. long, branched from base or sometimes simple; leaves thin, petiolate, pinnately divided, the segments 3–6 pairs, ovate, 1–2 cm. long, with few incisions or coarsely toothed, the petioles and rachis wingless, slightly auriculate-clasping; upper leaves becoming gradually smaller; heads about 10 mm. across, few, in a corymb, the florets 5 or 6; involucre narrowly tubular, about 6 mm. long, the inner bracts about 5, dark green; achenes linear-lanceolate, about 4 mm. long inclusive of the short beak, punctulate, scaberulous at the tip; pappus as long as the achene.—Sept.–Oct. Honshu (Shimotsuke and Yamato Prov.), Shikoku, Kyushu (Mount Ichifusa in Higo).—Korea and Manchuria.

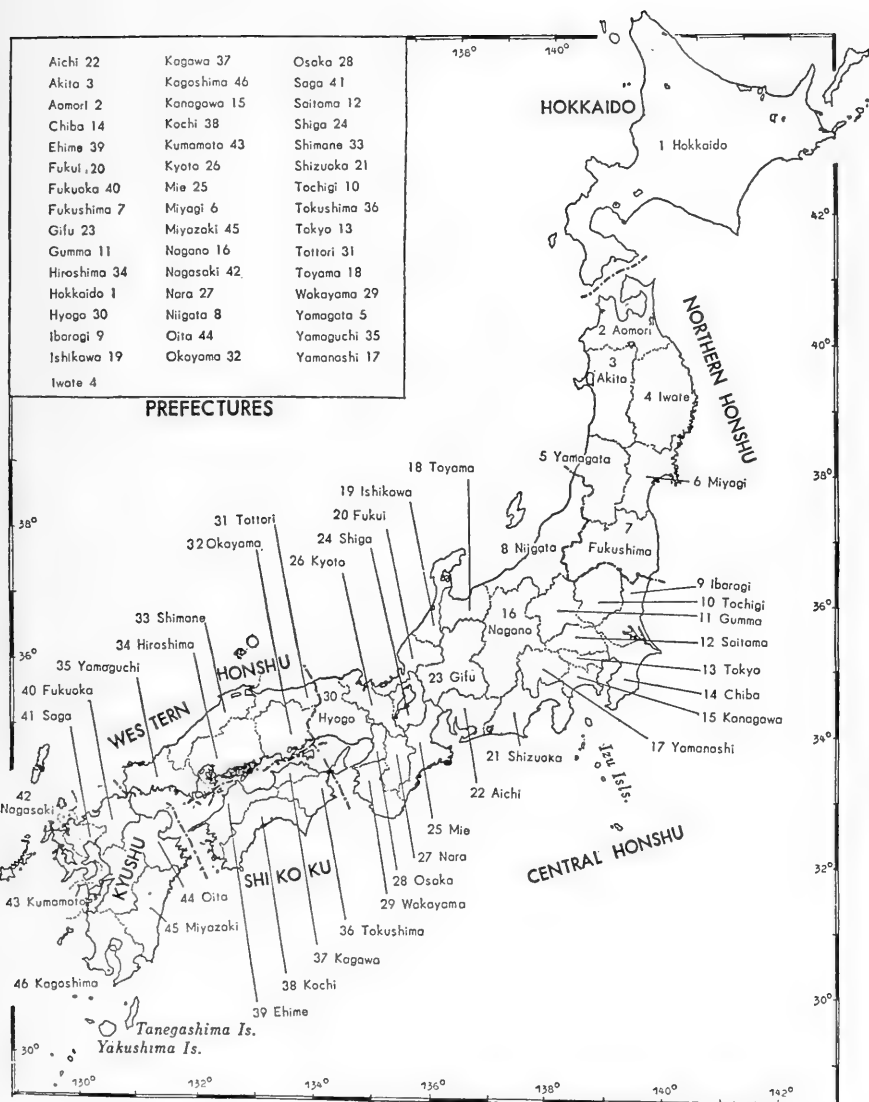

4. *Youngia yoshinoi* (Makino) Kitam. *Paraixeris yoshinoi* (Makino) Nakai; *Lactuca denticulata* var. *yoshinoi* Makino; *L. yoshinoi* (Makino) Makino & Nakai; *Ixeris yoshinoi* (Makino) Kitam.—IWA-YAKUSHI-SO, NAGABA-YAKUSHI-SO. Much-branched annual or biennial herb 30–40 cm. high; leaves oblong-lanceolate or broadly lanceolate, 7–15 cm. long, 1–3 cm. wide, narrowed to a petiolelike base, subtenture or loosely mucronate-toothed; heads about 1.2 cm. across, yellow, the florets 5 or 6; involucre 6 or 7 mm. across, the inner bracts about 5, dark green; achenes about 4 mm. long inclusive of the short beak, minutely scabrous; pappus about 4 mm. long.—Oct. Honshu (Bitchu Prov.).

REFERENCE LIST OF AUTHORS' NAMES

- ABEL: Clarke Abel, 1780–1826, United Kingdom.
 ABRAMS: Leroy Abrams, 1874–1956, U.S.A. (flora of Pacific States, U.S.A.).
 ABROM.: Johannes Abromeit, 1857–1946, Germany.
 ADAMS: Johannes Michael Friedrich Adams, 1780–1838, U.S.S.R.
 ADANS.: Michel Adanson, 1727–1806, France.
 AELLEN: Paul Aellen, 1896—, Switzerland.
 AGARDH: Jacob Georg Agardh, 1813–1901, Sweden.
 AHLBURG: Hermann Ahlburg, ?–1878, Germany (*Aucubaphyllum*).
 AIRY-SHAW: Herbert Kenneth Airy-Shaw, 1902—, United Kingdom (Coniferae).
 AIT.: William Aiton, 1731–1793, United Kingdom.
 AIT. F.: William Townsend Aiton, 1766–1849, United Kingdom.
 AKAHORI: Akira Akahori, 赤堀 昭, Japan.
 AKASAWA: Toshiyuki Akasawa, 赤澤時之, 1915—, Japan (Burmanniaceae).
 AKIYAMA: Shigeo Akiyama, 秋山 茂雄, 1906—, Japan (*Carex*).
 ALEF.: Friedrich Georg Christoph Alefeld, 1820–1872, Germany.
 ALISOVA: Evgeniia Nikolaevna Alisova-Klobukova, 1899—, U.S.S.R.
 ALL.: Carlo Allioni, 1725–1804, Italy.
 ALSTON: Arthur Hugh Garfit Alston, 1902–1958, United Kingdom (*Selaginella*, *Eugenia*).
 AMES: Oakes Ames, 1874–1950, U.S.A. (Orchidaceae).
 ANDERSS.: Nils Johan Andersson, 1821–1880, Sweden (*Salix*, Gramineae).
 ANDR.: Henry C. Andrews, 1796–1828, United Kingdom.
 ANDRÉ: Édouard François André, 1840–1911, France.
 H. ANDRES: Heinrich Andres, 1883–1957, Germany (Pyrolaceae).
 ANDRZ.: Antoni Lukianovich Andrzejowski, 1784–1868, U.S.S.R.
 ÅNGSTR.: Johan Ångström, 1813–1879, Sweden.
 ANT.: Franz Antoine, 1815–1886, Austria (Coniferae).
 ARAKI: Yeichi Araki, 荒木 英一, 1904–1955, Japan (*Hosta*).
 ARCANG.: Giovanni Arcangeli, 1840–1921, Italy.
 ARDUINO: Luigi Arduino, 1759–1834, Italy.
 ARMSTR.: John B. Armstrong, fl. 1850, New Zealand.
 ARN.: George Arnold Walker-Arnott, 1799–1868, United Kingdom.
 ASAI: Yasuhiro Asai, 浅井 康宏, 1933—, Japan (*Epipactis*).
 ASAMI: Yoshichi Asami, 浅見 興七, 1894—, Japan (*Malus*).
 ASCH.: Paul Friedrich August Ascherson, 1834–1913, Germany.
 AUBL.: Jean Baptiste Christophe Fusée Aublet, 1720–1778, France (French Guiana).
 AUCT.: Auctorum, of Authors.
 AVÉ-LALL.: Julius Léopold Eduard Avé-Lallemant, 1803–1867, Germany.
 BAB.: Charles Cardale Babington, 1808–1895, United Kingdom.
 BABCOCK: Ernest Brown Babcock, 1877–1955, U.S.A. (Compositae).
 BACKER: Cornelis Andries Backer, 1874–1963, Netherlands (Java).
 F. M. BAILEY: Frederick Manson Bailey, 1827–1915, United Kingdom (Australia).
 L. H. BAILEY: Liberty Hyde Bailey, 1858–1955, U.S.A. (*Carex*, *Rubus*, cultivated plants).
 BAILL.: Henri Ernest Baillon, 1827–1895, France.
 BAK.: John Gilbert Baker, 1834–1920, United Kingdom (ferns, Liliaceae, Amaryllidaceae).
 BAK. F.: Edmund Gilbert Baker, 1864–1949, United Kingdom.
 BAKHUIZEN: Reinier Cornelis Bakhuizen van den Brink, 1881–1945, Netherlands (Java).
 BALANS.: Benedict Balansa, 1825–1891, France (Indochina).
 BALBIS: Giovanni Battista Balbis, 1765–1831, Italy.
 BANKS: Sir Joseph Banks, 1743–1820, United Kingdom.
 BARNHART: John Hendley Barnhart, 1871–1949, U.S.A. (Lentibulariaceae).
 BARONI: Eugenio Baroni, 1865–1943, Italy.
 W. BARTON: William Paul Crillon Barton, 1786–1856, U.S.A.
 BASINER: Theodor Friedrich Julius Basiner, 1817–1862, (*Hedysarum*).
 BATALL.: Alexander Batalin, 1847–1898, U.S.S.R.

- BATEM.: James Bateman, 1811–1897, United Kingdom.
 BATSCHE: August Johann Georg Karl Batsch, 1761–1802, Germany (horticulture).
 BAUMG.: Johann Christian Gottlob Baumgarten, 1765–1845, Germany.
 BEAL: William James Beal, 1833–1924, U.S.A. (Gramineae).
 BEAN: William Jackson Bean, 1863–1947, United Kingdom.
 BEAUVERD: Gustave Beauverd, 1867–1942, Switzerland (Compositae).
 P. BEAUV.: Ambroise Marie François Joseph Palisot de Beauvois, 1752–1820, France (Gramineae).
 BECC.: Odoardo Beccari, 1843–1920, Italy (Palmae).
 BECHERER: Alfred Becherer, 1897—, Switzerland.
 G. BECK: Günther Beck von Mannagetta, 1856–1931, Austria.
 W. BECKER: Wilhelm Becker, 1874–1920, Germany (*Viola*).
 BECKM.: John Beckmann, 1739–1811, Germany.
 BEDD.: Richard Henry Beddome, 1830–1911, United Kingdom.
 BEETLE: Allan Ackerman Beetle, 1913—, U.S.A. (Cyperaceae).
 BEISSN.: Ludwig Beissner, 1853–1927, Germany (Coniferae).
 BELLARDI: Carol Antonio Ludovico Bellardi, 1741–1826, Italy.
 A. BENN.: Alfred William Bennett, 1833–1902, United Kingdom (*Potamogeton*).
 J. BENN.: John Joseph Bennett, 1801–1876, United Kingdom.
 BENTH.: George Bentham, 1800–1884, United Kingdom.
 BERCHTOLD: Friedrich, Graf von Berchtold, 1781–1876, Austria.
 BERG.: Peter Jonas Bergius, 1730–1790, Sweden.
 BERGER: Alwin Berger, 1871–1931, Germany (*Sedum*).
 BERNH.: Johann Jacob Bernhart, 1774–1850, Germany.
 BERTERO: Carlo Giuseppe Bertero, 1789–1831, Italy.
 BERTHEL.: Sabin Berthelot, 1794–1880, France.
 BERTOL.: Antonio Bertoloni, 1775–1869, Italy.
 BESS.: Wilibald Swibert Joseph Gottlieb von Besser, 1784–1842, Austria; Poland (flora of Russia).
 BEURL.: Pehr Johan Beurling, 1800–1866, Sweden (flora of Scandinavia).
 BIEB.: Baron Friedrich August Marschall von Bieberstein, 1768–1826, Germany (flora of Russia).
 BIGEL.: Jacob Bigelow, 1787–1879, U.S.A. (flora of Boston).
 BINN.: Simon Binnendijk, 1821–1883, Netherlands (Java).
 BISS. & MOORE: James Bisset, 1843–1911, and Spencer Moore, United Kingdom.
 BITTER: Friedrich August Georg Bitter, 1873–1927, Germany.
 BIV.: Baron Antonio Bivona-Bernardi, 1778–1834, Sicily.
 BL.: Karl Ludwig von Blume, 1796–1862, Netherlands (Malaysia).
 BLAKE: Sidney Fay Blake, 1892–1959, U.S.A. (Compositae).
 S. T. BLAKE: Stanley Thatcher Blake, 1910—, Australia (Gramineae).
 BLAKEL.: Ralph Antony Blakelock, 1915–1963, United Kingdom.
 BLANCO: Francisco Manuel Blanco, 1780–1845, Spain (Philippines).
 BLUFF & FINGERH.: Mathias Joseph Bluff, 1805–1837, and Karl Anton Fingerhut, flourished 1821–1833, Germany.
 BLYTT: Matthias Numsen Blytt, 1789–1862, Norway; Sweden.
 BOBROV: Eugenii Grigorievich Bobrov, 1902—, U.S.S.R.
 BOECKL.: Johann Otto Boeckeler, 1803–1899, Germany (Cyperaceae).
 BOEHMER: Georg Rudolph Boehmer, 1723–1803, Germany (*Boehmeria*).
 BOEHMER: Louis B. Boehmer (& Co.), 1882–1908, (nurseryman in Japan).
 BOENN.: Clemens Maria Friedrich von Boenninghausen, 1785–1864, Germany.
 BOERL.: Jacob Gijsbert Boerlage, 1849–1900, Netherlands.
 BOISS.: Edmond Pierre Boissier, 1810–1885, Switzerland (flora of Orient).
 H. BOISS.: Henri de Boissieu, 1875–1912, Switzerland (Saxifragaceae, Cruciferae).
 BOIVIN: Bernard Robert Boivin, 1916—, Canada.
 BOLLE: Friedrich Bolle (contemporary), Germany.
 BONATI: Gustave Bonati, 1873–1927, France (Scrophulariaceae).
 BONG.: August Heinrich Gustav Bongard, 1786–1839, U.S.S.R. (Sitka, Bonin).
 E. BONN.: Edmond Bonnet, 1848–1922, France (*Eragrostis*).
 BONPL.: Aimé Jacques Alexandre Bonpland, 1773–1858, France (S. America).
 BOOTH: Francis Booth, 1792–1863, United Kingdom; U.S.A. (*Carex*).
 BORB.: Vincze von Borbás, 1844–1905, Hungary.
 BOREAU: Alexandre Boreau, 1803–1875, France.
 A. BORISS.: Antonina Georgievna Borisova (Borissova), 1903—, U.S.S.R.
 BORKH.: Moritz Balthasar Borkhausen, 1760–1806, Germany.
 BORNM.: Joseph Friedrich Nicolaus Bornmueller, 1862–1948, Germany.

- BORY & CHAUB.: Baron de Jean Baptiste Geneviève Marcelin Bory de St. Vincent, 1778–1846, and Louis Anastase Chaubard, 1785–1854, France.
- V. D. BOSCH: Roelof Benjamin van den Bosch, 1810–1862, Netherlands.
- BOTSCH.: V. P. Botschantzev, Contemporary, U.S.S.R.
- BOUCHÉ: Carl David Bouché, 1809–1881, Germany.
- BOULENGER: George Albert Boulenger, 1858–1937, Belgium (*Rosa*).
- BOWLES: Edward Augustus Bowles, 1865–1954, United Kingdom.
- N.E. BR.: Nicholas Edward Brown, 1849–1934, United Kingdom.
- R. BR.: Robert Brown, 1773–1858, United Kingdom.
- P. BR.: Patrick Browne, 1720–1790, Ireland.
- BRAND: August Brand, 1863–1931, Germany (Polemoniaceae, Boraginaceae, Symplocaceae).
- A. BRAUN: Alexander Carl Heinrich Braun, 1805–1877, Germany.
- BREIT.: Wilhelm Breitenbach, 1856—.
- BRIOT: Pierre Louis Briot, 1804–1888, France.
- BRIQ.: John Isaac Briquet, 1870–1931, Switzerland.
- BRITT.: Nathaniel Lord Britton, 1859–1934, U.S.A.
- BRITT. & BROWN: Nathaniel Lord Britton and Addison Brown.
- BRITTEN: James Britten, 1846–1924, United Kingdom.
- BRONGN.: Adolphe Théodore Brongniart, 1801–1876, France.
- BROT.: Felix da Silva Avellar Brotero, 1744–1828, Portugal.
- BROUSS.: Pierre Marie Auguste Brousset, 1761–1801, France.
- BROWN: Addison Brown, 1830–1913, U.S.A.
- BSP.: N. L. Britton, Emerson Ellick Sterns, 1846–1906, and Justus Ferdinand Poggenburg, 1840–1893, U.S.A.
- BUBANI: Pietro Bubani, 1806–1888, Italy.
- L. V. BUCH: Christian Leopold von Buch, 1774–1854, Germany.
- BUCH.-HAM.: Francis Buchanan, or Lord Hamilton, 1762–1828, United Kingdom.
- BUCHEN.: Franz Georg Philipp Buchenau, 1831–1906, Germany (Juncaceae).
- BUCHHOZ: Pierre Joseph Buchhoz, 1731–1807, France.
- BUEK: Heinrich Nikolaus Buek II, 1796–1879, Germany.
- BUERG.: Heinrich Buerger (Bürger), 1804(?1806)–1858, Germany; Netherlands (collector in Japan).
- BULLOCK: Arthur Allman Bullock, 1906—, United Kingdom.
- BUNGE: Alexander Andreievich von Bunge, 1803–1890, U.S.S.R.
- BUREAU: Edouard Bureau, 1830–1918, France.
- BURGS.D.: Friedrich August Ludwig von Burgsdorf, 1747–1802, Germany.
- BURKILL: Isaac Henry Burkill, 1870—, United Kingdom.
- BURM.: Johannes Burman, 1706–1779, Netherlands (Ceylon, India).
- BURM. F.: Nicolaus Laurens Burman, 1733–1793, Netherlands (India).
- BURRET: Carl Ewald Max Burret, 1883—, Germany (Palmae, Tiliaceae).
- BURTT: Brian Lawrence Burt, 1913—, United Kingdom.
- E. BUSCH: Elizaveta Aleksandrovna Bush (Busch), 1886–1960, U.S.S.R.
- N. A. BUSCH: Nikolai Adolfovich Bush (Busch), 1869–1941, U.S.S.R.
- BUSE: L. H. Buse, 1819–1888, Netherlands (Gramineae of Malaysia).
- BYHOUWER: Jan Tijs Pieter Bijhouwer (Byhouwer), 1898–1938, Netherlands.
- CALLIER: Alfons Callier, 1866–1927, Germany (dendrology).
- A. CAMUS: Aimée Camus, 1879—, France (Gramineae).
- E. G. CAMUS: Edmond Gustave Camus, 1852–1915, France (Cyperaceae).
- CARD.: Jules Cardot, 1860–1934, France (Rosaceae).
- CARR.: Elie-Abel Carrière, 1816–1896, France (dendrology).
- CARRUTH.: William Carruthers, 1830–1922, United Kingdom (dendrology).
- CASAR.: Giovanni Casaretto, 1812–1879, Italy.
- CASP.: Johann Xavier Robert Caspary, 1818–1887, Germany (*Hydrilla*, Nymphaeaceae).
- CASS.: Comte de Alexandre Henri Gabriel de Cassini, 1781–1832, France (Compositae).
- CAV.: Antonio José Cavanilles, 1745–1804, Spain.
- ČELAK.: Ladislav Josef Čelakovský, 1834–1902, Czechoslovakia.
- CHAIX: Abbé Dominique Chaix, 1730–1799, France.
- CHAM.: Adelbert Ludwig von Chamisso, 1781–1838, Germany (poet-naturalist).
- CHAMP.: Lt. Col. John George Champion, 1815–1854, United Kingdom (Hongkong).
- CHANDLER: Marjorie Elizabeth Jane Chandler, 1897—, United Kingdom.
- CHANG: Chiao-Chien Chang, 張兆鑑, 1900—, China (Compositae).
- CHASE: Mary Agnes Chase, 1869–1963, U.S.A. (Gramineae).
- CH'EN: Feng-Huei Ch'en, 陳封懷, 1901—, China (Compositae).

- CHENG: Wan-Chün Cheng, 鄭萬鈞, 1903—, China (dendrology).
 CHEVAL: Auguste J. B. Chevalier, 1873–1956, France.
 CHIEN: Sung-shu Chien (Ch'ung-shu Ch'eng), 錢崇澍, 1883—, China.
 CHING: Ren-ch'ang (R. C. Ching), 秦仁昌, 1898—, China (ferns).
 CHODAT: Robert Hippolyte Chodat, 1865–1934, Switzerland.
 CHOISY: Jacques Denys Choisy, 1799–1859, Switzerland (Convolvulaceae).
 C. CHR.: Carl Friedrik Albert Christensen, 1872–1942, Denmark (ferns).
 CHRIST: Konrad Hermann Heinrich Christ, 1833–1933, Switzerland (ferns).
 CHUN: Woon-Young Chun, 陳煥鏞, 1895—, China (dendrology).
 CHURCH: George Lyle Church, 1903—, U.S.A. (Gramineae).
 CLAIRV.: Joseph Philippe de Clairville, 1742–1830, Switzerland.
 C. B. CLARKE: Charles Baron Clarke, 1832–1906, United Kingdom (Cyperaceae, Compositae, Commelinaceae).
 CLAUSEN: Robert Theodore Clausen, 1911—, U.S.A.
 CLAYT.: John Clayton, 1685–1773, Virginia.
 CLEYER: André Cleyer, ?–1697 or 1698, Germany (resident of Japan 1682–86; *Cleyera*).
 COGN.: Célestin Alfred Cogniaux, 1841–1916, Belgium (Cucurbitaceae, Melastomataceae).
 COHEN-STUART: Combert Pieter Cohen-Stuart, 1889—, Netherlands (Theaceae).
 COLEBR.: Henry Thomas Colebrooke, 1765–1837, United Kingdom (India).
 COLSM.: Johannes Colsmann, 1771–1830, Denmark.
 COMM.: Philibert Commerson, 1727–1773, France.
 CONSTANCE: Lincoln Constance, 1906—, U.S.A. (Umbelliferae).
 T. COOKE: Theodore Cooke, 1836–1910, United Kingdom.
 COPEL.: Edwin Bingham Copeland, 1873–1964, U.S.A. (ferns).
 CORNAZ: Edouard Cornaz, 1825–1911, France.
 CORNER: Edred John Henry Corner, 1906—, United Kingdom (Malay Penins.; *Ficus*).
 CORREA: José Francisco Correa da Serra, 1751–1823, Portugal.
 COSS.: Ernest Saint-Charles Cosson, 1819–1889, France.
 COSTE: Abbé Hyppolyte Jacques Coste, 1858–1924, France.
 COULT.: John Merle Coulter, 1851–1928, U.S.A.
 COURT.: Richard Joseph Courtois, 1806–1836, Belgium.
 COV.: Frederick Vernon Coville, 1867–1937, U.S.A. (Ericaceae, Juncaceae).
 COWAN: John Macqueen Cowan, 1892–1960, United Kingdom.
 CRAIB: William Grant Craib, 1882–1933, United Kingdom.
 CRANTZ: Heinrich Johann Nepomuk von Crantz, 1722–1797, Austria.
 CRÉP.: François Crépin, 1830–1903, Belgium.
 CROIZAT: Léon Camille Marius Croizat, 1894—, U.S.A.; Venezuela (Euphorbiaceae).
 CROOM: Hardy Bryon Croom, 1797–1887, U.S.A.
 CUFODONTIS: Georg Cufodontis, 1896—, Austria.
 CUMING: Hugh Cuming, 1791–1865, United Kingdom (Philippines).
 CURT.: William Curtis, 1746–1799, United Kingdom (Botanical Magazine).
 CYR.: Domenico Cyrillo, 1739–1799, Italy.
 DAHLST.: Gustav Adolph Hugh Dahlstedt, 1856–1934, Sweden (*Taraxacum*).
 DALLA-TORRE: Karl Wilhelm von Dalla-Torre, 1850–1928, Germany.
 DALLA-TORRE & SARNTH.: K. W. von Dalla-Torre, and Ludwig von Sarnthein.
 DALLIM.: William Dallimore, 1871–1959, United Kingdom (horticulture, dendrology).
 DANDY: James Edgar Dandy, 1903—, United Kingdom.
 DANGUY: Paul Danguy, 1862–1942, France.
 DANSER: Benedictus Hubertus Danser, 1891–1943, Netherlands (Loranthaceae).
 DAVEAU: Jules Alexandre Daveau, 1852–1929, France.
 DAVID: Armand David, 1826–1900, France (collector in China).
 DEANE: Walter Deane, 1848–1930, U.S.A.
 DC.: Augustin Pyramus de Candolle, 1778–1841, Switzerland.
 A. DC.: Alphonse Louis Pierre Pyramus de Candolle, 1806–1893, Switzerland.
 C. DC.: Casimir de Candolle, 1836–1918, Switzerland.
 DEB.: Jean Odon Debeaux, 1826–1910, France (flora of China).
 DE BRUYN: Ary Johannes de Bruyn (Bruijn), 1811–1895, Netherlands.
 DECNE.: Joseph Decaisne, 1807–1882, France.
 DEGL.: Jean Vincent Yves Degland, 1773–1841, France.
 DEL.: Alire Raffeneau Delile, 1778–1850, France.
 DELAVAY: Abbé Jean Marie Delavay, 1834–1895, France (collector in China).
 DESCOURT.: Michel Étienne Descourtilz, 1775–1836, France.
 DESF.: René Louiche Desfontaines, 1750–1833, France.

- DESR.: Louis Auguste Joseph Desrousseaux, 1753–1838, France.
 DESV.: Augustin Nicaise Desvaux, 1784–1856, France.
 DE VRIESE: Willern Hendrik de Vriese, 1806–1862, Netherlands (Malaysia).
 DEWEY: Rev. Chester Dewey, 1784–1867, U.S.A. (*Carex*).
 DIELS: Friedrich Ludwig Emil Diels, 1874–1945, Germany.
 DIETR.: Friedrich Gottlieb Dietrich, 1768–1850, Germany.
 A. DIETR.: Albert Dietrich, 1795–1856, Germany.
 D. N. F. DIETR.: David Nathanael Friedrich Dietrich, 1800–1888, Germany.
 F. G. DIETR.: Friedrich Gottlieb Dietrich, 1768–1850, Germany.
 DRPP.: Ludwig Dippel, 1827–1914, Germany (dendrology).
 DODE: Louis Albert Dode, 1875–1943, France (dendrology).
 DOELL: Johann Christoph Doell, 1808–1885, Germany.
 DOI: Tohei Doi, 土井藤平, 1882–1946, Japan.
 DOMIN: Karel Domin, 1882–1954, Czechoslovakia (*Koeleria*).
 D. DON: David Don, 1799–1841, United Kingdom.
 G. DON: George Don, 1798–1856, United Kingdom.
 DONN: James Donn, 1758–1813, United Kingdom.
 DOUGL.: David Douglas, 1798–1834, United Kingdom.
 DREJER: Solomon Thomas Nicolai Drejer, 1813–1842, Denmark (*Carex*).
 DROBOV: Vassilii Petrovich Drobov, 1885–1956, U.S.S.R. (Gramineae).
 DRUCE: George Claridge Druce, 1850–1932, United Kingdom.
 DRUDE: Carl Georg Oscar Drude, 1852–1933, Germany.
 DRYAND.: Jonas Carlsson Dryander, 1748–1810, Sweden; United Kingdom.
 DUBOIS: François Noel Alexandre Dubois, 1752–1824, France.
 DUBY: Jean Étienne Duby, 1798–1885, Switzerland.
 DUCHART.: Pierre Étienne Simon Duchartre, 1811–1894, France.
 DUCHESNE: Antoine Nicolas Duchesne, 1747–1827, France.
 DULAC: Abbé Joseph Dulac, France.
 DUM. COURS.: Georges Louis Marie Dumont de Courset, 1746–1824, France.
 DUMORT.: Count Barthélemy Charles Joseph Dumortier, 1797–1887, Belgium.
 DUNAL: Michel Felix Dunal, 1789–1856, France.
 DUNN: Stephen Troyste Dunn, 1868–1938, United Kingdom.
 DURAND & SCHINZ: Théophile Alexis Durand, 1855–1912, Belgium, and Hans Schinz, 1858–1941, Switzerland.
 DURAZZ.: Antonio Durazzini, Italy.
 D'URV.: Jules Sebastian Cesar Dumont D'Urville, 1790–1842, France.
 DYER: William Turner Thiselton-Dyer, 1843–1928, United Kingdom.
 DYKES: William Rickatson Dykes, 1877–1925, United Kingdom (*Iris*, *Tulipa*).
 EATON: Daniel Cady Eaton, 1834–1895, U.S.A. (ferns).
 A. A. EATON: Alvah Augustus Eaton, 1865–1908, U.S.A. (ferns).
 EBERM.: Carl Heinrich Ebermaier, 1802–1870, Germany.
 EDGEW.: Michael Pakenham Edgeworth, 1812–1881, United Kingdom (Bengal).
 EHRENB.: Christian Gotfried Ehrenberg, 1795–1876, Germany.
 EHRH.: Friedrich Ehrhart, 1742–1795, Germany.
 ELL.: Stephen Elliott, 1771–1830, U.S.A.
 ELLIS: John Ellis, 1710–1776, Ireland.
 ELMER: Adolph Daniel Edward Elmer, 1870–1942, U.S.A. (Philippines).
 ELWES: Henry John Elwes, 1846–1922, United Kingdom (*Lilium*, *Coniferae*).
 ENDL.: Stephan Friedrich Ladislaus Endlicher, 1804–1849, Austria.
 ENGELM.: George Engelmann, 1809–1884, Germany; U.S.A.
 ENGL.: Heinrich Gustav Adolph Engler, 1844–1930, Germany.
 EXELL: Arthur Wallis Exell, 1901—, United Kingdom.
 FABR.: Philipp Konrad Fabricius, 1714–1774, Germany.
 FARW.: Oliver Atkins Farwell, 1867–1944, U.S.A.
 FASSETT: Norman Carter Fassett, 1900–1954, U.S.A.
 FAURIE: Urban Faurie, 1847–1914, France (collector in Japan).
 FAWC.: William Fawcett, 1851–1926, United Kingdom.
 FED.: Andrei Aleksandrovich Fedorov, 1908—, U.S.S.R.
 FEDDE: Friedrich Karl Georg Fedde, 1873–1942, Germany (Papaveraceae, Berberidaceae).
 B. FEDTSCH.: Boris Aleksevitch Fedtschenko, 1872–1947, U.S.S.R.
 O. FEDTSCH.: Olga Alexandrovna Fedtschenko, 1845–1921, U.S.S.R.
 FÉE: Antoine Laurent Apollinaire Fée, 1789–1874, Germany (Ferns).
 FEER: Heinrich Feer, 1857–1892, Switzerland (Campanulaceae).

- FENZI: Eduard Otto Fenzi, 1808-1879, Austria.
 FENZL: Eduard Fenzl, 1808-1879, Austria (Caryophyllaceae).
 FERN.: Merritt Lyndon Fernald, 1873-1950, U.S.A.
 FIEBER: Franz Xavier Fieber, 1807-1812, Hungary.
 FINET: Achille Eugene Finet, 1863-1913, France (Orchidaceae).
 FIORI: Adriano Fiori, 1865-1950, Italy.
 FISCH.: Friedrich Ernst Ludwig von Fischer, 1782-1854, U.S.S.R.
 FISCH. & MEY.: Friedrich Ernst Ludwig von Fischer and Carl Anton von Meyer.
 FLAKSB.: Konstantin Andreevich Fliaksberger (Flaksberger), 1880-1942, U.S.S.R. (*Triticum*).
 FLEROV: Aleksandr Fedorovich Flerov, 1872-1960, U.S.S.R.
 FLODERUS: Bjorn Gunnar Floderus, 1867-1941, Sweden (*Salix*).
 FLUEGGE: Johan Fluegge, 1775-1816, Germany.
 FOCKE: Wilhelm Olbers Focke, 1834-1922, Germany (*Rubus*).
 FOMIN: Alexander Vasilievich Fomin, 1867-1935, U.S.S.R. (ferns).
 FORBES: Francis Blackwell Forbes, 1839-1908, U.S.A. (China).
 FORBES & HEMSL.: F. B. Forbes, and W. B. Hemsley, United Kingdom (enum. Chinese plants).
 FORSELLES: Jacob Heinrich Forselles, 1785-1855, Finland.
 FORSK.: Pehr Forskål, 1736-1768, Finland (Egypt, Arabia).
 FORST.: Johann Reinhold Forster, 1729-1798, Germany (Pacific Isl.).
 FORST. F.: Johann Georg Adam Forster, 1754-1794, Germany.
 FORT.: Robert Fortune, 1812-1880, United Kingdom.
 FRANCH.: Adrien Franchet, 1834-1900, France (flora of Asia).
 FR. & SAV.: A. Franchet and L. Savatier (flora of Japan).
 FRESEN.: Johann Baptist Georg Wolfgang Fresenius, 1808-1866, Germany.
 FREYN: Joseph Franz Freyn, 1845-1903, Czechoslovakia.
 FRIES: Elias Magnus Fries, 1794-1878, Sweden.
 TH. FRIES: Theodor Magnus Fries, 1832-1913, Sweden (*Hieracium*).
 FRITSCH: Karl Fritsch, 1864-1934, Austria (Gesneriaceae).
 FROEDERSTR.: Harold Froederstroem, 1876-1944, Sweden (*Sedum*).
 FROEL.: Joseph Aloys Froelich, 1766-1841, Germany.
 FRYE & RIGG: Theodore Christian Frye, 1869-1962, and George Burton Rigg, 1872-1961, U.S.A.
 FUKUYAMA: Noriaki Fukuyama, 福山 伯明, 1912-1946, Japan (Orchidaceae).
 FURTADO: Caetano Xavier Dos Remedios Furtado, 1897—, Malaya.
 FURUMI: Masatomi Furumi, 古海 正福, 1888-1930, Japan (Scrophulariaceae).
 FUSS: Johann Michael Fuss, 1814-1883, Transylvania (Jugoslavia).
 GAERTN.: Joseph Gaertner, 1732-1791, Germany.
 GAERTN. F.: Karl Friedrich von Gaertner, 1772-1850, Germany.
 GAERTN., MEY. & SCHERB.: Philipp Gottfried Gaertner, 1754-1825, Bernhard Meyer, 1767-1836, and Johannes Scherbius, 1769-1813, Germany.
 GAGNEP.: François Gagnepain, 1866-1952, France.
 GAMBLE: James Sykes Gamble, 1847-1925, United Kingdom (India).
 GAND.: Abbé Michel Gandoger, 1850-1926, France.
 GARCKE: Friedrich August Garcke, 1819-1904, Germany.
 GARDN.: George Gardner, 1812-1849, United Kingdom (India).
 GAUDICH.: Charles Gaudichaud-Beaupré, 1789-1864, France.
 GAUDIN: Jean François Gottlieb Philippe Gaudin, 1766-1833, Switzerland (Gramineae).
 GAWL.: See KER-GAWL.
 J. GAY: Jacques Étienne Gay, 1786-1864, France.
 GEEL: Petrus Cornelis van Geel, 1796-1838, Belgium (horticulture).
 GELERT: Otto Carl Leonor Gelert, 1862-1899, Denmark.
 GEORGI: Johann Gottlieb Georgi, 1729-1802, U.S.S.R.
 GIESENH.: Karl Giesenhagen, 1860-1928, Germany (ferns).
 GILG: Ernst Gilg, 1867-1933, Germany.
 GILIB.: Jean Emmanuel Gilibert, 1741-1814, France.
 GING.: Frédéric Charles Jean Gingins de Lassaraz, 1790-1863, Switzerland (*Viola*).
 GLEDITSCH: Johann Gottlieb Gleditsch, 1714-1786, Germany.
 GLEHN: Peter von Glehn, 1837-1876, U.S.S.R. (Sakhalin).
 GLUECK: Christian Maximilian Hugo Glueck, 1868-1940, Germany (hydrophytes).
 GMEL.: Samuel Gottlich Gmelin, 1743-1774, U.S.S.R. (Siberia).
 J. F. GMEL.: Johann Friedrich Gmelin, 1748-1804, Germany.
 GODR.: Dominique Alexandre Godron, 1807-1880, France.
 GOEPP.: Johann Heinrich Robert Goeppert, 1800-1884, Germany.

- GOERING: Philip Friedrich Wilhelm Goering (Görling), 1809-1876, Germany (Collector in Japan).
- GOMBÓCZ: Endre Gombóc, 1882-1945, Hungary.
- GONTSCHE.: Nikolai Fedorovich Gontscharov, 1900-1942, U.S.S.R.
- GOODEN.: Rev. Samuel Goodenough, 1743-1827, United Kingdom.
- GORD.: George Gordon, 1806-1879, Ireland (Coniferae).
- GORODK.: Boris Nikolaevich Gorodkov, 1890-1953, U.S.S.R. (*Carex*).
- GORSKI: Stanislaw Batys Gorski, 1802-1864, Lithuania (Gramineae).
- GRAEBN.: Karl Otto Robert Peter Paul Graebner, 1871-1933, Germany.
- A. GRAY: Asa Gray, 1810-1888, U.S.A.
- S. F. GRAY: Samuel Frederick Gray, 1766-1828, United Kingdom.
- P. S. GREEN: Peter Shaw Green, 1920—, United Kingdom (*Osmanthus*).
- GREENE: Edward Lee Greene, 1842-1915, U.S.A.
- GREN.: Jean Charles Marie Grenier, 1808-1875, France.
- GREV.: Robert Kaye Greville, 1794-1866, United Kingdom.
- GRIFF.: William Griffith, 1810-1845, United Kingdom (India).
- GRIG.: Yuri Sergeevich Grigoriev (G. Grigorjev), 1905—, U.S.S.R.
- GRIMM: Johann Friedrich Karl Grimm, 1737-1821, Germany (*Stellaria*).
- GRISEB.: August Heinrich Rudolph Grisebach, 1814-1879, Germany.
- GRONOV.: Johannes Fredericus Gronovius, 1690-1762, Netherlands.
- GROSS: Hugo Gross, 1888—, Germany (*Polygonum*).
- GROSSHEIM: Alexandr Alfonsovich Grossheim, 1888-1948, U.S.S.R.
- GRUBOV: Valery Ivanovitch Grubov, 1917—, U.S.S.R.
- GUERKE: Robert Louis August Max Guerke, 1854-1911, Germany.
- GUILL.: André Guillaumin, 1885-1952, France.
- GUSS.: Giovanni Gussone, 1787-1866, Italy.
- HACK.: Eduard Hackel, 1850-1926, Austria (Gramineae).
- HAENKE: Thaddeus Haenke, 1761-1817, Czechoslovakia (traveler).
- HAGERUP: Olaf Hagerup, 1889-1961, Denmark.
- HAGIWARA: Tokio Hagiwara, 萩原時雄, 1896—, Japan (Convolvulaceae).
- HAGSTR.: Johan Oskar Hagström, 1860-1922, Sweden (*Potamogeton*, *Ruppia*).
- HAINES: Henry Hazelfoot Haines, 1867-1945, United Kingdom (India).
- HALLER: Albert von Haller, 1708-1777, Switzerland.
- HALLER F.: Albert von Haller fil., 1758-1823, Switzerland.
- HALLIER: Hans Gottfried Hallier, 1868-1932, Netherlands.
- HAMAYA: Toshio Hamaya, 濱谷 稔夫, 1928—, Japan (Thymelaeaceae).
- HAMET: Raymond-Hamet, 1890—, France.
- HAMILT.: See Buch.-Ham.
- HANCE: Henry Fletcher Hance, 1827-1886, United Kingdom (China).
- HANCOCK: William Hancock, 1847-1914, United Kingdom (collector in Japan and China).
- HAND.-MAZZ.: Heinrich von Handel-Mazzetti, 1862-1940, Austria (China).
- HARA: Hiroshi Hara, 原 寛, 1911—, Japan.
- HARMS: Hermann August Theodor Harms, 1870-1942, Germany.
- HARPER: Roland McMillan Harper, 1878—, U.S.A.
- HARTM.: Carl Johan Hartman, 1790-1849, Sweden.
- HASK.: Justus Karl Haskarl, 1811-1894, Germany (Java).
- HATUS.: Sumihiko Hatusima, 初島住彦, 1906—, Japan (dendrology).
- HAUSSKN.: Heinrich Carl Haussknecht, 1838-1903, Germany (*Epilobium*).
- HAW.: Adrian Hardy Haworth, 1768-1833, United Kingdom (Cactaceae, *Euphorbia*).
- HAYATA: Bunzo Hayata, 早田 文藏, 1874-1934, Japan (Formosa).
- HAYASHI: Yasaka Hayashi, 林 彌榮, 1911—, Japan (dendrology).
- HAYEK: August von Hayek, 1871-1928, Austria (flora of Orient, *Anemone*).
- HAYNALD: Ludwig von Haynald, 1816-1891, Hungary.
- H. B. K.: Baron Friedrich Wilhelm Heinrich Alexander von Humboldt, Aimé Jacques Alexandre Bonpland, and Carl Sigismund Kunth (flora of trop. Amer.).
- HEDL.: Johann Theodor Hedlund, 1861-1953, Sweden.
- HEGELM.: Christof Friedrich Hegelmaier, 1833-1906, Germany (hydrophytes).
- HEGI: Gustav Hegi, 1876-1932, Switzerland.
- HEIM.: Anton Heimerl, 1857-1942, Austria (*Achillea*).
- HEIST.: Lorenz Heister, 1683-1758, Germany.
- HELLER: Amos Arthur Heller, 1867-1944, U.S.A.
- HEMSL.: William Botting Hemsley, 1843-1924, United Kingdom.
- HENR.: Jan Theodor Henrad, 1881—, Netherlands (Gramineae).

- HENRY: Augustine Henry, 1857–1930, United Kingdom (collector in China).
 L. HENRY: Louis Henry, 1853–1903, France (cultivated plants).
 HERB.: Hon. William Herbert, 1778–1847, United Kingdom (Amaryllidaceae).
 HERBICH: Franz Herbich, 1791–1865, Austria; Poland.
 HERD.: Ferdinand Gottfried Theobald Maximilian von Herder, 1828–1896, U.S.S.R.
 HERINCQ: François Herincq, 1820–1891, France.
 HERRM.: Rudolf Albert Wolfgang Herrmann, 1885—, Germany.
 HERT.: Wilhelm Gustav Herter, 1884–1958, Germany.
 HESSE: Hermann Albrecht von Hesse, 1852–1937, Germany (nurseryman).
 VAN HEURCK: Henri Ferdinand van Heurck, 1838–1909, Belgium.
 HEYNE: Benjamin Heyne, —1819, Germany (India).
 HEYNH.: Gustav Heynhold, 1800—, Germany.
 HEYWOOD: Vernon H. Heywood, 1927—, United Kingdom.
 HIERN: William Philip Hiern, 1839–1925, United Kingdom.
 HIERON.: Georg Hans Emo Wolfgang Hieronymus, 1846–1921, Germany (vascular cryptogams).
 HIKINO: Hiroshi Hikino, ヒキノヒロシ, 1931—, Japan.
 HILL: Sir John Hill, 1716–1775, United Kingdom.
 A. W. HILL: Sir Arthur William Hill, 1875–1941, United Kingdom.
 HILLEBR.: Wilhelm Hillebrand, 1821–1886, Germany (Hawaii).
 HIROE: Minosuke Hiroe, 廣江美之助, 1914—, Japan (Umbelliferae).
 HISAUCHI: Kiyotaka Hisauchi (or Hisauti), 久内清孝, 1884—, Japan.
 HITCHC.: Albert Spear Hitchcock, 1865–1935, U.S.A. (Gramineae).
 E. HITCHC.: Edward Hitchcock, 1793–1864, U.S.A. (*Botrychium simplex*).
 HIYAMA: Kozo Hiyama, 檜山庫三, 1905—, Japan.
 HOCHREUT.: Bénédict Pierre Georges Hochreutiner, 1873–1959, Switzerland.
 HOCHST.: Christian Friedrich Hochstetter, 1787–1860, Germany (Africa).
 HOFFM.: Georg Franz Hoffmann, 1760–1826, Germany (Umbelliferae).
 O. HOFFM.: Karl August Otto Hoffmann, 1853–1909, Germany (Compositae).
 HOFFMANNS.: Count Johann Centurius von Hoffmannsegg, 1766–1849, Germany.
 HOLM: Herman Theodor Holm, 1854–1932, U.S.A.
 HOLMBERG: Otto Rudolf Holmberg, 1874–1930, Sweden.
 HOLTUM: Richard Eric Holtum, 1895—, United Kingdom (Malaya).
 HONDA: Masaji Honda, 本田正次, 1897—, Japan.
 HOOK.: Sir William Jackson Hooker, 1785–1865, United Kingdom.
 HOOK. & ARN.: W. J. Hooker and G. A. Walker-Arnott.
 HOOK. F.: Sir Joseph Dalton Hooker, 1817–1911, United Kingdom.
 HOPPE: David Heinrich Hoppe, 1760–1846, Germany.
 HORIKAWA: Tomiya Horikawa, 1920–1956, 堀川富彌, Japan (*Quercus*).
 HORKEL: Johann Horkel, 1769–1847, Germany.
 HORNEM.: Jens Wilken Hornemann, 1770–1841, Denmark.
 HORNIBR.: Murray Hornibrook, 1874–1949, United Kingdom (Coniferae).
 HORNSTEDT: Cladius Fredrik Hornstedt, 1758–1809, Sweden.
 HORT.: Hortorum, of Gardens.
 HOSOKAWA: Takahide Hosokawa, 細川隆英, 1909—, Japan (ecology, Formosa).
 HOST: Nicolaus Thomas Host, 1761–1834, Austria.
 HOTTA: Teikichi Hotta, 堀田 碩吉, 1899—, Japan (*Morus*).
 HOUSE: Homer Doliver House, 1878–1949, U.S.A.
 HOUTT.: Martinus Houttuyn, 1720–1798, Netherlands.
 HOUZ. DE LEHAIE: Jean Houzeau de Lehaie, 1820–1888, Belgium (bamboo).
 HOVEY: C. M. Hovey, 1810–1887, U.S.A.
 HOWELL: Thomas Jefferson Howell, 1842–1912, U.S.A.
 HU: Hsien-Hsu Hu, 胡 光 燾, 1894—, China (dendrology).
 S. Y. HU: Shiu-Ying Hu, 胡 秀 英, 1910—, China; U.S.A.
 C. E. HUBB.: Charles Edward Hubbard, 1900—, United Kingdom (Gramineae).
 F. T. HUBB.: Frederic Tracy Hubbard, 1875–1962, U.S.A. (Gramineae).
 HUDS.: William Hudson, 1730–1793, United Kingdom.
 HUGHES: Dorothy K. Hughes (Mrs. Wilson Popenoe), 1899–1932, U.S.A.
 HULT.: Oskar Eric Gunnar Hultén, 1894—, Sweden.
 HUMB.: Baron Friedrich Wilhelm Heinrich Alexander von Humboldt, 1769–1858, Germany.
 HURUSAWA: Isao Hurusawa, 古澤 潔夫, 1916—, Japan (Euphorbiaceae).
 HUTCHINS.: John Hutchinson, 1884—, United Kingdom (classification, Ranunculaceae).
 HUTH: Ernst Huth, 1854–1897, Germany (Ranunculaceae).

- HYLANDER: Nils Hylander, 1904—, Sweden.
- INUMA: Yokusai Inuma, 飯沼 恭孝, 1782–1865, Japan ("Somoku Dzusetu").
- IKENO: Seichiro Ikeno, 池野 成一郎, 1866–1943, Japan (*Plantago*).
- ILJIN: Modese Mikhailovich Iljin (Iliin), 1889—, U.S.S.R. (Compositae).
- IMAMURA: Shun'ichiro Imamura, 今村 駿一郎, 1903—, Japan (Podostemaceae).
- INMAN: Ondess Lamar Inman, 1890–1942, U.S.A.
- INOKUMA: Taizo Inokuma, 猪熊 泰三, 1904—, Japan (dendrology).
- IRMSCH.: Edgar Irmischer, 1887—, Germany (*Begonia*, *Saxifraga*).
- IRVING: Walter Irving, 1867—, United Kingdom.
- ISHIDOYA: Tsutomu Ishido, 石戸 谷 勉, 1884–1958, Japan.
- I. IRÔ: Hiroshi Itô, 伊藤 洋, 1909—, Japan (ferns).
- K. IRÔ: Koji Itô, 伊藤 浩司, 1934—, Japan.
- T. IRÔ: Tokutarô Itô, 伊藤 篤太郎, 1868–1941, Japan.
- IWATA: Jiro Iwata, 岩田 次郎, 1906—, Japan.
- K. IWATSUKI: Kunio Iwatsuki, 岩槻 邦男, 1934—, Japan.
- JACK: William Jack, 1795–1822, United Kingdom.
- JACKS.: Benjamin Dayton Jackson, 1846–1927, United Kingdom.
- JACOB-MAKOV: Lamert Jacob-Makov, 1790–1873, Belgium (cultivated plants).
- JACQ.: Nicolaus Joseph Baron von Jacquin, 1727–1817, Austria.
- JACQUEM.: Victor Jacquemont, 1801–1831, France.
- JAN CZ.: Eduard Janczewski, Ritter von Glinka, 1846–1918, Poland (*Ribes*).
- JANSEN: Pieter Jansen, 1882–1955, Netherlands (Gramineae).
- JOHNSTON: Ivan Murray Johnston, 1898–1960, U.S.A. (Boraginaceae).
- JORD.: Alexis Jordan, 1814–1897, France.
- JOTANI: Yukio Jôtani, 常谷 幸雄, 1904—, Japan.
- JUEL: Hans Oskar Juel, 1863–1931, Sweden ("Plantae Thunberg").
- JUNGH.: Franz Wilhelm Junghuhn, 1809–1864, Germany (Malaysia).
- JUSS.: Antoine Laurent de Jussieu, 1748–1836, France.
- A. JUSS.: Adrien Henri Laurent de Jussieu, 1797–1853, France.
- B. JUSS.: Bernard de Jussieu, 1699–1777, France.
- JUZEP.: Sergei Vasilievich Juzepczuk (Jusepczuk), 1893–1959, U.S.S.R.
- KAEMPFER: Engelbert Kaempfer, 1651–1716, Germany (traveler in Japan).
- KALENIC.: Johann Kaleniczenkow (Ivan Osipovich Kaleniczenkow), 1805–1876, U.S.S.R.
- KAMIKOTI: Sizuka Kamikôti, 上河内 静, 1910—, Japan (Lauraceae of Formosa).
- KANEH.: Ryôzô Kanehira, 金平 亮三, 1882–1947, Japan (dendrology, Formosa).
- KANITZ: Agost Kanitz, 1843–1896, Hungary.
- KAREL.: Grigorii Silych Karelin, 1801–1872, U.S.S.R.
- KARST.: Gustav Karl Wilhelm Hermann Karsten, 1817–1908, Germany.
- KAULF.: Georg Friedrich Kaulfuss, 1786–1830, Germany.
- KAWAKAMI: Takiya Kawakami, 川上 瀧 彌, 1871–1915, Japan.
- KAWANO: Syô'ichi Kawano, 河野 昭一, 1936—, Japan (flora of Hokkaido).
- KEARNEY: Thomas Henry Kearney, 1874–1956, U.S.A. (Malvaceae).
- KESSLER: Karl von Keissler, 1872—, Austria.
- KELLER: Robert Keller, 1854–1939, Switzerland (*Rosa*, *Rubus*, *Hypericum*).
- KELSO: Leon Kelso, 1907—, U.S.A. (*Glyceria*, *Salix*).
- H. KENG: Hsuan Keng, 耿 煊, 1923—, China; Formosa.
- Y. L. KENG: Yi-Li Keng, 耿 以 禮, 1898—, China (Gramineae).
- KER-GAWL.: John Bellenden Ker, or John Ker Bellenden, John Gawler (before 1804), or Bellenden Ker, 1765–1842, United Kingdom.
- KIKUCHI: Akio Kikuchi, 菊地 秋 雄, 1883–1951, Japan (pomology, *Pyrus*).
- M. KIKUCHI: Masao Kikuchi, 菊地 政 雄, 1908—, Japan.
- KIMURA: Arika Kimura, 木村 有 香, 1900—, Japan (*Salix*).
- Y. KIMURA: Yôjirô Kimura, 木村 陽 二 郎, 1912—, Japan (*Hypericum*).
- KING: Sir George King, 1840–1909, United Kingdom (India).
- KIRCHN.: G. Kirchner, 1837–1885, Germany.
- KITAG.: Masao Kitagawa, 北川 政 夫, 1909—, Japan.
- KITAIB.: Paul Kitaibel, 1757–1817, Germany (flora of Hungary).
- KITAM.: Sirô Kitamura, 北村 四 郎, 1906—, Japan (Compositae).
- KITTLITZ: Friedrich Heinrich von Kittlitz, 1799–1874, Germany.
- KLENZE: —Klenze, 19th century, Germany (*Pyrola japonica*).
- KLETT: Gustav Theodor Klett, 1808–1882, Germany.
- KLOTZSCH: Johann Friedrich Klotzsch, 1805–1860, Germany.

- KNIGHT: Josef Knight, 1781 (?)–1855, United Kingdom.
 KNOLL: Fritz Knoll, 1883—, Austria (*Astilbe*).
 R. KNUTH: Reinhard Gustav Paul Knuth, 1874–1957, Germany (Geraniaceae, *Dioscorea*).
 KOBUSKI: Clarence Emmeren Kobuski, 1900–1963, U.S.A. (Theaceae).
 C. KOCH: See K. KOCH.
 K. KOCH: Karl Heinrich Emil Koch, 1809–1879, Germany (dendrology).
 W. KOCH: Wilhelm Daniel Joseph Koch, 1771–1847, Germany (Umbelliferae).
 KODAMA: Shinsuke Kodama, 兒玉親輔, 1884—, Japan (Pteridophyta).
 KOEHNE: Bernhard Adalbert Emil Koehne, 1848–1918, Germany (dendrology).
 KOELER: Georg Ludwig Koeler, 1765–1807, Germany.
 KOENIG: Johann Gerhard Koenig, 1728–1789, Latvia (traveler and naturalist se. Asia).
 KOERN: Friedrich Koernicke, 1828–1908, U.S.S.R. (Eriocaulaceae, *Deutzia*, cereals).
 KOIDZ.: Gen'ichi Koidzumi, 小泉源一, 1883–1953, Japan.
 H. KOIDZ.: Hideo Koidzumi, 小泉秀雄, 1886–1945, Japan (*Taraxacum*).
 KOMAR.: Vladimir Leontievitch Komarov, 1869–1946, U.S.S.R. (e. Asia).
 KOMAT.: Shunzō Komatsu, 小松春三, 1879–1932, Japan (Ericaceae).
 KOORD.: Sijfert Hendrik Koorders, 1863–1919, Netherlands (Java).
 KORIBA: Kwan Koriba, 郡場 寛, 1882–1957, Japan (Podostemaceae).
 KORSH.: Sergyei Ivanovitch Korshinsky, 1861–1900, U.S.S.R.
 KORT: Antoine Kort, 1874–1951, Belgium (cultivated plants).
 KORTH.: Pieter Willem Korthals, 1807–1892, Netherlands.
 KOSO-POL.: Boris Mikhailovich Koso-Polianski, 1890–1957, U.S.S.R. (Umbelliferae).
 KOSTEL.: Vincenz Franz Kosteletzky, 1801–1887, Czechoslovakia.
 KOYAMA: Mitsuo Koyama, 小山光男, 1885–1935, Japan (dendrology).
 T. KOYAMA: Tetsuo Koyama, 小山鐵夫, 1933—, Japan.
 KRAENZL.: Fritz Wilhelm Ludwig Kraenzlin, 1874–1934, Germany (Orchidaceae).
 H. KRASCHEN.: Hippolit Mikhailovich Krasheninnikov (H. Krasheninnikov), 1884–1947, U.S.S.R.
 S. KRASCHEN.: Stefan Petrovich Krasheninnikov, 1713–1755, U.S.S.R. (traveler in Kamchatka, Kuriles).
 KRAUSE: Kurt Krause, 1883—, Germany (Liliaceae).
 V. KRECZ.: Vitalii Ivanovitch Kreczetovicz, 1901–1942, U.S.S.R. (*Carex*).
 KRYLOV: Porfirii Nikitovich Krylov, 1850–1931, U.S.S.R.
 KUDO: Yushūn Kudō, 工藤祐舜, 1887–1932, Japan.
 KUDO & SUSAKI: Y. Kudō and Chusuke Susaki, 須崎忠輔, 1866–1933, Japan.
 KUEKENTH.: Georg Kuekenenthal, 1864–1956, Germany (Cyperaceae).
 KUHN: Friedrich Adalbert Maximilian Kuhn, 1842–1894, Germany (ferns).
 KUMAZAWA: Masao Kumazawa, 熊澤正夫, 1904—, Japan (palynology, *Ranunculus*).
 KUNG: Hsien-Wu Kung, 孔憲武, 1897—, China.
 KUNTH: Carl Sigismund Kunth, 1788–1850, Germany.
 O. KUNTZE: Carl Ernst Otto Kuntze, 1843–1907, Germany.
 KUNZE: Gustav Kunze, 1793–1851, Germany (ferns).
 KURATA: Satoru Kurata, 倉田 悟, 1922—, Japan (dendrology).
 KUROSAWA: Sachiko Kurosawa, 1937—, 黒澤幸子, Contemporary, Japan.
 KURZ: Wilhelm Sulpiz Kurz, 1834–1878, Germany (Burma; India).
 KUSAKA: Masao Kusaka, 草下正夫, 1915—, Japan (dendrology).
 KUSN.: Nikolai Ivanovitch Kusnetzov, 1864–1932, U.S.S.R. (*Gentiana*).
 V. KUSN.: Vladimir Alexandrovich Kusnetzov, 1877–1940, U.S.S.R. (*Beckmannia*).
 L.: Carolus Linnaeus (Carl von Linné), 1707–1778, Sweden.
 L.F.: Carl von Linné fil., 1741–1783, Sweden.
 LABILL.: Jacques Julien Houtton de la Billardière, 1755–1834, France.
 LACKSCH.: Paul Lackschewitz, 1865–1936, U.S.S.R.
 LAEST.: Lars Levi Laestadius, 1800–1861, Lapland.
 LAG.: Mariano Lagasca y Segura, 1776–1839, Spain.
 LAHARPE: Jean de Laharpe, 1802–1863?, France (Juncaceae).
 LALLAVE.: Canónigo Pablo de La Llave, 1773–1883, Mexico.
 LALLEM.: Julius Leopold Edward Avé-Lallemant, 1803–1867, Germany.
 LAM: Herman Johannes Lam, 1892—, Netherlands (Verbenaceae).
 LAM.: Jean Baptiste Pierre Antoine de Monet de Lamarck, 1744–1829, France.
 LAMB.: Aylmer Bourke Lambert, 1761–1842, United Kingdom.
 LAMOTTE: Martial Lamotte, 1820–1883, France.
 LANGE: Johan Martin Christian Lange, 1818–1898, Denmark.
 LANGSD.: Georg Heinrich von Langsdorff, 1774–1854, Germany.
 LA PYL.: Auguste Jean Marie Bachelot de la Pylaie, 1786–1856, France.

- K. LARSEN: Kai Larsen, 1926—, Denmark.
- LAUTERB.: Carl Adolf Georg Lauterbach, 1864–1937, Germany.
- LAVALL.: Alphonse Lavallée, 1835–1884, France (dendrology).
- LAVRENKO: Eugenii Mikhailovich Lavrenko, 1900—, U.S.S.R.
- LAWRANCE: Mary Lawrance, 1790–1831, United Kingdom.
- LAWRENCE: George Hill Mathewson Lawrence, 1910—, U.S.A.
- LAXM.: Erich Laxmann, 1737–1796, U.S.S.R.
- LEBAS: E. Lebas, France?
- LECOMTE: Henri Lecomte, 1856–1934, France.
- LECOQ: Henri Lecoq, 1802–1871, France.
- LECOYER: C. J. Lecoyer, fl. 1875, Belgium (*Thalictrum*).
- LEDEB.: Carl Friedrich von Ledebour, 1785–1851, U.S.S.R.
- LEHAIE: See HOUZ. DE LEHAIE.
- LEHM.: Johann Georg Christian Lehmann, 1792–1860, Germany (*Potentilla*, Boraginaceae).
- LEICHTL.: Max Leichtlin, 1831–1910, Germany (horticulture).
- LEJ.: Alexander Louis Simon Lejeune, 1779–1858, Belgium.
- LEM.: Charles Antoine Lemaire, 1801–1871, Belgium (cultivated plants).
- LEMOINE: Pierre Louis Victor Lemoine, 1823–1911, and Emile Lemoine, 1862–1942, France (cultivated plants).
- LEPECH.: Ivan Lepechin, 1737–1802, U.S.S.R.
- LESCHEN.: Louis Théodor Leschenault de la Tour, 1773–1826, France.
- LESS.: Christian Friedrich Lessing, 1810–1880, Germany (Compositae).
- LÉV.: Augustin Abel Hector Léveillé, 1863–1918, France.
- LEX.: Juan Martínez de Lexarza, 1785–1824, Mexico.
- LEYSS.: Friedrich Wilhelm von Leysser, 1731–1815, Germany.
- L'HÉRIT.: Charles Louis L'Héritier de Brutelle, 1746–1800, France.
- LIEBM.: Frederik Michael Liebmann, 1813–1856, Denmark.
- LIGHTF.: Rev. John Lightfoot, 1735–1788, United Kingdom.
- LILJEBL.: Samuel Liljebblad, 1761–1815, Sweden.
- LIMPR.: Wolfgang Limpricht, flourished 1913–1941, Germany (*Pedicularis*, China).
- H. LINDB.: Harald Lindberg, 1871—, Finland.
- LINDBL.: Alexis Eduard Lindblom, 1807–1853, Sweden.
- LINDEM.: Eduard von Lindemann, 1825–1900, U.S.S.R.
- LINDEN: J. J. Linden, 1817–1898, Belgium.
- LINDL.: John Lindley, 1799–1863, United Kingdom.
- LINDM.: Carl Axel Magnus Lindman, 1856–1928, Sweden.
- LINDSAY: Robert Lindsay, 1846–1913, United Kingdom.
- LINGELSH.: Alexander von Lingelsheim, 1874–1937, Germany (Oleaceae).
- LINK: Johann Heinrich Friedrich Link, 1767–1851, Germany.
- LIU: Tchen-Ngo Liou, 劉 慎 謬, China.
- LITV.: Dmitri Ivanovitch Litvinov, 1854–1929, U.S.S.R.
- LLANOS: Antonio Llanos, 1806–1881, Spain (Philippines).
- LODD.: Conrad Loddiges, 1743?–1826, and George Loddiges, 1784–1846, United Kingdom.
- LOES.: Ludwig Eduard Theodor Loesener, 1865–1941, Germany (Aquifoliaceae).
- LOES. F.: O. Loesener, flourished about 1926, Germany (*Veratrum*).
- LOISEL.: Jean Louis Augusta Loiseleur-Deslongchamps, 1774–1849, France.
- LOUD.: John Claudius Loudon, 1783–1843, United Kingdom (cultivated plants).
- LOUR.: Juan Loureiro, 1715–1796, Portugal (Cochin China).
- LOWE: Edward Joseph Lowe, 1825–1900, United Kingdom.
- LUERSS.: Christian Luerssen, 1843–1916, Germany.
- LUTATI: F. Vignolo Lutati, 1878—, Italy.
- MA: Yü-Ch'üan Ma, 馬 毓 泉, China.
- MAACK: Richard Maack, 1825–1886, U.S.S.R.
- MACBR.: James Francis Macbride, 1892—, U.S.A. (Boraginaceae, *Clintonia*).
- MACKENZIE: Kenneth Kent Mackenzie, 1877–1934, U.S.A. (*Carex*).
- MACNAB: William Ramsay MacNab, 1844–1889, United Kingdom (*Abies*).
- MACOUN: John Macoun, 1832–1920, Canada.
- MAEKAWA: Tokujirō Maekawa, 前川 徳次郎, 1886—, Japan (*Chrysanthemum*).
- F. MAEKAWA: Fumio Maekawa, 前川 文夫, 1908—, Japan (*Hosta*, *Asarum*).
- MAGNUS: Paul Wilhelm Magnus, 1844–1914, Germany.
- MAKINO: Tomitarō Makino, 牧 野 富太郎, 1862–1957, Japan.
- MALINV.: Luis Jules Ernst Malinvaud, 1836–1913, France.
- MALME: Gustav Oskar Malme, 1864–1937, Sweden.

- MANSE.: Rudolf Mansfeld, 1901-1960, Germany (Orchidaceae).
 MARKGR.: Friedrich Markgraf, 1897—, Germany.
 MARQ.: Cecil Victor Boley Marquand, 1897—, United Kingdom.
 MARSILI: Giovanni M. Marsili, 1727-1795, Italy.
 MARTELLI: Ugolino Martelli, 1860-1934, Italy.
 MARTENS: Martin Martens, 1797-1863, Belgium.
 MARTIUS: Karl Friedrich Philipp von Martius, 1794-1868, Germany (flora of Brazil).
 MAR.-VICT.: Frère Marie-Victorin, 1885-1944, Canada.
 MASAM.: Genkei Masamune, 正 宗 藏 敬, 1899—, Japan (Formosa, Orchidaceae).
 MAST.: Maxwell Tylden Masters, 1833-1907, United Kingdom (cultivated plants).
 MATSUDA: Sadahisa Matsuda, 松 田 定 久, 1857-1921, Japan (flora of China).
 MATSUM.: Jinzō Matsumura, 松 村 任 三, 1856-1928, Japan.
 MATSUNO: Jūtārō Matsuno, 松 野 重 太 郎, 1868-1946, Japan.
 MATTF.: Johannes Mattfeld, 1895-1951, Germany.
 MAXIM.: Carl Johann Maximowicz, 1827-1891, U.S.S.R.
 MAXON: William Ralph Maxon, 1877-1948, U.S.A. (ferns).
 MAYR: Heinrich Mayr, 1856-1911, Germany (Coniferae).
 MAZEL: Eugène Mazel, flourished 1872, France (cultivated plants).
 MCCLINTOCK: Elizabeth McClintock, 1912—, U.S.A. (*Hydrangea*).
 MCCLURE: Floyd Alonzo McClure, 1897—, U.S.A. (bamboo).
 MEDIC.: Friedrich Casimir Medicus, 1736-1808, Germany.
 L. W. MEDIC.: Ludwig Wallrad Medicus, 1771-1850, Germany.

 MIYABE: Kingo Miyabe, 宮 部 金 吾, 1860-1951, Japan.
 MIYAKE: Tsutomu Miyake, 三 宅 勉, 1880—, Japan (Sakhalin).
 MIYOSHI: Manabu Miyoshi, 三 好 學, 1861-1939, Japan.
 MIZUSHIMA: Masami Mizushima, 水 島 正 美, 1925—, Japan (Caryophyllaceae).
 MOEHR.: Paul Heinrich Gerhard Moehring, 1710-1792, Germany.
 MOELLER: Hjalmar Moeller, 1866-1941, Sweden (Podostemaceae).
 MOENCH: Conrad Moench, 1744-1805, Germany.
 MOHLENBROCK: Robert H., Jr., 1931—, U.S.A. (*Zornia*).
 MOHNIKE: Otto Gottlieb Johan Mohnike, 1814-1887, Germany (collector in Japan).
 MOLDENKE: Harold Norman Moldenke, 1909—, U.S.A. (*Verbenaceae*).

- MOMIYAMA: Yasuitsi Momiyama, 榎山泰一, 1904—, Japan.
 MOMOSE: Sizuo Momose, 百瀬静男, 1906—, Japan (ferns).
 MOMOTANI: Yoshihide Momotani, 桃谷好英, 1928—, Japan.
 MONJUS.: Vladimir A. Monjushko, 1903–35.
 MOORE: Thomas Moore, 1821–1887, United Kingdom (Pteridophyta).
 S. MOORE: Spencer Le Marchant Moore, 1851–1931, United Kingdom.
 MOQ.: Christian Horace Benedict Alfred Moquin-Tandon, 1804–1863, France (Chenopodiaceae, Amaranthaceae).
 MOREL: F. Morel, flourished 1883–1916, France.
 MORI: Kunihiko Mori, 森 邦彦, 1905—, Japan.
 MORIKAWA: Kinichi Morikawa, 森川均一, 1898–1936, Japan.
 MORITZI: Alexander Moritzi, 1806–1850, Switzerland.
 MORONG: Rev. Thomas Morong, 1827–1894, U.S.A. (*Potamogeton*).
 MORR.: Charles François Antoine Morren, 1807–1858, Belgium.
 E. MORR.: Charles Jacques Edouard Morren, 1833–1886, Belgium.
 MORR. & DECNE.: C. F. A. Morren and Joseph Decaisne.
 MORTON: Conrad Vernon Morton, 1905—, U.S.A. (Filices).
 MOUILL.: Pierre Mouillefert, 1845–1903, France (dendrology).
 MUELL.-ARG.: Jean Mueller (Argoviensis, i.e., of Aargau), 1828–1896, Switzerland (Euphorbiaceae).
 F. MUELL.: Baron Ferdinand Jacob Heinrich von Mueller, 1825–1896, Australia.
 P. J. MUELL.: Philipp Jacob Mueller, 1832–1889, France.
 MUHL.: Henry Ludwig Muhlenberg, 1756–1817, U.S.A.
 MUNRO: William Munro, 1818–1880, United Kingdom.
 MURATA: Gen Murata (Gen Nakai), 1927—, 村田 源 (中井源), Japan.
 MURB.: Svante Samuel Murbeck, 1859–1946, Sweden (*Gentiana*).
 MUROI: Hiroshi Muroi, 室井 神, 1914—, Japan.
 MURR.: Johann Anders Murray, 1740–1791, Sweden; Germany (Coniferae).
 A. MURR.: Andrew Murray, 1812–1878, United Kingdom (Coniferae).
 MUTIS: José Celestino Mutis, 1732–1811, Spain (explorer in Colombia).
 NAKAI: Takenoshin Nakai, 中井 猛之進, 1882–1952, Japan.
 G. NAKAI: Changed to Gen Murata, see MURATA.
 NAKAJIMA: Sadao Nakajima, 中島定雄, Japan.
 NAKANO: Harufusa Nakano, 中野治房, 1883—, Japan.
 NANNF.: Johan Axel Nannfeldt, 1904—, Sweden.
 NASH: George Valentine Nash, 1864–1921, U.S.A.
 NATHORST: Alfred Gabriel Nathorst, 1850–1921, Sweden.
 NAUD.: Charles Victor Naudin, 1815–1899, France (Cucurbitaceae, Melastomataceae).
 NAVES: Andrés Naves, 1839–1910, Spain (Philippines).
 NECK.: Noel Joseph de Necker, 1729–1793, France.
 NEES: Christian Gottfried Daniel Nees von Esenbeck, 1776–1858, Germany.
 T. NEES: Theodor Friedrich Ludwig Nees von Esenbeck, 1787–1837, Germany (medicinal plants).
 NEES & EBERM.: T. F. L. Nees and Karl Heinrich Ebermaier, 1802–1870, Germany.
 NEKRASSOWA: Wera Leontievna Nekrassowa, 1884—, U.S.S.R. (Saxifragaceae).
 NELMES: Ernest Nelves, 1896–1959, United Kingdom (*Carex*).
 A. NELS.: Aven Nelson, 1859–1952, U.S.A.
 NEMOTO: Kwanji Nemoto, 根本 莞爾, 1860–1936, Japan.
 NESTL.: Christian Gottfried Nestler, 1778–1832, Germany.
 NEUBERT: Wilhelm Neubert, 1808–1905, Germany (Gart. Mag.).
 NEUMANN: Louis Neumann, 1827–1903, France (cultivated plants).
 NEVSKI: Sergei Arsenievich Nevski, 1908–1938, U.S.S.R.
 NEWBOLD: Patty Thum Newbold, U.S.A.
 NEWM.: Edward Newman, 1801–1876, United Kingdom.
 NICHOLS: George Nicholson, 1847–1908, United Kingdom (cultivated plants).
 NIEDENZU: Franz Josef Niedenzu, 1857–1937, Germany.
 NIEUWL.: Julius Aloysius Arthur Nieuwland, 1878–1936, U.S.A.
 NISHIDA: Makoto Nishida, 西田 誠, 1927—, Japan (Pteridophyta).
 NOISSETTE: Louis Claude Noisette, 1772–1849, France.
 NUTT.: Thomas Nuttall, 1786–1859, United Kingdom; U.S.A. (collector, flora of North America).
 NYM.: Carl Fredrik Nyman, 1820–1893, Sweden.
 ODASHIMA: Kijiro Odashima, 小田島喜次郎, Japan.
 OED.: Georg Christian von Oeder, 1728–1791, Denmark.
 OERST.: Anders Sandøe Oersted, 1816–1872, Denmark.
 OETT.: H. von Oettingen, flourished about 1905, Latvia.

- OGATA: Masasuke Ogata, 緒方正資, 1883-1944, Japan (Pteridophyta).
- OHBA.: Tatsuyuki Ohba, 大場達之, 1936—, Japan.
- OHKI: Kiichi Ohki, 大木 麒一, 1882—, Japan.
- M. OHKI: Masao Ohki, 大木正夫, 1930—, Japan (*Betula*).
- OHWI: Jisaburō Ohwi, 大井次三郎, 1905—, Japan (Cyperaceae, Gramineae).
- ŌKUBO: Saburō Ōkubo, 大久保三郎, 1857-1914, Japan.
- OKUYAMA: Shunki Okuyama, 奥山春季, 1909—, Japan.

- POELLN.: Karl von Poellnitz, 1896-1945, Germany.
- POIR.: Jean Louis Marie Poiret, 1755-1834, France.
- POIT.: Antoine Poiteau, 1766-1854, France (cultivated plants).
- POJARK.: Antonina Ivanovna Pojarkova, 1897—, U.S.S.R.
- POLL.: Johann Adam Pollich, 1740-1780, Germany?
- POLUNIN: Nicholas Polunin, 1909—, United Kingdom.
- POPOV: Mikhail Grigorievich Popov, 1893-1955, U.S.S.R.
- PORSILD: Alf Erling Porsild, 1901—, Canada (Arctic flora).

- POURR.: Pierre André Pourret, 1754–1818, France.
- PRAEG.: Robert Lloyd Praeger, 1865–1953, Ireland (*Sedum*).
- PRAIN: Sir David Prain, 1857–1944, United Kingdom.
- PRANTL: Karl Anton Eugen Prantl, 1849–1893, Germany.
- PRESC.: John D. Prescott, —1837, U.S.S.R. (*Cyperaceae*).
- C. PRESL: (Carel) Karel Boriweg Presl, 1794–1852, Czechoslovakia.*
- J. PRESL: Jan Swaptopluk Presl, 1791–1849, Czechoslovakia.
- PRICE: William Robert Price, 1886—, United Kingdom.
- PRINTZ: Karl Hendrik Oppegaard Printz, 1888—, Denmark (flora of Siberia).
- PRITZ.: Georg August Pritzel, 1815–1874, Germany (*Anemone*, bibliogr.).
- E. PRITZ.: Ernst Georg Pritzel, 1875–1946, Germany (*Lycopodiaceae*).
- PROKHAN.: Yaroslav Ivanovich Prokhanov (Prokhanoff), 1902—, U.S.S.R.
- PULLE: August Adriaan Pulle, 1878–1955, Netherlands.
- PULLIAT: Victor Pulliat, 1827–1866, France.
- PURSH: Frederick Traugott Pursh, 1774–1820, Germany; U.S.A. (flora of U.S.A.).
- QUISUMBING: Eduardo Quisumbing, 1895—, Philippines.
- RACIB.: Marian Raciborski, 1863–1917, Poland (ferns).
- RADDE: Gustav Ferdinand Richard Johannes Radde, 1831–1903, Germany.
- RADDI: Giuseppe Raddi, 1770–1829, Italy (Brazil).
- RADLK.: Ludwig Adolph Timotheus Radlkofer, 1829–1927, Germany (*Sapindaceae*).
- RAEUSCH.: Ernst Adolf Raeuschel, flourished 1772–1797, Germany ("Nomenclator Botanicus").
- RAF.: Constantine Samuel Rafinesque-Schmaltz, 1783–1840, U.S.A.
- RAMAT.: Abbé Thomas Albin Joseph d'Audibert de Ramatuelle, 1750–1794, France.
- RAVEN: Peter Raven, Contemporary, U.S.A. (*Epilobium*).
- R. RAYMUND: Raymund Rapaics von Ruhmwert, 1885—, Hungary.
- RECHING.: Karl Rechinger, 1867–1952, Austria.
- RECHINGER F.: Karl Heinz Rechinger, 1906—, Austria (*Rumex*).
- REDOUT.: Pierre Joseph Redouté, 1761–1840, France (*Liliaceae*, flower painter).
- REEDER: John Raymond Reeder, 1914—, U.S.A. (*Gramineae*).
- REGEL: Eduard August von Regel, 1815–1892, Germany; U.S.S.R.
- REG. & TIL.: Eduard August von Regel and Heinrich Sylvester Theodor Tiling.
- REHD.: Alfred Rehder, 1863–1949, Germany; U.S.A. (dendrology).
- REICHENB.: Heinrich Gottlieb Ludwig Reichenbach, 1793–1879, Germany (Europe, *Aconitum*).
- REICHENB. F.: Heinrich Gustav Reichenbach, 1823–1889, Germany (*Orchidaceae*).
- E. M. REID: Eleanor Mary Reid, 1860–1953, United Kingdom.
- REINW.: Kaspar Georg Karl Reinwardt, 1773–1854, Netherlands (Malaysia).
- RENDLE: Alfred Barton Rendle, 1865–1938, United Kingdom.
- RETZ.: Anders Johan Retzius, 1742–1821, Sweden.
- A. RICH.: Achille Richard, 1794–1852, France (*Hydrocotyle*, *Elaeagnus*).
- J. RICH.: Sir John Richardson, 1787–1865, United Kingdom.
- L. C. RICH.: Louis Claude Marie Richard, 1754–1821, France (collector in trop. Amer.).
- RIGHT.: Karl Richter, 1855–1891, Austria (pl. Europe).
- RICKER: Percy Leroy Ricker, 1878—, U.S.A. (*Lespedeza*).
- RIDL.: Henry Nicholas Ridley, 1855–1956, United Kingdom (Malaya).
- DU RIETZ: Gustav Einar Du Rietz, 1895—, Sweden (*Euphrasia*, lichens, ecology).
- RIGG: George Burton Rigg, 1872–1961, U.S.A.
- A. & C. RIV.: Marie Auguste Rivière, 1821–1877, and Charles Marie Rivière, 1845–?, France (bamboo):
- ROBINS.: Benjamin Lincoln Robinson, 1864–1935, U.S.A.
- C. B. ROBINSON: Charles Budd Robinson, 1871–1913, U.S.A.; Philippines.
- ROCHEBR.: Alphonse Trémeau de Rochebrune, 1834–1912, France.
- ROEM.: Johann Jacob Roemer, 1763–1819, Germany.
- ROHRB.: Paul Rohrbach, 1847–1871, Germany (*Caryophyllaceae*).
- ROLFE: Robert Allen Rolfe, 1855–1921, United Kingdom (*Orchidaceae*, Formosa).
- ROMAIN: Charles Romain, France.
- RONN.: Karl Ronniger, 1871–1954, Austria (*Thymus*, *Galium*).
- ROSC.: William Roscoe, 1753–1831, United Kingdom (*Zingiberaceae*).
- ROSE: Joseph Nelson Rose, 1862–1928, U.S.A. (*Cactaceae*).
- ROSENBURGH: Cornelis Rugier Willem Karel Alderwerelt van Rosenburgh, 1863–1936, Netherlands (ferns).
- ROSEND.: Carl Otto Rosendahl, 1875–1956, U.S.A. (*Mitella*).
- ROSENST.: Eduard Rosenstock, 1856—, (*Pteridophyta*).
- ROSENTH.: Käthe Rosenthal, flourished about 1919, Austria (*Daphniphyllum*).
- ROSENVINGE: Janus Lauritz Andreas Kolderup Rosenvinge, 1858–1939, Denmark.

- ROSHEV.: Roman Iulievich Rozhevitz (Roshevitz), 1882-1949, U.S.S.R. (Gramineae).
- ROSTK.: Friedrich Wilhelm Gottlieb Rostokovius, 1770-1848, Germany.
- ROTH: Albrecht Wilhelm Roth, 1737-1834, Germany.
- ROTHERT: Wladislaw Adolfovich Rother, 1863-1916, U.S.S.R. (*Sparganium*).
- ROTTB.: Christen Friis Rottboell, 1727-1797, Denmark.
- ROTTL.: Johann Peter Rottler, 1749-1836, Denmark.
- ROUSS.: Joseph Jules Jean Jacques Rousseau, 1905-, Canada.
- ROXB.: William Roxburgh, 1751-1815, United Kingdom (India).
- ROYLE: John Forbes Royle, 1799-1858, United Kingdom (India).
- RUDGE: Edward Rudge, 1763-1846, United Kingdom.
- RUDOLPH: Johann Heinrich Rudolph, 1744-1809, U.S.S.R. (*Dicentra*).
- RUEMPLER: Theodor Ruempler, 1817-1891, Germany.
- RUHL.: Eugen Otto Willy Ruhland, 1878-, Germany (Eriocaulaceae).
- RUIZ: Hipólito Ruiz-Lopez, 1754-1815, Spain.
- RUMPH.: Georg Eberhard Rumphius, 1628-1702, Germany ("Fl. Amboina").
- RUPR.: Franz Joseph Ruprecht, 1814-1870, U.S.S.R.
- RYDB.: Per Axel Rydberg, 1860-1931, U.S.A. (flora of Rocky Mts.).
- RYLANDS: Thomas Glazebrook Rylands, 1818-1900, United Kingdom (*Athyrium alpestre*).
- SABINE: Joseph Sabine, 1770-1837, United Kingdom.
- ST. HIL.: Auguste de Saint Hilaire, 1779-1853, France.
- ST. JOHN: Harold St. John, 1892-, U.S.A. (Pacific Is.).
- ST. YVES: Alfred Saint-Yves, 1855-1933, France (Gramineae).
- SAKAMOTO: Sadao Sakamoto, 阪本孝男, 1930-, Japan.
- SALISB.: Richard Anthony Salisbury, 1761-1829, United Kingdom.
- G. SAM.: Gunnar Samuelsson, 1855-1944, Sweden.
- SANDER: Henry Frederick Conrad Sander, 1847-1920, United Kingdom.
- SARG.: Charles Sprague Sargent, 1841-1927, U.S.A. (dendrology).
- SASAKI: Syun'iti Sasaki, 佐々木舜一, 1888-1960, Japan (flora of Formosa).
- SATA: Tyosyun Sata, 佐多長春, 1907-, Japan (*Ficus*).
- SATAKE: Yoshisuke Satake, 佐竹義輔, 1902-, Japan (*Eriocaulon*, *Juncus*, *Boehmeria*).
- SATOMI: Nobuo Satomi, 里見信生, 1922-, Japan.
- SAVAT.: SAV.: Paul Amedée Ludovic Savatier, 1830-1891, France (flora of Japan).
- SAVI: Gaetano Savi, 1769-1844, Italy.
- SAWADA: Taketarō Sawada, 澤田 武太郎, 1899-1938, Japan.
- SCHANGIN: Petr Ivanovich Schangin, 1741-1816, U.S.S.R.
- SCHAUER: Johan Conrad Schauer, 1813-1848, Germany (Verbenaceae).
- SHELLE: Ernst Schelle, fl. 1890-1930, Germany (Garteninspektor Univ. Tübingen).
- SCHERB.: Johannes Scherbius, 1769-1813, Germany (flora of Witter.).
- SCHINDL.: Anton Karl Schindler, 1879-, Germany (Leguminosae, Haloragaceae).
- SCHINZ: Hans Schinz, 1858-1941, Switzerland.
- SCHIPCZ.: Nikolai Valerianovich Shipchinskii (Shipczinsky), 1886-1955, U.S.S.R. (Ranunculaceae).
- SCHISCHK.: Boris Konstantinovich Shishkin (Schischkin), 1886-1963, U.S.S.R. (Caryophyllaceae).
- SCHK.: Christian Schkuhr, 1741-1811, Germany (*Carex*).
- SCHLEICH.: Johann Christoph Schleicher, 1768-1834, Switzerland.
- SCHLEID.: Matthias Jacob Schleiden, 1804-1881, Germany.
- SCHLTDL.: Dietrich Franz Leonhard von Schlechtendal, 1794-1866, Germany.
- SCHLTR.: Friedrich Reichardt Rudolf Schlechter, 1872-1925, Germany (Orchidaceae).
- SCHMALH.: Johannes Theodor Schmalhausen, 1849-1894, U.S.S.R.
- F. SCHMIDT: Friedrich Schmidt, 1832-1908, U.S.S.R. (Sakhalin, Bureja).
- F. W. SCHMIDT: Franz Willibald Schmidt, 1764-1796, Czechoslovakia.
- J. SCHM.: Johann Anton Schmidt, 1823-1905, Germany.
- C. K. SCHN.: Camillo Karl Schneider, 1876-1951, Germany (dendrology).
- SCHNIZL.: Adelbert Schnizlein, 1814-1868, Germany.
- SCHOTT: Heinrich Wilhelm Schott, 1794-1865, Austria (Araceae).
- SCHOTTKY: Ernst Max Schottky, 1888-1915, Switzerland.
- SCHRAD.: Heinrich Adolph Schrader, 1767-1836, Germany.
- SCHRANK: Franz von Paula Schrank, 1747-1835, Germany.
- SCHREB.: Johann Christian Daniel von Schreber, 1739-1810, Germany.
- SCHULT.: Joseph August Schultes, 1773-1831, Germany.
- SCHULT. F.: Julius Hermann Schultes, 1804-1840, Austria.
- SCHULTZ-BIP.: Carl Heinrich Schultz *Bipontinus* (i.e., of Zweibrücken), 1805-1867, Germany (Compositae).
- O. E. SCHULZ: Otto Eugen Schulz, 1874-1936, Germany (Cruciferae).

- K. SCHUM.: Karl Moritz Schumann, 1851–1904, Germany (Zingiberaceae).
 SCHUMACHER.: Heinrich Christian Friedrich Schumacher, 1757–1830, Denmark.
 SCHUR.: Philipp Johann Ferdinand Schur, 1799–1878, Austria.
 SCHWEICK.: Herald Georg Wilhelm Johannes Schweickerd, 1903—, South Africa.
 SCHWEIN.: Lewis David de Schweinitz, 1780–1834, U.S.A.
 SCHWERIN.: Graf Fritz von Schwerin, 1856–1934, Germany.
 SCOP.: Giovanni Antonio Scopoli, 1723–1788, Italy.
 SCRIBN. & SMITH.: Frank Lamson Scribner, 1851–1938, U.S.A. (Gramineae); Jared Gage Smith, 1866—, U.S.A.
 SEALY.: Joseph Robert Sealy, 1907—, United Kingdom (*Camellia*; cultivated plants).
 SEEM.: Berthold Carl Seemann, 1825–1871, Germany (China, Araliaceae).
 SEEMEN.: Karl Otto von Seemen, 1838–1910, Germany (*Salix*).
 SER.: Nicolas Charles Seringe, 1776–1858, France (Cucurbitaceae, Saxifragaceae).
 SERGIEV.: Lidia Palladievna Sergievskaja, 1897—, U.S.S.R.
 SERV.: Camille Servetaz, 1870–1947, France (*Elaeagnus*).
 SETCHELL.: William Albert Setchell, 1864–1943, U.S.A.
 SHERFF.: Earl Edward Sherff, 1886—, U.S.A.
 SHIBATA.: Keita Shibata, 柴田 桂太, 1877–1949, Japan (*Sasa*).
 T. SHIMIZU.: Tatemi Shimizu, 清水 建美, 1932—, Japan.
 SHIMOTOMAI.: Naomasa Shimotomai, 下斗米 直昌, 1899—, Japan (*Chrysanthemum*).
 SHIRAI.: Mitsutaro Shirai, 白井 光太郎, 1863–1932, Japan.
 SHIRAS.: Homi Shirasawa, 白澤 保美, 1868–1947, Japan (dendrology).
 SIBTH.: John Sibthorp, 1758–1796, United Kingdom.
 SIEB.: Philipp Franz von Siebold, 1796–1866, Germany; Netherlands.
 SIEB. & ZUCC.: P. F. von Siebold and J. G. Zuccarini.
 SIEBER.: Franz Wilhelm Sieber, 1789–1844, Austria.
 SIMONK.: Lajos töl Simonkai, 1851–1910, Hungary.
 SIMS.: John Sims, 1749–1831, United Kingdom.
 SKAN.: Sidney Alfred Skan, 1870–1940, United Kingdom.
 SKOTTSB.: Carl Johan Fredrik Skottsberg, 1880–1963, Sweden (flora of Pacific Is.).
 SKVORT.: B. V. Skvortzov (B. W. Skvortzow), flourished 1917–1955, U.S.S.R.; China (Manchuria), Brazil.
 SLEDGE.: William A. Sledge, 1904—, United Kingdom.
 SLOSS.: Margaret Slosson, 1872—, U.S.A. (ferns).
 SMALL.: John Kunkel Small, 1869–1938, U.S.A.
 A. C. SMITH.: Albert Charles Smith, 1906—, U.S.A.
 HARRY SMITH.: Harry Smith, 1889—, Sweden (China, *Saxifraga*, *Gentiana*).
 J. SMITH.: John Smith, 1798–1888, United Kingdom (Pteridophyta).
 J. E. SMITH.: Sir James Edward Smith, 1759–1828, United Kingdom.
 J. J. SMITH.: Johannes Jacobus Smith, 1867–1947, Netherlands (Orchidaceae).
 L. B. SMITH.: Lyman Bradford Smith, 1904—, U.S.A. (Bromeliaceae).
 W. W. SMITH.: William Wright Smith, 1875–1956, United Kingdom (Chinese flora).
 SOBOL.: Gregor Federovitch Sobolewski, 1741–1807, U.S.S.R.
 SOLAND.: Daniel Carl Solander, 1736–1782, Sweden; United Kingdom.
 SOLMS-LAUB.: Count Hermann Maximilian Carl Ludwig Friedrich Laubach, 1842–1915, Germany.
 SOMM.: Carlo Pietro Stefano Sommier, 1848–1922, Italy.
 SONNERAT.: Pierre Sonnerat, 1749–1814, France (China, India).
 Soó.: Károly Rezső Soó von Bere, 1903—, Hungary (*Melampyrum*, Orchidaceae).
 SOWERB.: James Sowerby, 1757–1822, and James De Carl Sowerby, 1787–1871, United Kingdom (English botany).
 SPACH.: Édouard Spach, 1801–1879, France.
 SPAE.: Dieudonné Spae, 1819–1879, Belgium (*Lilium*).
 SPAETH.: Franz Ludwig Spaeth, 1838–1913, Germany (cultivated plants).
 SPENNER.: Fridolin Karl Leopold Spenner, 1798–1841, Germany.
 SPRAGUE.: Thomas Archibald Sprague, 1877–1958, United Kingdom.
 SPRENG.: Kurt Polykarp Joachim Sprengel, 1766–1833, Germany.
 SPRING.: Frédéric Antoine Spring, 1814–1872, Belgium (Pteridophyta).
 STAFF.: Otto Stapf, 1858–1933, Austria; United Kingdom (Gramineae).
 STAUNTON.: Sir George Leonard Staunton, 1737–1801, United Kingdom (China).
 STEARN.: William Thomas Stearn, 1911—, United Kingdom (cultivated plants).
 STEBBINS.: George Ledyard Stebbins, Jr., 1906—, U.S.A.
 STEINB.: Elisabeth Ivanovna Steinberg, 1884–1963, U.S.S.R. (*Aconitum*).
 STELLER.: Georg Wilhelm Steller, 1709–1746, Germany (Siberia).
 STEPH.: Christian Friedrich Stephan, 1757–1814, U.S.S.R.
 STERNB.: Caspar, Graf von Sternberg, 1761–1838, Austria (*Saxifraga*).

- STEUD.: Ernst Gottlieb Steudel, 1783-1856, Germany.
- STEV.: Christian von Steven, 1781-1863, U.S.S.R. (flora of Russia; *Pedicularis*).
- STEWART: Albert Newton Steward, 1897-1959, U.S.A.; China (Polygonaceae).
- STOKER: Fred Stoker, 1878-1943, United Kingdom (cultivated plants).
- STOKES: Jonathan Stokes, 1755-1831, United Kingdom.
- STOUT: Arlow Burdette Stout, 1876-1957, U.S.A. (*Hemerocallis*).
- SUGAYA: Sadao Sugaya, 菅谷貞男, 1917-, Japan.
- SUGIMOTO: Jun'ichi Sugimoto, 杉本順一, 1901-, Japan.
- SUKATSCHEV: Vladimir Nikolaevich Sukhachev (Sukatschev), 1880-, U.S.S.R.
- SUMMERF.: Sören Christian Summerfelt, 1794-1838, Norway.
- SUMMERH.: Victor Samuel Summerhayes, 1897-, United Kingdom.
- SURING.: Jan Valckenier Suringer, 1865-1932, Netherlands (*Rhododendron*).
- SUTÖ: Tiharu Sutö, 須藤千春, 1910-, Japan (*Chrysosplenium*, *Carex*).
- SUTTON: Rev. Charles Sutton, 1756-1846, United Kingdom.
- SUZUKI: Sigeyosi Suzuki, 鈴木重良, 1894-1937, Japan (Formosa).
- T. SUZUKI: Tokio Suzuki, 1911-, 鈴木時夫, Japan; Formosa (*Rhododendron*, *Chrysosplenium*).
- SVENSON: Henry Knute Svenson, 1897-, U.S.A. (*Eleocharis*).
- SW.: Olof Peter Swartz, 1760-1818, Sweden.
- SWALLEN: Jason Richard Swallen, 1903-, U.S.A. (Gramineae).
- SWEET: Robert Sweet, 1783-1835, United Kingdom (*Geranium*, cultivated plants).
- SWINGLE: Walter Tennyson Swingle, 1871-1952, U.S.A. (*Citrus*).
- SWINHÖE: Robert Swinhoe, 1836-1877, United Kingdom (collector in Formosa).
- SYME: John Thomas Irvine Boswell, né Syme, afterwards Boswell-Syme, 1822-1888, United Kingdom.
- SZYSZ.: Ignaz Szyszyłowicz, 1857-1910, Poland.
- TAGAWA: Motozi Tagawa, 田川基二, 1908-, Japan (ferns).
- TAGG: Harry Frank Tagg, 1874-1933, United Kingdom (*Rhododendron*).
- TAKAH.: Yoshinao Takahashi, 高橋良直, flourished 1896-1915, Japan (plant pathologist).
- TAKEDA: Hisayoshi Takeda, 武田久吉, 1883-, Japan.
- TAKENOUCHI: Makoto Takenouchi, 竹内 亮, 1894-, Japan.
- TAMURA: Michio Tamura, 田村道夫, 1927-, Japan.
- TANAKA: Yoshio Tanaka, 田中芳男, 1838-1916, Japan.
- T. TANAKA: Tyōzaburō (or Chōzaburō) Tanaka, 田中長三郎, 1885-, Japan (*Citrus*).
- Y. TANAKA: Yuichiro Tanaka, 田中諭一郎, 1900-, Japan (*Citrus*).
- TANAKA & ONO: Yoshio Tanaka and Motoyoshi Ono, Japan.
- TANG: Tsin Tang (Ching T'ang), 唐 進, 1900-, China (Cyperaceae).
- TARD.-BL.: Marie L. Tardieu-Blot, 1902-, France (Pteridophyta).
- Y. TASHIRO: Yasusada Tashiro, 1856-1928, 田代安定, Japan.
- Z. TASHIRO: Zentarō Tashiro, 1872-1947, 田代善太郎, Japan.
- TATEW.: Misao Tatewaki, 館脇 操, 1899-, Japan (flora of Hokkaido).
- TAUB.: Paul Hermann Wilhelm Taubert, 1862-1897, Germany (Leguminosae).
- TAUSCH: Ignaz Friedrich Tausch, 1793-1848, Austria (*Hieracium*).
- TEIJSM.: Johannes Elias Teijsmann (Teysmann), 1808-1882, Netherlands; Java.
- TEMPLE: F. L. Temple, fl. 1887-1893, U.S.A. (nurseryman).
- TENORE: Michele Tenore, 1780-1861, Italy.
- TERRAC.: Achille Terraciano, 1861-1917, Italy (*Chrysosplenium*).
- TEUTSCHELL: Messers. Teutschell of Colchester, United Kingdom.
- TEYSM.: See TEIJSM.
- THELL.: Albert Thellung, 1881-1928, Switzerland.
- THOMS.: Thomas Thomson, 1817-1878, United Kingdom (India).
- THORY: Claude Antoine Thory, 1759-1827, France.
- THOU.: Louis Marie Aubert Du Petit Thouars, 1758-1831, France.
- THUILL.: Jean Louis Thuillier, 1757-1822, France.
- THUNB.: Carl Pehr Thunberg, 1743-1828, Sweden (flora of Japan).
- THW.: George Henry Kendrick Thwaites, 1811-1882, United Kingdom (Ceylon).
- TLING: Heinrich Sylvester Theodor Tiling, 1818-1871, U.S.S.R.
- TIMM: Joachim Christian Timm, 1754-1805, Germany (*Nuphar pumilum*).
- TINDALE: Mary D. Tindale, (contemporary) Australia (Pteridophyta).
- TOBLER: Friedrich Tobler, 1879-, Germany (*Hedera*).
- TODARO: Augustino Todaro, 1818-1892, Sicily.
- TOEPFFER: Adolph Toepffer, 1853-1931, Germany.
- TOLMATCHEV: Aleksandr Innokentevich Tolmachev (Tolmatchev), 1903-, U.S.S.R.
- TORR.: John Torrey, 1796-1873, U.S.A.

- TOYOKUNI: Hideo Toyokuni, 豊國秀夫, 1932—, Japan (*Gentiana*).
- TRACY: Samuel Mills Tracy, 1847–1920, U.S.A.
- TRATT.: Leopold Trattinnick, 1764–1849, Austria (*Rosa*, *Hosta*).
- TRAUTV.: Ernst Rudolph von Trautvetter, 1809–1889, U.S.S.R.
- TRÉC.: Auguste Adolphe Lucien Trécul, 1818–1896, France.
- TREL.: William Trelease, 1857–1945, U.S.A. (Onagraceae, Liliaceae).
- TREVIR.: Christian Ludolf Treviranus, 1779–1864, Germany.
- TRIANA: José (Jérónimo) Triana, 1828–1890, Colombia (Melastomataceae).
- TRIM.: Henry Trimmen, 1843–1896, United Kingdom (Ceylon).
- TRIN.: Carl Bernhard von Trinius, 1778–1844, U.S.S.R. (Gramineae).
- TRYON: Rolla Milton Tryon, 1916—, U.S.A. (Filices).
- TSCHONOSKI: Tschonoski (or Chonosuke) Sukawa, 須川長之助, 1841–1925, Japan (collector for Maximowicz).
- TUCKERM.: Edward Tuckerman, 1817–1886, U.S.A.
- TURCZ.: Nikolai Stepanovich Turczaninov, 1796–1864, U.S.S.R.
- TURRILL: William Bertram Turrill, 1890–1961, United Kingdom.
- TUYAMA: Takasi Tuyama, 津山 尚, 1910—, Japan.
- TZVEL.: Nikolai Nikolaievich Tzvelev (Tsvelev), 1925—, U.S.S.R. (*Dimeria*).
- UCHIDA: Shigetaro Uchida, 内田 繁太郎, 1885—, Japan (bamboo).
- UITTEN: Hendrik Uittien, 1898–1944, Netherlands (Cyperaceae).
- ULBR.: Eberhard Ulbrich, 1879–1952, Germany (Theligonaceae, Ranunculaceae).
- UNDERW.: Lucien Marcus Underwood, 1853–1907, U.S.A. (Filices).
- URBAN: Ignatius (Ignatz) Urban, 1848–1931, Germany (Scrophulariaceae).
- UYEKI: Homiki Uyeki, 植木秀幹, 1882—, Japan (Korea, dendrology).
- VAHL: Martin Hendriksen Vahl, 1749–1804, Denmark (Cyperaceae).
- VALETON: Theodorice Valetton, 1855–1929, Netherlands (Rubiaceae).
- VAN HALL: Hermann Christiaan van Hall, 1801–1874, Netherlands.
- VAN HOUTTE: Louis Van Houtte, 1810–1876, Belgium (cultivated plants).
- VAN TIEGH.: Philippe van Tieghem, 1838–1914, France (Loranthaceae).
- VAN'T.: Eugène Vaniot, —1913, France (*Carex*, Compositae).
- VAN STEENIS: Cornelis Gijbert Gerrit Jan van Steenis, 1901—, Netherlands; Java ("Flora Malesiana").
- VASEY: George Vasey, 1822–1893, U.S.A. (Gramineae).
- VASING.: Antonina Vasilievna Vasinger-Alektorova, 1892–194–?, U.S.S.R.
- VASS.: Viktor Nikolayenich Vasiliev (Vassiljev), 1890—, U.S.S.R.
- VATKE: Georg Carl Wilhelm Vatke, 1849–1889, Germany.
- VEITCH: John Gould Veitch, 1839–1870, United Kingdom (cultivated plants).
- VELL.: José Mariano da Conceição Vellozo, 1742–1811, Brazil.
- VENT.: Étienne Pierre Ventenat, 1757–1808, France.
- VIDAL Y SOLAR: Sebastian Vidal y Solar, 1842–1889, Spain (Philippines).
- VEILL.: Eugène Vieillard, 1819–1896, France.
- VIERR.: Fritz Vierhapper, 1876–1902, Austria.
- VILL.: Dominique Villars, 1745–1814, France.
- F. VILL.: Célestine Fernandez-Villar, 1838–1907, Spain (Philippines).
- VILM.: Pierre Philippe André Levéque de Vilmorin, 1746–1804, France (cultivated plants).
- VIS.: Roberto de Visiani, 1800–1878, Italy.
- VIV.: Domenico Viviani, 1772–1840, Italy.
- VOGEL: Julius Rudolph Theodor Vogel, 1812–1843, Germany.
- VOIGT: Johann Otto Voigt, 1798–1843, Germany.
- VOSS: Andreas Voss, 1857–1924, Germany (cultivated plants).
- VVED.: Aleksei Ivanovich Vvedenski (Vvedensky), 1898—, U.S.S.R. (Liliaceae).
- WAHLENB.: Göran (Georg) Wahlenberg, 1780–1851, Sweden.
- WALDST.: Count Franz Adam von Waldstein-Wartemberg, 1759–1823, Austria.
- WALKER: Egbert H. Walker, 1899—, U.S.A. (Myrsinaceae, "Bibl. e. Asiat. Bot.").
- WALL.: Nathaniel Wallich (Nathan Wolff), 1786–1854, Denmark (India, Nepal).
- WALLR.: Carl Friedrich Wilhelm Wallroth, 1792–1857, Germany.
- WALP.: Wilhelm Gerhard Walpers, 1816–1853, Germany.
- WALT.: Thomas Walter, 1740–1788, U.S.A.
- F. T. WANG: Fa-Tsuan Wang, 汪 發 纘, 1900—, China (Orchidaceae).
- WANGENH.: Friedrich Adam Julius von Wangerheim, 1747–1800, Germany.
- WANGER.: Walther Leonhard Wangerin, 1884–1938, Germany (Cornaceae).
- WARB.: Otto Warburg, 1859–1938, Germany.
- WARD: Francis Kingdon-Ward, 1885–1958, United Kingdom (collector in China).
- WARREN: Fred Adelbert Warren, 1902—, U.S.A.

- S. WATANABE: Sadamoto Watanabe, 渡邊定元, 1934—, Japan (*Betula*).
 S. WATS.: Sereno Watson, 1858–1925, U.S.A.
 WATT: George Watt, 1851–1930, United Kingdom (India, economic plants).
 WAWRA: Heinrich Ritter Wawra von Fernsee, 1831–1887, Austria (collector).
 WEATHERBY: Charles Alfred Weatherby, 1875–1949, U.S.A. (Filices).
 WEBB: Philip Barker Webb, 1793–1854, United Kingdom.
 WEBER: Georg Heinrich Weber, 1752–1828, Germany.
 WEBERB.: August Weberbauer, 1871–1948, Germany; Peru.
 WEDD.: Hugh Algernon Weddell, 1819–1877, France (S. America, Urticaceae).
 WEHRH.: Heinrich Rudolf Wehrhahn, 1882–1940, Germany.
 WEIGEL: Christian Ehrenfried Weigel, 1748–1831, Germany.
 WEIHE: Carl Ernst August Weihe, 1779–1834, Germany (*Stellaria*).
 WELW.: Friedrich Martin Josef Welwitsch, 1806–1872, Austria; Portugal.
 WENDL.: Johann Christoph Wendland, 1755–1828, Germany (flora of Germany, *Rosa*).
 H. WENDL.: Hermann A. Wendland, 1832–1903, Germany (Palmae).
 WENZIG: Theodor Wenzig, 1824–1892, Germany.
 WESSMAEL: Alfred Wessmael, 1832–1905, Belgium.
 WETTST.: Richard Ritter von Wettstein, 1863–1931, Austria.
 WEYRICH: Heinrich Weyrich, 1828–1863, U.S.S.R. (collector in Japan).
 C. T. WHITE: Cyrill Tennison White, 1890–1950, Australia.
 T. G. WHITE: Theodore Greely White, 1872–1901, U.S.A.
 WIDDER: Felix Josef Widder, 1892—, Austria.
 WIEG.: Karl McKay Wiegand, 1873–1942, U.S.A.
 WIGGERS: Friedrich Heinrich Wiggers, 1746–1811, Germany.
 WIGHT: Robert Wight, 1796–1872, United Kingdom (India).
 W. F. WIGHT: William Franklin Wight, 1874–1954, U.S.A. (Leguminosae).
 WIKSTR.: Johann Emanuel Wikstroem, 1789–1856, Sweden.
 WILDL.: Karl Ludwig Willdenow, 1765–1812, Germany.
 WILLIAMS: Frederic Newton Williams, 1862–1923, United Kingdom (Caryophyllaceae).
 WILS.: Ernest Henry Wilson, 1876–1930, U.S.A. (dendrology, *Lilium*).
 G. F. WILS.: George Fox Wilson, 1896–1951, United Kingdom (*Lilium*).
 WIMM.: Christian Friedrich Heinrich Wimmer, 1803–1868, Germany.
 WINKL.: Hubert Winkler, 1875–1941, Germany (Betulaceae).
 C. WINKL.: Constantin Alexander Winkler, 1848–1900, U.S.S.R. (Compositae).
 H. WINKL.: Hans Winkler, 1877–1945, Germany.
 WIRTGEN: Philipp Wilhelm Wirtgen, 1806–1870, Germany.
 DE WIT: Hendrik Cornelis Dirk de Wit, 1909—, Netherlands (Leguminosae, Gramineae).
 WITHER.: William Withering, 1741–1799, United Kingdom.
 WITTM.: Marx Carl Ludwig Wittmack, 1839–1929, Germany.
 E. WOLF: Egbert Wolf, 1860–1931, U.S.S.R. (dendrology).
 T. WOLF: Franz Theodor Wolf, 1841–1924, Germany (*Potentilla*).
 H. WOLFF: Karl Friedrich August Hermann Wolff, 1866–1929, Germany (Umbelliferae).
 WOOD: Alphonso Wood, 1810–1881, U.S.A.
 WORMSK.: Morten Wormskjöld, 1783–1845, Denmark.
 WOYNAR: Heinrich Woyнар, 1865–1917, Austria.
 WRIGHT: Charles Henry Wright, 1864–1941, United Kingdom.
 C. WRIGHT: Charles Wright, 1811–1886, U.S.A. (collector on U.S. North Pacific Exploring Expedition).
 WU: Yin-Ch'an Wu, 吳 韞 珍, China.
 WULFEN: Franz Xaver von Wulfen, 1728–1805, Hungary.
 YABE: Yoshitaka Yabe, 矢部吉頼, 1876–1931, Japan (Umbelliferae, Manchuria).
 YAMAMOTO: Yoshimatsu Yamamoto, 1893–1947, 山本由松, Japan (Formosa).
 YAMAZAKI: Takasi Yamazaki, 山崎 敬, 1921—, Japan (Scrophulariaceae).
 YANAGIHARA: Masayuki Yanagihara, 柳原政之, flourished about 1941, Japan (Formosa).
 YANAGITA: Yoshizo Yanagita, 柳田由藏, 1872–1945, Japan.
 YATABE: Ryokichi Yatabe, 矢田部良吉, 1851–1899, Japan.
 YOSHINAGA: Torama Yoshinaga (Inoue), 吉永虎馬 (井上虎馬), 1871–1946, Japan.
 ZABEL: Hermann Zabel, 1832–1912, Germany (dendrology).
 ZAHN: Karl Hermann Zahn, 1865–1940, Germany (*Hieracium*).
 ZENKER: Jonathan Karl Zenker, 1799–1837, Germany.
 ZINSERL.: Yuri Dmitrievich Tzinzerling (Y. Zinserling), 1894–1938, U.S.S.R. (*Eleocharis*).
 ZOLL.: Heinrich Zollinger, 1818–1859, Switzerland (Java).
 ZUCC.: Joseph Gerhard Zuccarini, 1797–1848, Germany (Japan).

INDEX OF JAPANESE PLANT NAMES

aquatica, 169var. *latifolia*, 169 —*caduciflora*, 169*latifolia*, 2, 169*terrestris*, 214

Zizyphs, 615

jubba, 615var. *inermis*, 615

Zizyphus (cont.)

sativa, 615*vulgaris*, 615var. *inermis*, 615var. *spinosa*, 615

Zornia, 557

angustifolia, 557*cantonensis*, 557*diphylla*, 557

Zostera, 124

asiatica, 125*caespitosa*, 124*caulescens*, 125*japonica*, 125*marina*, 124*nana*, 125*pacifica*, 125

ZOSTERACEAE, 124

Zoyisia, 178

hondana, 178*japonica*, 178*liukiuensis*, 178*macrostachya*, 2, 3, 178*matrella* var. *macrantha*,

178

pungens, 178var. *japonica*, 178var. *tenuifolia*, 178*sinica*, 178var. *macrantha*, 178var. *nipponica*, 178var. *robusta*, 178var. *sinica*, 178*tenuifolia*, 178

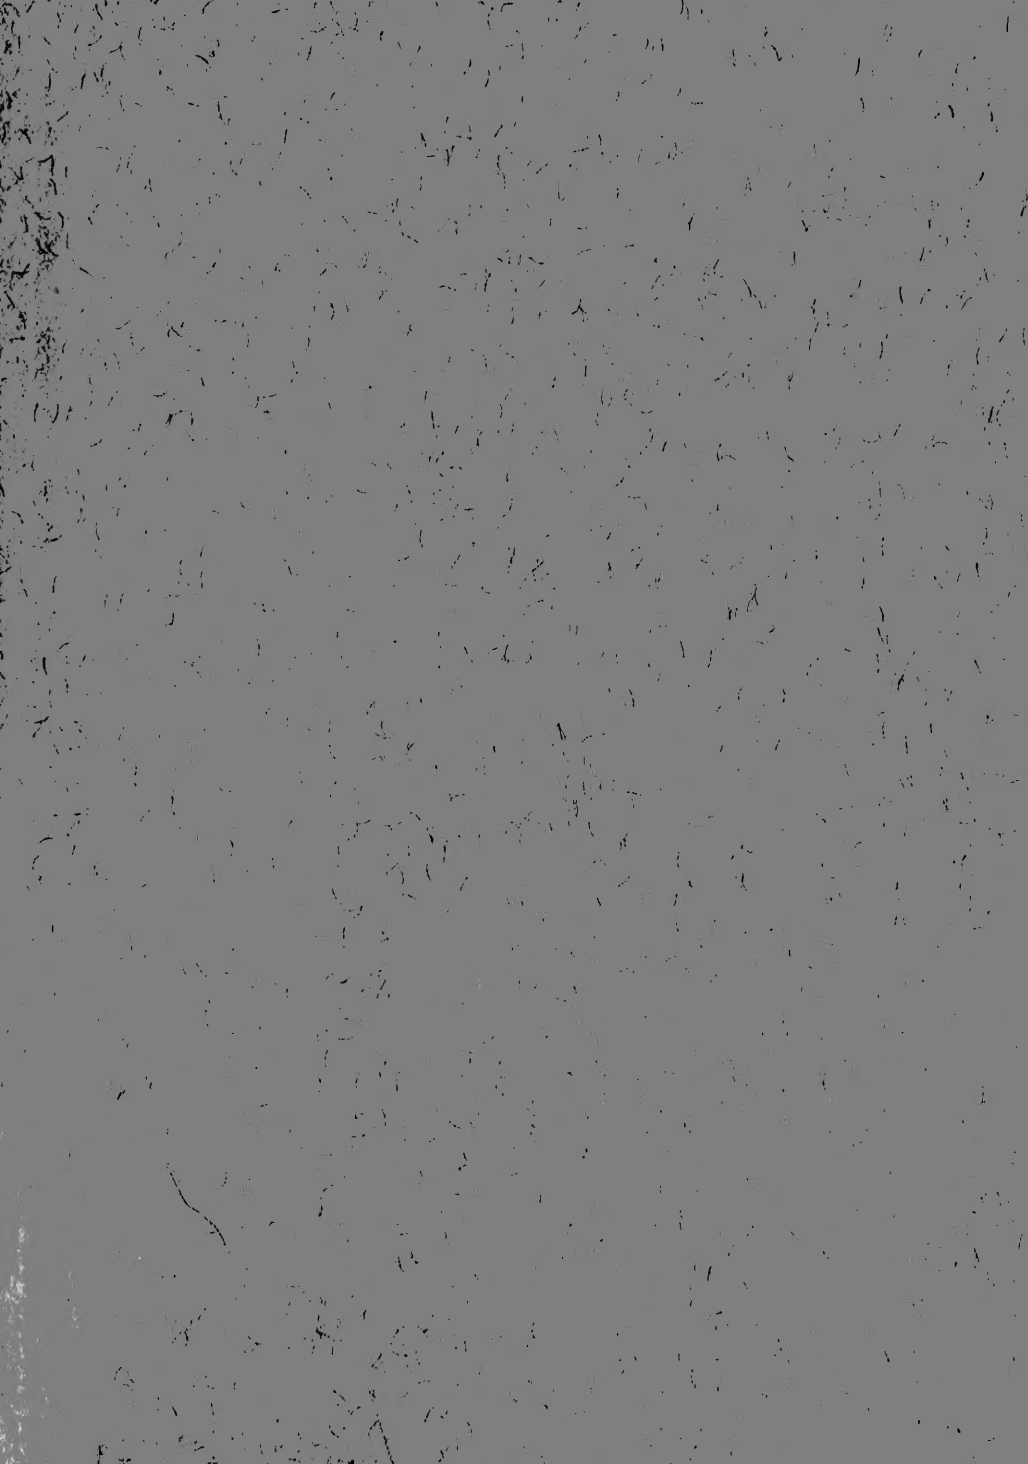

ZYGOPHYLLACEAE, 581

INDEX OF ENGLISH NAMES

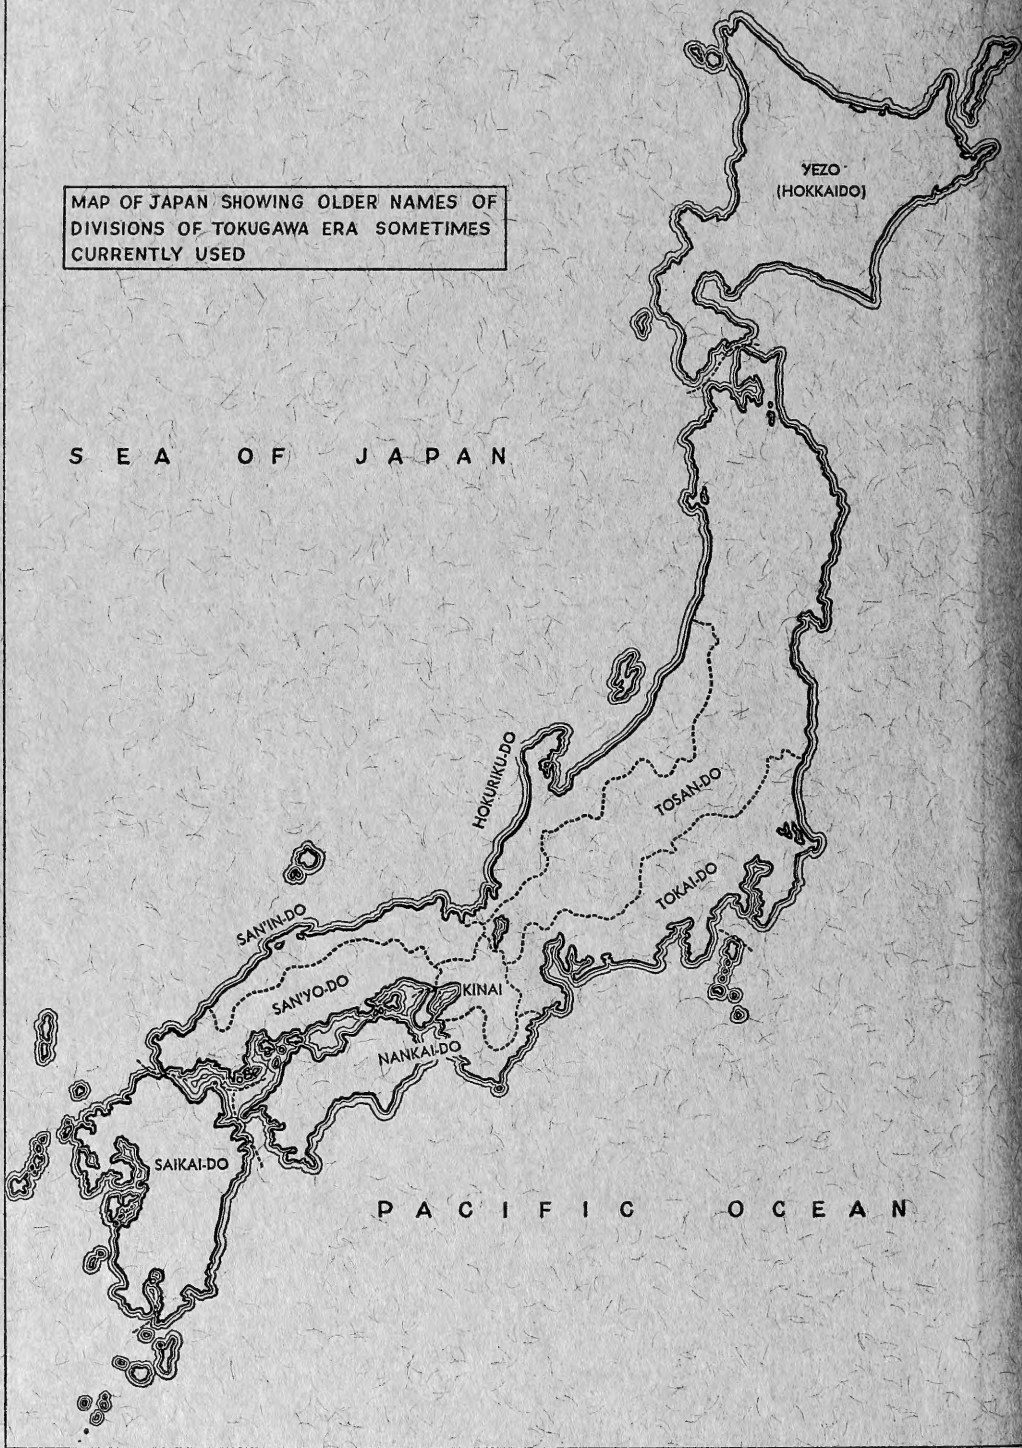

(Mostly names of families.)

- Acanthus family, 817
 Actinidia family, 626
 Alangium family, 651
 Amaranth family, 417
 Amaryllis family, 311
 Aroid family, 255
 Arrowgrass family, 125
 Aspidium family, 50
 Balanophora family, 402
 Balsam family, 613
 Bamboo tribe, 131
 Barberry family, 461
 Birch family, 370
 Birthwort family, 397
 Bladderwort family, 605
 Bladderwort family, 813
 Blechnum family, 89
 Borage family, 755
 Boxwood family, 595
 Broom-rape family, 810
 Buckthorn family, 614
 Buckwheat family, 402
 Burmannia family, 318
 Bur-reed family, 118
 Buttercup family, 439
 Caltrop family, 581
 Campanula family, 848
 Caper family, 479
 Carrot family, 667
 Cattail family, 118
 Cercidiphyllum family, 439
 Chickweed family, 422
 Chloranthus family, 360
 Citrus family, 581
 Climbing fern family, 32
 Clubmoss family, 22
 Composite family, 855
 Coriaria family, 596
 Crowberry family, 595
 Cycad family, 109
 Cypress family, 116
 Davallia family, 47
 Diapensia family, 688
 Dicotyledons, 359
 Dogbane family, 743
 Dogwood family, 686
 Duckweed family, 264
 Ebony family, 724
 Eelgrass family, 124
 Elaeocarpus family, 620
 Elm family, 380
 Euphorbia family, 438
 Evening Primrose family, 654
 Ferns, 21
 Fern allies, 21
 Figwort family, 790
 Filmyfern family, 33
 Flag family, 580
 Flacourtiaceae family, 642
 Flowering plants, 109
 Frogbit family, 128
 Garcinia family, 630
 Gentian family, 735
 Geranium family, 577
 Ginger family, 316
 Ginkgo family, 109
 Ginseng family, 661
 Gleichenia family, 32
 Gloxinia family, 812
 Goodenia family, 854
 Goosefoot family, 413
 Gourd family, 846
 Grape family, 618
 Grapefruit family, 28
 Grass family, 131
 Heath family, 693
 Holly family, 598
 Honeysuckle family, 833
 Hornwort family, 438
 Horsechestnut family, 611
 Horsetail family, 21
 Iris family, 315
 Icacina family, 606
 Lardizabala family, 461
 Laurel family, 469
 Leadwort family, 723
 Lily family, 279
 Linden family, 621
 Lizard's-tail family, 359
 Logania family, 734
 Loosestripe family, 648
 Madder family, 820
 Magnolia family, 467
 Mahogany family, 585
 Mallow family, 623
 Mangrove family, 651
 Maple family, 607
 Marattia family, 31
 Marechal family, 661
 Marsilea family, 107
 Melastoma family, 652
 Mesembryanthemum family, 421
 Mezereum family, 643
 Milkweed family, 744
 Milkwort family, 585
 Mint family, 766
 Mistletoe family, 396
 Monocotyledons, 118
 Moonseed family, 465
 Morning-glory family, 751
 Moschatel family, 843
 Mulberry family, 382
 Mustard family, 479
 Myoporaceae family, 818
 Myrsine family, 712
 Myrtle family, 652
 Naiad family, 123
 Nettle family, 386
 Nightshade family, 787
 Oak family, 376
 Olax family, 395
 Oleaster family, 644
 Olive family, 728
 Osunda family, 31
 Palm family, 253
 Pea family, 551
 Pepper family, 359
 Phanerogams, 109
 Philodendron family, 272
 Phryma family, 819
 Pickersweed family, 272
 Pine family, 111
 Pipevine family, 265
 Pittosporum family, 515
 Plagiogyria family, 48
 Plantain family, 819
 Plum-yew family, 111
 Podocarp family, 110
 Pokeweed family, 420
 Polemonium family, 754
 Polypody family, 96
 Pondweed family, 120
 Poppy family, 474
 Primrose family, 715
 Protea family, 394
 Psilotum family, 21
 Pteris family, 36
 Purslane family, 422
 Quassia family, 585
 Quillwort family, 28
 Rafflesia family, 401
 Riverweed family, 393
 Rose family, 517
 Rush family, 273
 Sabia family, 612
 Salvinia family, 107
 Sandalwood family, 395
 Saxifrage family, 498
 Sedge family, 195
 Seed plants, 109
 Seed plants (key to), 10
 Selaginella family, 26
 Sesame family, 810
 Shinleaf family, 690
 Soapberry family, 611
 Sorrel family, 580
 Spiderwort family, 270
 Spindle-tree family, 601
 Spleenwort family, 91
 Spurge family, 588
 Stachyurus family, 643
 Stemonaceae family, 278
 Sterculia family, 625
 Stenocarpus family, 493
 Styracaceae family, 727
 Sumac family, 596
 Sundew family, 492
 Sweet-gale family, 369
 Symplocos family, 725
 Taxodium family, 115
 Teasel family, 845
 Theligonum family, 661
 Treefern family, 49
 Triuris family, 130
 Trochodendron family, 438
 Valerian family, 843
 Vascular cryptogams, (key to), 9
 Verbena family, 762
 Violet family, 633
 Vittaria family, 106
 Walnut family, 369
 Waterfern family, 47
 Waterlily family, 435
 Water-milfoil family, 659
 Water-plantain family, 126
 Water-starwort family, 594
 Waterwort family, 633
 White Alder family, 690
 Willow family, 361
 Witch-hazel family, 516
 Yam family, 313
 Yew family, 109
